

Fish and Game Commission Meeting Binder

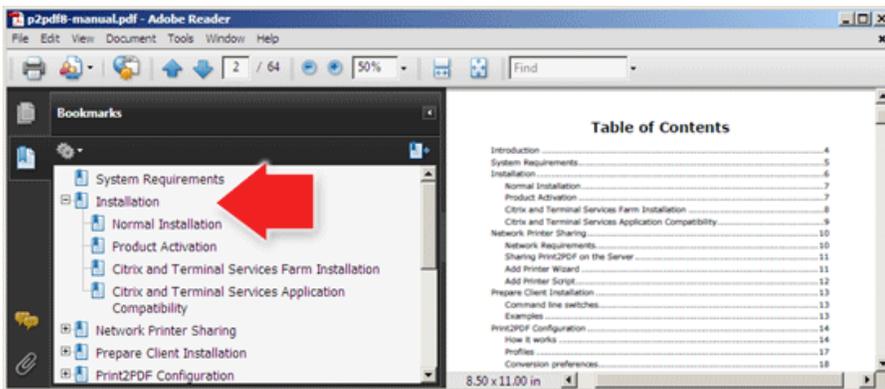

December 9-10, 2015
Commission Meeting

EASY GUIDE TO THE BINDER

1. Download and open the binder document using your Adobe Acrobat program/application.
2. Immediately click/tap on the “bookmark symbol” located near the top left-hand corner.

3. A bookmark panel should appear on either the top or the left-hand side of the screen. To make adjustments, simply use the Page Display option in the View tab. If done correctly, you should see something like:

4. We suggest leaving open the bookmark panel to help you move efficiently among the analysis sheets and supporting documents included in the binder. It's helpful to think of these bookmarks as a table of contents which allows you to go to specific points in the binder without having to scroll through hundreds of pages.
5. Resize the bars by placing the icon in the dark, vertical line located between the text boxes and using a long click/tap to move ←|→ in either direction. You may also adjust the sizing of the documents by adjusting the sizing preferences located on the Page Display icons found in the top toolbar or in the View tab.
6. Upon locating an analysis sheet for an agenda item that interests you, notice that you can get more information by double-clicking/tapping on any item underlined in red.
7. Return to the analysis sheet by simply re-clicking/tapping on the item in the bookmark panel.

OVERVIEW OF FISH AND GAME COMMISSION BUSINESS MEETING

- This is the 145th year of continuous operation of the Fish and Game Commission (Commission) in partnership with the Department of Fish and Wildlife (Department). Our goal is the preservation of our heritage and conservation of our natural resources through informed decision making. These meetings are vital in achieving that goal. In that spirit, we provide the following information to be as effective and efficient toward that end. Welcome and please let us know if you have any questions.
- We are operating under Bagley-Keene Open Meeting Act and these proceedings are being recorded and broadcast via Cal-Span.
- In the unlikely event of an emergency, please note the location of the nearest emergency exits. Additionally, the restrooms are located _____.
- Items may be heard in any order pursuant to the determination of the Commission President.
- The amount of time for each agenda item may be adjusted based on time available and the number of speakers.
- Speaker cards need to be filled out **legibly** and turned in to the staff **before** we start the agenda item. Please make sure to list the agenda items you wish to speak to on the speaker card.
- We will be calling the names of several speakers at a time so please line up behind the speakers' podium when your name is called. If you are not in the room when your name is called you may forfeit your opportunity to speak on the item.
- When you speak, please state your name and any affiliation. Please be respectful. Disruptions from the audience will not be tolerated. Time is precious so please be concise.
- To receive meeting agendas and regulatory notices about those subjects of interest to you, please visit the Commission's website, www.fgc.ca.gov, and sign up for our electronic mailing lists.
- **Beginning October 1, 2015, all petitions for regulation change must be submitted in writing on the authorized petition form, FGC 1 Petition to the California Fish and Game Commission for Regulation Change, available at <http://www.fgc.ca.gov/public/information/petitionforregulatorychange.aspx>.**
- **Reminder!** Please silence your mobile devices and computers to avoid interruptions.
- **Warning!** The use of a laser pointer by someone other than a speaker doing a presentation may result in arrest.

INTRODUCTIONS FOR FISH AND GAME COMMISSION COMMISSION MEETINGS

FISH AND GAME COMMISSIONERS

Jack Baylis	President (Los Angeles)
Jim Kellogg	Vice-President (Discovery Bay)
Jacque Hostler-Carmesin	Member (McKinleyville)
Eric Sklar	Member (Saint Helena)
Anthony Williams	Member (Huntington Beach)

COMMISSION STAFF

Sonke Mastrup	Executive Director
Michael Yaun	Legal Counsel
Susan Ashcraft	Marine Advisor
Melissa Miller-Henson	Program Manager
Caren Woodson	Analyst
Mary Brittain	Administrative Assistant

OFFICE OF THE ATTORNEY GENERAL

Chris Ames	Deputy Attorney General
------------	-------------------------

DEPARTMENT OF FISH AND WILDLIFE- Directorate

Chuck Bonham	Director
Dan Yparraguirre	Deputy Director, Wildlife and Fisheries Division
David Bess	Chief, Law Enforcement Division

I would also like to acknowledge special guests who are present:
(i.e., elected officials, tribal chairpersons, other special guests)

Commissioners
Jack Baylis, President
Los Angeles

Jim Kellogg, Vice President
Discovery Bay

Fish and Game Commission

Wildlife Heritage and Conservation
Since 1870

MEETING AGENDA December 9-10, 2015

Town and Country Resort & Convention Center
500 Hotel Circle North, San Diego

Field Trip: Fund for Animals Wildlife Center
December 8, 2015, at 3:00 p.m.
18740 Highland Valley Road, Ramona, CA 92065
Members of the public are invited, but must provide their own transportation.

The meeting will be live streamed at www.cal-span.org

NOTE: See important meeting procedures and information at the end of the agenda.

DAY 1 – DECEMBER 9, 2015, 8:30 A.M.

1. Call to order/roll call to establish quorum
2. Approve agenda and order of items
3. Public forum for items not on the agenda
The Commission **may not** discuss or take action on any matter raised during this item, except to decide whether to place the matter on a future meeting agenda. (Pursuant to sections 11125 and 11125.7(a), Government Code)

CONSENT ITEMS

4. Authorize publication of notice of intent to amend ocean salmon sport fishing regulations
 - (A) Season dates, size limits, and daily bag limits for April 2016
(Subsection 27.80(c), Title 14, CCR)
 - (B) Season dates, size limits, and daily bag limits for May-November 2016
(Subsection 27.80(d), Title 14, CCR)
5. Receive request from Charles Friend Oyster Company to amend State Water Bottom Lease No. M-430-04 to add new aquaculture cultivation methods

CONSENT ITEMS

6. Receive request from Tomales Bay Oyster Company to amend State Water Bottom Lease No. M-430-05 to add new aquaculture cultivation methods
7. Approve request from Hog Island Oyster Company to renew State Water Bottom Lease No. M-430-15 for aquaculture
8. Marine Resources Committee
 - (A) Meeting summary
 - I. Receive and adopt recommendations
 - (B) Work plan development
 - I. Update on work plan and draft timeline
 - II. Discuss and approve new topics
9. Tribal Committee
 - (A) Discuss items identified for a proposed rulemaking to allow tribal take exemptions in select marine protected areas
 - (B) Work plan development
 - I. Update on work plan and draft timeline
 - II. Discuss and approve new topics
10. Adopt proposed changes to marine protected areas regulations (Section 632, Title 14, CCR)
11. Request for authorization to publish notice of intent to amend Pacific halibut sport fishing regulations (Section 28.20, Title 14, CCR)
12. Receive draft Spiny Lobster Fishery Management Plan
13. Receive proposed final Master Plan for Marine Protected Areas pursuant to the Marine Life Protection Act
14. Approve request for an extension of time to transfer Mr. Thomas L. Ptak's transferable nearshore fishery permit and nearshore fishery trap endorsement for the Nearshore Fishery South Coast Regional Management Area
15. Approve request for an extension of Santa Barbara Mariculture's State Water Bottom Lease No. M-653-02 for aquaculture
16. Receive informational update on electronic reporting and pilot program for commercial passenger fishing vessel log books
17. Request for authorization to publish notice of intent to amend Commission meeting procedures regulations (Section 665, Title 14, CCR)

18. Approve Commission Conflict of Interest Code pursuant to the requirements of the Political Reform Act
19. Announce results from Executive Session
20. Receive presentation on state agencies' climate change policies and provide direction for development of Commission policy
21. Items of interest from previous meetings
 - (A) Action on petitions for regulation change received at the October 2015 meeting
 - (B) Action on non-regulatory requests received at the October 2015 meeting
 - (C) Update on domoic acid in recreational and commercial crab fisheries
 - (D) Update on schedule and approach to sea urchin regulatory change proposal
22. Department informational items
 - (A) Director's report
 - (B) Wildlife and Fisheries Division, and Ecosystem Conservation Division
 - (C) Law Enforcement Division
 - (D) Marine Region
 - (E) Other
23. Other informational items
 - (A) Executive director's report
 - (B) Staff report
 - (C) Legislative update and possible action
 - (D) Federal agencies report
 - (E) Other
24. Recess

DAY 2 – DECEMBER 10, 2015, 8:00 A.M.

25. Call to order
26. Public forum for items not on the agenda
The Commission **may not** discuss or take action on any matter raised during this item, except to decide whether to place the matter on a future meeting agenda. (Pursuant to sections 11125, 11125.7(a), Government Code)

CONSENT ITEMS

27. Receive the Department's 90-day evaluation report on the petition to list the Humboldt marten (*Martes caurina humboldtensis*) as an endangered species under the California Endangered Species Act (Pursuant to Section 2073.5, Fish and Game Code)

28. Wildlife Resources Committee

- (A) Work plan development
 - I. Update on work plan and draft timeline
 - II. Discuss and approve new topics
 - III. Make appointments to Predator Policy Workgroup

29. Approve proposed amendments to Commission Designated Wild Trout Waters Policy

30. Adopt proposed changes to endangered or threatened animals regulations to add gray wolf (*Canis lupus*) to the list of endangered species (Section 670.5, Title 14, CCR)

31. Consider the petition, Department's evaluation report, and comments received to determine whether listing the tricolored blackbird (*Agelaius tricolor*) as a threatened or endangered species may be warranted (Pursuant to Fish and Game Code, Section 2074.2).
Note: If the Commission determines listing may be warranted, a one-year status review will commence before the final decision on listing is made.

32. Sport fishing regulations (Section 1.05, et al., Title 14, CCR)

- (A) Certify California Environmental Quality Act document
- (B) Adopt proposed changes to regulations

33. Request for authorization to publish notice of intent to amend Central Valley salmon sport fishing regulations (Subsection 7.50(b)(5), (68) and (156.5), Title 14, CCR)

34. Request for authorization to publish notice of intent to amend Klamath River salmon sport fishing regulations (Subsection 7.50(b)(91.1), Title 14, CCR)

35. Fisheries at risk (Section 8.01, Title 14, CCR)

- (A) Consider and re-adopt emergency regulations regarding special measures for fisheries at risk due to drought conditions.
- (B) Request for authorization to publish notice of intent to adopt permanent regulations regarding special measures for fisheries at risk

36. Request for authorization to publish notice of intent to amend mammal hunting regulations
(Sections 265, et al., Title 14, CCR)
37. Request for authorization to publish notice of intent to amend waterfowl hunting regulations
(Sections 502 and 507, Title 14, CCR)
38. Discuss and act on future Commission meeting items
 - (A) Next meeting – February 10-11, 2016, in Sacramento
 - (B) Rulemaking calendar updates
 - (C) New business
 - (D) Other
39. Adjournment

EXECUTIVE SESSION
(Not Open to Public)

Pursuant to the authority of Government Code Section 11126(a)(1) and (e)(1), and Section 309 of the Fish and Game Code, the Commission will meet in closed Executive Session. The purpose of this Executive Session is to consider:

- (A) Pending litigation to which the Commission is a Party
 - I. Big Creek Lumber Company and Central Coast Forest Assoc. v. California Fish and Game Commission (Coho listing, south of San Francisco)
 - II. James Bunn and John Gibbs v. California Fish and Game Commission (squid permits)
 - III. Center for Biological Diversity and Earth Island Institute v. California Fish and Game Commission (black-backed woodpecker)
 - IV. Dennis Sturgell v. California Fish and Game Commission, California Department of Fish and Wildlife, and Office of Administrative Hearings (revocation of Dungeness crab vessel permit No. CT0544-T1)
 - V. Kele Younger v. California Fish and Game Commission, et al. (restricted species inspection fee waiver and Administrative Procedure Act)
- (B) Possible litigation involving the Commission
 - I. Tricolored blackbird
 - II. Bobcat trapping prohibition
- (C) Staff performance and compensation
- (D) Receive hearing officer recommendations on license and permit items
 - I. Mr. Peter Vitali – Appeal of the Department's permanent revocation of his hunting privileges and request for reinstatement of such privileges

IMPORTANT COMMISSION MEETING PROCEDURES INFORMATION

WELCOME TO A MEETING OF THE CALIFORNIA FISH AND GAME COMMISSION

This is the 145th year of operation of the Commission in partnership with the California Department of Fish and Wildlife. Our goal is the preservation of our heritage and conservation of our natural resources through informed decision making; Commission meetings are vital in achieving that goal. In that spirit, we provide the following information to be as effective and efficient toward that end. Welcome and please let us know if you have any questions.

PERSONS WITH DISABILITIES

Persons with disabilities needing reasonable accommodation to participate in public meetings or other Commission activities are invited to contact the Reasonable Accommodation Coordinator at (916) 651-1214. Requests for facility and/or meeting accessibility should be received at least 10 working days prior to the meeting to ensure the request can be accommodated.

SUBMITTING WRITTEN MATERIALS

The public is encouraged to comment on any agenda item. Submit written comments by one of the following methods: **E-mail to fgc@fgc.ca.gov; hand delivery to Fish and Game Commission, 1416 Ninth Street, Room 1320, Sacramento, CA 95814; or hand-deliver to a Commission meeting. *The Commission no longer accepts written comments or requests for regulations changes via facsimile; please submit written comments by email, mail service or in person, or submit requests for regulation change at <http://www.fgc.ca.gov/public/FGC1.docx>.***

Written comments received at the Commission office by **5:00 p.m. on November 24** will be made available to Commissioners prior to the meeting. Comments received by **12 noon on December 4** will be marked late and made available to Commissioners at the meeting. Otherwise, 10 copies of written comments must be brought to the meeting. All materials provided to the Commission may be made available to the general public.

PETITIONS FOR REGULATORY CHANGE AND NON-REGULATORY REQUESTS

All petitions for regulatory change and non-regulatory requests will follow a two-meeting cycle to ensure proper review and thorough consideration of each item. All requests submitted by **12 noon on December 4** (or heard during public forum at the meeting) will be scheduled for receipt at this meeting, and scheduled for consideration at the next business meeting.

All petitions for regulation change must be submitted in writing on the authorized petition form, FGC 1 Petition to the California Fish and Game Commission for Regulation Change, available at <http://www.fgc.ca.gov/public/information/petitionforregulatorychange.aspx>.

VISUAL PRESENTATIONS/MATERIALS

All electronic presentations must be submitted by **December 4 at 12 noon** and approved by the Commission executive director before the meeting.

1. Electronic presentations must be provided by email or delivered to the Commission on a USB flash drive by the written materials deadline.
2. All electronic formats must be Windows PC compatible.
3. It is recommended that a print copy of any electronic presentation be submitted in case of technical difficulties.
4. A data projector, laptop and presentation mouse will be available for use at the meeting.

CONSENT CALENDAR

A summary of all items will be available for review at the meeting. Any item may be removed from the consent calendar by the Commission, or upon the request of the Department or member of the public who wishes to speak to that item.

LASER POINTERS may only be used by a speaker during a presentation; use at any other time may result in arrest.

SPEAKING AT THE MEETING

To speak on an agenda item, please complete a "Speaker Card" and give it to the designated staff member before the agenda item is announced. Cards will be available near the entrance of the meeting room. Only one speaker card is necessary for speaking to multiple items.

1. Speakers will be called in groups; please line up when your name is called.
2. When addressing the Commission, give your name and the name of any organization you represent, and provide your comments on the item under consideration.
3. Each speaker has up to three minutes to address the Commission as determined by the presiding commissioner. If there are several speakers with the same concerns, please appoint a spokesperson and avoid repetitive testimony.
4. Speakers may cede their time to an individual spokesperson, but only under the following conditions:
 - a. Individuals ceding time forfeit their right to speak to the agenda item; and
 - b. The minimum number of individuals required to cede time to a spokesperson and the amount of time allocated are *arranged in advance* with the presiding commissioner.
5. If you are presenting handouts/written material to the Commission at the meeting, please provide 10 copies to the designated staff member just prior to speaking.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

3. PUBLIC FORUM**Today's Item****Information** **Action**

Receipt of public comments and requests for regulatory and non-regulatory actions.

Summary of Previous/Future Actions

- **Today's receipt of requests and comments** **Dec 9-10, 2015; San Diego**
- Direction to grant, deny, or refer requests **Feb 10-11, 2016; Sacramento**

Background

FGC generally receives three types of correspondence: Requests for regulatory action, requests for non-regulatory action, and informational only. The Administrative Procedure Act (APA) requires action on regulatory requests to be either denied or granted and notice made of that determination. At the end of public forum a motion may be made to provide direction to staff on any items for which FGC wishes to receive additional information or take immediate action. Otherwise, FGC will determine the fate of the regulatory and non-regulatory requests at the next commission meeting to allow staff time to evaluate requests.

Significant Public Comments

1. See regulatory requests in Exhibit 1
2. See non-regulatory requests in Exhibit 2

Recommendation (N/A)**Exhibits**

1. Table containing a summary of new petitions for regulation change received by Nov 24 at 5:00 p.m., the comment deadline for the meeting binder.
2. Table containing a summary of new non-regulatory requests received by Nov 24 at 5:00 p.m., the comment deadline for the meeting binder.
- 3-9. Individual, new petitions and requests that are summarized in the tables.
- 10-17. Informational-only items; staff will not take any action on these unless otherwise directed by FGC.

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

4. OCEAN SALMON (CONSENT)**Today's Item**Information Action

Authorization to publish two notices of intent to change ocean salmon sport fishing regulations.

Summary of Previous/Future Actions

- | | |
|---|--|
| <ul style="list-style-type: none"> • Today's notice hearing • Discussion hearing • Adoption hearing (A) • Adoption hearing (B) | <p>Dec 9-10, 2015; San Diego
 Feb 10-11, 2016; Sacramento
 Mar 15, 2016; Teleconference
 Apr 18, 2016; Teleconference</p> |
|---|--|

Background

Two notices are proposed:

1. Agenda Item 4(A): Subsection 27.80(c) is proposed for amendment for Apr 2016 salmon season conformance with federal rules.
2. Agenda Item 4(B): Subsection 27.80(d) is proposed for amendment for May to Nov 2016 salmon season conformance with federal rules.

FGC annually adopts ocean salmon sport fishing regulations in state waters to conform to federal rules. The Pacific Fishery Management Council (PFMC) coordinates West Coast management of recreational and commercial ocean salmon fisheries in the federal fishery management zone, 3 to 200 miles offshore WA, OR and CA. PFMC ocean salmon recommendations are subsequently implemented by the National Marine Fisheries Service, effective on May 1 of each year.

The proposed regulations include a broad range of options from no fishing in all areas off California to limited salmon fishing in all areas to increase flexibility and encompass possible PFMC recommendations. The exact opening and closing dates, bag limit, minimum size, and days of the week open will be determined after considering the final federal regulations and may be different for each area.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Authorize publication of two notices as recommended by DFW.

DFW: Authorize publication of two notices.

Exhibits

1. DFW memo, received Oct 19, 2015
2. ISOR (A)
3. ISOR (B)

6. TOMALES BAY OYSTER COMPANY (CONSENT)**Today's Item**Information Action

Receive request from Tomales Bay Oyster Company to amend State Water Bottom Lease No. M-430-05 to add new aquaculture cultivation methods.

Summary of Previous/Future Actions

- | | |
|--|--|
| <ul style="list-style-type: none"> • Today receive request • Consider approval | <p>Dec 9-10, 2015; San Diego</p> <p>TBD</p> |
|--|--|

Background

FGC has the authority to lease state water bottoms to any person for aquaculture for an initial lease term not to exceed 25 years (Sections 15400 and 15405, Fish and Game Code). Regulations require that any changes to existing leases must be approved by FGC (Section 237(c)(1), Title 14, CCR).

Mr. Tod Friend of Tomales Bay Oyster Company holds State Water Bottom Lease No. M-430-05 in Tomales Bay for purposes of culturing shellfish, and also holds a second state water bottom lease, No. M-430-04, under the business name Charles Friend Oyster Company, in Tomales Bay. Mr. Friend has submitted a request to amend lease M-430-05 to add authorization for "longlines, floats, and rack and bag" cultivation methods within the lease area, consistent with those authorized under lease No. M-430-04, to provide consistent authorized uses across both leases.

Upon receipt by FGC, DFW will review the request relative to management and biological considerations, and to identify any recommended changes to the terms of the leases. Action on the lease amendment request will be placed on a future FGC meeting agenda once DFW has completed its review.

Significant Public Comments (N/A)**Recommendation (N/A)****Exhibits**

1. Request from Tod Friend, Tomales Bay Oyster Company, received Oct 13, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the Consent Calendar, items 4, 6 and 7.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

7. HOG ISLAND OYSTER COMPANY (CONSENT)**Today's Item**Information Action

Approve Hog Island Oyster Company's request to renew State Water Bottom Lease No. M-430-15 for aquaculture.

Summary of Previous/Future Actions

- Received request to renew Feb 11-12, 2015; Sacramento
- **Today approve request to renew Dec 9-10, 2015; San Diego**

Background

FGC has the authority to lease state water bottoms that grant exclusive privilege to any person for conducting aquaculture, for an initial lease term not to exceed 25 years (Fish and Game Code sections 15400 and 15405). An existing lease holder may request to renew a lease prior to expiration and, if still actively engaged in aquaculture as determined by FGC, the lessee shall have a prior right to renew the lease on terms agreed upon between FGC and the lessee (Fish and Game Code Section 15406).

In 2011, FGC approved a new lease template that specified terms to be applied to new leases as well as lease renewals (Exhibit 1). The new lease template established, among other things, a lease term of 15 years with subsequent 10-year renewal terms, and annual lease rental rates based on high, moderate, and low productivity classifications (\$50, \$100, or \$150 per acre, respectively), with a provision that the State may review and recalculate lease rental rates no more frequently than every five years. The tenant is required provide to the State financial assurance sufficient for site clean-up if the lease is terminated or abandoned.

Hog Island Oyster Company has held FGC-issued state water bottom lease M-430-15 in Tomales Bay since 1992. The existing lease, originally established in 1990, encompasses 128.2 acres of state water bottom tidelands in Tomales Bay for cultivating shellfish, and is set to expire on February 28, 2016 (exhibits 2 and 3). The lessee, Mr. John Finger of Hog Island Oyster Company, has submitted a request to renew the lease for a period of 15 years (Exhibit 4). There are no proposed changes to the culture methods or species currently authorized for the lease.

DFW has reviewed the current lease and request for renewal and provided recommendations to FGC (Exhibit 5). No changes to lease provisions or operations are proposed and, as a result, DFW has determined that the proposed project is subject to a Class 1, or "Existing Facilities" categorical exemption from CEQA review. The renewed lease would be subject to the new lease template and rental rate schedule, set a renewed lease term of 15 years, and set a new annual rental rate based on a 10-year average production for the lease area, which DFW staff has indicated would place this lease at the low productivity classification rate of \$50 per acre.

Finally, to ensure that the lessee's current financial securities (see escrow agreement, Exhibit 3) are sufficient, DFW will conduct a site survey to confirm existing structures, obtain a third-

STAFF SUMMARY FOR DECEMBER 9-10, 2015

party estimate for clean-up, and adjust required financial securities to cover site clean-up as required under the lease terms.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Approve the lease renewal as recommended by DFW, and request that DFW proceed with steps to review and update the escrow agreement if warranted.

DFW: Approve the lease renewal for a period of 15 years.

Exhibits

1. Current lease template for State water bottom leases
2. Hog Island Oyster Company Lease M-430-15, amendments, and maps
3. Hog Island Oyster Company Escrow Agreement
4. Letter from Hog Island Oyster Co. requesting renewal of lease M-430-15, received Dec 5, 2014
5. DFW memo, received Nov 23, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the Consent Calendar, items 4, 6 and 7.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

8. MRC**Today's Item**Information Action

This is a standing item to receive MRC reports and recommendations, including a summary from the Nov 4, 2015 meeting (Exhibit 1).

Summary of Previous/Future Actions

- Most recent MRC meeting Nov 4, 2015; Ventura
- **Today's report and recommendations** **Dec 9-10, 2015; San Diego**
- Next MRC meeting Mar 21, 2016; Los Alamitos

Background

FGC directs the work of the committees (see Exhibit 2 for the current MRC two year work plan). Based on work referred to MRC for its Nov 4, 2015 meeting, MRC has the following recommendations for FGC consideration:

1. Master Plan for Marine Protected Areas: Schedule review and discussion for three FGC meetings, as opposed to the minimum of two required for the master plan, per DFW recommendation (see staff summary for Agenda Item 13).
2. California's Fishing Communities: Consider hosting a scoping discussion on fishing communities at or in conjunction with a future FGC meeting.
3. Kelp Regulations Review: Support DFW's recommendation to revise the order of FGC's approved 3-Phase approach to amending kelp harvest regulations, and undertake Phase 3 (improve management) prior to Phase 2 (funding and fees to cover management).
4. Possible Future Agenda Topics: Consider scheduling the following topics on future MRC and/or FGC meeting agendas:
 - a. FGC – Schedule for Feb 2016 an update from DFW's Marine Region on outcomes of the federal process to protect unmanaged forage species
 - b. MRC – Receive update from the Ocean Protection Council (OPC) on ocean acidification
 - c. MRC – Refer an informational item on plastic pollution and marine debris (by Plastic Pollution Coalition, and possibly OPC)
 - d. MRC – Receive update from DFW on the commercial sea cucumber fishery

Significant Public Comments

1. See MRC meeting summary for comments received during the meeting (Exhibit 1)
2. Ken Bates, Humboldt commercial fisherman, requests that FGC and DFW staff hold a meeting with north coast community members to discuss a community based fishing proposal for coastal communities north of Point Arena, prepared by Dan Yoakum, Bob Juntz, Mary Fairbanks, Linda Hildebrand, and Ken Bates (Exhibit 3)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Recommendation

FGC staff: (1) Approve MRC recommendations 1, 2, and 3; (2) Provide direction on potential agenda topics identified under recommendation 4, in the context of the MRC current work plan; (3) support request from Ken Bates to explore his request.

Committee: See background above and Exhibit 1.

DFW: (1) FGC hold three meetings to discuss the master plan for MPAs; and (2) FGC agree that DFW should undertake Phase 3 for kelp harvest regulations before Phase 2 (MRC recommendations 1 and 3 above).

Exhibits

1. Nov 4, 2015 MRC meeting summary
2. MRC Two-Year Work Plan
3. Email and attachment from Ken Bates, dated Nov 24, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission approves the MRC recommendations, approves a Feb 2016 update on the federal process to protect unmanaged forage species, approves _____ topics for future MRC meetings, and directs staff to continue discussions with fishing communities regarding support by the FGC

STAFF SUMMARY FOR DECEMBER 9-10, 2015

9. TRIBAL COMMITTEE**Today's Item****Information** **Action**

Update on the Tribal Committee's proposed draft rulemaking to accommodate tribal requests for take exemptions in select marine protected areas.

Summary of Previous/Future Actions

- | | |
|----------------------------------|-------------------------------|
| • TC tribal take discussion | Apr 7, 2015; Santa Rosa |
| • TC tribal take discussion | Jun 9, 2015; Mammoth Lakes |
| • TC meeting to draft rulemaking | Oct 6, 2015; Los Angeles |
| • FGC discussion of progress | Oct 7, 2015; Los Angeles |
| • Today's discussion | Dec 9, 2015; San Diego |
| • Notice hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

During FGC's rulemaking processes to adopt a network of marine protected areas (MPAs), the issue of impacting traditional gathering by Native American tribes surfaced. In particular, during the north coast study region planning effort (Point Arena to the California-Oregon border), the issue of tribal take of living marine resources was recognized as a traditional use to avoid impacting through the siting and designation of MPAs. FGC exempted take of living marine resources in specific MPAs by tribes that could demonstrate traditional use of those resources in those MPAs; this exemption did not apply to MPAs designated as "reserves".

FGC has received several requests since the north coast process from tribes that were not afforded the take exemptions in other study regions (for examples see exhibits 1-4). In a more recent instance, the Kashia Band of Pomo Indians would like to revisit the marine reserve regulations governing the Stewarts Point area. In 2010, the tribe, DFW, and FGC worked to modify the Stewarts Point MPA to maintain access to fishing and gathering, and ceremonial activities on the tribe's ancestral lands along the coast. A key element of the solution was that the property surrounding Stewarts Point was privately-owned and limited access largely to tribal members; the property has since changed hands, and is about to change hands again. The new property owners want to protect the conservation values of the property, but will also offer a public access trail running the length of the property. While the public trail will make the shoreline accessible to the public, the tribe is concerned about inappropriate access to its sacred areas, and the new owners are concerned about public safety arising from activities along the bluffs and shoreline (no exhibit)

Significant Public Comments (N/A)**Recommendation (N/A)****Exhibits**

1. Letter from the U.S. Bureau of Indian Affairs regarding tribal take in MPAs by

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Resighini Rancheria, received Aug 20, 2012

2. Letter from Resighini Rancheria requesting tribal take exemptions in select MPAs in north coast, received Aug 20, 2012
3. Letter from Cher-Ae Heights Indian Community of the Trinidad Rancheria, regarding consultation about tribal take exemption for Reading Rock SMCA, received Aug 14, 2013
4. Letter from Santa Ynez Band of Chumash Indians requesting tribal take exemption in SMCAs in Santa Barbara County, received Nov 1, 2011
5. Draft tribal take in MPAs regulations
6. Letter from Santa Ynez Band of Chumash Indians, received Oct 14, 2015

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

10. MARINE PROTECTED AREAS**Today's Item**Information Action

Adopt proposed changes to marine protected area (MPA) regulations.

Summary of Previous/Future Actions

- Notice hearing Aug 4-5, 2015; Fortuna
- Discussion hearing Oct 7-8, 2015; Los Angeles
- **Today's adoption hearing Dec 9-10, 2015; San Diego**

Background

The proposed regulations will clarify and correct errors and inconsistencies in the regulations as follows:

- Clarify the origin of MPA and marine managed area (MMA) definitions.
- Clarify the allowed and prohibited take for marine resources in state marine reserves (SMRs), state marine conservation areas (SMCAs), state marine parks (SMPs), and state marine recreational management areas (SMRMAs).
- Remove the allowance for aquaculture within Drakes Estero SMCA.
- Clarify aquaculture use in Morro Bay SMRMA.
- Update obsolete commercial troll gear references.
- Remove the allowance for the commercial harvest of kelp within Año Nuevo SMCA and change its classification from an SMCA to an SMR, consistent with the original intent.
- Simplify the names of twenty-one MMAs.
- Adjust the shared boundary between Laguna Beach SMR and Laguna Beach no-take SMCA to address municipality concerns.
- Replace the coordinate boundary at Goleta Slough SMCA with the mean high tide line.
- Delete unnecessary text pertaining to the mean high tide line for three offshore MMAs.
- Refine boundaries to improve geographic accuracy for 106 MMAs and special closures by:
 - adding a third decimal place to increase precision for all current coordinates ending at 1/100th of a minute;
 - moving coordinates closer to an intended point of reference;
 - adding additional coordinates to existing boundaries; and
 - anchoring offshore boundaries on the 3-nautical mile state line.
- Correct a printing error in subsection 632(b)(120) and make other non-substantive changes for clarity and consistency.

At its Aug 4, 2015, meeting, FGC received a request from Mr. Joe Exline for an alternate western boundary line for Laguna Beach SMR, rather than the boundary correction proposed

STAFF SUMMARY FOR DECEMBER 9-10, 2015

by DFW. FGC received testimony in opposition to this recommendation and did not include Mr. Exline's proposal in the rulemaking.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Adopt the changes to the regulations as recommended by DFW.

DFW: Adopt the changes as originally proposed.

Exhibits

1. DFW memo, received Jul 20, 2015
2. ISOR
3. [ISOR Attachment 1 – Summary of proposed language amendments](#)
4. [ISOR Attachment 2 – Summary of proposed boundary refinement amendments](#)
5. [ISOR Attachment 3 – Proposed boundary refinement images](#)
6. DFW email confirming that there are no significant comments and no additional proposed changes to the regulations, received Nov 23, 2015
7. Table of all proposed regulation amendments for marine managed areas
8. DFW presentation

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the proposed changes to Section 632 related to marine protected area regulations.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

11. PACIFIC HALIBUT**Today's Item**Information Action

Authorization to publish notice of intent to change Pacific halibut sport fishing regulations.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

Proposed changes to Section 28.20 modify the season to include a range from May 1 to October 31 which may include periodic closures, and replace existing text regarding the 2015 quota with a reference to the Federal Register specifying the 2016 federal quota amount.

Pacific halibut is internationally managed under the authority of the Northern Pacific Halibut Act of 1982 between the USA and Canada. Pacific halibut along the US west coast is jointly managed through authorities of the International Pacific Halibut Commission, Pacific Fishery Management Council, and National Marine Fisheries Service, in conjunction with the west coast state agencies. For consistency, FGC routinely adopts regulations to bring State law into conformance with federal and international law for Pacific halibut.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Authorize publication of the notice as recommended by DFW.

DFW: Authorize publication of the notice.

Exhibits

1. DFW memo, received Oct 19, 2015
2. ISOR
3. DFW presentation

Motion/Direction

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend Section 28.20 related to Pacific halibut sport fishing.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

12. DRAFT SPINY LOBSTER FISHERY MANAGEMENT PLAN**Today's Item**Information Action

Receive draft California Spiny Lobster Fishery Management Plan (FMP).

Summary of Previous/Future Actions

- | | |
|---|----------------------------------|
| • MRC vetting and recommendation | Mar 4, 2015; Marina |
| • Discuss regulatory options and give direction | Jun 10-11, 2015; Mammoth Lakes |
| • Today receive draft spiny lobster FMP | Dec 9-10, 2015; San Diego |
| • Discuss FMP; regulations notice hearing | Feb 10-11, 2016; Sacramento |
| • Adopt FMP, certify CEQA; regulations discussion | Apr 13-14, 2016; Santa Rosa |
| • Regulations adoption hearing | Jun 22-23; Huntington Beach |

Background

The Marine Life Management Act (MLMA) requires that FMPs form the primary basis for managing California's marine fisheries (Section 7072 et seq., Fish and Game Code). Pursuant to the mandates of the MLMA, a spiny lobster FMP has been under development since 2012, to guide the future management of the fishery in a way that ensures sustainability. The Lobster Advisory Committee (LAC), a multi-stakeholder advisory body, developed consensus recommendations for the FMP and implementing regulations, which were presented to the MRC and recommended by MRC for FGC support. The draft FMP, and proposed regulations necessary to implement the plan, were subsequently prepared by DFW based on LAC recommendations and MRC and FGC input.

The draft FMP has undergone independent scientific peer review and tribal review and is now being submitted by DFW for public review and adoption by FGC (exhibits 1 and 2). Originally scheduled to be delivered to FGC in Aug 2015, the timeline was extended to provide adequate time for DFW to consider and integrate input from the peer review.

MLMA requires that FGC hold at least two public hearings prior to adoption, and that the draft be available to the public for review at least 30 days prior to the first hearing and discussion. The MLMA master plan for fisheries further clarifies the adoption process and provides that, in addition to the public hearings, written comments may be submitted at any time up to adoption (Exhibit 3). FGC may either adopt the FMP, or, if it determines changes are warranted, may reject the FMP for DFW to revise and resubmit for further public review before adoption.

Significant Public Comments (N/A)**Recommendation**

Accept the draft FMP and direct staff to publish notice of FGC intent to adopt the FMP and commence the comment period, with a discussion in Feb 2016 and discussion and possible adoption in Apr 2016.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Exhibits

1. DFW memo, received Nov 20, 2015
2. Draft California Spiny Lobster FMP, dated Nov 10, 2015
3. Illustration of FGC FMP adoption process, MLMA master plan, Figure 5-2
4. DFW presentation

Motion/Direction

Moved by _____ and seconded by _____ that the Commission directs staff to publish a notice of its intent to adopt an FMP for the California spiny lobster fishery.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

13. MASTER PLAN FOR MPAS**Today's Item****Information** **Action**

Receive proposed final master plan for marine protected areas (MPAs), an updated version of the 2008 FGC-adopted draft master plan. Today, DFW will present an overview of the approach used to update the plan, and highlight areas that represent new policy direction for FGC consideration (exhibits 1-2).

Summary of Previous/Future Actions

- MRC receives overview of master plan for MPAs update Nov 4, 2015; Ventura
- **Today receive draft proposed final master plan** **Dec 9-10, 2015; San Diego**
- Discuss proposed final master plan Feb 10-11, 2016; Sacramento
- Discuss and adopt final master plan Apr 13-14, 2016; Santa Rosa

Background

The Marine Life Protection Act (MLPA) calls for creating an improved network of MPAs, redesigned to increase its coherence and effectiveness at protecting the State's marine life, habitats, and ecosystems (Section 2853(a), Fish and Game Code). To help achieve its goals, the MLPA directs DFW to prepare, and FGC to adopt, a "master plan" to guide the design, implementation, and management of a redesigned network of MPAs in California (Section 2855, Fish and Game Code).

A draft master plan for MPAs was adopted by FGC in 2008 (available at www.dfg.ca.gov/marine/mpa/masterplan.asp) as a "living document" with a focus on providing guidance for designing California's MPAs through a regional approach. The master plan played a significant policy role in providing consistent scientific and design feasibility standards and guidelines across all planning regions. The regional design and adoption phases were completed in 2012 and, now that the coastwide MPA network is in place, focus has shifted from planning to implementation and management. To reflect the new focus, DFW has prepared a draft updated master plan for FGC adoption as a final master plan pursuant to Section 2859, Fish and Game Code, and to serve as a foundation for managing the Marine Life Protection Program statewide (Exhibit 3).

DFW has collaborated extensively with staff from FGC, the Ocean Protection Council, and the California Ocean Science Trust to tie together MPA management, monitoring, research and evaluation concepts and priorities across statewide and regional scales. One notable proposed change is to establish a ten year management review cycle for evaluating the statewide MPA network for efficacy and adaptive management. The proposed final master plan also includes five appendices that memorialize the planning and design phase, tribal consultation policies, and regional MPA network details and monitoring plans (Exhibit 4).

Today marks the first public opportunity to review the draft final document. A preliminary draft was made available by request to California tribes and tribal communities on Sep 25, 2015, and DFW presented an overview to the Marine Resources Committee at its Nov 4, 2015 meeting.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Significant Public Comments (N/A)**Recommendation**

FGC staff: Schedule discussion on the merits of the contents of the plan for Feb and Apr 2016.

Committee: While Fish and Game Code only requires two hearings before FGC adopts the final master plan, the MRC supports holding three meetings for additional public input opportunity.

DFW: DFW supports a three meeting process to provide adequate public input and discussion.

Exhibits

1. DFW presentation
2. DFW memo, dated Nov 13, 2015
3. Draft final master plan, dated Nov 2015
4. Draft Appendices A-F, available
at <https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Master-Plan>

Motion/Direction

Confirm for staff that a discussion hearing in Feb 2016 and a discussion/adoption hearing in Apr 2016 are acceptable.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

14. THOMAS PTAK ESTATE**Today's Item**Information Action

Approve request for an extension of time to transfer Mr. Thomas L. Ptak's transferable nearshore fishery permit and nearshore fishery trap endorsement for the Nearshore Fishery South Coast Regional Management Area to Dec 15, 2016.

Summary of Previous/Future Actions (N/A)

- Approved extension to transfer to Dec 15, 2015 Dec 3, 2014; Van Nuys
- **Today's request for an extension of time Dec 9-10, 2015; San Diego**

Background

Thomas L. Ptak died on March 13, 2012; at his death he owned five California commercial fishing permits. Attorneys for Mr. Ptak's estate indicate that they or the estate's representatives have been in communication with DFW's License and Revenue Branch (LRB) since less than a week after Mr. Ptak's death to understand the process by which Mr. Ptak's permits could be transferred.

On June 5, 2014, DFW approved the transfer of Mr. Ptak's transferable nearshore fishery permit and nearshore fishery trap endorsement for the south coast region; on Jun 22, 2014 DFW notified the estate and buyer of the permits that the transfer was rescinded because more than a year had passed since Mr. Ptak's death.

On Aug 22, 2014 attorneys for the estate appealed DFW's denial to FGC. After several conversations between FGC and DFW staff in Sep and Oct 2014, it was determined that a more efficient and mutually agreeable route would be for FGC to grant a time extension rather than incur the time and costs of an appeal hearing. Attorneys for the estate and Christine Allen as Executor of the Estate of Mr. Thomas L. Ptak therefore requested an extension of time to sell/transfer Mr. Ptak's transferable nearshore fishery permit and trap endorsement, which FGC granted on Dec 9, 2014; DFW did not object to the time extension.

Christine Allen as Executor of the Estate of Mr. Thomas L. Ptak contacted FGC staff in Nov 2015, indicating that DFW seized the subject permit and trap endorsement (and three other permits) which had prevented the estate from transferring either to a willing buyer. Attorneys for the estate and Christine Allen therefore requested another extension of time to sell/transfer Mr. Ptak's transferable nearshore fishery permit and trap endorsement (exhibits 1 and 2).

DFW has objected to the extension of time because it believes that FGC has no authority to grant the extension and because it accuses the estate of using the permits illegally after the death of Mr. Ptak; DFW has requested that FGC remove the agenda item (Exhibit 3). An attorney for the estate and Ms. Allen have responded to DFW's objection (Exhibit 4) by again requesting that FGC provide a one year extension of time to transfer the permits, direct DFW to allow the permits to be renewed, and to return all five permits to Christine Allen as executor of the estate.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

At this time it is clear that the parties do not agree on a path forward; staff believes any possibility of resolution is best managed through an appeal hearing through the Office of Administrative Hearings (OAH).

Significant Public Comments (N/A)**Recommendation**

FGC staff: Do not approve the request for an extension of time to transfer Mr. Thomas L. Ptak's permit and trap endorsement because it does not appear that FGC has that authority. The estate requested in Aug 2014, and has the right to, an appeal process, which staff recommends managing through OAH.

DFW: Do not approve the request for an extension of time to transfer Mr. Thomas L. Ptak's permit and trap endorsement, and remove the request as an agenda item, because FGC does not have the authority to waive the deadlines and because the estate has used the permits to illegally fish after Mr. Ptak's death.

Exhibits

1. Letter from Chris Shrouds, attorney for the Estate of Thomas L. Ptak, requesting an extension of time to transfer Thomas L. Ptak's transferable south coast region nearshore fishery permit, received Nov 11, 2015
2. Letter from Chris Shrouds, attorney for the Estate of Thomas L. Ptak, requesting an extension of time to transfer Thomas L. Ptak's transferable south coast region trap endorsement, received Nov 11, 2015
3. DFW letter objecting to the request for an extension, received Nov 23, 2015
4. Letter from Chris Shrouds, attorney for the Estate of Thomas L. Ptak, responding to the DFW objection, received Nov 25, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission approves the request from the Estate of Mr. Thomas L. Ptak to appeal the Department's denial of an application to transfer a transferable nearshore fishery permit and a nearshore fishery trap endorsement for the Nearshore Fishery South Coast Regional Management Area, and directs staff to initiate an appeal process through the Office of Administrative Hearings.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

15. SANTA BARBARA MARICULTURE'S STATE WATER BOTTOM LEASE**Today's Item**Information Action

Approve an extension of Santa Barbara Mariculture's existing State Water Bottom Lease No. M-653-02 for aquaculture while under review for renewal.

Summary of Previous/Future Actions

- | | |
|--|----------------------------------|
| • Approved one year lease extension | Dec 3, 2014; Van Nuys |
| • Received request to renew lease | Jun 9, 2015; Mammoth Lakes |
| • Today approve lease extension | Dec 9-10, 2015; San Diego |
| • Discuss/approve lease renewal | TBD, 2016 |

Background

FGC has the authority to lease state water bottoms to any person for aquaculture if such a lease is in the public interest (Section 15400, Fish and Game Code). The lessee shall have a prior right to renew the lease on terms agreed upon between FGC and the lessee (Section 15406, Fish and Game Code).

Santa Barbara Mariculture holds FGC-issued State Water Bottom Lease (lease) No. M-653-02 (Exhibit 1). Since the original lease period of 2005-2010, FGC has approved several short-term extensions (see Exhibit 2) which have, in part, been in response to a request from the leaseholder to renew the 72-acre lease under a reconfigured shape and position. The proposed new shape would remove the 26 seaward-most acres of the lease area and reestablish them alongside the remaining shoreward-most 46-acre area, resulting in a contiguous alongshore shape intended to be more compatible with vessel traffic patterns.

At DFW's request, FGC granted the extensions to allow continued operations while DFW worked on resolving the complex issues associated with the lease renewal and boundary reconfiguration request. In 2014, based on legal counsel, the lessee was informed that the request constitutes two separate but interrelated discretionary actions for FGC consideration: A lease renewal for the retained area within lease No. M-653-02 (this agenda item), and a new lease application for the new area adjacent to, but outside, the current lease area for M-653-02. FGC additionally approved a one-year extension to the existing lease (through January 17, 2016) for administration of this new guidance. FGC received the two separated requests at its June 2015 meeting with recognition that both items are intended to be scheduled concurrently for FGC consideration, and requested that DFW initiate its review (exhibits 3 and 4).

One step required is environmental review of each project area pursuant to the California Environmental Quality Act (CEQA). The applicant is responsible for initial drafting of environmental review documents for the lead agency. DFW is still working with the applicant to refine and finalize these reviews. In light of the January 17, 2016 lease expiration, DFW has brought to staff's attention that an additional extension is needed to allow for continued operation of the existing aquaculture area until the review is complete (Exhibit 5). DFW requests a final one year extension under existing terms until analyses for both project areas are completed and ready for concurrent FGC consideration.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Significant Public Comments (N/A)**Recommendation**

FGC staff: FGC staff supports extending the lease an additional year under existing terms and conditions to allow concurrent consideration of the lease renewal and new lease application in 2016.

DFW: Extend lease for a period of one year under existing terms and conditions.

Exhibits

1. Santa Barbara Mariculture State Water Bottom Lease M-653-02, issued Nov 3, 2005
2. Lease history and renewal timeline for M-653-02
3. Santa Barbara Mariculture request for lease renewal and application for new lease, received Apr 15, 2015
4. Map of current and proposed lease areas
5. DFW memo, received Dec 1, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission approves the request for a one year extension of the lease period for Santa Barbara Mariculture State Water Bottom Lease No. M-653-02.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

16. E-REPORTING**Today's Item****Information** **Action**

Receive update and presentation from DFW concerning transitioning from commercial marine logbooks to electronic reporting, and give direction for potential rulemaking.

Summary of Previous/Future Actions

- | | |
|---|----------------------------------|
| • Today receive update; give direction | Dec 9-10, 2015; San Diego |
| • Notice hearing | Feb 10-11, 2016; Sacramento |
| • Discussion/Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

DFW is proposing to allow the submission of electronic reports of fishing activities instead of paper logs for all fisheries requiring logbooks. DFW has embarked on a large-scale information technology project to develop electronic reporting for commercial marine fisheries. When fully operational, the project will include public-facing, web-based user interfaces that offer commercial fishermen the option to submit electronic fishing activity records instead of paper logs.

The first electronic logbook to be developed is the Commercial Passenger Fishing Vessel (CPFV) logbook, which has been pilot-tested in the field by a group of commercial fishermen and is ready to be used throughout the State. DFW is on schedule to request authorization to publish notice at the Feb 2016 meeting.

Significant Public Comments (N/A)**Recommendation (N/A)****Exhibits**

1. DFW presentation

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

17. MEETING PROCEDURES**Today's Item**Information Action

Authorization to publish notice of intent to amend FGC meeting procedure regulations.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Previous notice hearing | Oct 7-8, 2015; Los Angeles |
| • Today's Notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

Per direction received at the Feb, Aug and Oct 2015 FGC meetings, staff has prepared proposed regulations related to meeting procedures, which will do the following:

- Define the number of members constituting a quorum to conduct Commission and committee meetings;
- Provide that no more than two commissioners may attend committee meetings;
- Provide that a motion must receive at least three votes to pass or fail;
- Establish a deadline for public requests for meeting agenda items;
- Specify that agenda items will be approved by majority vote of the Commission;
- Specify that committee agenda items may not include items scheduled for action by the Commission, unless otherwise directed by majority vote of the Commission;
- Specify that the Commission president or his designee may amend meeting agendas;
- Establish a deadline, consistent with the Bagley-Keene Open Meeting Act, for public distribution of agendas;
- Outline the process and timeline for receipt of and action on WRC and MRC recommendations; and
- Specify the process for public participation in Commission and committee meetings including:
 - when public testimony will be taken;
 - appropriate public forum topics;
 - time limits for public comment at Commission meetings and methods the public may use to receive additional time;
 - when and how to submit written comments;
 - when and how to submit audio and visual presentations and how to receive approval of the presentation from the executive director; and
 - potential consequences of disruptive behavior.

Staff requests feedback on any items of potential concern or additional items to include in the proposed regulations.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Significant Public Comments

1. Several comments recommending procedures for WRC meetings (Exhibits 3-7, 11-12)
2. One comment recommending voting requirements in cases where only three commissioners are present, and requesting public forum be included as the first and last agenda items for each day of each meeting (Exhibit 8)
3. Two comments requesting that all FGC communications be made on government issued devices/servers (Exhibits 9-10)

Recommendation

Authorize publication of the notice.

Exhibits

1. Proposed regulatory text
2. Summary of public recommendations and staff responses
3. Letter from Scott Franklin, Michel & Associates, P.C., representing the National Rifle Association of America (NRA), received Apr 14, 2014
4. Letter from C.D. Michel, Michel & Associates, P.C, representing NRA, received Jul 11, 2014
5. Letter from Ashlee Titus, Bell, McAndrews & Hiltachk, LLP, representing the National Shooting Sports Foundation (NSSF), received Jul 21, 2014
6. Letter from Dennis Anderson, Safari Club International, received Jul 14, 2014
7. Letter from C.D. Michel, Michel & Associates, P.C, representing NRA, received Jul 31, 2014
8. Email from Eric Mills, Action for Animals, received Jun 30, 2015
9. Letter from C.D. Michel, Michel & Associates, P.C., representing NRA and California Rifle and Pistol Association, received Jun 5, 2015
10. Letter from Trevor Santos, NSSF, received Jul 9, 2015
11. Letter from Sean Brady, Michel & Associates, P.C., representing NRA received Sep 24, 2015 (also under 21A)
12. Sample form letter of approximately 40 received
13. FGC staff presentation

Motion/Direction

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend Section 665, Title 14, California Code of Regulations, regarding meeting procedures as recommended by Commission staff.

OR

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend Section 665, Title 14, California Code of

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Regulations, regarding meeting procedures as recommended by Commission staff and adding/deleting the following: (Enumerate deletions and/or additions.)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

18. CONFLICT OF INTEREST CODE**Today's Item**Information Action

Approve updated conflict of interest code as required by the Political Reform Act.

Summary of Previous/Future Actions

FGC approved its last conflict of interest code in 2005 as a joint code with DFW and the Wildlife Conservation Board.

Background

The Political Reform Act requires decision-making bodies to adopt a conflict of interest code and to update it regularly to keep it current.

Significant Public Comments (N/A)**Recommendation**

Approve the updated conflict of interest code so that it may be approved by the Fair Political Practices Commission in a timely fashion.

Exhibits

1. Proposed updated conflict of interest code

Motion/Direction

Moved by _____ and seconded by _____ that the Commission approves the updated conflict of interest code.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

19. EXECUTIVE SESSION**Today's Item**Information Action

- (A) Pending litigation to which FGC is a party: See agenda for complete list of litigation.
- (B) Possible litigation involving FGC: Tricolored blackbird, bobcat trapping ban.
- (C) Staff performance and compensation: Update on staffing.
- (D) Hearing officer recommendations on license and permit items:
 - I. Mr. Peter Vitali

Summary of Previous/Future Actions (N/A)**Background**

This is a standing agenda item for FGC to announce results from its executive session.

- (C) **Recruiting Leadership.** As of January 1, 2016, the commission will likely have vacancies of its executive director and deputy executive director positions. Staff has prepared updated duty statements for both positions for consideration (Exhibits C1-C2)

Signature Authority. While vacancies exist in both executive positions, FGC must authorize an alternate to sign for official FGC documents and communications.
- (D) **Vitali Proposed Decision.** FGC has received a proposed decision from the hearing officer, the Office of Administrative Hearings (OAH), as well as an objection from Peter Grow on behalf of his client and DFW's response to the objection.

Significant Public Comments (N/A)**Recommendation**

- (C) **FGC staff:** Develop plan for recruitment of both leadership positions and how to operate while positions vacant.
- (D) **FGC staff:** Adopt the proposed decision for Peter Vitali.
DFW: Adopt the proposed decision for Peter Vitali.

Exhibits

- C1. Executive director duty statement
- C2. Deputy executive director duty statement
- D1. OAH's proposed decision for Peter Vitali (exhibits will be available during executive session)
- D2. Peter Vitali objection to the proposed decision
- D3. DFW response to Peter Vitali's objection

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the Office of Administrative Hearings' proposed decision for Peter Vitali.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

20. CLIMATE CHANGE POLICY**Today's Item****Information** **Action**

Presentation by DFW regarding various agency climate change policies and possible direction on drafting an FGC policy.

Summary of Previous/Future Actions

- Discussion of potential climate change policy Oct 7-8 2015; Los Angeles
- **Today's presentation from DFW Dec 9-10, 2015; San Diego**

Background

Per direction received at the Oct 2015 FGC meeting, DFW is making this presentation today on climate change policies of other states and other California state agencies as background for a discussion about a potential FGC policy on climate change. FGC staff seeks direction from FGC on next steps.

Significant Public Comments (N/A)**Recommendation (N/A)****Exhibits**

1. Letter from Dennis Fox supporting the idea of ongoing adaptive management in response to climate change, received Sep 30, 2015

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

21. ITEMS OF INTEREST FROM PREVIOUS MEETINGS**Today's Item**Information Action

This is a standing agenda item for FGC to provide direction on regulatory petitions and non-regulatory requests from the public, as well as other items of interest from previous meetings. For this meeting:

- (A) Action on petitions for regulatory change received at the Oct meeting and pending items from previous meetings.
- (B) Action on non-regulatory requests received at the Oct meeting and pending items from previous meetings.
- (C) Domoic acid and crab fisheries
- (D) Sea urchin regulations

Summary of Previous/Future Actions

- (A-B) FGC received the requests in exhibits A1 and B1 in three ways: (1) Requests received at the office through Sep 24 were published as tables in the Oct meeting binder, (2) requests received as late handouts were delivered at the Oct meeting, and (3) requests that were received during public forum at the Oct meeting.
- (C) FGC approved emergency regulations delaying the recreational Dungeness crab season and closed the recreational rock crab fishery at the Nov 5, 2015 teleconference meeting.
- (D) At its Oct 7, 2015 meeting, FGC directed staff to work with the California Sea Urchin Commission (CSUC) on a draft initial statement of reasons (ISOR) and appropriate CEQA document for proposed sea urchin regulation changes, and to schedule a 2016 rulemaking.

Background

- (A-B) FGC provides guidance and direction to staff regarding requests from the public received by mail and email and during public forum at the previous FGC meeting. The public request logs listed as exhibits capture the regulatory and non-regulatory requests received through the last meeting that require FGC guidance.
- (C) A massive toxic bloom of the marine diatom *Pseudo-nitzschia* has been detected along the California coast, resulting in significant impacts to coastal resources and marine life. Some *Pseudo-nitzschia* species produce a potent neurotoxin, known as domoic acid, which can accumulate in shellfish, other invertebrates, and sometimes fish, leading to illness and death in a variety of birds and mammals. Recent test results have shown persistently high levels of domoic acid in Dungeness crab and rock crab caught along the California coastline.

Domoic acid levels in recent samples have exceeded the State's action level for the crabs' body meat as well as the viscera, commonly referred to as crab butter, and therefore pose a significant risk to the public if they are consumed, as determined by the California Department of Public Health (CDPH). As a result, the Office of

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Environmental Health Hazard Assessment (OEHHA), in consultation with CDPH, has recommended the fisheries be closed. The Department, CDPH, OEHHA, and the Ocean Protection Council are coordinating efforts to monitor toxicity levels and ensure public safety.

The emergency regulations will remain in effect until the director of the Office of Environmental Health Hazard Assessment, in consultation with the director of the California Department of Public Health, determines that domoic acid levels in crab no longer pose a significant risk to public health and no longer recommends that fisheries be closed.

- (D) CSUC developed a regulation change proposal in consultation with DFW to address industry concerns over the potential for inactive urchin diving permits to become active and result in unsustainable fishery conditions. CSUC proposed to reduce the permit capacity goal from 300 to 150 permits through a revised 10-to-1 permit issuance system; close a loophole in the lottery timing for issuing new permits; and add one day of fishing to the current four allowed Jun – Oct in southern California. In Oct 2014, FGC accepted an MRC recommendation to grant the petition and schedule a rulemaking in 2015, but this was subsequently put on hold. In Oct 2015, FGC agreed to reschedule the rulemaking for 2016 based on CSUC commitment to provide resources to support the rulemaking.

Update: Staff analysis of a timeline necessary to prepare the draft rulemaking and CEQA review suggests that it is not likely to be ready for scheduling until mid-2016. However, this would result in another lottery occurring (in Aug 2016) and further exceeding permit capacity before the loophole is closed. The lottery loophole portion of the rulemaking is simple enough that staff believes it could be completed in time to suspend the next lottery if the rulemaking only focuses on that change, and all other proposed changes are advanced to a subsequent rulemaking. This two-phase rulemaking is supported by CSUC if it is the only avenue to prevent the lottery from occurring again under the current loophole.

Significant Public Comments (N/A)

Recommendation

- (A-B) Adopt staff recommendations for the regulatory and non-regulatory requests with either (1) deny the request, (2) grant the request, or (3) refer the request to MRC, WRC, TC, DFW staff, or FGC staff for further evaluation or information gathering. The exhibits contain staff recommendations for each request.
- (C) N/A
- (D) Schedule sea urchin rulemaking in two phases during the rulemaking calendar updates agenda item (Agenda Item 38(B), this meeting). Staff suggests scheduling phase one for notice in Feb 2016, and discussion/adoption in Apr 2016, to address a lottery loophole. Schedule phase two for the remainder of the proposal, with timing yet to be determined.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Exhibits

- A1. Regulatory requests received at the Oct 2015 meeting
- B1. Non-regulatory requests received at the Oct 2015 meeting
- C1. Presentation on Domoic acid impacts to crab fisheries

Motion/Direction

(A-B) Moved by _____ and seconded by _____ that the commission adopts the staff recommendations for actions on October 2015 regulatory and non-regulatory requests.

OR

Moved by _____ and seconded by _____ that the Commission adopts the staff recommendations for actions on October 2015 regulatory and non-regulatory requests, except for item(s) _____ for which the action is _____.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

23A. OTHER ITEMS – EXECUTIVE DIRECTOR REPORT**Today's Item**Information Action

Receive the executive director's report and provide direction to staff.

Summary of Previous/Future Actions (N/A)**Background*****Commission Priorities and Capacity***

FGC receives a constant deluge of requests for consideration and action, many more than there is time and resources to address. Efforts to prioritize workload have largely focused on urgency and significance; however, this results in important but not urgent issues being left unresolved. Examples of issues that have fallen into the "unresolved and deferred" pit include fishery management plan reviews (squid, nearshore), reviewing and revising existing policies, streamlining routine rulemakings to reduce FGC and DFW staff workload, and restricted species program overhaul. In addition, the current approach is producing taxing meeting agendas, leaving both the public and commissioners with a feeling of being rushed through topics. The sense of hurried discussions led, in part, to the president earlier this year suggesting a limit on the number of agenda topics per meeting. FGC would be well-served to develop a better process for prioritizing and managing FGC workload, especially in light of the current limited staffing capacity.

Significant Public Comments (N/A)**Recommendation**

Before FGC makes a commitment to a new project, a discussion of expectations, workload, and priorities should be conducted so that commissioners may make a more informed decision regarding the task and how it may affect other important work that is the unique purview of FGC and for which the public depends on FGC to be proactively addressing.

Exhibits (N/A)**Motion/Direction**

Direct FGC staff to work in conjunction with DFW, FGC's key partner in achieving its mandates, to develop a proposed process for better prioritizing and managing FGC workload (Note: this is a new project that will involve a significant amount of work to complete, but is worth the investment).

STAFF SUMMARY FOR DECEMBER 9-10, 2015

23B. OTHER ITEMS – STAFF REPORT**Today's Item**Information Action

Receive the staff report, including the Oct meeting highlights and staff time allocations.

Summary of Previous/Future Actions (N/A)**Background*****Oct Meeting Highlights***

As requested, staff has prepared a shortened summary of meeting outcomes for the previous meeting (Exhibit B1).

Staff Capacity and Roles

In an effort to help keep FGC current on its staffing and where staff is expending its time, staff has developed a report that shows the allocation of time in general categories for the previous month, as well as highlights some of the specific activities for the previous and current months (Exhibit B2).

For the most recent Wildlife Advisor recruitment effort, nearly two dozen individuals have submitted applications for the position (senior environmental scientist, specialist), with four of the applications incomplete. Staff reviewed the applications and interviewed six potential candidates; second round interviews will be conducted in December. The position remains open until filled.

The need for dedicated legal assistance has been steadily increasing as FGC issues have become more complex. To address this need, Michael Yuan became FGC's legal counsel on Nov 2, 2015. Michael has spent his first month with FGC in various training and learning how FGC operates.

Executive Director Sonke Mastrup has taken another position with the state effective Jan 1, 2016; his last day in the FGC office will be Dec 24, 2015. In the first few months of 2016 he will be available to the interim executive director for limited consultations.

The deputy executive director has been on leave since March of 2014; that position is expected to become vacant in early 2016, at which time a recruitment effort can begin.

Significant Public Comments (N/A)**Recommendation (N/A)****Exhibits**

B1. Staff summary of the Oct 2015 FGC meeting outcomes

B2. *Staff Report on Staff Time Allocation* – dated November 25, 2015

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

23C. OTHER ITEMS – LEGISLATIVE UPDATE

Today's Item	Information <input checked="" type="checkbox"/>	Action <input type="checkbox"/>
---------------------	--	--

Review and discuss legislation of interest, and provide staff direction.

Summary of Previous/Future Actions

- | | |
|---|----------------------------------|
| • Brief legislative update | Oct 7-8, 2015; Los Angeles |
| • Today's update and possible action | Dec 9-10, 2015; San Diego |

Background

FGC staff has prepared a list of legislative bills that may be of interest to FGC, which includes a brief synopsis and current bill status. Items highlighted in yellow indicate legislation of particular interest or that may impact FGC's resources and workload.

This is an opportunity for FGC to provide direction to staff concerning any proposed legislation. At any meeting FGC may direct staff to provide information or share concerns with bill authors. FGC members also have the option to take positions on bills at the same meeting an update is provided.

The State legislature recessed on September 11, 2015, and will reconvene on January 4, 2016. The last day for the Governor to sign or veto bills passed by the Legislature was October 11, 2015.

Updates on Adopted Legislation (N/A)**Updates on Pending Legislation**

AB 290 (Bigelow) – This is a 2-year bill; would re-define “pigs”, prohibit release into uncontrolled areas, eliminate DFW-required management plan, require up to 40% of funds from sale of wild pig validations be used to remedy damage by pigs, replace the wild pig tag with a validation on the hunting license which permits unlimited take and possession, set pig validation at \$15 for residents and \$30 for nonresidents, and prohibit take at night unless DFW is notified by 3:00 p.m. prior to the planned take.

AB 435 (Chang) – This is a 2-year bill; would require that each department, board, and commission of the Natural Resources Agency, except as specified, and each department, board, and office of the California Environmental Protection Agency webcast all onsite public meetings, in a manner that enables listeners and viewers to ask questions and provide public comment by telephone or electronic communication commensurate with those attending the meeting.

AB 665 (Frazier) – This is a 2-year bill; would confirm that the state fully occupies the field of authority for the taking and possession of fish and game. The bill was amended to alleviate concerns regarding the prohibition of cities and counties from enacting laws that affect incidental take for the purpose of protecting health and/or safety. The bill clarifies that unless otherwise authorized by the Fish and Game Code or other state or federal law, FGC and DFW

STAFF SUMMARY FOR DECEMBER 9-10, 2015

are the only entities that may adopt or promulgate regulations regarding the take or possession of fish and game on any lands or waters within the state.

AB 729 (Atkins) – This is a 2-year bill. Per FGC request, staff met with Speaker Atkins' staff. Legislative staff indicated Speaker Atkins is not seeking to remove FGC's aquaculture lease authority. FGC staff agreed to keep in touch with the office and monitor the legislation.

SB 345 (Berryhill) – This is a 2-year bill. If passed, the bill would (1) authorize charitable organizations to possess fish taken under a sport fishing license in excess of a possession under certain provisions, (2) require FGC to adopt regulations to clarify when a possession limit is not violated by processing into food lawfully taken sport fish, (3) make annual fishing licenses valid for a full 12 months, and (4) create a junior fishing license.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

26. PUBLIC FORUM (DAY 2)**Today's Item****Information** **Action**

Receipt of public comments and requests for regulatory and non-regulatory actions.

Summary of Previous/Future Actions

- **Today's receipt of requests and comments** **Dec 9-10, 2015; San Diego**
- Direction to grant, deny, or refer requests **Feb 10-11, 2016; Sacramento**

Background

FGC generally receives three types of correspondence: Requests for regulatory action, requests for non-regulatory action, and informational only. The Administrative Procedure Act (APA) requires action on regulatory requests to be either denied or granted and notice made of that determination. At the end of public forum a motion may be made to provide direction to staff on any items for which FGC wishes to receive additional information or take immediate action. Otherwise, FGC will determine the fate of the regulatory and non-regulatory requests at the next commission meeting to allow staff time to evaluate requests.

Significant Public Comments

1. See regulatory requests in Exhibit 1
2. See non-regulatory requests in Exhibit 2

Recommendation (N/A)**Exhibits**

See exhibits for Item No. 3.

Motion/Direction (N/A)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

27. HUMBOLDT MARTEN (CONSENT)**Today's Item**Information Action

This item is to inform the public that FGC has received DFW's evaluation on the petition from the Environmental Protection Information Center and Center for Biological Diversity to list Humboldt marten as endangered under the California Endangered Species Act (CESA).

Summary of Previous/Future Actions

- | | |
|--|----------------------------------|
| • Received petition | Jun 8, 2015 |
| • FGC transmitted petition to DFW | Jun 18, 2015 |
| • Published notice of receipt of petition | Jul 24, 2015 |
| • Acted on DFW request for 30-day extension | Oct 7-8, 2015; Los Angeles |
| • Today receive evaluation and recommendation | Dec 9-10, 2015; San Diego |
| • Determine whether petitioned action may be warranted | Feb 10-11, 2016; Sacramento |
| • If FGC moves species to candidacy, status report due | Feb 2017; TBD |

Background

On, Jun 8, 2015, FGC received a petition from the Environmental Protection Information Center and Center for Biological Diversity to list the Humboldt marten as an endangered species under CESA. FGC will consider the petition, DFW's evaluation and other information submitted to FGC at the Feb 11, 2016, meeting in Sacramento.

Significant Public Comments

This meeting is not intended for FGC discussion as the law requires the public to have 30 days to review the petition and public release of the evaluation report; however, under Bagley-Keene, FGC must allow public comment on this item if requested.

Recommendation (N/A)**Exhibits**

1. DFW memo and evaluation report

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the consent calendar, item 27.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

28. WILDLIFE RESOURCES COMMITTEE**Today's Item**Information Action

Appoint members to the drafting and reviewing groups of the predator policy workgroup from the applicants in Exhibits 3 & 8.

Summary of Previous/Future Actions

- | | |
|--|--------------------------------|
| • Most recent WRC meeting | Sep 9, 2015; Fresno |
| • Discuss and approve recommendations | Oct 8-9, 2015; Los Angeles |
| • Today's discussion and appointments | Dec 10, 2015; San Diego |

Background

Earlier this year FGC staff identified the growing public participation and group dynamics of the predator management policy review as preventing meaningful progress. At the May WRC meeting a possible solution was identified and tentatively approved by FGC at its June meeting. Based on the proposed solution, staff presented structural and functional recommendations for a Predator Policy Workgroup (Exhibit 2), which FGC adopted at its Aug 2015 meeting. Also in Aug the president nominated Bill Gaines, Noelle Cremers, and Jean Su to the writing group.

At its Oct meeting, FGC focused on resolving the structure and function of the Predator Policy Workgroup and deciding on recommendations from the Sep WRC meeting. FGC accepted the recommendations from the Sep WRC meeting and directed staff to prepare for appointments to the Predator Policy Workgroup at the Dec FGC meeting.

In preparation for the Dec meeting, staff has prepared a table listing the applicants for the Predator Policy Workgroup, indicating if applications are complete and in which of the groups (writing or reviewing) they preferred to participate (Exhibit 3). The individual applications are provided for review in Exhibit 8.

FGC directs committee work. This agenda item is used to provide direction to WRC for further work at its January 2016 meeting. Topics that were previously referred to WRC and are ongoing:

- Predator management policy review
- One year versus calendar term fishing license
- Feral pig management
- Possession of game for processing into food (Sec. 3080(e), Fish and Game Code)

Significant Public Comments

1. The AI Taucher Conservation Coalition (ATCC) is requesting clarification as to what process WRC is using to implement the Predator Policy Workgroup relative to the approved by FGC in Aug, 2015 (Exhibit 1).

STAFF SUMMARY FOR DECEMBER 9-10, 2015

2. National Shooting Sports Foundation (NSSF) expresses concerns about transparency and process being used by WRC to address predator policy (Exhibit 4).
3. Safari Club International (SCI) is concerned about WRC form and function relative to predator policy project (Exhibit 5).
4. Support letter for Rick Hopkins and Keli Hendricks applications to the predator policy workgroup (Exhibit 6).
5. Several individual letters requesting that WRC not function until there are rules and procedures in place (see Exhibit 7 for sample).

Recommendation

Appoint no more than six individuals to the writing group and no more than 15 individuals to the review group. In addition, until a WRC advisor is hired, staff does not have the capacity to initiate the work the workgroup.

Exhibits

1. Letter from ATCC regarding WRC function, received Sep 8, 2015
2. Predator Policy Workgroup proposal, approved Aug 2015
3. Applicants to the Predator Policy Workgroup, as of Nov 18, 2015
4. Letter from NSSF regarding WRC structure and function, received Sep 24, 2015
5. Letter from SCI regarding WRC form and function, received Sep 24, 2015
6. Letter from Assembly Member Marc Levine supporting applicants to the workgroup, received Nov 16, 2015
7. Sample letter, from Andy White, requesting that WRC rules and procedures are established, received Oct 5, 2015
8. Predator Policy Workgroup applications

Motion/Direction

Moved by _____ and seconded by _____ that the Commission appoints _____ to the writing and _____ to the review groups of the Predator Policy Workgroup

STAFF SUMMARY FOR DECEMBER 9-10, 2015

29. WILD TROUT WATERS POLICY**Today's Item****Information** **Action**

Addition of waters to the list of FGC-designated Wild Trout Waters.

Summary of Previous/Future Actions (N/A)**Background**

Existing law (Fish and Game Code Section 1727) requires DFW to annually submit to FGC a list of no less than 25 miles of stream or stream segments and at least one lake deemed suitable for designation as wild trout waters. DFW proposes the addition of two new waters:

1. Little Kern River drainage, including tributaries, from the confluence with the Kern River upstream to the headwaters (Tulare County).
2. Maggie Lake (Tulare County)

DFW proposes that Little Kern River drainage also be designated as a Heritage Trout Water, which is a further designation by the Commission to recognize the beauty, diversity, historical significance, and special values of California's native trout.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Approve these amendments as recommended by DFW.

DFW: Approve the recommended amendments.

Exhibits

1. DFW memo
2. Commission Designated Wild Trout Waters Policy text with proposed amendments
3. Section 1727, Fish and Game Code

Motion/Direction

Moved by _____ and seconded by _____ that the Commission approves the proposed amendments to the Commission Designated Wild Trout Waters Policy.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

30. GRAY WOLF**Today's Item**Information Action

Adopt proposed regulation changes to add gray wolf to the list of endangered species.

Summary of Previous/Future Actions

- Notice hearing Jun 4, 2014; Fortuna
- **Today's discussion/adoption hearing Dec 9-10, 2015; San Diego**

Background

On Feb 27, 2012, the Center for Biological Diversity, Big Wildlife, the Environmental Protection Information Center, and the Klamath-Siskiyou Wildlands Center petitioned FGC to list the gray wolf as an endangered species under the California Endangered Species Act (CESA). On Oct 3, 2012, FGC voted to accept the petition for further evaluation and to initiate a 12-month review of the status of the gray wolf in California. DFW submitted its final status review at FGC's Feb 5, 2014 meeting, gave a detailed presentation on the status review at FGC's April 16, 2014 meeting, and gave an abbreviated presentation on the status review at FGC's Jun 4, 2014 meeting, FGC considered the petition, DFW's status report and other information included in the administrative record of proceedings and determined that listing the gray wolf as an endangered species under CESA is warranted. At the same meeting, FGC authorized publication of a notice of its intent to amend Section 670.5 regarding animals of California declared to be endangered or threatened; the notice was published in the California Regulatory Notice Register on Oct 23, 2015.

Significant Public Comments

1. Several letters opposing the proposal to list gray wolf as an endangered species and urging FGC to reject the proposed amendments (exhibits 2-4).

Recommendation

FGC staff: Adopt the proposed changes to Section 670.5 to add gray wolf to the list of endangered species.

Exhibits

1. ISOR
2. Letter from Holly Gallagher, Colusa County Fish & Game Advisory Commission, received Nov 4, 2015
3. Email from Michael Payne, Shasta County Sportsmen's Association, dated Oct 23, 2015
4. Letter from California Cattlemen's Association, California Farm Bureau Federation, and California Wool Growers Association, dated Nov 24, 2015

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission adopts the proposed changes to Section 670.5 related to animals of California declared to be endangered or threatened.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

31. TRICOLORED BLACKBIRD**Today's Item**Information Action

Determine whether tricolored blackbird warrants listing as endangered under the California Endangered Species Act (CESA), pursuant to sections 2074.2 and 2076.5 of the Fish and Game Code.

Summary of Previous/Future Actions

- FGC transmitted petition to DFW Oct 15, 2014
- Published notice of receipt of petition Oct 21, 2014
- Took emergency action to list Dec 3, 2014; Van Nuys
- Received DFW's petition evaluation April 9, 2015; Santa Rosa
- Decision that listing is not warranted Jun 11, 2015; Mammoth Lakes
- Received request to reconsider Jun 11 decision Aug 5, 2015; Fortuna
- Received CBD's 2015 petition and DFW's evaluation, and rejected the request to reconsider the Jun 11 decision Oct 7-8, 2015; Los Angeles
- **Today determine whether listing may be warranted** Dec 9-10, 2015; San Diego
- If FGC moves to candidacy, status report due Dec 2016; San Diego

Background

In Dec 2014 FGC listed tricolored blackbird as endangered through emergency regulations that expired on Jun 30, 2015. In the interim, DFW prepared and submitted to FGC a petition evaluation as required by CESA; the petition evaluation was received by FGC at its Apr 9, 2015 meeting and on Jun 11, 2015 it made a decision that listing tricolored blackbird as endangered was not warranted. At its Aug 2015 meeting, FGC deferred a decision on CBD's request for reconsideration of the 2014 petition to its Oct 2015 meeting and at the Oct meeting the request was rejected.

On Aug 19, 2015 CBD submitted a petition that was largely the same as the petition submitted to FGC on Oct 8, 2014 to take emergency action to list the tricolored blackbird as an endangered species. The Aug 2015 petition included an addendum composed of two new relevant studies on the tricolored blackbird. The review of the new information does not change DFW's previous recommendation to accept and consider the petition using the standard listing process.

Significant Public Comments

1. A letter from Conway Preservation Group concerned about the potential for costly requirements associated with the listing, and their direct impact on private landowners, and questioning the potential conservation benefits of listing (Exhibit 2).
2. FGC has received over 3,000 form letters and other comments supporting the petition (see exhibits 3-6 for examples).
3. A letter from Nossaman LLP on behalf of Dairy Cares opposing the petition (Exhibit 7)

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Recommendation

FGC staff: Accept the petition for further evaluation during a standard listing process.

DFW: There is sufficient information to indicate that the petitioned action may be warranted; accept the petition for further evaluation using a standard listing process.

Exhibits

1. Aug 19, 2015 petition
2. DFW memo and updated petition evaluation
3. Letter from Conaway Preservation Group, received Nov 17, 2015
4. Email from Santa Lucia Conservancy of Carmel, dated Oct 15, 2015
5. Letter from Napa Solano Audubon Society, received Nov 17, 2015
6. Letter from Audubon California, received Nov 20, 2015
7. Example form letter "Support a state listing for the tricolored blackbird"
8. Letter from Nossaman LLP on behalf of Dairy Cares, dated Nov 24, 2015
9. DFW presentation

Motion/Direction

- 1a. Moved by _____ and seconded by _____ that the Commission, pursuant to Section 2076.5 of the Fish and Game Code, finds that the petitioned action to *list the tricolored blackbird as an endangered species on an emergency basis is warranted* based on the information before the Commission and therefore amends Section 670.5, Title 14, California Code of Regulations, to add the tricolored blackbird as an endangered species.

OR

- 1b. Moved by _____ and seconded by _____ that the Commission, pursuant to Section 2076.5 of the Fish and Game Code, finds that the petition and other information before the Commission to list the tricolored blackbird on an emergency basis as an endangered species *does not provide sufficient information to warrant an emergency listing*.

AND

- 2a. the Commission does not provide sufficient information to indicate that the petitioned action may be warranted.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

32. SPORT FISH 2016**Today's Item**Information Action

Certify the negative declaration pursuant to the California Environmental Quality Act (CEQA) and adopt the proposed changes to sport fishing regulations.

Summary of Previous/Future Actions

- | | |
|-----------------------------------|----------------------------------|
| • DFW's status report | Jun 10-11, 2015; Mammoth Lakes |
| • Notice hearing | Aug 4-5, 2015; Fortuna |
| • Discussion hearing | Oct 7-8, 2015; Los Angeles |
| • Today's adoption hearing | Dec 9-10, 2015; San Diego |

Background

DFW's proposal for this year's sport fish rulemaking combines DFW and public requests for changes to Title 14, CCR. This proposal:

- revises snagging definition for clarity and consistency,
- creates a new definition for landlocked salmon and bag and possession limits for non-anadromous waters,
- creates flexibility for black bass contest drawing dates,
- increases fishing opportunities around the de-commissioned Red Bluff Diversion Dam,
- closes Yolo Bypass, Toe Drain, and Tule Canal to sturgeon fishing to protect vulnerable fish, and
- makes general clean-up to clarify San Francisco and San Pablo bay boundaries, recognize Solano Lake in 7.50(b), and technical fixes to reptile and green sturgeon regulations

Pursuant to CEQA, based on the initial study the proposed project will have a less than significant or no impact on the environment, supporting a negative declaration.

Significant Public Comments (N/A)**Recommendation**

1. Certify CEQA negative declaration.
2. Adopt regulations as proposed by DFW.

Exhibits

1. DFW presentation
2. Negative declaration
3. ISOR
4. Preadopt statement

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission certifies the negative declaration, adopts the proposed project, and adopts the proposed changes to freshwater sport fishing regulations.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

33. CENTRAL VALLEY SALMON**Today's Item**Information Action

Authorization to publish notice of intent to amend central valley salmon regulations to conform with federal guidelines.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 18, 2016; Teleconference |

Background

DFW is proposing changes to subsections 7.50(b)(5), (68) and (156.5), proposing a range of bag and possession limits in the American, Feather, and Sacramento rivers to encompass possible Pacific Fishery Management Council (PFMC) 2016 recommendations for Central Valley salmon stocks in mid-April. The scope of this option is intentionally broad to increase flexibility for development of the final Central Valley salmon seasons. Specific bag and possession limits for Central Valley adult fall-run Chinook salmon will be presented to FGC at its Apr meeting after the final PFMC recommendations are adopted by the National Marine Fisheries Service. For consistency, FGC generally adopts regulations to bring State law into conformance with federal law for Central Valley salmon.

Significant Public Comments (N/A)**Recommendations (N/A)****Exhibits**

1. ISOR
2. DFW presentation

Motion/Direction

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend Subsections 7.50(b)(5), (68) and (156.5) regarding Central Valley Salmon.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

34. KLAMATH RIVER SALMON**Today's Item**Information Action

Authorization to publish notice of intent to change Klamath River Basin sport fishing regulations.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 18, 2016; Teleconference |

Background

Subsection 7.50(b)(91.1) is proposed for amendment to:

1. **Change quota, bag limit and possession limit.** For notice purposes, DFW recommends an allocation range of 0-67,600 adult Klamath River Basin Fall Chinook Salmon (KRFC); bag limit between 0-4 KRFC with no more than 0-4 fish over 22" until the sub-quota is met, then 0 fish over 22"; possession limit between 0-12 KRFC with no more than 0-12 fish over 22" when the take of salmon over 22" is allowed.
2. **Clean up for clarity and consistency.**

No changes are proposed for the Klamath River spit. Consistent with a request from FGC for additional research and data at Blue Creek, no changes are proposed for the Klamath River at the mouth of Blue Creek pending results of a study.

FGC annually adopts Klamath River Basin sport fishing regulations consistent with federal fishery management goals. Specific bag and possession limits are adopted after the Pacific Fishery Management Council reviews West Coast salmon stocks and fishery allocations have been proposed. Two tribal entities within the Klamath River System (Hoopa Valley Tribe and Yurok Tribe) maintain fishing rights for ceremonial, subsistence and commercial fisheries that are managed consistent with federal fishery management goals.

Significant Public Comments

1. Several stakeholders, including the Del Norte and Humboldt counties, have requested that the closure at the mouth of Blue Creek be repealed or amended (exhibits 4 and 5).

Recommendation

FGC staff: Authorize publication of the notice as recommended by DFW.

DFW: Authorize publication of the notice.

Exhibits

2. ISOR

STAFF SUMMARY FOR DECEMBER 9-10, 2015

3. DFW presentation
4. Letter from Del Norte Co. Board of Supervisors, received Sep 25, 2015
5. Letter from Humboldt Co. Board of Supervisors, received Jun 15, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend subsection 7.50(b)(91.1) related to Klamath River Basin sport fishing.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

35. FISHERIES AT RISK**Today's Item**Information Action

Authorization to publish notice of 90-day emergency extension, and notice of intent to make permanent fisheries at risk regulations.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

- (A) Consider and re-adopt emergency regulations regarding special measures for fisheries at risk, Section 8.01, Title 14, CCR.

DFW and FGC staff are currently working together to formulate a regular rulemaking proposal (see 35(B)) that will refine the approach and associated language based on experience and feedback from the public, and with revisions to increase the efficacy of the current emergency action. This action is set to expire on December 29, 2015 unless FGC adopts a request for a 90-day extension, and files it with OAL the week prior to the expiration. Pursuant to Section 11346.1(h), Government Code, OAL may approve not more than two readoptions, each for a period not to exceed 90 days, of an emergency regulation that is the same as or substantially equivalent to an emergency regulation previously adopted by that agency. The readoption shall be permitted only if the agency has made substantial progress and proceeded with formulating a full rulemaking within the 180 days of the emergency.

Pursuant to the authority vested in it by Fish and Game Code Section 240, and for the reasons set forth in the attached "Statement of Emergency Readoption," FGC expressly finds that the adoption of this regulation is necessary for the immediate conservation, preservation, or protection of fish resources.

- (B) Request for authorization to publish notice of intent to adopt permanent regulations regarding special measures for fisheries at risk.

To ensure that California's fisheries are protected now and in the future, DFW is proposing that FGC make permanent the emergency regulations set forth in Section 8.01, Title 14, CCR, as amended in the attached ISOR.

Significant Public Comments (N/A)**Recommendations (N/A)****Exhibits**

1. (A) Statement of Emergency Action to Readopt

STAFF SUMMARY FOR DECEMBER 9-10, 2015

2. (A) Original Emergency Action
3. (A) DFW Memo Requesting Extension
4. (B) DFW presentation
5. (B) ISOR

Motion/Direction

35(A)

Moved by _____ and seconded by _____ that the Commission finds that adopting the proposed 90-day extension of emergency regulations, as established in Section 8.01, is necessary for the retention of immediate process for temporarily closing rivers to fishing while efforts are in place to make these regulations permanent.

35(B)

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to make permanent the addition of Section 8.01.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

36. MAMMAL HUNTING**Today's Item**Information Action

Authorization to publish notice of intent to amend mammal hunting regulations for the 2016-2017 seasons.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

Annual tag quotas for big game are indicated as a range (e.g., [0 - 40]) from which the final 2016 recommendation will be made at the conclusion of population survey efforts. For sections 364 and 364.1, the quotas and seasons are proposed to be moved into a more convenient tabular format; new hunts are also proposed for elk.

Additional change proposals include: modifications regarding the use of electronic collars on dogs; clarifying the definition of soft-nose bullets versus fragmenting bullets; clarifying the take of domestic pigeons and allowing an extended season for hunting non-native deer; and establishing a process for issuing refunds for unused fund-raising tags.

Significant Public Comments

Comment letters/emails have been received from a number of individuals both opposed to hunting elk in Del Norte County and in favor of mitigating damage the elk cause in the county by increasing the number of hunting tags.

Recommendations

Because commenters recommend both a zero elk tag quota and an increased elk tag quota, beyond the scope of the current recommendations from DFW, staff recommends that commenters requesting additional changes to elk regulations use the approved petition process for possible consideration in a future, annual review of elk tag quotas. DFW staff will provide a presentation and be available to discuss this issue.

22. Email from Helen Ferguson in favor of increasing tag numbers for both sexes of Roosevelt elk in Del Norte County, received Nov 24, 2015

Motion/Direction

Moved by _____ and seconded by _____ that the Commission authorizes publication of a notice of its intent to amend Sections 265, 353, 360, 361, 362, 363, 364, 364.1, 472 and 708.18 regarding mammal hunting regulations for the 2016-2017 season.

STAFF SUMMARY FOR DECEMBER 9-10, 2015

37. WATERFOWL**Today's Item**Information Action

Authorization to publish notice of intent to amend waterfowl regulations for the 2016-2017 season.

Summary of Previous/Future Actions

- | | |
|---------------------------------|----------------------------------|
| • Today's notice hearing | Dec 9-10, 2015; San Diego |
| • Discussion hearing | Feb 10-11, 2016; Sacramento |
| • Adoption hearing | Apr 13-14, 2016; Santa Rosa |

Background

DFW is proposing three changes to Section 502:

- Increase the white goose daily bag limit from 15 to 20 in most zones. This change will also result in an increase in the total bag limit in respective zones.
- Increase the white goose daily bag limit from 15 to 20 in the Imperial County Special Management Area.
- Increase the age requirement to participate in Youth Waterfowl Hunting Days from 15 years of age and younger to 17 years of age and younger.
- DFW proposes to delete that part of subsection 507(a)(2) prohibiting the possession of a firearm while archery hunting for migratory birds.

Significant Public Comments

Three alternatives are offered by the public regarding hunting in Morro Bay Special Management Area, which include 1) Eliminate all hunting during the Martin Luther King, Jr. weekend during the Morro Bay Winter Bird Festival; 2) Change the start time for hunting to 8 AM on Saturdays and Sundays instead of 7 AM; 3) Change the days of hunting to Wednesdays, Saturdays and Sundays (see Exhibit 4 for a sample).

The issue of hunting in Morro Bay is a semi-annual debate amongst the hunters that value the unique recreational opportunities provided there and some of the local residents who believe the opportunity infringes on their ability to enjoy some of the other benefits provided by Morro Bay. Existing regulations reflect the results of many negotiations in front of FGC to find an appropriate balance between competing interests. Significant efforts have been invested over the years in evaluating the situation and determining reasonable adjustments to the hunting activities out on the bay.

Regarding alternatives proposed for the Morro Bay Special Management Area, current regulations (Section 506) already provide for a later morning start time (7 a.m. rather than ½ hour before sunrise in all other hunt zones in California) and a substantial portion of Morro Bay is not open for hunting. The current balance on hunting in Morro Bay is consistent with the federal framework and FGC's mandate to conserve wildlife and provide recreational opportunity. Given this history, FGC staff does not support considering changes to the Morro

STAFF SUMMARY FOR DECEMBER 9-10, 2015

Bay regulations without additional efforts to work with affected stakeholders to resolve the issues.

Recommendations

FGC staff: Authorize publication of the notice as recommended by DFW.

DFW: Authorize publication of the notice which considers the Morro Bay recommendations as alternatives not supported (Exhibit 3).

38B. FUTURE MEETINGS – PERPETUAL TIMETABLE FOR REGULATORY ACTION**Today's Item**Information Action

Review and acknowledge requested changes to the perpetual timetable for anticipated regulatory actions.

Summary of Previous/Future Actions

- | | |
|---|----------------------------------|
| • Adopted 2015 rulemaking calendar | Dec 3, 2014; Van Nuys |
| • Last amended perpetual regulatory timetable | Oct 2015 |
| • Today's requested changes to timetable | Dec 9-10, 2015; San Diego |

Background

At each FGC meeting, FGC staff provides the latest approved timetable along with any requests for changes.

Through a memo (Exhibit B1) DFW has requested changes to the regulatory timetable (Exhibit B2):

- Add a proposed rulemaking to establish standards for imposing penalty enhancements for illegal take of game with defined characteristics.
- Add the semiannual recreational groundfish rulemaking to match federal changes.
- Add a Pacific halibut conformance package to initiate an automated approach to federal conformance regulations.

Significant Public Comments (N/A)**Recommendation**

FGC staff: Acknowledge that requested changes to the regulatory timetable are acceptable.

DFW: See Exhibit B2 for DFW's requested changes.

Exhibits

- B1. DFW memo requesting changes to the perpetual timetable for regulatory actions, dated Nov 24, 2015
- B2. Perpetual timetable for anticipated regulatory actions, updated Dec 1, 2015

From: [Jim Cloninger](#)
To: [FGC](#)
Subject: Proposal: How to obtain a deer hunting tag in California
Date: Thursday, February 12, 2015 11:13:59 AM

Fish and Game Commission: I want to propose the following procedure to obtain a resident deer hunting tag in California.

Proposal: Conduct the deer hunting draw for a deer tag the same as the draw for elk, pronghorn and sheep. Namely, resident applicant pays an application fee, the amount the same as the elk, pronghorn and sheep application fee. The actual draw will be the same. A deer tag applicant would pay the application fee, submit an application with up to 3 deer hunting zones. If the applicant is successful for any of his/her zone choices, he/she is entitled to purchase a deer hunting tag for that zone. If the applicant is not successful in drawing his/her first choice, a preference point will be granted. If the applicant is not successful for any of his/her choices, he/she may purchase a "left over" deer hunting tag, or not hunt deer that season.

Discussion: I have conducted a survey of the states that border California to determine a procedure norm for a resident to obtain a deer hunting tag.

Oregon: Must purchase a hunting license - \$29.50. Application fee to apply for a deer hunting tag - \$8.00. If successful in the draw, deer hunting tag - \$24.50.

Nevada: Must purchase a hunting license - \$33.00. Application fee to apply for a deer hunting tag - \$13.00. If successful in the draw, deer hunting tag - \$30.00.

Arizona: Must purchase a hunting license - \$37.00. Application fee to apply for a deer hunting tag - \$13.00. If successful in the draw, deer hunting tag - \$45.00.

California: Must purchase a hunting license - \$46.40. Must purchase a non refundable deer hunting tag before the draw - \$30.81.

As you can see an applicant for a deer hunting tag in California is more expensive: \$30.81 for California, \$13.00 for Nevada, \$13.00 for Arizona, \$8.00 for Oregon. The average application fee for obtaining a deer hunting tag in bordering states is \$11.33. A California applicant has to pay \$19.48 more for being unsuccessful in the deer hunting tag draw!!!! California's procedure must be changed to the normal procedure as used in bordering states.

James Cloninger, Antioch,CA

To request a change to regulations under the authority of the California Fish and Game Commission (Commission), you are required to submit this completed form to: California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814 or via email to FGC@fgc.ca.gov. Note: This form is not intended for listing petitions for threatened or endangered species (see Section 670.1 of Title 14).

Incomplete forms will not be accepted. A petition is incomplete if it is not submitted on this form or fails to contain necessary information in each of the required categories listed on this form (Section I). A petition will be rejected if it does not pertain to issues under the Commission’s authority. A petition may be denied if any petition requesting a functionally equivalent regulation change was considered within the previous 12 months and no information or data is being submitted beyond what was previously submitted. If you need help with this form, please contact Commission staff at (916) 653-4899 or FGC@fgc.ca.gov.

SECTION I: Required Information.

Please be succinct. Responses for Section I should not exceed five pages

1. Person or organization requesting the change (Required)

Name of primary contact person: Curtis Haney
 Address: [REDACTED]
 Telephone number: [REDACTED]
 Email address: [REDACTED]

RECEIVED
 CALIFORNIA
 FISH AND GAME
 COMMISSION
 2015 SEP 29 PM 2:05
 MLS

2. Rulemaking Authority (Required) - Reference to the statutory or constitutional authority of the Commission to take the action requested: Title 14, CONS, FGC, Division 1, Chapter 2, Article1, Section 205

3. Overview (Required) - Summarize the proposed changes to regulations: Change CA F&W Regulations, Chapter 4, (Ocean Fishing), Section 29.05 (b) (1) (Invertebrates, General) (Add Barnacles to the list of Invertebrates that can be harvested, and remove them from being prohibited to, “Take or Possess”).

4. Rationale (Required) - Describe the problem and the reason for the proposed change: “Take or Possession” of barnacles in California ocean waters is currently prohibited. I and many of my fellow divers love the taste of Gooseneck/Leaf Barnacles which are abundant on rocks exposed at low tide. Currently, the only legal way to consume barnacles locally is to go to an expensive restaurant and order them off the menu. Barnacles served in restaurants are all imported from Spain. I personally spoke with Jerry Kashiwada, a marine biologist at the CDFW office in Fort Bragg and asked him why Barnacles could not be harvested. The only reason he could think of was that when the regulations were written it was assumed that no one harvested or ate barnacles! He suggested I petition the commission to have barnacles added to the list of invertebrates that are allowed to be harvested.

SECTION II: Optional Information

To request a change to regulations under the authority of the California Fish and Game Commission (Commission), you are required to submit this completed form to: California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814 or via email to FGC@fgc.ca.gov. Note: This form is not intended for listing petitions for threatened or endangered species (see Section 670.1 of Title 14).

Incomplete forms will not be accepted. A petition is incomplete if it is not submitted on this form or fails to contain necessary information in each of the required categories listed on this form (Section I). A petition will be rejected if it does not pertain to issues under the Commission's authority. A petition may be denied if any petition requesting a functionally equivalent regulation change was considered within the previous 12 months and no information or data is being submitted beyond what was previously submitted. If you need help with this form, please contact Commission staff at (916) 653-4899 or FGC@fgc.ca.gov.

SECTION I: Required Information.

Please be succinct. Responses for Section I should not exceed five pages

1. Person or organization requesting the change (Required)

Name of primary contact person: Eric Boyd

Address: [REDACTED]

Telephone number: [REDACTED]

Email address: [REDACTED]

2. Rulemaking Authority (Required) - Reference to the statutory or constitutional authority of the Commission to take the action requested: Title 14, Division 1, Subdivision 2, Chapter 8, Sections 551 and 552

3. Overview (Required) - Summarize the proposed changes to regulations: Allow hunters using a State of California Wildlife area or National Wildlife refuge to carry 50 shot shells in the field. [Currently hunters are allowed only 25 shot shells].

4. Rationale (Required) - Describe the problem and the reason for the proposed change: Although the bag limits for geese have risen dramatically over the last several years, hunters are still crippled by the 25 shot shell limit on Wildlife Areas and NWR's. The goose limits alone are now 25 birds. Coupled with the possibility of 7 ducks as well and the 25 shot limit has become a rule preventing anyone from actually harvesting a full limit of ducks and geese. I have tried to work with the Department of Fish and Wildlife over the last several years on this change. I have been unsuccessful. It is now necessary to bring this directly to the Commission. Please change this rule to a shell limit that makes sense. A maximum of 50 shells would be logical.

SECTION II: Optional Information

5. Date of Petition: 10/202015

6. Category of Proposed Change

- Sport Fishing
- Commercial Fishing
- Hunting
- Other, please specify: [Click here to enter text.](#)

7. **The proposal is to:** *(To determine section number(s), see current year regulation booklet or <https://govt.westlaw.com/calregs>)*

- Amend Title 14 Section(s):551 and 552
- Add New Title 14 Section(s): [Click here to enter text.](#)
- Repeal Title 14 Section(s): [Click here to enter text.](#)

8. **If the proposal is related to a previously submitted petition that was rejected, specify the tracking number of the previously submitted petition** [Click here to enter text.](#)

Or Not applicable.

9. **Effective date:** If applicable, identify the desired effective date of the regulation. If the proposed change requires immediate implementation, explain the nature of the emergency: December 1, 2015

10. **Supporting documentation:** Identify and attach to the petition any information supporting the proposal including data, reports and other documents: see enclosed information regarding effective shot sizes for ducks versus geese.

11. **Economic or Fiscal Impacts:** Identify any known impacts of the proposed regulation change on revenues to the California Department of Fish and Wildlife, individuals, businesses, jobs, other state agencies, local agencies, schools, or housing: none

12. **Forms:** If applicable, list any forms to be created, amended or repealed:
none

SECTION 3: FGC Staff Only

Date received: [Click here to enter text.](#) 10/27/15

FGC staff action:

- Accept - complete
- Reject - incomplete
- Reject - outside scope of FGC authority

Date petitioner was notified of receipt of petition and pending action: 11/10/15

State of California – Fish and Game Commission

PETITION TO THE CALIFORNIA FISH AND GAME COMMISSION FOR REGULATION CHANGE

FGC 1 (NEW 10/23/14) Page 3 of 3

Granted for consideration of regulation change

10/20/2015

General survey and information regarding shot size effectiveness on ducks and geese.

Since non-toxic shot has been required to hunt waterfowl in the USA there have been many studies and tests performed by various researchers and ballistics experts on effectiveness of shot sizes to take ducks and geese. These groups and individuals include:

Ducks Unlimited

L. P. Brezny. Gun Digest Guide to Modern Shotgunning

Tom Roster, Shotshell Ballistics Editor, American Waterfowler magazine

See included T. Roster Lethality Table referenced by the Wisconsin Department of

Natural Resources: dnr.wi.gov/topic/hunt/documents/tomrosterontoxicshot.pdf - 19k - 2013-02-18

California Waterfowl Association

Mr. Roster's data attached show the best selection for geese is steel shot size BBB and for ducks size #3's.

Therefore in order to maximize cleanly taking geese or ducks and minimize crippling you should be shooting two different shot sizes. Since the restriction for shot shells is now 25 total, hunters typically carry only the shot size for birds they expect to find the most opportunities in public areas. Unfortunately if they carry shot for ducks but have opportunities for geese, they will attempt to take the larger birds with the small shot size. This results in many crippled and lost birds due to the less effective shot size. The opposite is also true, that if the hunter is shooting the larger shot for geese, if taking ducks is attempted, the larger shot with more open patterns and fewer pellets per shell will cause more crippling of ducks.

With the opportunity to take 25 geese and 7 ducks in the field, it is logical and prudent to allow for the proper amount and shot size for these two different species. A 50 shot shell limit would allow hunters to carry the correct shot sizes for the given opportunities. Maintaining a 25 shell limit is neither logical from the standpoint of daily bag limits nor conducive to proper conservation and clean harvest of waterfowl.

Eric Boyd

©TOM ROSTER'S 2013 NONTOXIC SHOT LETHALITY TABLE©

Proven Nontoxic Shot Loads For Waterfowl & Upland Game Birds ¹ Load Velocity: 1,225 - 1,600 FPS ACTIVITY	Typical Shooting Range of Activity (Yards)	Most Effective Nontoxic Shot Size(s) For Birds Listed Under ACTIVITY At The Distances Listed In The Second Column	Minimum Load Weight (Ounces)	Minimum Pellet Hits Needed on Lethal Areas for Clean Kills	Minimum Pattern Count Needed at Any Distance for Clean Kills (# of Pellets in 30" Circle)	Most Effective Choke(s) (Given in Lead Shot Choke Designations)	NOTE: The pellets in the steel shot loads listed in this table were traditional, highly spherical ball-shaped pellets of ~ 7.86 g/cc density and 90-95 DPH hardness. The HEVI-Shot pellets were of 12.0 g/cc density and slightly harder than traditional steel pellets.
Large Geese At Long Range Giant, Western, Atlantic and Interior Canadas	50-65	Steel BBB to T	1-1/4	1-2	50-55	Improved Modified	
	50-70	HEVI-Shot 2 to B	1-1/2	1-2	50-55	Improved Modified, Full

To request a change to regulations under the authority of the California Fish and Game Commission (Commission), you are required to submit this completed form to: California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814 or via email to FGC@fgc.ca.gov. Note: This form is not intended for listing petitions for threatened or endangered species (see Section 670.1 of Title 14).

Incomplete forms will not be accepted. A petition is incomplete if it is not submitted on this form or fails to contain necessary information in each of the required categories listed on this form (Section I). A petition will be rejected if it does not pertain to issues under the Commission's authority. A petition may be denied if any petition requesting a functionally equivalent regulation change was considered within the previous 12 months and no information or data is being submitted beyond what was previously submitted. If you need help with this form, please contact Commission staff at (916) 653-4899 or FGC@fgc.ca.gov.

SECTION I: Required Information.

Please be succinct. Responses for Section I should not exceed five pages

1. Person or organization requesting the change (Required)

Name of primary contact person: James G. McCabe

Address: [REDACTED]

Telephone number: [REDACTED]

Email address: [REDACTED]

- 2. Rulemaking Authority (Required)** - Reference to the statutory or constitutional authority of the Commission to take the action requested: The Fish and Game Code, Section: §5061 Rules and Regulations. Authorizes the Fish and Game Commission to establish regulations for commercial take, sale, transport, export or import of native reptiles. To date, the Commission has adopted two regulations under this authority. The first regulation is: CCR, Title 14, Section 651, Commercial Take of Native Reptiles and Amphibians for Scientific or Educational Institutions. The second regulation is: CCR, Title 14, Section 43, Captive Propagation and Commercialization of Native Reptiles. We are requesting the Commission to modify existing regulations or establish new regulations that would permit the collection of venom from native reptiles for the commercial production of vaccines, anti-venom and other therapeutics agents; for both domesticated animals and human use. The purpose is to produce effective products against the bites from native venomous snakes. CCR. Title 14, Section 43 pertains to the production of captive born reptiles for the purpose of selling them in the pet trade and has no application to the commercialization of venom or products produced from venom. CCR, Title 14, Section 651, Commercial Take of Native Reptiles and Amphibians for Scientific or Educational Institutions could be modified to accommodate the activities we are describing. We would need the Commission to expand the definition of scientific and educational organization to include commercial operations which would be permitted to maintain venomous reptiles for the purpose of venom extraction for the production of vaccines, antivenom and other therapeutic agents. §40. General Provisions Relating to Native Reptiles and Amphibians; (f) Biological Supply Houses and Exempt Organizations is another section that could be modified or additions made to the code to accommodate the commercialization of venom. These options are discussed in detail below in section 3. Overview.

- 3. Overview (Required)** - Summarize the proposed changes to regulations: The Fish and Game Code, Section: 5061 authorizes the Fish and Game Commission to establish regulations for commercial take, sale, transport, export or import of native reptiles. We would like the Commission to create new regulations which would include the following points: **1.** Allow for the venom from native reptiles to be collected, processed and stored for commercial use to produce vaccines, antivenom and other therapeutic products. **2.** The new regulation(s) would make provisions for trained, experienced personnel to be permitted to hold and maintain native venomous reptiles under humane conditions for prolonged periods of time to allow for multiple venom extractions. **3.** Venomous reptiles maintained for the purpose of venom extraction will be exempt from bag limits as they will not be considered under the “sport take” provisions of the Fish and Wildlife regulations. **4.** Venomous reptiles used for the purpose of venom extraction would be classified as nuisance animals that would otherwise be destroyed as they pose a threat to domestic animals or human life. **5.** Individuals or Companies permitted to commercialize the venom from native reptiles will **not** be allowed to purchase native venomous reptiles or the venom from native reptiles in any form (i.e.: Lyophilized or “raw” unprocessed liquid) from a third party source. This is to discourage the commercial hunting of native snakes. CCR, Title 14, Section 651, Commercial Take of Native Reptiles and Amphibians for Scientific or Educational Institutions could be modified to accommodate the activities we are describing. We would need the Commission to expand the definition of “Organization” to include commercial operations which produce vaccines, antivenom and other therapeutic agents. §40. General Provisions Relating to Native Reptiles and Amphibians; (f) Biological Supply Houses and Exempt Organizations is another section that could be modified or additions made to the code to accommodate the commercialization of venom. One possible modification to section (f), (2) Organizations and Schools Exempt from Permit; could read: “Organizations that extract venom from native reptiles for biomedical research or therapeutic products are exempt from permit. Another possible option would be to create a paragraph (f), (“3”) that could state: The Department may issue permits to owners of businesses that extract venom from reptiles for the production of Therapeutic/Biomedical products and/or biomedical research.
- 4. Rationale (Required)** - Describe the problem and the reason for the proposed change: Our published research on the efficacy of the only commercially available canine rattlesnake vaccine lead us to the conclusion that the this vaccine is ineffective against the bite from the two most commonly encountered rattlesnakes in California, the Northern and Southern Pacific Rattlesnakes [Comparison of the protective effect of a commercially available western diamondback rattlesnake toxoid vaccine for dogs against envenomation of mice with western diamondback rattlesnake (*Crotalus atrox*), northern Pacific rattlesnake (*Crotalus oreganus oreganus*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*) venom., Am J Vet Res. 2015 Mar;76(3):272-9., J. McCabe ,et al., article attached as part of the Supporting Documentation]. This is due to the fact that the vaccine is made from the venom of an unrelated species of rattlesnake and the antibodies produced by the vaccinated animal has no protective value as they are unable to bind and neutralize the venom from the bite of a Pacific Rattlesnake. Mr. Brockett and I would like to produce both canine and equine vaccine that would be effective for California and that it would require the use of venom from native rattlesnakes. The logical progression would be to then produce antivenom for domestic animals and ultimately to produce a regionally specific antivenom for humans. The Problem is that under the current regulations it is illegal to commercialize any part of a native animal. This makes it impossible to start a company to produce vaccine, antivenom or any other therapeutic

agents in the state of California using the biochemically unique venoms found in our state's native reptiles. We are proposing that the current regulations be modified or new regulations be written to permit qualified people /companies to collect, process, hold and commercially distribute products produced from the venom of reptiles that are medically relevant and critically needed. This would include provisions for the long term maintenance of venomous reptiles for the purpose of venom extraction and would allow for qualified people/companies to maintain rattlesnakes over the current bag limit. It should be pointed out that the law is currently being violated by the producer of the canine and equine vaccine, Red Rock Biologics, Woodland, CA. The Red Rock vaccine is produced from the venom of a native rattlesnake (Western Diamondback, *Crotalus atrox*). The only way we could use the existing regulations is to set up a business in another state and simply place an order with a recognized biological supply house for Pacific rattlesnakes. The snakes would be collected and shipped out of state. This would mean that the state of California would be losing business revenue in the form of taxes, employment for California residents and the loss of a company that generates valuable products targeted for use on the west coast. We would prefer to start a business in the state of California and feel it would be an asset to the state. Although we are initially focusing on a vaccine for veterinary use (given prophylactically to companion animals) we also recognize the need for a California specific antivenom for the treatment of snake bites for animals and humans. The following quote from Bryan G. Fry, world renowned herpetologist and venom researcher sums up the current dilemma regarding the treatment of Pacific Rattlesnake bites with the only FDA approved antivenom, CroFab: "In California alone, around 800 people are bitten by rattlesnakes every year. Although just a handful die, the venom is painful, debilitating, and can lead to lengthy hospital stays. To make things worse, Fry says that the antivenom that Americans use for rattlesnake bites—CroFab—is ineffective against the Southern Pacific rattler. "It's notoriously poor," he says. "People have to be kept in the hospital for up to a week getting continuous infusions just to keep them alive." There are two problems. First, CroFab uses antibodies that are less allergenic than those in other antivenoms, but get cleared from the body very quickly. "You end up with very expensive urine," says Fry. Second, it doesn't contain antibodies that target the specific proteins used by the Southern Pacific rattlesnake. "They were relying on toxins to be similar to stuff from other rattlesnakes, but even within this one [subspecies], you get completely different venoms. It's been a debacle." [Source: <http://phenomena.nationalgeographic.com/2014/01/27/rattlesnakes-two-hours-apart-pack-totally-different-venoms/>] We hope that the Fish and Game Commission recognizes the need for and benefit from the commercialization of venom from native reptiles for the production of valuable and potentially lifesaving therapeutic products.

SECTION II: Optional Information

5. **Date of Petition:** [Click here to enter text.](#)

6. **Category of Proposed Change**

Sport Fishing

Commercial Fishing

Hunting

Other, please specify: The Fish and Game Code, Section: §5061 Rules and Regulations. Authorizes the Fish and Game Commission to establish regulations for commercial take, sale, transport, export or import of native reptiles. CCR, Title 14, Section 651, Commercial Take of

Native Reptiles and Amphibians for Scientific or Educational Institutions. §40. General Provisions Relating to Native Reptiles and Amphibians; (f) Biological Supply Houses and Exempt Organizations.

7. **The proposal is to:** *(To determine section number(s), see current year regulation booklet or <https://govt.westlaw.com/calregs>)*
- Amend Title 14 Section(s): The Fish and Game Code, Section: §5061 Rules and Regulations. Authorizes the Fish and Game Commission to establish regulations for commercial take, sale, transport, export or import of native reptiles. CCR, Title 14, Section 651, Commercial Take of Native Reptiles and Amphibians for Scientific or Educational Institutions. tific or Educational Institutions. §40. General Provisions Relating to Native Reptiles and Amphibians; (f) Biological Supply Houses and Exempt Organizations
 - Add New Title 14 Section(s): The Fish and Game Code, Section: §5061 Rules and Regulations. Authorizes the Fish and Game Commission to establish regulations for commercial take, sale, transport, export or import of native reptiles. CCR, Title 14, Section 651, Commercial Take of Native Reptiles and Amphibians for Scientific or Educational Institutions tific or Educational Institutions. §40. General Provisions Relating to Native Reptiles and Amphibians; (f) Biological Supply Houses and Exempt Organizations
 - Repeal Title 14 Section(s): [Click here to enter text.](#)
8. **If the proposal is related to a previously submitted petition that was rejected, specify the tracking number of the previously submitted petition** [Click here to enter text.](#)
Or Not applicable.
9. **Effective date:** If applicable, identify the desired effective date of the regulation. If the proposed change requires immediate implementation, explain the nature of the emergency: Although we would like to begin formulating a new canine/equine vaccine as soon as possible our request would not qualify as an emergency.
10. **Supporting documentation:** Identify and attach to the petition any information supporting the proposal including data, reports and other documents: We have attached the following documents in support of our petition: **#1.** A publication, co-authored by James McCabe, from the American Journal of Veterinary Research (March 2015, 76(3): 272-279). The significance of this publication is that it shows the current canine rattlesnake vaccine is ineffective against the bite of the most commonly encountered rattlesnake in the state of California and the need for regionally specific vaccines and antivenom produced from the venom of native rattlesnakes. **#2.** A publication from the Journal of Proteomics (March 2014, 99:68-83). The significance of this publication is to draw attention to the extreme variation in venom composition among different populations of Southern Pacific Rattlesnakes. This consequently results in the drastically variable degrees of neutralization by CroFab antivenom. This means that certain patients will receive massive amounts of antivenom with little benefit because it is unable to neutralize the venom due to its different chemical structure. CroFab is the product most commonly used in California (and the United States) to treat snake bites. The variability in venom composition between populations of Pacific Rattlesnakes is also the reason why any successful vaccine or antivenom produced in the future, for California, will require collecting venom from these well-defined populations to insure the product is efficacious. **#3.** Letters of support from two renowned scientists in the field of venom research who recognize the value

in producing regionally specific vaccine and antivenom as well as the valuable resource that would be made available to other researchers if a dependable source of venom was available.

11. Economic or Fiscal Impacts: Identify any known impacts of the proposed regulation change on revenues to the California Department of Fish and Wildlife, individuals, businesses, jobs, other state agencies, local agencies, schools, or housing: The commercialization of venom from native rattlesnakes would have a positive economic impact for the State of California. Venom would be utilized to produce canine and equine vaccines as well as antivenom and other therapeutics for human use. The production of these types of products would create employment opportunities, generate tax revenue for the State and more importantly produce products that would be tailor made to neutralize the effects from the bites of native rattlesnakes. The implementation of new regulations allowing for the commercialization of native rattlesnake venom would most likely have little or no impact on the revenues or expenditures to the California Department of Fish and Wildlife (CDFW). The long term benefits to the State of California would be in the production of vaccines and antivenom that could potentially save lives, reduce pain and suffering of patients and the expense of prolonged hospitalization associated with rattlesnake bites. The commercialization of native rattlesnake venom would also create a legal means by which universities, pharmaceutical and bio-technology companies could secure raw material for future research and development of other beneficial therapeutics.

12. Forms: If applicable, list any forms to be created, amended or repealed:

Not applicable at this time.

UNIVERSITY of
NORTHERN COLORADO

*College of Natural and Health Sciences
School of Biological Sciences*

To: California Department of Fish and Wildlife
From: Dr. Stephen P. Mackessy, Professor of Biology
Re: request for bag limit exemption on California rattlesnakes
Date: 10 April 2015

To whom it may concern:

I am writing this letter in support of James McCabe and Jim Brockett and their plan to develop a new rattlesnake vaccine for dogs and horses that is specifically formulated for California. A recent publication by James McCabe and co-authors has shown that the current vaccine available provides no protection against the bites inflicted by the most commonly encountered species of rattlesnake on the West Coast. The production of such a vaccine will require the maintenance of multiple snakes from many locations within the state, as there are significant geographic variations in venom composition in several species which occur in California. My understanding is that Mr. Brockett and Mr. McCabe are requesting an exemption from the current bag limit regulations for this reason, which I support. This work with California venomous snakes and the vaccine(s) resulting from it will also be a valuable resource for academic and biomedical researchers, as there is currently no supplier of locality-specific rattlesnake venom for species native to California.

Both Mr. Brockett and Mr. McCabe are uniquely qualified to accomplish this goal, as they have a combined total of over 80 years of experience working with venomous reptiles and currently hold permits to maintain non-native venomous snakes. Mr. Brockett is one of the most successful and respected animal trainers in the film industry. Mr. McCabe has worked in biomedical research for over 30 years, and his experience includes working in the Venom Research Laboratory of Dr. Findley Russell at USC.

In conclusion, I believe the proposed project will benefit pets as well as the research community. Please feel free to contact me if you have any questions concerning this letter of support.

Sincerely,

Comparison of the protective effect of a commercially available western diamondback rattlesnake toxoid vaccine for dogs against envenomation of mice with western diamondback rattlesnake (*Crotalus atrox*), northern Pacific rattlesnake (*Crotalus oreganus oreganus*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*) venom

Charles C. Cates DVM

Erika V. Valore MS

Marcelo A. Couto DVM, PhD

Gregory W. Lawson DVM, PhD

James G. McCabe BA

Received April 11, 2014.

Accepted September 30, 2014.

From the Division of Laboratory Animal Medicine, David Geffen School of Medicine, University of California-Los Angeles, Los Angeles, CA 90095. Dr. Cates' present address is Cedars Sinai Medical Center, Comparative Medicine Department, 8700 Beverly Blvd, Davis Room 7004, Los Angeles, CA 90048.

Address correspondence to Dr. Cates (charles.cates@cshs.org).

OBJECTIVE

To evaluate effectiveness of a commercially available toxoid manufactured from western diamondback (WD) rattlesnake (*Crotalus atrox*) venom against envenomation of mice with WD, northern Pacific (NP) rattlesnake (*Crotalus oreganus oreganus*), and southern Pacific (SP) rattlesnake (*Crotalus oreganus helleri*) venom.

ANIMALS

90 specific pathogen-free female mice.

PROCEDURES

Mice were allocated into 3 cohorts (30 mice/cohort). Mice received SC injections of *C atrox* toxoid (CAT) vaccine (n = 15/group) or adjuvant (15/group) at day 0 and again at 4 weeks. At 8 weeks, mice were challenge-exposed with 1 of 3 venoms. Survival until 48 hours was evaluated by use of log-rank analysis of survival curves and the z test for proportions.

RESULTS

6 of 15 WD-challenged CAT-vaccinated mice, 3 of 15 NP-challenged CAT-vaccinated mice, and 0 of 15 SP-challenged CAT-vaccinated mice survived until 48 hours. All adjuvant-only vaccinates survived ≤ 21 hours. Mean survival time of CAT vaccinates was longer than that of adjuvant-only vaccinates for all venoms (1,311 vs 368 minutes for WD, 842 vs 284 minutes for NP, and 697 vs 585 minutes for SP). Results of the z test indicated a significantly increased survival rate for vaccinates exposed to WD rattlesnake venom but not for vaccinates exposed to NP or SP rattlesnake venom. Log-rank analysis revealed a significant difference between survival curves of vaccinated versus unvaccinated mice exposed to NP but not WD or SP venom.

CONCLUSIONS AND CLINICAL RELEVANCE

CAT vaccination improved survival rate and survival time after challenge exposure with WD rattlesnake venom and may offer limited protection against NP rattlesnake venom but did not provide significant cross-protection against SP rattlesnake venom. (*Am J Vet Res* 2015;76:272–279)

In 2011, 5,700 incidents of snake envenomation in humans were reported by the American Association of Poison Control Hotlines.¹ The true number of envenomations likely is higher because reporting is not mandatory, many snakebites go unreported, some snake-bite victims do not seek treatment, and some treating physicians do not consult with a poison control center.^{2,3} Although the incidence of rattlesnake envenomation in the pet population has not been quantified, it is thought to exceed that for humans (> 150,000 bites/y by 1 estimate⁴) because of a high

rate of outdoor exposure, unreported or unnoticed incidents, and a presumed limited-threat judgment for bitten animals.^{4,5}

A conditionally licensed WD rattlesnake (*Crotalus atrox*) toxoid vaccine is available for administration to dogs and horses at risk for snakebite and is intended to aid in the reduction of morbidity and deaths attributable to rattlesnake envenomation.^{6,7} The authors are not aware of any data on evaluation of the effectiveness of the CAT vaccine in scientific journals.⁸ Manufacturer data and advertisements suggest this CAT vaccine is efficacious against bites from WD rattlesnakes and also provides cross-protection against envenomation from other rattlesnake species.^{9a} However, analysis of snake venom reveals it to be a complex milieu of peptides and proteins, and venom from related species and subspecies of rattlesnakes can differ markedly in composition.^{10–13} A vaccine that

comprises venom from a single species might provide only limited protection against envenomation by other species of rattlesnakes. In California, companion animals are not typically exposed to WD rattlesnakes because these rattlesnakes are found only in sparsely populated areas in the southeast region of the state. Rather, pets are much more likely to encounter NP rattlesnakes (*Crotalus oreganus oreganus*) and SP rattlesnakes (*Crotalus oreganus helleri*), which inhabit heavily populated and traversed regions of central and coastal California. Therefore, we hypothesized that the CAT vaccine might provide limited cross-protection against 2 important species of rattlesnakes found in California. The purpose of the study reported here was to use rattlesnake envenomation of mice to evaluate the comparative effectiveness of the CAT vaccine against the venom of WD, NP, and SP rattlesnakes.

Materials and Methods

ANIMALS

Ninety specific pathogen-free outbred female Swiss Webster mice (4 to 6 weeks old) were obtained from a commercial source. Mice were allowed to acclimate for 72 hours. Mice were housed in groups (5 mice/cage) on corncob bedding with cotton nesting material in individually ventilated cages in an Association for Assessment and Accreditation of Laboratory Animal Care International-accredited biocontainment facility. All mice were fed standard laboratory rodent chow and provided with ad libitum access to reverse-osmosis-purified acidified water. The room was maintained at 20° to 21°C with relative humidity of 30% to 70%, 10 to 15 air changes/h, and a photoperiod of 12 hours of light to 12 hours of darkness. Use of the mice in this study was approved by the Institutional Animal Care and Use Committee of the University of California-Los Angeles.

EXPERIMENTAL PROCEDURES

A randomized, blinded, placebo-controlled study was conducted. On the basis of an a priori power analysis (power = 0.8, 0% censoring, and 50-to-50 ratio of control mice to experimental mice), the 90 mice were randomly selected by an individual unaffiliated with the study and assigned to treatment and control groups (45 mice/group). Treatment mice received an injection (0.2 mL, SC) of CAT vaccine^b at day 0 and again at 4 weeks. Control mice received an injection (0.2 mL, SC) of pharmaceutical-grade aluminum hydroxide adjuvant^c at day 0 and again at 4 weeks. Four weeks after administration of the second injection of CAT vaccine or adjuvant, mice were challenge-exposed with rattlesnake venom.

VENOM

The Society for the Study of Amphibians and Reptiles classification of the western rattlesnake (*Crotalus oreganus*) was used for the present study. The NP and SP rattlesnakes are 2 of 5 recognized subspecies of western rattlesnake, and the WD rattlesnake is a mono-

typic species with no recognized subspecies. Lyophilized WD rattlesnake venom was obtained.^d The venom was collected from WD rattlesnakes throughout the range of these rattlesnakes within the United States. Venom of NP and SP rattlesnakes was collected from various regions throughout northern and southern California¹⁴⁻¹⁶ (Figure 1). Samples of NP rattlesnake venom were collected at Sanger (Fresno County), Sutter Butte (Sutter County), Lake Berryessa (Napa County), Vacaville (Solano County), Johnsondale (Tulare County), and Modesto (Stanislaus County). Samples of SP rattlesnake venom were collected at Rasnow Peak, Hidden Valley, Santa Rosa Valley, Carlisle Canyon, Lake Sherwood, and Oak Park (Ventura County); Acton, Castaic, Leona Valley, Topanga Canyon, Malibu Canyon, and Griffith Park (Los Angeles County); Oak Hills, Phelan, Devil's Canyon, and Big Bear (San Bernardino County); Idyllwild-Pine Cove and Garner Valley (Riverside County); and De Luz (San Diego County). Venom samples were processed in accordance with a standardized protocol. The final lyophilized venom product contained equal parts (vol/vol) from each sample location. In preliminary experiments, the LD₅₀ was estimated for each venom on the basis of the animal-sparing up-and-down LD₅₀ testing paradigm.¹⁷⁻²⁶ Those LD₅₀ values then were used in the study as follows: WD rattlesnake venom, 2.8 mg/kg; NP rattlesnake venom, 1.7 mg/kg; and SP rattlesnake venom, 1.5 mg/kg. These LD₅₀ values are similar to those published previously.²⁷⁻³¹

Figure 1—Map of the distribution for WD rattlesnakes (*Crotalus atrox*; black-shaded area), NP rattlesnakes (*Crotalus oreganus oreganus*; light gray-shaded area), and SP rattlesnakes (*Crotalus oreganus helleri*; dark gray-shaded area) in California and locations for collection of venom samples (circles). The range of each of the rattlesnakes was obtained from previously published information.¹⁴⁻¹⁶ Notice that major metropolitan population centers are located exclusively in the ranges of NP and SP rattlesnakes.

Table 1—Summary of survival data for mice inoculated with CAT vaccine or adjuvant only at 0 and 4 weeks and challenge-exposed 4 weeks later with venom of WD rattlesnakes (*Crotalus atrox*), NP rattlesnakes (*Crotalus oreganus oreganus*), and SP rattlesnakes (*Crotalus oreganus helleri*).

*An endpoint of 2,880 min (ie, 48 hours) for survival was determined prior to the study (ie, surviving mice were euthanized at 48 hours after venom injection). Despite the fact some mice were expected to live > 48 hours after venom injection, survival time was limited in this manner to avoid effects on reported mean survival times in surviving mice and is in accordance with commonly accepted practices for survival studies.²³ †Values were significant at $P \leq 0.05$.

— = Not applicable because there were no surviving mice in either of these groups.

VENOM CHALLENGE EXPOSURE

Three cohorts (30 mice/cohort [15 treated mice and 15 control mice]) were challenge-exposed with 1 of the 3 venoms at 4 weeks after the second injection of CAT vaccine or adjuvant. Venom was administered to each mouse via IP injection at twice the calculated LD₅₀. For injection, lyophilized venom was reconstituted in sterile water to create a stock solution of 5 mg/mL, which was then diluted as needed to provide the dose for administration. Mice were closely monitored for 48 hours after venom administration.

Before venom administration, body weight and baseline core body temperature were recorded. Temperature was obtained with a 1.5-cm-long thermistor probe inserted via the rectum into the colon; temperature was recorded once per hour for up to 10 hours and thereafter as needed. An observer who was unaware of the venom administered or vaccination status of the mice assessed their condition and determined when a mouse would be euthanized. Mice were euthanized by gradual-fill CO₂ inhalation when they became nonresponsive to stimuli, were in marked respiratory distress (agonal breathing or intermittent gasping), or had a prolonged period of moribundity (severely limited response to stimuli and core body temperature < 70% of the baseline core temperature for > 2 hours). Surviving mice were euthanized 48 hours after venom administration, and a postmortem blood sample was obtained via cardiocentesis.

ANTIBODY TITERS

Blood samples were collected from the retro-orbital venous sinus of isoflurane-anesthetized mice 1 week before venom challenge exposure (ie, 3 weeks after the second injection of CAT vaccine or adjuvant) for use in determination of 2 sets of serum antibody titers. First, to verify that mice generated antibodies against the CAT vaccine, serial serum antibody titers of 3 randomly selected vaccinated mice were compared with serial serum an-

tibody titers of 3 randomly selected adjuvant-only control mice. Second, to compare specificity of antibodies generated, dilutions (1:8,000) of serum obtained from 8 randomly selected vaccinated mice were tested against each of the 3 venoms. To generate serial titers and evaluate antibody specificity, 96-well ELISA plates were coated (100 µL/well) with reconstituted venom diluted in 0.1M carbonate buffer (1 µg/mL). Plates were sealed with acetate and incubated overnight at 22°C. After incubation, wells were washed (PBS solution with 0.05% Tween20) and then blocked by incubating on a plate shaker for 15 minutes at 22°C. Diluted serial serum samples were then applied to wells in triplicate. Plates were incubated on a plate shaker for 30 minutes at 22°C. Wells then were washed and horseradish peroxidase-conjugated goat anti-mouse IgG was added; plates were incubated on a plate shaker for 30 minutes at 22°C. Wells were then washed, and the chromogenic substrate tetramethylbenzidine was added. After incubation on a plate shaker for 10 minutes, the reaction was stopped by the addition of 2N sulfuric acid; plates then were immediately evaluated to determine the OD at 450 nm by use of an automated ELISA reader. The OD was used as an indicator of the presence of antivenom IgG as well as for comparisons of relative reactivity between venom types and general assessment of interindividual variation.

STATISTICAL ANALYSIS

Mean survival time in minutes and Kaplan-Meier survival curves were generated for the 3 venoms and saline (0.9% NaCl) solution control samples. A z test of proportions was used to compare survival rates of vaccinated versus control mice for all venoms. Log-rank analysis was used to compare Kaplan-Meier survival curves of vaccinated versus control mice for all venoms. Multilevel, mixed-effects linear regression modeling^c was used to compare specificity of an antibody

titer of 1:8,000 for all venoms. Significance for all tests was set at $P \leq 0.05$.

Results

SURVIVAL RATE AND SURVIVAL TIME

Both survival rate and survival time were analyzed (Table 1). For mice vaccinated with CAT vaccine, 6 of 15 mice challenge-exposed with WD rattlesnake venom, 3 of 15 mice challenge-exposed with NP rattlesnake venom, and 0 of 15 mice challenge-exposed with SP rattlesnake venom were alive at 48 hours after venom injection, whereas adjuvant-only control mice survived ≤ 21 hours after injection of any of the 3 rattlesnake venoms. Mean survival time of vaccinated mice was longer than that of adjuvant-only control mice for all venoms (1,311 vs 368 minutes for WD rattlesnake venom, 842 vs 284 minutes for NP rattlesnake venom, and 697 vs 585 minutes for SP rattlesnake venom). Survival analysis for individual venom revealed that results of the z test for proportions were significant ($P = 0.01$) only for WD rattlesnake venom. Log-rank analysis of survival curves revealed significant ($P = 0.01$) differences only for NP rattlesnake venom (Figure 2). Maximum survival time was greatest for vaccinated mice, compared with survival time for adjuvant-only control mice, for all venoms. Notably, minimum survival time was greater for control mice than for vaccinated mice for both WD and NP rattlesnake venoms. This was evident on the Kaplan-Meier survival curve for WD rattlesnake venom as an initial increase in death of vaccinated mice, compared with that of control mice, at early time points (< 300 minutes after venom injection). Because of this finding, a log-rank analysis for WD rattlesnake venom that excluded early time points was conducted ($n = 7$ mice) and revealed a significant ($P = 0.004$) effect.

Student t test analysis of prestudy mean body weight and baseline core body temperature revealed that these variables did not differ significantly among any of the groups ($P = 0.08$ to 0.67 ; data not shown). No morbidity or deaths were associated with receiving the vaccine or adjuvant alone.

ANTIBODY TITERS

Antibody titers against all 3 rattlesnake venoms for the 3 vaccinated and 3 control mice were plotted (Figure 3). Dilutions tested were 1:4,000, 1:8,000, 1:16,000, 1:32,000, 1:64,000, and 1:128,000. Mice vaccinated with CAT developed measurable antibody titers against all 3 venoms, whereas mice receiving only adjuvant had no evidence of reactive serum antibodies against any venom. The OD for a 1:8,000 dilution of serum obtained from 8 additional randomly selected vaccinated mice tested against all 3 venoms was plotted (Figure 4). Comparison of OD for the various venoms suggested a decreasing reactivity as follows: the reactivity of WD rattlesnake venom was greater than that of NP rattlesnake venom, and the reactivity of NP rattlesnake venom was greater than that of SP rattlesnake venom. Analysis of a multilevel mixed-effects linear regression model with venom as

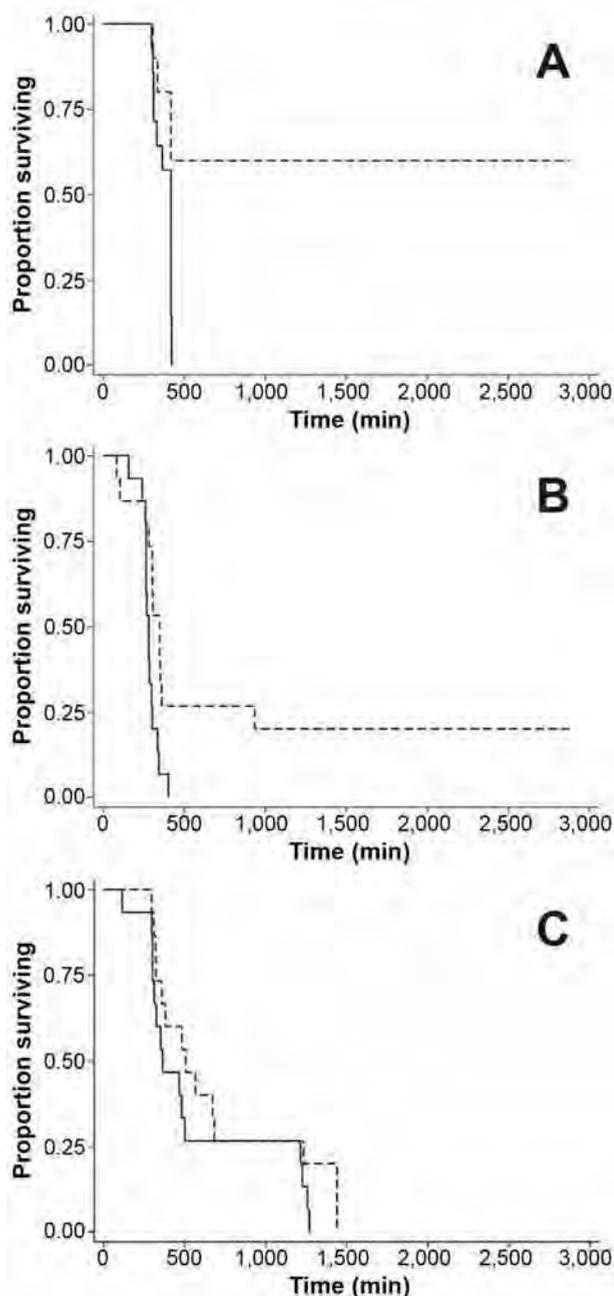

Figure 2—Kaplan-Meier survival curves for vaccinated mice (dashed lines) and adjuvant-only control mice (solid lines) after challenge exposure with WD rattlesnake venom (A), NP rattlesnake venom (B), and SP rattlesnake venom (C). There were 15 mice in each group. Time of challenge exposure (injection of venom) was designated as time 0. There was a significant ($P = 0.01$; log-rank analysis) difference in survival curves of vaccinated versus adjuvant-only mice after injection of only NP rattlesnake venom. In panel A, notice the possible early death phenomenon attributable to ADE of WD rattlesnake venom.

the sole categorical predictor revealed significant ($P \leq 0.001$) differences in OD for each venom. Interindividual variation was also evident because the majority (6/8) of the mice had titers with OD values approaching or exceeding 1.0, whereas the remainder (2/8) had OD values < 0.5 .

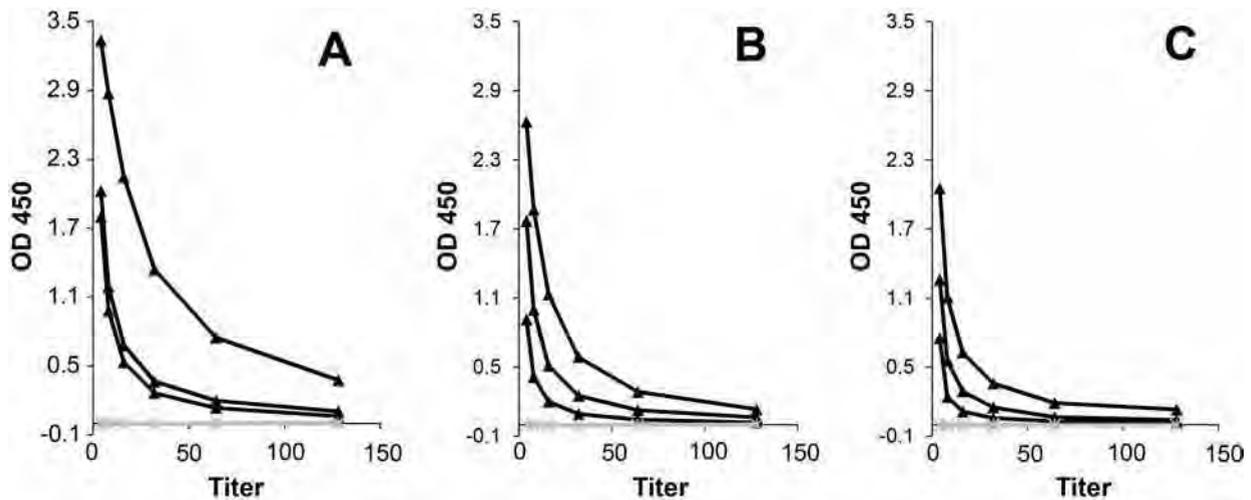

Figure 3—Serial serum dilution antibody titers for 3 vaccinated mice (black symbols) and 3 adjuvant-only control mice (gray symbols) against venom of WD rattlesnakes (A), NP rattlesnakes (B), and SP rattlesnakes (C) as determined by OD measured at 450 nm (OD 450). Each black symbol represents results for 1 mouse; the gray symbol represents results for 3 mice. Notice that the antibody response of vaccinated mice was greater than that of the control mice for all venoms. There was a pattern that specificity (ie, increased OD 450) was greater against venom of WD rattlesnakes than against venom of NP or SP rattlesnakes. The x-axis represents a dilution factor of 1:1,000. Dilutions tested were 1:4,000, 1:8,000, 1:16,000, 1:32,000, 1:64,000, and 1:128,000.

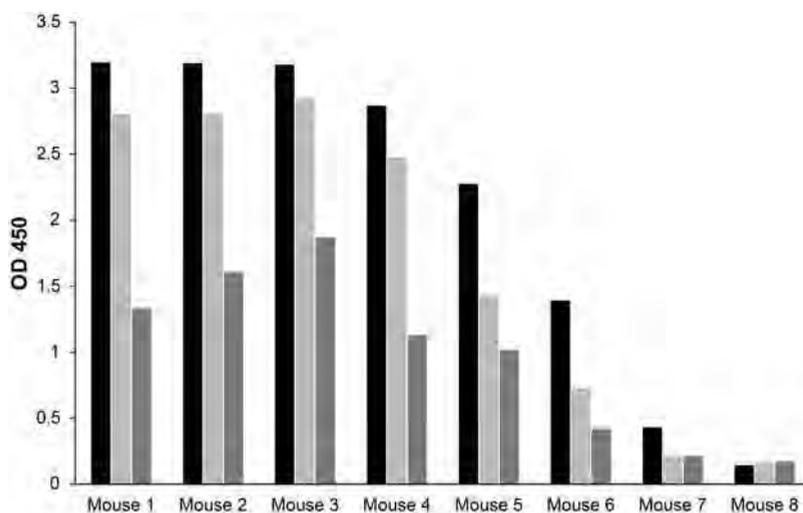

Figure 4—Single serum dilution (1:8,000) antibody titers for 8 randomly selected mice against venom of WD rattlesnakes (black bars), NP rattlesnakes (light gray bars), and SP rattlesnakes (dark gray bars). Notice the marked interindividual differences as well as differences in specificity among venoms (WD rattlesnake > NP rattlesnake > SP rattlesnakes venom). There was a significant ($P \leq 0.001$; multilevel mixed-effects linear regression) difference in OD 450 among venoms.

Discussion

In the present study, survival analysis after rattlesnake envenomation of mice was conducted in a randomized, blinded, placebo-controlled study to evaluate the comparative effectiveness of CAT vaccine against 3 rattlesnake venoms. The data reported included evaluation of survival rate (whether a mouse died ≤ 48 hours after venom injection) as well as evaluation of survival time (number of minutes a mouse survived after venom injection, up to 48 hours). Survival time is an important consideration in light of the

fact a venom vaccine may be useful if it extends the course of the envenomation, thereby allowing additional time to seek primary medical treatments such as antivenin and intensive care. In addition, antibody titers of vaccinated and adjuvant-only control mice were compared as well as specificity of the antibodies generated against each of the 3 venoms. Overall, results of the challenge-exposure experiment indicated that CAT vaccination resulted in a significant increase in survival rate and survival time against injection with WD rattlesnake venom; equivocal results after injection of NP rattlesnake venom, which would likely require a greater number of mice to verify a difference; and no significant improvement in survival measures after injection of SP rattlesnake venom. Analysis of antibody titers revealed a clearly measurable antibody response in vaccinated mice, compared with that in

adjuvant-only control mice, against all 3 venoms. The antibodies were most reactive against WD rattlesnake venom, with significantly less reactivity against venoms of the 2 other rattlesnake species.

Analysis of the data for the present study indicated that administration of CAT vaccine conferred an increase in survival rate and survival time in vaccinated versus control mice challenge-exposed with WD rattlesnake venom. Mean survival time was greater in vaccinated than in control mice, and survival rate improved significantly ($P = 0.01$; z test for proportions). Unexpectedly, results for log-rank analysis of

survival curves did not reveal significant differences. This result was particularly surprising because challenge exposure with NP rattlesnake venom had a significant effect, as determined by use of log-rank analysis, despite the fact there were only half as many survivors as for challenge exposure with WD rattlesnake venom. Notably, minimum survival time was greater for control versus vaccinated mice for both WD and NP rattlesnake venom (Table 1). This was also evident on the Kaplan-Meier survival curve for WD rattlesnake venom as an initial increase in death of vaccinated versus adjuvant-only control mice at early time points (< 300 minutes after venom injection; Figure 2). The early deaths may have sufficiently altered early time points of the curve of vaccinated mice after injection of WD rattlesnake venom such that statistical modeling resulted in a curve for vaccinated mice that was indiscernible from the curve for the control mice, despite the clear difference at later time points ($P = 0.004$ for log-rank analysis after 300 minutes). We propose that the early deaths could have been attributable to 1 factor or a combination of factors, such as genetic predisposition to venom sensitivity, injection near or into a vascular bed that hastened systemic exposure to venom, or an antibody-mediated early death phenomenon that has been observed in a laboratory setting when testing vaccines against viruses and bacterial toxins.³²⁻³⁹

Use of the vaccine may afford limited cross-protection against NP rattlesnake venom; however, the data are not entirely conclusive. Mean survival rate of vaccinated mice significantly ($P = 0.01$; log-rank analysis of survival curves) exceeded that of adjuvant-only control mice, which suggested a protective effect. However, results of the z test for proportions of survival time did not reveal significant ($P = 0.07$) differences. However, it is plausible that testing a larger population of mice may have allowed us to detect a more subtle effect by use of the z test of proportions.

The vaccine did not provide significant protection against SP rattlesnake venom, although the mice with the greatest survival time were in the vaccinated group. The CAT vaccine may have been less effective against SP rattlesnake venom because of the divergent molecular composition of that venom. For example, 1 population of SP rattlesnakes can produce Mojave toxin, a unique and powerful neurotoxin, which to date has not been found in WD or NP rattlesnake venoms.^{15,40}

In addition to survival analysis, antibody titers were measured in a number of mice to verify an antibody response against the CAT vaccine (Figure 3). Compared with control mice, vaccinated mice had a variably robust antibody response, and initial titers suggested that the antibodies were more specific for WD rattlesnake venom than for the NP or SP rattlesnake venoms. On the basis of this observation, sera from 8 randomly selected vaccinated mice were evaluated for antibody specificity against each of the 3 venoms evaluated in the study (Figure 4). Linear regression analy-

sis revealed significantly increased OD against WD rattlesnake venom, as compared with results against SP or NP rattlesnake venoms. The analysis indicated that antibodies generated by mice were most specific against the venom of manufacture (ie, WD rattlesnake venom), compared with specificity against the other 2 genetically distinct venoms. It should be emphasized that antibody titers were measured only to verify that mice generated an antibody response against the vaccine and to evaluate the specificity of that antibody response. The magnitude of the murine antibody response and how it may relate to survival of vaccinated dogs and horses (or the ability of clinicians to provide a prognosis for survival of vaccinated animals) in real-life situations were beyond the scope of the present study.

The present study had several potential confounders. First, on the basis of a previous manufacturer-designed study,^a mice in the present study were injected with a vaccine dose of 0.2 mL, which could be from 50- to 1,500-fold as high (by volume) as manufacturer-recommended doses for dogs and horses.^{6,7} Potentially, this could have resulted in a more robust antibody response and more enhanced protective benefit than typically would be afforded to companion animals. On the other hand, it should be mentioned that mice were challenge-exposed with an extremely high (twice the LD_{50}) dose of venom administered via the IP route commonly used in venom studies on mice. In most naturally occurring scenarios, companion animals receive SC or IM injection of venom, which results in slower and less immediately severe systemic effects⁴¹ than were seen in the mice of the study reported here. In light of this, findings for the present study should be considered with the caveat that, in theory, the vaccine may improve survival rate and survival time, but these improvements remain to be definitively verified in practice settings for the specific species and situations of interest. Finally, it should be mentioned that we evaluated survival rate and survival time but did not directly assess morbidity. In actual envenomations, local effects such as severe necrosis, hemorrhage, and inflammation can cause substantial morbidity, which potentially can lead to severe incapacitation and death.⁴²⁻⁴⁵ It remains to be determined whether vaccination has substantial effects to prevent or reduce important local sequelae after snake envenomation. Despite these drawbacks, there are a number of reasons investigators should use the described method of envenomation of mice, including that it is a well-accepted technique for venom analysis and antivenin evaluation, adheres to the concept of replacement in research (ie, use of mice instead of dogs or horses), and has been used in experiments conducted by the manufacturer to obtain USDA licensing for the CAT vaccine.

Data from the rattlesnake envenomation of mice reported here indicated that administration of the CAT vaccine resulted in a significant increase in survival

rate and survival time after injection of WD rattlesnake venom, equivocal results after injection of NP rattlesnake venom (possibly requiring a greater number of animals to confirm a difference), and no significant improvement in survival variables after injection of SP rattlesnake venom. Analysis of antibody titers confirmed a measurable antibody response in vaccinated versus adjuvant-only control mice and confirmed that specificity of the antibody response was significantly greater against the venom of manufacture. Overall, results of the present study suggested that vaccination with the CAT vaccine may provide limited cross-protection against NP rattlesnake venom but no significant cross-protection against SP rattlesnake venom. Future studies should include more in-depth analysis of antibody titers, testing of alternative vaccination strategies involving other venoms, and investigation into early deaths seen in some of the vaccinated mice. Such studies will be useful in validating results of the present study and providing increased insight into the real-world effectiveness of a rattlesnake venom vaccine.

To whom it concerns,

I am writing this letter in support of James McCabe and Jim Brockett, who intend to develop a new rattlesnake vaccine for dogs and horses that is specifically formulated for California snake species. The current vaccine, produced by Red Rock Biologics, consists of heat-treated Western Diamondback Rattlesnake (*Crotalus atrox*) venom. My own unpublished research shows that this venom is highly dissimilar to that of most California rattlesnake species (the Red Diamond Rattlesnake, *Crotalus ruber*, being an exception), and therefore will not generate protective antibodies to other rattlesnake venoms. Indeed, a recent publication by James McCabe has shown that the current vaccine provides no protection against the bites inflicted by the most commonly encountered species of rattlesnake on the west coast, *Crotalus oreganus*.

The production of such a vaccine will require the maintenance of multiple snakes from many locations within the state, as there are geographic variations in venom composition. My understanding is that Mr. Brockett and Mr. McCabe are requesting an exemption from the current bag limit regulations for this reason. In addition to their need for production of this vaccine, their extraction of venom from these snakes would also comprise a valuable resource for other academic and biomedical researchers, as there is currently no existing supplier of locality-specific rattlesnake venom for species native to California. I will share with Mr. Brockett and Mr. McCabe my unpublished data on geographic variation in venom of all California rattlesnake taxa so that they can plan accordingly which geographic locations to focus on, thereby reducing the total number of snakes they would need to sample and maintain (though the number will still exceed the current limit).

Both Mr. Brockett and Mr. McCabe are uniquely qualified to accomplish this goal, as they have a combined total of over 80 years of experience working with venomous reptiles and currently hold permits to maintain nonnative venomous snakes. Mr. Brockett is one of the most successful and respected animal trainers in the film industry. Mr. McCabe has worked in biomedical research for over 30 years. His experience includes working in the Venom Research Laboratory of Dr. Findley Russell at USC, and he has graciously provided my own laboratory with venom samples.

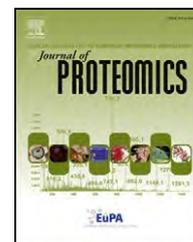

In conclusion, I believe the proposed project will benefit pets as well as the research community. Please feel free to contact me if you have any questions regarding this letter of support.

All best wishes,

ABSTRACT

Due to the extreme variation of venom, which consequently results in drastically variable degrees of neutralization by CroFab antivenom, the management and treatment of envenoming by *Crotalus oreganus helleri* (the Southern Pacific Rattlesnake), one of the most medically significant snake species in all of North America, has been a clinician's nightmare. This snake has also been the subject of sensational news stories regarding supposed rapid (within the last few decades) evolution of its venom. This research demonstrates for the first time that variable evolutionary selection pressures sculpt the intraspecific molecular diversity of venom components in *C. o. helleri*. We show that myotoxic β -defensin peptides (aka: crotamines/small basic myotoxic peptides) are secreted in large amounts by all populations. However, the mature toxin-encoding nucleotide regions evolve under the constraints of negative selection, likely as a result of their non-specific mode of action which doesn't enforce them to follow the regime of the classic predator–prey chemical arms race. The hemorrhagic and tissue destroying snake venom metalloproteinases (SVMPs) were secreted in larger amounts by the Catalina Island and Phelan rattlesnake populations, in moderate amounts in the Loma Linda population and in only trace levels by the Idyllwild population. Only the Idyllwild population in the San Jacinto Mountains contained potent presynaptic neurotoxic phospholipase A₂ complex characteristic of Mohave Rattlesnake (*Crotalus scutulatus*) and Neotropical Rattlesnake (*Crotalus durissus terrificus*). The derived heterodimeric lectin toxins characteristic of viper venoms, which exhibit a diversity of biological activities, including anticoagulation, agonism/antagonism of platelet activation, or procoagulation, appear to have evolved under extremely variable selection pressures. While most lectin α - and β -chains evolved rapidly under the influence of positive Darwinian selection, the β -chain lectin of the

¹ Joint first-author.

Catalina Island population appears to have evolved under the constraint of negative selection. Both lectin chains were conspicuously absent in both the proteomics and transcriptomics of the Idyllwild population. Thus, we not only highlight the tremendous biochemical diversity in *C. o. helleri*'s venom-arsenal, but we also show that they experience remarkably variable strengths of evolutionary selection pressures, within each toxin class among populations and among toxin classes within each population. The mapping of geographical venom variation not only provides additional information regarding venom evolution, but also has direct medical implications by allowing prediction of the clinical effects of rattlesnake bites from different regions. Such information, however, also points to these highly variable venoms as being a rich source of novel toxins which may ultimately prove to be useful in drug design and development.

Biological significance

- These results have direct implications for the treatment of envenomed patients.
- The variable venom profile of *Crotalus oreganus helleri* underscores the biodiscovery potential of novel snake venoms.

1. Introduction

Knowledge of venom composition has increased dramatically with improvements in technology and the advent of new techniques, in particular the use of mass spectrometry in venom proteomics [1–15] and venom gland transcriptome analysis [16–27]. Snake venoms are complex secretions composed of numerous enzymes, toxins, peptides, small organic molecules, and inorganic components that have diverse modes of action on both prey and human victims [28–32]. Snake venom serves both predatory and defensive purposes [28–30,33–38]. Variation in venom profiles has been shown between species within the same genus [5,11,12,15,27,39–44] and between individuals within the same species, with the intraspecific differences found among geographic locales [2,11,12,45–52], between sexes [46,47,53] and between juveniles and adults [9,46,47,54,55]. Venom variation has also been reported between venom glands of a single individual [56]. Some authors have argued that venom diversity is the product of neutral evolutionary processes and not subject to natural selection [57,58], whereas others have argued that strong natural selection has driven adaptation to particular prey species [12,30,31,40,46,47,59–63].

Venom in reptiles originated from a single early recruitment event approximately 180 million years ago (mya) during the early Jurassic period and is a plesiotypic trait of the Toxicofera clade [10,12,18,20–23,30,31,40,64]. New World pit vipers are thought to have descended from a single ancestral Asian pit viper species that colonized the New World via the Bering land bridge [65,66], with rattlesnakes having a mid-Cenozoic origin in the Mexican highlands [67–69]. The venom arsenals of Crotaline snakes are characterized by a great diversity of venom-components; generalized venom “types” have been proposed, depending upon metalloprotease activity and toxicity [70]. Type I venoms possess high levels of metalloprotease activity and lower toxicity (>1.0 µg/g mouse body weight), whereas type II venoms have low metalloprotease activity and higher toxicity (<1.0 µg/g mouse body weight). The presence of these two venom types in a diversity of well-defined species clades suggests that it is not dependent upon phylogeny [49,52,70–72].

Crotalus oreganus helleri is a medium-sized rattlesnake inhabiting Baja California northward through southern California, and the Pacific islands of Santa Catalina (Los Angeles County, California) and Coronado Del Sur (Tijuana, Mexico) [67]. Pronounced tectonic activity in the region has produced considerable variation in available habitat [73]. The species utilizes habitat ranging from sea level to >3000 m and prey encountered are highly varied. Significant regional variation in venom composition exists [51,74], with both type I and type II venoms identified in local populations [49]; however this dichotomy of venom types fails to characterize the full extent of venom variability in the species. *C. o. helleri* is the most medically relevant species of the region and is responsible for the majority of severe envenomations in southern California [29,75]. Therefore, determining intraspecific variation of *C. o. helleri* venom components and the factors influencing their molecular evolution can yield important implications for clinical treatment of envenomation. Venom variation also offers substantial potential for bioprospecting and pharmaceutical discovery [8,18–23,30,40,76]. These variations have been the subject of many popular press reports that grossly misattribute them to unparalleled recent diversification of the venom [77] and thus display a fundamental lack of understanding on how venom evolves.

In this study, we investigated the diversity of toxins present in *C. o. helleri*, across its geographic range, using a combined proteomics–transcriptomics approach to investigate the relative molecular evolution and diversification within a given toxin type, and the relative expression levels of particular toxin types.

2. Materials and methods

2.1. Sampling

We sampled four southern California populations of *C. o. helleri* from areas with pronounced geological, elevational, and floristic differences. Human envenomations from snakes in these

different regions have exhibited distinct symptoms ranging from hemorrhage to muscle fasciculations to paralysis. The four populations chosen (Fig. 1) were: (1) Catalina Island, which is dominated by coastal sage scrub, interspersed with chaparral and oak woodland, has never been connected to the mainland [73] and has supported an isolated population since at least the Pleistocene; (2) Idyllwild in the San Jacinto Mountains has high altitude pine and cedar montane forests (elevation ~1600 m); (3) Loma Linda consists of low rolling hills covered with grasses and, on north facing slopes, *Salvia mellifera* and other shrubs; and (4) Phelan comprises a transition zone between High Desert (Mohave) and coastal mountain scrub. We sampled one snake from each region for transcriptome sequencing. We used the same snake for proteome analysis of the Phelan and Loma Linda populations, and a separate individual of same sex and size from the exact same locality for the other two locations in addition to two more specimens for each location other than Loma Linda, for which only one more specimen was obtained due to the rarity of *C. o. helleri* in this location. We used only adult specimens for venom analysis due to potential ontogenetic shifts in venom composition [9,70].

2.2. Transcriptome sequencing, phylogenetics, selection analyses, and structural analyses

2.2.1. Transcriptome sequencing

Total RNA was extracted from venom glands using the standard TRIzol Plus method (Invitrogen). Extracts were enriched for mRNA using standard RNeasy mRNA mini kit (Qiagen) protocol. mRNA was reverse transcribed, fragmented and ligated to a unique 10-base multiplex identifier (MID) tag prepared using standard protocols and applied to one PicoTiterPlate (PTP) for simultaneous amplification and sequencing on a Roche 454 GS FLX + Titanium platform (Australian Genome Research Facility). An average of 50,000 sequences were read for each library. Automated grouping and analysis of sample-specific MID reads informatically separated sequences from the other transcriptomes on the plates, which were then post-processed to remove low quality sequences before de novo assembly into contiguous sequences (contigs) using v 3.4.0.1 of the MIRA software program. Assembly details for the transcriptomes are shown

in Supplementary Table 1. All raw reads have been deposited in the NCBI Sequence Read Archive (<http://www.ncbi.nlm.nih.gov/sra/>) with the accession numbers of: SRR871501 *C. o. helleri* (Catalina Island), SRR871502 *C. o. helleri* (Idyllwild), SRR871503 *C. o. helleri* (Loma Linda), and SRR871504 *C. o. helleri* (Phelan). Assembled contigs were processed using CLC Main Work Bench (CLC-Bio) and Blast2GO bioinformatic suite to provide Gene Ontology, BLAST and domain/Interpro annotation. The above analyses assisted in the rationalization of the large numbers of assembled contigs into phylogenetic ‘groups’ for detailed phylogenetic analyses outlined below.

2.2.2. Selection analyses

Translated nucleotide sequences were aligned using MUSCLE 3.8 [78] and the alignments were manually inspected to rectify errors. All nucleotide sequences and multiple sequence alignments used for selection analyses are available as Supplementary file 2 and Supplementary Figs. 1–4, respectively. In order to reconstruct gene phylogenies for selection assessments, maximum-likelihood method implemented in PhyML [79] was employed on the nucleotide datasets and node support was evaluated with 1000 bootstrapping replicates. All the maximum-likelihood trees are provided as Supplementary Figs. 5–7, with the results of branch-site REL test mapped onto them. In order to detect the nature of selection and its influence on various venom-encoding genes of *C. o. helleri*, we utilized maximum-likelihood models implemented in Codeml of the PAML [80]. We employed site-specific models that estimate positive selection statistically as a non-synonymous-to-synonymous nucleotide-substitution rate ratio (ω) significantly greater than 1. For technical details regarding models/methods see [20,81]. FUBAR [82] implemented in HyPhy [83] was employed to provide additional support to the aforementioned analyses and to detect sites evolving under the influence of pervasive diversifying and purifying selection pressures. Mixed Effects Model Evolution (MEME) [82] was also employed to efficiently detect episodically diversifying sites. To clearly depict the proportion of sites under different regimes of selection, an evolutionary fingerprint analysis was carried out using the evolutionary selection distance (ESD) algorithm implemented in Datamonkey [84]. We further utilized the branch-site Random Effects Likelihood (REL) test [85] to identify lineages evolving under the influence of episodic diversifying selection pressures.

2.2.3. Structural analyses

To depict the natural selection pressures influencing the evolution of various *C. o. helleri* venom-components (only those with sufficient numbers of full-length sequences were analyzed in this regard: β -defensin, kallikrein and lectin), we mapped the sites under positive selection on the homology models created using Phyre 2 web server [86]. PyMOL 1.3 [87] was used to visualize and generate the images of homology models. ConSurf web server [88] was used for mapping the evolutionary selection pressures on the three-dimensional homology models.

Homology models of the presynaptic PLA₂ complex from *C. o. helleri* (Coh) (GenBank: GAKR01000015 [acid subunit] and GenBank: GAKR01000016 [basic subunit]) and the homologue from *Crotalus scutulatus scutulatus* (Ccs) (UniProt: P18998 [acid subunit] and UniProt: P62023 [basic subunit]) were built using the crystal structure of crotoxin from *Crotalus durissus terrificus* (Cdt)

Fig. 1 – *C. o. helleri* populations investigated.

(PDB: 3ROL; UniProt: P08878 [acid subunit]; UniProt: P0CG56 [basic subunit]) [89] as a template. Template to sequence alignments were generated using SPDBV [90,91] and exported as FASTA-formatted text. The 3ROL coordinates together with the alignment file were used for comparative modeling using MODELLER [92]. Images of these homology models were obtained using VMD [93] and Tachyon ray tracing. Charged surfaces were obtained by running the Adaptive Poisson–Boltzmann Solver APBS plug-in [94] to VMD. Representation in VMD was set to “orthographic”, depth cueing was set to “off”, and render mode was set to “GLSL”.

2.3. Proteomics

2.3.1. HPLC

Lyophilized crude venom was diluted to a concentration of 3 mg/mL in Buffer A (0.065% TFA, 2% acetonitrile in Nanopure water) and centrifuged at 15,000 g for 10 min. The supernatant (100 µL) was fractionated on an ÄKTAmicro high-pressure liquid chromatography (HPLC) system (GE Healthcare Life Sciences, Piscataway, NJ, USA) fitted with two reversed-phase (RP) columns (SOURCE 5RPC ST polystyrene/divinyl benzene, 4.6 × 150 mm; GE Healthcare) run in series at a flow rate of 0.5 mL/min, using a linear gradient of 0–100% Buffer B (0.05% TFA, 80% acetonitrile in Nanopure water) over 40 column volumes. Protein elution was monitored at 214 nm using Unicorn 5.0 (GE Healthcare Life Sciences) software, and fractions were collected manually.

2.3.2. LC–MS

Each fraction was subjected to reduction and alkylation prior to enzymatic digestion using dithiothreitol and iodoacetamide, respectively, following the protocol outlined by Matsudaira [95].

Proteins were then digested with proteomics-grade porcine pancreatic trypsin (Sigma-Aldrich, St. Louis, MO, USA). We desalted samples using C₁₈ ZipTips (EMD Millipore, Billerica, MA, USA) according to the manufacturer’s protocol. The desalted tryptic peptides were resuspended in mobile phase A (2% acetonitrile, 0.1% formic acid in water). Liquid chromatography was conducted on a ThermoFinnigan LCQ Deca XP spectrometer (ThermoFinnigan, Waltham, MA, USA) equipped with a PicoView 500 nanospray apparatus using Xcalibur software (ver. 1.3; ThermoFinnigan, Waltham, MA, USA) for instrument control and data acquisition. Separation was performed on a 10-cm × 75-µm-i.d. C18 BioBasic bead column (New Objective, Woburn, MA, USA) by injecting 20-µL samples. Mobile phase B consisted of 98% acetonitrile, 2% water, and 0.1% formic acid. The gradient program was: 0% B at 0.18 mL/min for 7.5 min; 0% B at 0.35 mL/min for 0.5 min; linear gradient to 20% B at 15 min at 0.35 mL/min; linear gradient to 75% B at 55 min at 0.3 mL/min (flow rate constant for remainder of the program); linear gradient to 90% B at 60 min; hold at 90% B until 85 min; linear gradient to 0% B at 90 min; hold at 0% B until 120 min. Spectra were acquired in positive ion mode with a scan range of 300–1500 m/z. We converted MS/MS data into peak list files using ExtractMSn implemented in BioWorks (version 3.1; ThermoFinnigan) with the following parameters: peptide molecular weight range of 300–3500, threshold of 100,000, precursor mass tolerance of 1.4, and minimum ion count of 35. We conducted MS/MS database searches using Mascot (licensed, version 2.2, Matrix Science, Boston, MA, USA) against the National Center for Biotechnology Information non-redundant (NCBI nr) database in the taxon Metazoa with a parent tolerance of 1.20 Da, fragment tolerance of 0.60 Da, and two missed trypsin cleavages allowed. We

specified carbamidomethylation of cysteine and oxidation of methionine in Mascot as fixed and variable modifications, respectively.

2.3.3. MALDI ToF MS and MALDI ToF/ToF MS/MS

RP-HPLC fractions were submitted to the Institute for Integrated Research in Materials, Environments and Society at California State University, Long Beach, to determine whole protein molecular masses and protein identification/similarity. For MALDI ToF/ToF MS/MS analysis, tryptic peptides were mixed with α -cyano-4-hydroxy cinnamic acid (CHCA) matrix and directly spotted onto MALDI plates. MS spectra were collected using 1000 laser shots/spectrum, and MS/MS spectra from 3000 shots/spectrum. Peptides with signal-to-noise ratio above 15 in MS mode were selected for MS/MS analysis, with a maximum of 15 MS/MS spectra allowed per spot. Internal calibration was achieved using ToF/ToF Calibration Mixture (AB SCIEX). We searched MS/MS data against the NCBI database within

Metazoa using GPS Explorer, running Mascot (version 2.1) search engine with a peptide tolerance of 300 ppm, MS/MS tolerance of 0.8 Da, and one missed cleavage allowed. We specified carbamidomethylation of cysteine as a fixed modification, and the following as variable modifications: carbamyl, Gln/pyro-Glu (N-term Q), and Glu/pyro-Glu (N-term E). Mass spectrometry data for the peaks in Supplementary File 1 is presented in Supplementary Spreadsheet 1.

2.3.4. Statistical analyses

To confirm that population differences existed among the 11 snakes with the quantitative RP-HPLC data presented in Supplementary Spreadsheet 2, we subjected the percent protein present in each of the 11 toxin families (area under the peaks) to a 4×11 (population \times toxin family) analysis of variance (ANOVA [96]), treating population as a between-subjects factor and toxin family as a within-subjects factor. We rank-transformed the data to avoid analysis of percentage data that summed to 100 for

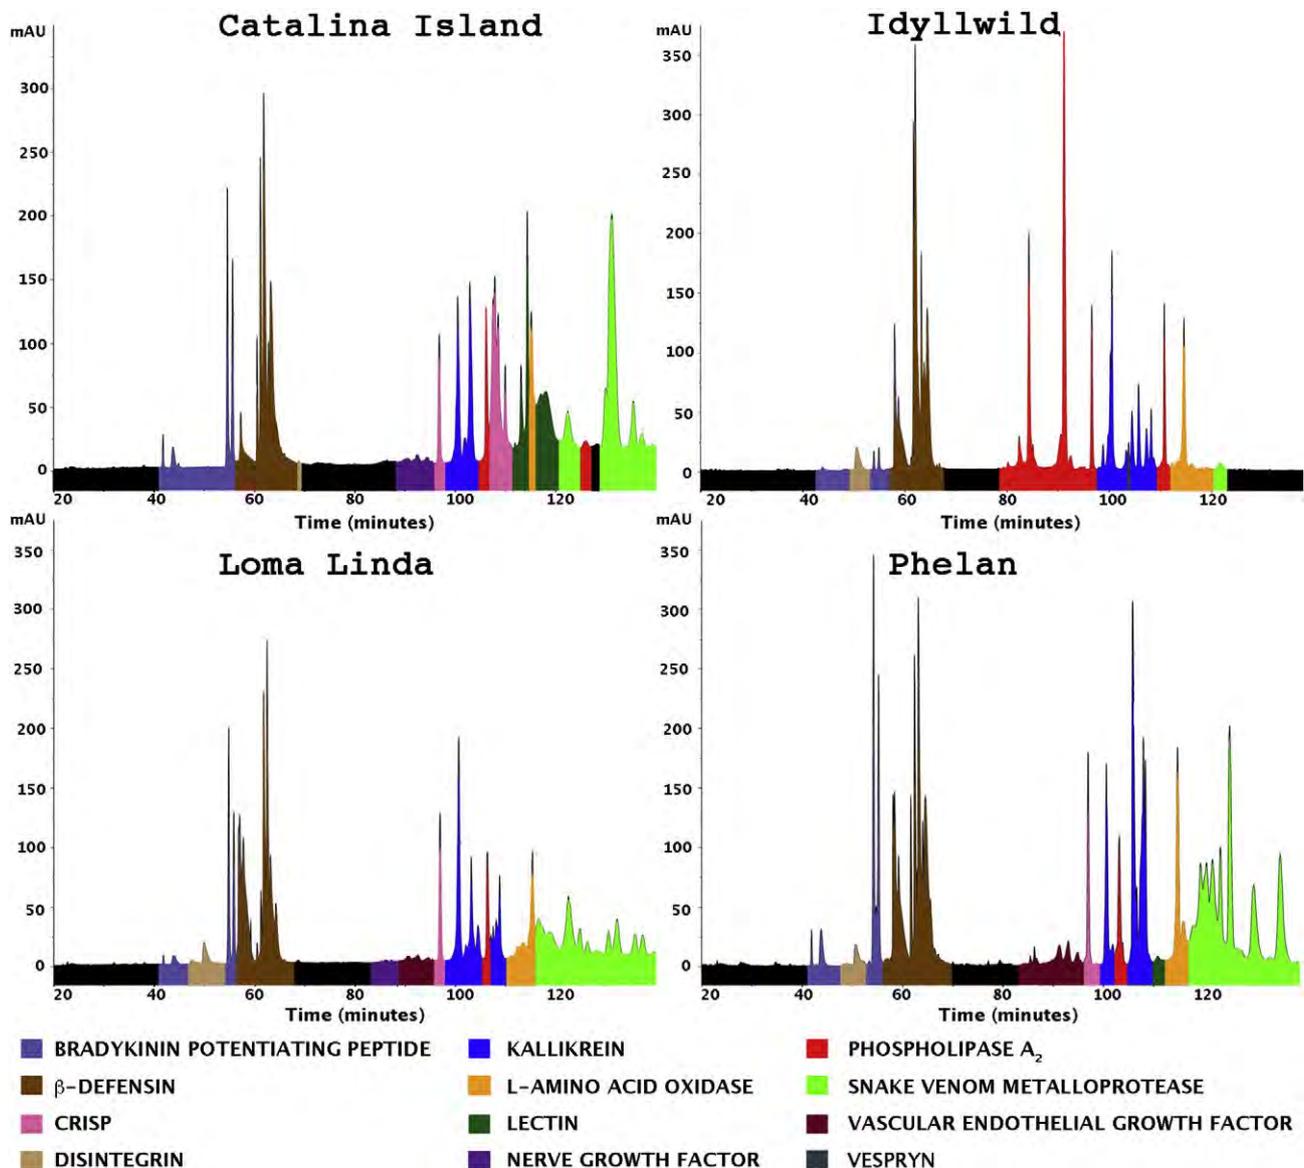

Fig. 2 – LC-MS/MS annotated RP-HPLC chromatograms from the four different *C. o. helleri* populations examined in this study.

each individual. Although our samples were small and data were somewhat non-normal and heteroscedastic, general linear models generally handle data well that fail to meet parametric assumptions and the results were extremely robust. We also ran

a non-parametric Kruskal–Wallis ANOVA for each toxin family to compare the populations, which allowed us to confirm the results from the parametric ANOVA; this latter test requires no assumptions about data distribution [96]. We computed effect

sizes (approximate variance explained) as adjusted partial eta-squared (η^2) for the parametric ANOVA and as η^2 (computed as $\chi^2 / [\text{total } N - 1]$) for the Kruskal–Wallis ANOVAs [96,97]. Eta-squared values ≥ 0.14 are generally deemed large [98]. We conducted these analyses using SPSS 13.0 for Windows, with alpha = 0.05. Following Nakagawa [99], we did not apply Bonferroni adjustments to multiple tests.

3. Results and discussion

Random sequencing recovered sequences for 13 different venom protein encoding gene families (Table 1), with all but Kunitz and Hyaluronidase recovered by both proteomics and transcriptomics. The inability of our combined approach to detect these two venom-components in both result sets may be due to a number of factors, such as, i) differential transcription/translation: not all toxins being replenished at equal stoichiometric rates or simultaneously; ii) technical limitation: the relative separation ability of the HPLC column utilized; iii) co-elution of toxins: one toxin type dominating another and thus obscuring the signal of a toxin present in significantly lower amounts; iv) transcriptomics: the non-exhaustive random sampling procedure utilized which would statistically be likely to recover the most abundant toxin types, with lower-level expressed toxins not recovered; and/or v) microRNA silencing: whereby toxin coding regions undergo transcription but not translation [100]. Lectin toxins, however, were conspicuously absent in both the proteomics and transcriptomics of the Idyllwild population. Sequences analyzed in this study have the GenBank accession numbers of: *C. o. helleri* (Catalina Island) GAKQ01000001–GAKQ01000026; *C. o. helleri* (Idyllwild) GAKR01000001–GAKR01000018; *C. o. helleri* (Loma Linda) GALC01000001–GALC01000026; and *C. o. helleri* (Phelan) GAKS01000001–GAKS01000031. It must be noted that in accordance with the new GenBank deposition rules to exclude fragments of less than 200 base pairs, only the full length sequences were deposited. Thus 27 β -defensins were not deposited, even though their processed and secreted toxin regions were sequenced (only regions of the signal peptide were incomplete). Thus, while these sequences could not be deposited into GenBank, they were utilized in the analyses and are included in the Supplementary material.

Our proteomics analyses revealed significant differences in the venoms of the four populations (Fig. 2), with venom RP-HPLC profiles within a population largely congruent among individuals (Supplementary Fig. 8; note: only two Loma Linda specimens were able to be analyzed due to the rarity of *C. o. helleri* in this locality). The parametric ANOVA yielded a highly significant interaction between population and toxin family ($F_{9,8,22,9} = 13.15$, $P < 0.001$, adjusted partial $\eta^2 = 0.31$; Greenhouse–Geisser adjustment of degrees-of-freedom applied), indicating that the distribution of toxins among the toxin families differed significantly among the populations. The Kruskal–Wallis ANOVAs confirmed that toxin quantity varied significantly among populations for some (nerve growth factor, cysteine-rich secretory protein [CRiSP], lectin; all $P = 0.21$ – 0.35 , $\eta^2 = 0.86$ – 0.97) but not all toxin families. Five additional toxins (BPP, β -defensin, kallikrein, PLA₂, SVMP) approached significance ($P < 0.10$) with exceptional effect sizes ($\eta^2 > 0.63$). Thus,

the ANOVAs confirmed population differences despite the small sample sizes.

Some toxin types were notable for being either highly conserved in their coding sequences (β -defensin, natriuretic), whereas others were extremely variable (kallikrein, lectin, PLA₂, SVMP). While the β -defensins and bradykinin potentiating peptides (BPPs) were of low complexity, our proteomics analyses of the relative expression levels revealed that they are expressed

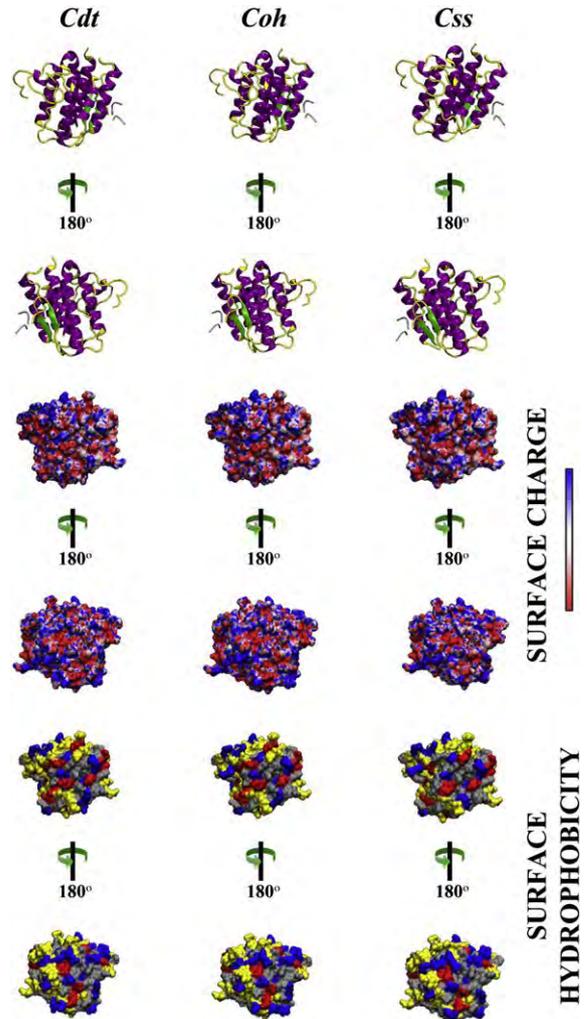

Fig. 4 – Comparative ribbon, surface charge and surface hydrophobicity of the heterodimeric presynaptic neurotoxic phospholipase A₂ complex from the venoms of *Crotalus durissus terrificus* (Cdt) (PDB: 3ROL; UniProt: P08878 [acidic subunit]; UniProt: P0CG56 [basic subunit]), *Crotalus helleri* (Coh) (GenBank: GAKR01000015 [acidic subunit] and GenBank: GAKR01000016 [basic subunit]) and *Crotalus scutulatus* (Css) (UniProt: P18998 [acidic subunit] and UniProt: P62023 [basic subunit]). Cartoon images show helices in purple, sheets in green and other structural regions in yellow. Surface charge potentials were mapped on surfaces allowing for color scale data range values of -10.00 to $+10.00$ using the RWB coloring scheme. Surface residue hydrophobicity mapping of residue-type surfaces depicts acidic residues in red, basic residues in blue, polar residues in yellow, and nonpolar residues in silver.

in very high amounts in all populations, with β -defensin in particular invariantly expressed in large quantities (Fig. 2). The multi-product natriuretic/BPP precursor was invariant within and between populations in both the plesiotypic natriuretic peptide domain and the apotypic (derived) BPP domains located within the propeptide region. In contrast, the lectin sequences were highly variable, including the apotypic of novel cysteines which may facilitate novel structural folding or unique subunit formation with lectins or other toxin types (Fig. 3). Consistent with the proteomic results of this study and a previously published study of San Jacinto Mountain specimens [49] as well as observed notable clinical effects, only the Idyllwild population contained both the acidic and basic subunits of the neurotoxic PLA₂ complex type, with both chains virtually identical to the well-characterized potent presynaptic neurotoxins from *C. d. terrificus* and *C. s. scutulatus* (Fig. 4). It was also

notable that the Idyllwild population secreted the lowest amount of SVMPs (Fig. 2), with only a single isoform obtained in the transcriptome and only detectable in trace levels in the proteome. In contrast, the other populations secreted SVMPs in large amounts, with the Phelan having the greatest complexity while the Catalina Island population had less complexity but a much higher relative expression level. This is consistent with the pattern observed for *C. s. scutulatus*, that there is an inverse relationship between the relative amount of neurotoxic PLA₂ and hemorrhagic SVMP [37,101,102]. Thus, it is quite evident how a biochemical arsenal with such variability in neurotoxic, hemotoxic and myotoxic venom-components can complicate clinical treatment of bite victims, not only through the production of highly variable clinical effects, but also as a consequence the reciprocal variability in the efficacy of anti-venom binding. It should be noted that the venom proteomics of

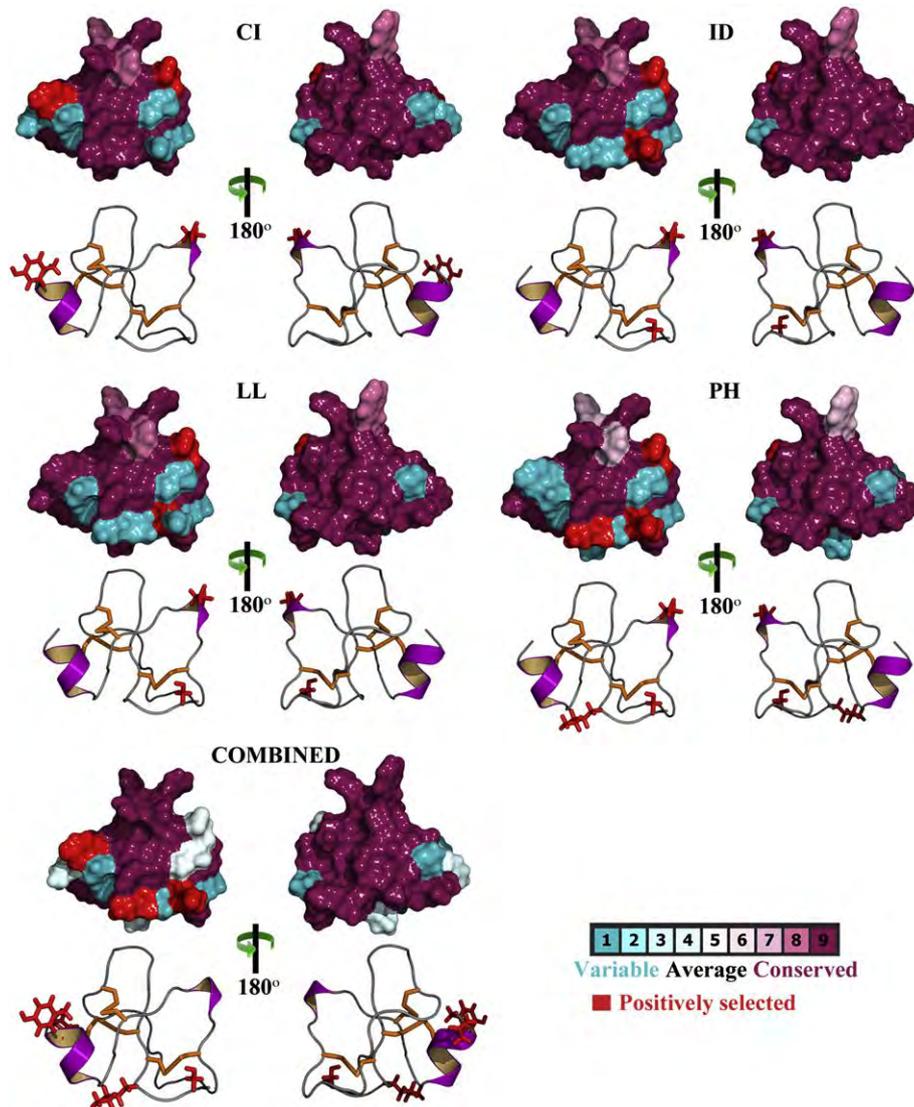

Fig. 5 – Molecular evolution of *C. o. helleri* β -defensins. Three-dimensional homology models (built using the PDB template 1Z99) of β -defensins with evolutionary conservation of amino acids mapped onto them, depicting the locations of positively selected sites (in red) detected by site-model 8 (PP \geq 0.95, BEB). multiple animals ($n = 3$; except Loma Linda population, where these animals are extremely rare) from the same region were fairly similar. Hence, it can be safely assumed that the venom-gland transcriptomics of randomly chosen animals represents the overall venomomics (genetic makeup of the venom gland) of the representative population.

Understanding the nature and strength of natural selection pressures, which sculpt genetic diversity, is the central theme of molecular evolutionary studies. Since non-synonymous mutations are more likely to influence the structure and function of a protein and hence in turn influence the fitness of the organism, evaluating the rate of accumulation of non-synonymous mutations (dN) in genes, relative to synonymous mutations (dS), as a ratio known as ω (or dN/dS ratio), is essential. We assessed the role of evolutionary selection pressures in shaping various venom proteins in different populations of *C. o. helleri*

using various state-of-art selection assessment methodologies. We detected a significant influence of positive Darwinian selection on the evolution of most venom protein encoding genes in these snakes (Figs. 5–7; Tables 2–4; Supplementary Tables 2–5; Supplementary Figs. 1–7 and 9–11).

Site-specific selection assessments indicated that β -defensins, which were expressed in relatively large amounts by all *C. o. helleri* populations examined, followed a regime of weak positive selection: Catalina Island: $\omega = 1.33$ and 3 positively selected (PS); Idyllwild: $\omega = 2.07$ and 3 PS; Loma Linda: $\omega = 1.14$ and 2 PS; Phelan: $\omega = 1.31$ and 5 PS; All: $\omega = 1.18$ and 11 PS (Fig. 5; Table 2). However, the mapping of mutations onto sequence alignments indicated that most hypermutable sites detected by site-specific methods in β -defensins were concentrated in the non-secreted regions of the toxin that are not likely to contribute in the envenoming process. It was also evident

that the entire stretch of nucleotides encoding the secreted region of β -defensins evolved under the extreme influence of negative selection, with 76% of residues being extremely well conserved (percent identity $\geq 90\%$; Supplementary Fig. 1). This was also supported by the results of MEME, an extremely

accurate method of detecting episodic bursts of adaptation, which detected fewer episodically diversifying sites in β -defensins (Table 2). Mapping of variable sites on the structure of the β -defensin ‘crotamine’ from *C. d. terrificus* (PDB code: 1Z99 [103]), which is homologous and thus structurally very similar

to β -defensin, revealed that the N-terminal positions 23 (Y in sequence 1; Supplementary Fig. 1) and 25 (R in sequence 1; Supplementary Fig. 1) as well as the C-terminal residues in position 61 (K in sequence 1; Supplementary Fig. 1), 62 (S in sequence 1; Supplementary Fig. 1), and 63 (G in sequence 1; Supplementary Fig. 1) are structurally more flexible (for the remaining positively selected amino acids 3D-structure coordinates were not resolved). This can be explained by the fact that these locations in the protein structure fall outside the disulfide bond-stabilized core. Although the highly conserved positions, such as 28 (K), 53 (R), 54 (W), and 55 (R; all referred to in sequence 1; Supplementary Fig. 1) were also solvent exposed, they were located inside the disulfide bridge-stabilized protein core and thus experienced heavy constraints of negative selection. However, the lack of variation in secreted regions of β -defensins may be indicative of their unique mode of action as peptides non-specifically target and destabilize the negatively charged microbial membranes using their cationic amino acid residues, resulting in membrane permeabilization [104]. Not-surprisingly, 29% of the residues in *C. o. helleri* β -defensins were cationic (K, R and H) and were extremely well conserved (percent identity $\geq 80\%$; Supplementary Fig. 1). Hence, it is expected that the evolutionary constraints favor the preservation of cationic residues required for toxicity. The branch-site REL (BSR) test, which significantly identifies lineages that follow the regime of episodic diversification, clearly highlighted the

differences in strengths of evolutionary selection pressures acting upon β -defensins in *C. o. helleri* populations (Supplementary Fig. 5). In the Phelan population this test detected as many as four episodically diversifying branches in β -defensin gene lineage, while detecting only one branch each in Catalina Island and Loma Linda populations, and two branches in the Idyllwild population (Supplementary Fig. 5).

While the kallikreins found in each of the *C. o. helleri* populations examined were found to be rapidly evolving under the influence of positive selection [Catalina Island: $\omega = 1.35$ and 7 PS; Idyllwild: $\omega = 1.63$ and 11 PS; Loma Linda: $\omega = 1.60$ and 24 PS; Phelan: $\omega = 1.38$ and 24 PS; All: $\omega = 1.36$ and 36 PS] (Fig. 6; Supplementary Fig. 2), the number of positively selected sites detected by M8's Bayes empirical Bayes (BEB) approach, varied from 7 to 24, highlighting the differential rate of evolution of kallikreins in various *C. o. helleri* populations (Table 3). The number of branches detected by the BSR test as episodically diversifying in kallikrein encoding genes varied from 4 to 10 in various populations (Supplementary Fig. 6), again highlighting the differential role of selection in shaping these venom protein encoding genes.

Lectin α -chain [Catalina Island: $\omega = 2.36$ and 15 PS; Loma Linda: $\omega = 2.51$ and 14 PS; Phelan: $\omega = 3.07$ and 16 PS; All: $\omega = 2.23$ and 27 PS] and lectin β -chain [Catalina Island: $\omega = 0.46$ and 0 PS; Loma Linda: $\omega = 2.73$ and 11 PS; Phelan: $\omega = 2.34$ and 28 PS; All: $\omega = 2.29$ and 29 PS] were found to evolve under the significant

influence of positive selection (Table 4; Supplementary Fig. 3). However, β -chain of the Catalina Island population was remarkably revealed to have evolved under the influence of negative selection ($\omega = 0.46$, 0 PS; Table 4; Supplementary Fig. 4). Other than at position 56, amino acid residues in all other positions were invariant (Supplementary Fig. 4). The rapid rate of molecular evolution observed in lectins is consistent with the great diversity of novel sequences recovered, including the apotyposis or the derivation of novel cysteine residues (Fig. 3). The rapid accumulation of hypermutable sites under the influence of positive selection in β -chain lectins from all *C. o. helleri* populations except those from Catalina Island, where the toxin-encoding gene has evolved under strong negative selection, is intriguing and warrants further experimental evaluations to understand the stark differences in the magnitude of selection pressures. While the BSR test detected a few lineages as episodically diversifying in the α -chain lectins of various populations, the results of this test in the β -chain lectins were particularly interesting (Supplementary Fig. 7). This test failed to

detect any branch in the Catalina Island population, while detecting a single branch in Loma Linda population as episodically diversifying (Supplementary Fig. 7). In contrast, as many as 6 branches were detected as following the regime of episodic adaptation in β -chain lectins of the Phelan population (Supplementary Fig. 7). Similar to the results of all state-of-art selection assessment methods outlined above, the evolutionary fingerprints of venom-encoding genes in *C. o. helleri* clearly depicted the differential influence of natural selection on their evolution (Supplementary Figs. 9–11).

The structure and surface chemistry of the presynaptic PLA₂ complex from *C. o. helleri* is very well conserved when compared to the homologues from *C. d. terrificus* and *C. s. scutulatus* (Fig. 4). Both amino acid type distribution on the protein surface as well as studying surface charges and surface hydrophobicity of all three PLA₂ complexes revealed only minor differences. While the positive and negative charged patches in globo were located in the same positions, minimal differences were observed in the size and charge of these surface regions. Since the PLA₂s of *C. d. terrificus* and *C. s. scutulatus* are well-characterized to be potent neurotoxins (cf. [89,105]), we conclude that the described similarities of *C. o. helleri* PLA₂ to the former ones are responsible for neurotoxic effects of PLA₂s observed in the *C. o. helleri* population. The precise evolutionary regimes followed by genes encoding PLA₂ and SVMs in these snakes remain to be elucidated.

Thus, it is evident that *C. o. helleri* venom-encoding genes have experienced differential evolutionary selection pressures. Differential rate of molecular evolution or expression occurred not only between toxin types within the venom of a particular population, but also for the same toxin type between populations. These results demonstrate that the different populations of *C. o. helleri* follow distinct evolutionary trajectories, with the differential venom profiles likely driven by variation in predatory ecology. This is a reflection of the complex evolutionary history of this species, which ranges from sea level to high mountain peaks and occupies a diverse range of habitats. These habitats possess differing lizard and mammal prey assemblages [106–108], and evidence from other snakes suggests that strong natural selection has driven venom adaptation to particular prey species [12,20,21,30,31,40,46,47,59,61–63,109]. Although climate might be expected to influence venom composition, our data suggest otherwise concerning the dichotomy of type I (proteolytic or “tenderizer”) versus type II (more toxic) venoms [70]. It has been suggested that snakes at higher elevation with the greatest temperature fluctuations could be expected to possess a type I venom to facilitate digestion [70]. However, the population that faces the highest temperature fluctuations (Idyllwild) possesses a type II venom that lacks almost entirely the metalloproteases typical of type I venoms. These results also indicate significant differences in potential human envenomation profiles, consistent with the complex clinical picture previously observed, with some populations being hemorrhagic while others are neurotoxic. The exquisite diversity of venom-components highlighted in this study and the variation in intensity and the nature of natural selection shaping the molecular toxin scaffolds may not only result in distinct envenoming profiles but may also induce variable responses to antivenom. Hence, understanding the true molecular diversity of venom and the evolutionary forces that shape them not only

aids in the prediction of clinical effects but also reveals that these highly variable venoms are a rich source of novel toxins, some of which may have significant potential for use as lead compounds in drug design and development. Thus, the results of this study not only contribute to the body of knowledge regarding venom evolution but also have applied outcomes both from a clinical perspective and also from drug design. These results will also be useful in science communication to demonstrate that there is indeed significant variation in the venom of this medically important species, but that such evolution has not occurred recently but rather the venom diversity seen today is reflective of the long evolutionary history, not of recent changes as popularly misunderstood. Thus this species is a model for the broader penetration of lay-person understanding of venom diversity and the clinical and economic importance of such variation.

To request a change to regulations under the authority of the California Fish and Game Commission (Commission), you are required to submit this completed form to: California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814 or via email to FGC@fgc.ca.gov. Note: This form is not intended for listing petitions for threatened or endangered species (see Section 670.1 of Title 14).

Incomplete forms will not be accepted. A petition is incomplete if it is not submitted on this form or fails to contain necessary information in each of the required categories listed on this form (Section I). A petition will be rejected if it does not pertain to issues under the Commission's authority. A petition may be denied if any petition requesting a functionally equivalent regulation change was considered within the previous 12 months and no information or data is being submitted beyond what was previously submitted. If you need help with this form, please contact Commission staff at (916) 653-4899 or FGC@fgc.ca.gov.

SECTION I: Required Information.

Please be succinct. Responses for Section I should not exceed five pages

1. Person or organization requesting the change (Required)

Name of primary contact person: Dennis Thibeault, Vice President Forestry, Mendocino Redwood Company, LLC

Address: [REDACTED]

Telephone number: [REDACTED]

Email address: [REDACTED]

2. Rulemaking Authority (Required) - Reference to the statutory or constitutional authority of the Commission to take the action requested: California Fish & Game Code § 1580; California Fish & Game Code § 2855; California Public Resources Code § 36600, 36700 , 36725[(a),(e)]

3. Overview (Required) - Summarize the proposed changes to regulations: Remove special closure regulations for Rockport Rocks in 14 CCR § 632 (b)(17)

4. Rationale (Required) - Describe the problem and the reason for the proposed change: The above-mentioned special closure was enacted on a parcel private property owned by Mendocino Redwood Company, LLC (MRC). The special closure as currently written prohibits complete access to this parcel of land from March 1 to August 31. MRC was never informed—neither verbally nor in writing—by the California Department of Fish and Wildlife or the North Coast Regional Stakeholders Group about including Rockport Rocks in a special closure when formally proposed in 2010. Evidence from historical documents establishing the North Coast Marine Protected Area (MPA) indicate that the designation of Rockport Rocks as a special closure area was an unintentional error because it was mistakenly assumed to be a part of the Coastal National Monument managed by the Bureau of Land Management. The CDFW is also on record stating that MPAs “will not affect private property rights” and that the “MPA designation process must take into account existing California State Lands Commission leases, California Fish and Game Commission state water bottom and kelp leases, tide and submerged lands grants, private tidelands, and any other legal entitlements.” Overall, had these facts been disclosed during the MLPA process, this area would have been removed from the original proposal prior to the Commission’s vote on the matter.

SECTION II: Optional Information

5. **Date of Petition: November 17, 2015**
6. **Category of Proposed Change**
- Sport Fishing
 - Commercial Fishing
 - Hunting
 - Other, please specify: Special Closure Area for
7. **The proposal is to:** *(To determine section number(s), see current year regulation booklet or <https://govt.westlaw.com/calregs>)*
- Amend Title 14 Section(s): Click here to enter text.
 - Add New Title 14 Section(s): Click here to enter text.
 - Repeal Title 14 Section(s): 14 CCR § 632 (b)(17)
8. **If the proposal is related to a previously submitted petition that was rejected, specify the tracking number of the previously submitted petition** Click here to enter text.
Or Not applicable.
9. **Effective date:** If applicable, identify the desired effective date of the regulation.
If the proposed change requires immediate implementation, explain the nature of the emergency: As soon as possible; the designation of Rockport Rocks special closure area was an unintentional error as all the facts of ownership were neither made available to the CDFW nor the Commission during the special closure designation process.
10. **Supporting documentation:** Identify and attach to the petition any information supporting the proposal including data, reports and other documents: Supplementary information including a cover letter substantiating MRC's case is attached to this petition.
11. **Economic or Fiscal Impacts:** Identify any known impacts of the proposed regulation change on revenues to the California Department of Fish and Wildlife, individuals, businesses, jobs, other state agencies, local agencies, schools, or housing: Designation of Rockport Rocks as a special closure is a potential encumbrance to MRC being able to sell the parcel or sell a conservation easement to an interested party.
12. **Forms:** If applicable, list any forms to be created, amended or repealed:
Click here to enter text.

SECTION 3: FGC Staff Only

Date received: Click here to enter text.

FGC staff action:

- Accept - complete

- Reject - incomplete
- Reject - outside scope of FGC authority

Tracking Number

Date petitioner was notified of receipt of petition and pending action: 11/24/15

Meeting date for FGC consideration: Receive 12/9/15, Action 2/10/16

FGC action:

- Denied - same as petition _____

Tracking Number

- Granted for consideration of regulation change

November 23, 2015

Mr. Jack Baylis, President
California Fish and Game Commission
1416 Ninth Street, Suite 1320
Sacramento, CA 95814

Dear Mr. Baylis

We have recently been made aware a parcel of our property, referred to as "Rockport Rocks," was included in a special closure area during the Marine Life Protection Act (MLPA) designation process. Unfortunately this occurred without any type of notification to us from the California Department of Fish and Wildlife (CDFW) or the North Coast Regional Stakeholders Group (NCRSG). MRC's ownership of Rockport Rocks (aka "Sea Lion Rock") is well-established by a patent, grant deed, and numerous historical documents and photographs spanning nearly a century and are available upon request.

This special closure, 14 CCR § 632(b)(17), inhibits our private property rights and our ability to enjoy our property. We provide limited public access to Rockport Beach and the beach is visited and enjoyed by hundreds of employees, family and friends every year. The seasonal closure, which goes from March 1 to August 31, effectively prohibits access to this parcel of land by the property owner, and potentially limits recreational and educational activities (e.g., fishing, abalone diving, kayaking, kelp harvesting, bird watching, tidepooling, etc.) in nearshore waters historically enjoyed by visitors to Rockport Beach.

The public nature of the special closure has also created a potential encumbrance to MRC's ability to sell the parcel or negotiate a conservation easement with an interested party should it ever decide to do so. In 2011, the Bureau of Land Management (BLM) and the United States Fish and Wildlife Service indicated interest in acquiring Rockport Rocks for conservation purposes in the Report "Potential Murre Restoration Projects Northern California".

Our investigation into this matter leads us to conclude that the inclusion of MRC property in a special closure was done in error. First, documents for the MLPA process suggest that the CDFW and the NCRSG assumed that Rockport Rocks were part of the publically owned California Coastal National Monument system administered by the BLM. Secondly, the CDFW stated in a memorandum dated 1/31/08 from John Ugoretz to the MLPA Stakeholder Group that MPAs "will not affect private property rights" and that the "MPA designation process must take into account existing California State Lands Commission leases, California Fish and Game Commission state water bottom and kelp leases, tide and submerged lands grants, private tidelands, and any other legal entitlements". In fact, the Vizcaino Rocks special closure, located 0.6 miles to the south of Rockport Rocks, clearly embodies this philosophy as it has a modified boundary that extends 300' from only the seaward side of the rock, presumably because a buffer around the entire rock would overlap with a private beach owned by the Save-the-Redwoods League.

We conclude had CDFW, NCRSG, or the Commission known MRC was the owner of Rockport Rocks, this special closure would not have been included in the final rulemaking package that was eventually adopted. Based on the facts presented here, we kindly request that the Commission remove the special closure regulations on Rockport Rocks.

If you have any questions, would like documentation of the above statements or would like to discuss the matter further, please give me a call at (707) 463-5112 or email me at dthibeault@mendoco.com.

Sincerely,

A handwritten signature in blue ink, appearing to read "D. Thibeault".

Dennis Thibeault
Vice President Forestry

ABOUT MRC

Mendocino Redwood Company (MRC) was created in 1998 from lands purchased in Mendocino and Sonoma counties with the publicly declared mission to be good stewards of the forest and at the same time run a successful business. We have made significant progress in that regard:

- 1. Adopting policies to make MRCs forestlands FSC certified (since November 2000);*
- 2. Adding more than 1 billion board feet of redwood and Douglas fir trees by lowering the rate of harvest;*
- 3. Defining of old growth down to the level of an individual tree, along with implementation of a policy to protect all individual old growth trees across our property;*
- 4. Elimination of traditional clear cutting from our property;*
- 5. Long term investments to improve habitat for fish across the property by controlling or holding back more than 1 million cubic yards of sediment (more than 100,000 dump trucks of dirt) from the coastal streams flowing through our forest;*
- 6. Removal of more than 36 long time fish barriers, increasing fish bearing streams by more than 20 miles.*
- 7. Operating as an open and transparent business; including an open invitation to take interested individuals anywhere in the forest;*
- 8. Completing a substantial rebuild of our Ukiah sawmill, assuring that Mendocino County will have infrastructure in the processing of wood products for many years to come; and*
- 9. Employing about 300 skilled employees in Mendocino County earning family-level wages and benefits.*

Subject: DFW bullfrog policies - please respond
Date: Sunday, November 01, 2015 11:08:02 AM

Dear Sonke Mastrup and the Fish & Game Commission of California,
I sent the letter pasted below to Director Bonham and Secretary Laird on August 26th but have not received a response. I would appreciate a response as soon as possible.
Thank you,

Dr. Kerry Kriger
SAVE THE FROGS!
Founder, Executive Director, Ecologist & California Taxpayer
www.savethefrogs.com
www.savethefrogs.com/kerry-kriger

SAVE THE FROGS! is the world's leading amphibian conservation organization. We work in California, across the USA, and around the world to prevent the extinction of amphibians, and to create a better planet for humans and wildlife. Since 2008, SAVE THE FROGS! has organized over 1,600 educational events in 60 countries to raise awareness for endangered amphibians.

#####

Dear John and Chuck,

DFW's Betsy Bolster informs us that the DFW only has one total employee dedicated to amphibians and reptiles, and that this is causing continued delays in releasing the DFW's amphibian conservation strategy report "A Guiding Vision for the Conservation and Management of California's Reptiles and Amphibians", which I believe has been in production for four years, an inordinately long time for a report. Given that amphibians and reptiles comprise two out of the five classes of vertebrates in the state, can you please immediately authorize additional staff to (1) complete the above mentioned document and (2) to develop a strategy for the DFW to discontinue issuing permits for the importation of bullfrogs or at the very least to charge importers a high fee for permits, which would deter applications and also fund DFW so that the Department could conduct disease testing of incoming amphibians and enforce regulations related to these infected amphibians.

On a related note, at its February meeting the FGC instructed the DFW to report back to the FGC on its progress related to dealing with the state's bullfrog importation problems but to the best of my knowledge the DFW has not followed through. I would appreciate if you could tell me when the DFW plans to report back on this issue.

Thank you!
Kerry

November 19, 2015

Jack Baylis, President
California Fish and Game Commission
1416 Ninth Street, Suite 1320
Sacramento, CA 95814

SUBJECT: Request for December Agenda Item on Crab Closure

Dear President Baylis:

On behalf of the recreational fishing community, we ask that the Fish and Game Commission's December 9 meeting include a specific agenda item to discuss the ongoing closures of the recreational Dungeness and rock crab fisheries.

On November 7, 2015, the Commission took emergency regulatory action to delay the opening of the recreational Dungeness crab season and to close the rock crab season throughout the State. The Commissioners noted the gravity of this emergency action and assured stakeholders that the fishery would reopen as soon as it is safe. The Department of Fish and Wildlife committed to weekly testing at each port.

Given the extraordinary nature of this action and the continued closures, there is a genuine need for the Commission and the Department to review the status of the closure and the results of the weekly tests at each port. We are aware that the commercial fishing sector strongly objects to the county-by-county regulatory approach adopted by the Commission for recreational anglers, preferring to delay the recreational opener and tie it to a statewide commercial opening date.

Respectfully submitted.

Subject: Petition BCD-001
Date: Thursday, October 15, 2015 9:03:41 AM

Greetings,

I am writing in regards to the petition submitted by Curtis Haney, tracking number (BCD-001) and am requesting amending Title 14 Section(s):Chapter 4, Section 29.05 (b) (1)

to include the public harvesting of Goose Neck Barnacles for personal consumption. The harvesting of these mollusks pose not more threat to the environment than the already allowed harvesting of mussels. The barnacles are tasty, nutritious, and as far as I know have a healthy population whereby harvesting for personal consumption would not threaten the species's survival.

Thank You,
Tom Handley

RE: SUPPORT FOR PETITION SUBMITTED BY CURTIS HANEY, TRACKING NUMBER (BCD-001) REQUESTING THE AMENDING OF TITLE 14 SECTION(S):CHAPTER 4, SECTION 29.05 (b) (1)

To the Fish and Game Commission;

I am an avid, law-abiding foodie who asks you to change the rules to allow the harvest Goose Neck Barnacles for personal consumption. It's illogical that harvesting them is prohibited, and the decision seems to be based on no science or facts.

Simply put, they're delicious and numerous. And they are hard as heck to harvest, so it's very difficult to pick very many and risk hurting the population. They are as abundant and self-replenishing as mussels. They should be held to the same seasonal and weight harvest rules as mussels, since they're no different.

I have unwittingly been harvesting them once a year at Thanksgiving, without realizing it was prohibited. It makes for a lovely activity and a real present to myself for dinner.

I thoroughly support the petition of Curtis Haney, tracking number BCD-001, requesting the amending of Title 14 Sections: Chapter 4, Section 29.05(b)(1).

Please lift the ban on harvesting Gooseneck Barnacles. Thank you for your consideration.

Date: Sunday, November 22, 2015 2:36:20 PM

Dear Fish and Game,

I am writing to add my support to the petition to allow for the harvesting of gooseneck barnacles.

These animals grow in great abundance along our coastline. The limited harvesting by private individuals would do little to impact the overall population.

Thank you,
David

Subject: amending Title 14 sec. Chap 4, sec29.05(b)(1)
Date: Saturday, November 21, 2015 11:21:32 PM

Dear Fish and Game Commission,

I writing to you to request a revision on the rule regarding the personal harvesting of (Gooseneck), Leaf Barnacles. They are considered a delicacy in Spain and are allowed to be harvested in Alaska. We previously collected them and they are delicious, a member of the lobster family. Harvesting times are limited to low tides. We previously collected them when we gathered mussels. Presently I have seen more barnacles then muscles in some locations. Please add them back into the recreational take species.

Please consider the petition submitted by Curtis Haney, tracking number (BCD-001) requesting the amendment of Title 14 Section(s):Chapter 4, Section 29.05 (b) (1)

Thank you,
Carol Reed

Subject: Roosevelt Elk in Del Norte Cty, CA
Date: Friday, November 13, 2015 2:46:05 PM

I am writing in regard to the future management of the Roosevelt Elk that are located in Del Norte County, CA. I know that many local people delight in seeing the elk in various places along the highway; it is one of the things that makes living here so special. There are many who do not approve of the lottery, but people don't know where to turn to make their voices heard. Also, the elk are one of the unique elements that draw tourists to our area; we should be celebrating them, not killing the finest surviving examples of these unique creatures so someone can hang another head on their wall. I have never had a problem with people legally hunting for 'groceries', but to hold a lottery to win a chance to kill – not cull – the elk who now grace our county lands is reprehensible and reflects poor stewardship on the part of all entities responsible.

I was appalled by the front page local news article where someone proudly spoke of the 'trophy' bull he had hunted through the lottery. Responsible management of the herd(s), in my opinion, means culling only weaker members and females when needed, NOT stripping an already small gene pool of the superior genes you want passed on: that is not culling, that is a lottery for killing. I strongly suggest that you do some serious surveys and counts before hunting of any of the elk at any time. How else can you determine what are sustainable and responsible hunting practices? This needs to be done first! Officials admit that they have no idea how many elk are actually here, but they assume that there are "plenty of elk" for people to kill for no good reason.

I also believe that you need to determine ways to help maintain and improve the genetic integrity of the herds; to do so, the state must work to create wildlife corridors so the elk can continue their natural movements without being slaughtered as they move from public lands through private lands where they are hunted without regard to the future or the best interest of the elk or county. There also need to be corridors that allow the elk to travel to increase genetic diversity. It is not so long since they were virtually extinct – we should be working to improve the limited gene pool that remains, not to decimate it further. Wildlife corridors are being recognized as an important tool for conservation throughout our country; we need to do this for this signature species at least.

I hope that all officials involved will seriously consider viewing the elk as a precious resource – not of some lottery dollars – but as an important part of the biological diversity and great overall natural value of our area. The elk are part and parcel of the incredible ecosystem attracts people here, and it doesn't make sense to decimate the few remaining herds indiscriminately.

Thank you for your time and consideration.

Patricia Grady

Most of you are doing a wonderful job, and we Californians are very grateful!

I am sending the following article for your information; I found it very enlightening. Since less than 6% of Americans hunt, we, the other 94%+ request (demand?) that OUR wildlife and Public Lands should no longer be managed for the benefit of a tiny minority. There are months when a non-hunter is taking their life and their pets lives into their hands by daring to use OUR Public lands! I think it may clarify your jobs when you realize exactly WHO you are managing OUR lands for.

<http://www.mountainlion.org/featureimages/whopaysforwildlife/USA-O-NRWM-Smith-Molde-2014-Wildlife-Conservation-Management-Funding-in-the-US.pdf>

"Who really pays for wildlife in the U.S?" Using public information about budgets of various conservation, wildlife advocacy, and land management agencies and non-profit organizations, published studies and educated assumptions regarding sources of Pittman-Robertson Act and Dingle-Johnson Act federal excise monies from the sale of sporting equipment, the authors contend that approximately **95% of federal, 88% of non-profit, and 94% of total funding for wildlife conservation and management come from the non-hunting public.** The authors further contend that a proper understanding and accurate public perception of this funding question is a necessary next step in furthering the current debate as to whether and how much influence the general public should have at the wildlife policy-making level, particularly within state wildlife agencies...wildlife is unequivocally a public Wildlife Conservation... asset under the Public Trust Doctrine, a better understanding and definition of how wildlife management is financed in this country, particularly the portion attributable to the general public, would be of considerable help in deciding whether the general public's interest is adequately represented in our current wildlife management system.

WILDLIFE CONSERVATION & MANAGEMENT FUNDING IN THE U.S. By Mark E. Smith¹ Donald A. Molde² October 2014 EXECUTIVE SUMMARY The authors present a novel approach to help answer the question "Who really pays for wildlife in the U.S.?" Using public information about budgets of various conservation, wildlife advocacy, and land management agencies and non-profit organizations, published studies and educated assumptions regarding sources of Pittman-Robertson Act and Dingle-Johnson Act federal excise monies from the sale of sporting equipment, the authors contend that approximately 95% of federal, 88% of non-profit, and 94% of total funding for wildlife conservation and management come from the non-hunting public. The authors further contend that a proper understanding and accurate public perception of this funding question is a necessary next step in furthering the current debate as to whether and how much influence the general public should have at the wildlife policy-making level, particularly within state wildlife agencies. INTRODUCTION With increased awareness and interest of the general (non consumptive) public in controversial wildlife management issues such as fur trapping, predator control, trophy hunting, coyote killing contests and wolf reintroduction, a debate is before us as to whether the general public is or should be afforded a proper voice in wildlife management decisions. Sportsmen favor the current system, which places a heavy emphasis on their interests through favorable composition of wildlife commissions and a continued emphasis on ungulate management. Nonhuman predators (wolves, mountain lions, coyotes,

ravens and others) are disfavored by wildlife managers at all levels as competition for sportsmen and are treated as second-class citizens of the animal kingdom. Sportsmen suggest this bias is justified because "Sportsmen pay for wildlife," a refrain heard repeatedly when these matters are discussed. Agency personnel and policy foster this belief as well. Do sportsmen really pay for wildlife? Is it a fact or an unfounded assertion or something in between? Are there ways of looking at financial and other information to test the merit of this claim? While wildlife is unequivocally a public Wildlife Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 2 asset under the Public Trust Doctrine (see, for example, SCOUS 1842 and Horner 2000), a better understand and definition of how wildlife management is financed in this country, particularly the portion attributable to the general public, would be of considerable help in deciding whether the general public's interest is adequately represented in our current wildlife management system. Summary of Findings While this question is not easy to answer and the information may be murky, we have devised a novel approach, using available public information and certain helpful assumptions to offer a perspective on this question, which, to our knowledge, has not been previously presented. The results are expressed both in terms of annual budgets by organization (Table 1) and acreages under management (Table 2). In summary, approximately 95% of federal, 88% of nonprofit, and 94% of total funding for wildlife conservation and management come from the non-hunting public. This runs counter to the common position promoted by many hunter-centric organizations and even to what state wildlife agencies often cite (e.g. Mayer, 2012). Another example of this is a motto of the Rocky Mountain Elko Foundation: "Hunting is Conservation." Obviously hunting per se is not conservation, but they claim that hunting funds conservation, nearly exclusively. The data in Table 1 shows that the financial contribution from hunters is a small portion of the total. Of the 8 largest federally funded wildlife programs listed in the top half of Table 1, a total of \$18.7 billion is spent annually on wildlife, land management and related programs (including hunter education). Approximately 5.3% of the combined operating budgets (top half of Table 1) and 4.9% of the land acquisition costs (Table 2) are funded by hunters or through hunting-related activities. The 10 largest non-profit conservation organizations contribute \$2.5 billion annually to habitat and wildlife conservation; of this, 12.3% comes from hunters and 87.7% from the non-hunting public (bottom half of Table 1). Methodology In Tables 1 & 2 values have been assigned for the portion of funding derived from hunters or hunting-related activities. The difference between "hunter" and "hunting related" as well as the allocation of Pittman-Robertson and Dingell-Johnston Act funds are discussed in the section entitled Pittman-Robertson & Dingell-Johnson Acts. The allocations for the other items are discussed in the sections entitled General Tax Revenue and Duck Stamp Act. State funding was not considered in this study, in part because most state wildlife agency funding flows from the federal government (about 70% in Nevada's case), and in part because it would be a task larger than our resources allowed. It is also generally true that the state funding (e.g. hunter license and tag Wildlife Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 3 sales) is rarely adequate to cover the direct costs of administering the related programs; therefore, state-level funding can reasonably be classified as hunting or sportsmen services rather than wildlife management. State-owned public lands are considered in terms of the acreage under management in Table 2. Also not considered is the portion that each agency or organization actually spends on conservation versus other activities. For example, most state wildlife agencies spent only a small portion of their total funding on conservation. Other organizations, such as the government funded National Wildlife Refuge System and the donor funded Nature Conservancy, spend the great majority of their funding on conservation. This differential was ignored in our analysis.

 \$19,853M 93.9% In our analyses we included those agencies and organizations commonly considered
 by the public to have as their focus habitat and wildlife management Wildlife Conservation &
 Management Funding in the U.S. Smith & Molde, Oct. 2014 4 or conservation (e.g. U.S. Department of
 the Interior Fish & Wildlife Service (FWS), National Wildlife Refuge System, Nature Conservancy,
 Audubon). We also included agencies and organizations whose primary purpose is to conserve or
 manage the lands that host wildlife (the U.S. Forest Service (USFS), U.S. Bureau of Land Management
 (US BLM), the state equivalents, the various land trusts). The organizations that manage habitat, such
 as the US BLM and the many private land trusts, are included herein because wildlife requires habitat.
 The goals of these organizations include various combinations of habitat management and
 conservation, biological diversity (necessary to ensure robust populations), food and water supply,
 watershed protection, migration corridor management, and other issues critical to wildlife conservation
 and management. A potentially controversial choice was to include the U.S. Department of Agriculture
 Wildlife Services. Their core function is to control native carnivores such as wolves, bears, and coyotes,
 ostensibly to protect agriculture and improve hunter opportunity (Bruskotter, 2011). Arguably they
 accomplish neither since most livestock mortality is due to weather, birthing, and disease, while most
 wildlife mortality is due to lack of food, impacts to habitat, and disease. While predator control is wildlife
 management it is not conservation. Nevertheless, we have included their budget in our funding
 analyses. Table 2: Summary of Land Under Direct Management (M = million acres) Land Purchases

 Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 5 SOURCES OF
 FUNDING & ALLOCATIONS The sources of our funding and land acreage figures were, in most cases,
 the official websites for the named agencies or organizations. The total acreage under management by
 land trusts was obtained from the Land Trust Alliance (<http://www.landtrustalliance.org>). Pittman-
 Robertson Act and Dingell-Johnston Act revenue were obtained from the most recently published
 federal budgets for the Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) and US Fish and
 Wildlife Services (FWS), the agencies responsible for collecting and administering these funds,
 respectively. See the section entitled PittmanRobertson and Dingell-Johnston Acts for a detailed
 discussion of how those revenues were allocated, as well as a brief discussion of the two Acts. General
 Tax Revenue Most of the federal programs relevant to wildlife management and conservation are
 funded from general tax revenue such as personal and corporate income taxes. The key exceptions to
 this are the tax transfers made to the states under three well known acts (and their amendments): the
 Federal Aid in Wildlife Restoration Act of 1937 (more commonly known as the Pittman-Robertson Act
 or PRA), the Federal Aid in Sport Fish Restoration Act (Dingell-Johnston Act or DJA), and the
 Migratory Bird Hunting Stamp Act (Duck Stamp Act). Each of these acts is discussed in more detail in
 subsequent sections. Rather than attempt an allocation of general tax revenue funding to "hunter
 funding" and "non-hunting public funding" by some complex analysis of demographics, we chose the
 simpler, and possibly equally accurate, method of allocation based on the percent of the population
 who hunts. According to the US FWS (2013), there were 14,631,327 hunting licenses issued by all US
 states in 2013, down from 14,960,522 in 2012. There are two important bias in these statistics: hunters
 who purchased licenses in more than one state are counted for each state; and most states exempt
 youth from license requirements (e.g. Nevada hunters under the age of 12 years are not required to
 purchase a license, in some states the age is 16). We could not find any published analyses on either,
 so we have made no change to the data published by the FWS. It is likely that both figures are small
 and each acts to reduce the effect of the other. According to the US Census Bureau (2013), the US
 population in July 2013 was 316,128,839. Dividing that into the number of hunting licenses sold in 2013
 suggests that 4.6% of the population, and therefore the same percentage of general tax revenue is
 paid by hunters. That figure has been used in Tables 1 & 2. An important side note is that while the
 US population increases annually, the number of hunting licenses sold is on the decline. Wildlife
 Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 6 Duck Stamp Act Funding

of wildlife land gets a lot of attention among sportsmen and other outdoor enthusiasts. One of the most common to come up in discussion is the Duck Stamp program and the land that it has successfully protected as refuges under the National Wildlife Refuge System. The federal government estimates that 1.9% of the 150,000,000 acres (or 2,850,000 acres) of land managed under this program was acquired with funds from programs including duck stamp sales (USFW, 2014; Lin, 2014). It has been estimated that collectors purchase 10% of duck stamps. Duck stamps allow free access to refuges that otherwise charge an entrance fee, and an unknown portion of the public purchases them for this purpose. To determine the total hunter-sourced portion of the National Wildlife Refuge System acreage, we combined 90% of the 1.9% with the hunter portion of general tax revenue (4.6%). Considering the four main federal agencies, the combined state-owned lands, and the collective non profits falling in the category of land trusts, there are 1.038 billion acres of wildlife habitat under conservation management, of which about 4.9% were funded by hunter and 95.1% funded by the non-hunting public. Pittman-Robertson & Dingell-Johnson Acts The process of determining the portion of the Pittman-Robertson Act (PRA) & Dingell-Johnson Act (DJA) excise taxes generated by hunting-related activities is both complex and imprecise. In the end, any such analysis can only be an estimate, since the revenue is not tracked in sufficient detail to allow a precise allocation. Our approach was to both recognize and minimize the biases created by our assumptions in these analyses. The approach taken in this study is briefly summarized here. Beginning in 1919, there has been an excise tax on firearms and ammunition (10 to 11% of the wholesale price). This tax was originally administered under the US Treasury, and the income went into the general fund. In 1937, the Pittman-Robertson Act transferred this tax to administration by the FWS for the exclusive purposes of wildlife management, hunting management, and hunter education. The Dingell-Johnston Act (1950), as amended by the Wallop and Breaux Act (1984), extended the excise tax to archery equipment, fishing supplies, recreational boat import duties, and marine fuel sales. PRA and DJA funding totaled \$522 million and \$360 million, respectively, for the 2013 fiscal year. Our analyses consider funding allocations in two portions: the first based on activity (hunting related versus non-hunting related), and the second on general population (hunters versus the non-hunting public). This section discusses the former; the latter uses the same allocation as for the other categories. We used this split approach for the PRA and DJA funds because firearms, ammunition, and archery equipment are purchased by both hunters and non-hunters and Wildlife Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 7 these are used for both hunting and non-hunting purposes. Therefore, putting the total revenue into either the "hunter" or "non-hunting public" categories would have created a strong bias. The next step was to consider the nature of the purchases that generate the excise taxes collected. According to the ATF (Hogue, 2013), the PRA revenue is generated in the following proportions: o 31% from handgun (pistols and revolvers) production o 37% from long guns (rifles and shotguns) production o 31% from ammunition production o 1% from archery equipment production Dingell-Johnston Act revenue is generated in the following proportions, according to US DF&W statistics (Michigan): o 54% from motorboat fuel o 15% from small engine fuel o 16% from fishing equipment, tackle, trolling motors o 9% from interest on trust fund deposits o 6% from import duties on boats Of these funds, we next made an estimate of the portion of the revenue generated from hunting. We used a variety of sources of information to produce these estimates, principally the following. From ATF statistics on sales of firearms by type (ATF, 2011), we identified those types of firearms that are used principally for hunting. We used the following allocations: traditional rifles and shotgun sales were allocated to hunting; modern sporting rifles (including tactical shotguns) were allocated principally (but not exclusively) to non-hunting. The results was a combined allocation of 40% of long guns to hunting. Handgun sales were allocated 5% to hunting based on anecdotal evidence. Statistics for ammunition sales published by industry sources (LuckyGunner, 2012 & 2013; Bushmann, 2014) were used to determine the approximate percentage of sales by caliber. Each caliber was then assigned to one of three categories: principally hunting, principally non-hunting, or split. Examples of ammunition classified herein as principally for hunting include .243 Winchester, .30-06 Springfield and .308 Winchester (traditional deer and elk calibers). Principally non-hunting ammunition include .380 acp, 9 mm parabellum (aka 9mm Luger), .45 acp, .338 Lapua and .50 BMG. Calibers considered to be used for both hunting and non-hunting include shotgun shells in all gauges, .223 Remington, 5.56x45mm, 7.62x39mm, and large bore magnum handgun calibers such as .44 Remington Magnum and .500 S&W Magnum. Based on the relative sales statistics, considerably less than 20% of ammunition sales appear to be hunting related, but 20% was used in our analysis; this higher figure was used because 2013 represented an anomaly in sales statistics, with sales more Wildlife Conservation & Management Funding in the U.S. Smith & Molde,

Oct. 2014 8 heavily weighted towards self-defense and tactical than a multi-year average would suggest. Of the DJA revenue, the only category related to hunting is small engine fuel sales, some of which is likely used for waterfowl hunting. Our research did not find any data on allocation of these sales; we assumed 15% is derived from hunting-related activities. Table 3 summarizes the allocations and presents the estimated total funding generated by hunting-related activities. The estimate of 14.5% is consistent with the results published by other authors, a commonly cited range being 14% to 22% of the DJA funds alone (Lin, 2014), which equates to 8% to 13% of the combined PRA and DJA funds.

Table 3: Allocation of Excise Tax Revenue Based on Activity (M = million US dollars)

Source Activities	Total Tax Revenue, \$	%
Handguns (revolvers, pistols)	164M	5.8%
Long guns (rifles, shotguns, MSRs)	194M	40.7%
Ammunition (all calibers)	163M	20.3%
Archery equipment and supplies	4M	3.3%
Fuel, motor boats	194M	0.0%
Fuel, small engine	54M	15.8%
Fishing equipment	59M	0.0%
Interest on reserves	32M	0.0%
Import duties on boats	22M	0.0%
TOTALS	\$882M	14.5%

Another way to estimate the portion of PRA funds generated by hunting activity is to compare the number of guns used for hunting with total gun ownership. There are an estimated 270 to 310 million firearms in America (Krouse, 2012; GunPolicy; Crime Prevention Research Center, 2014). There are 14.6 million licensed hunters (FWS, 2013), though the number of licensed hunters who actually hunt is unknown. If we make an assumption that the average hunter owns 3 guns for hunting (e.g. two rifles and a shotgun), then 43.8 million guns are used for hunting, or 14.1 to 16.2% of the total. This would suggest that 8.8 to 10.1% of the combined PRA and DJA funds are hunting-sourced. If we increase the per-hunter ownership assumption to 5 guns, the Wildlife Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 9 portion of combined funding increase to 14.8 to 16.9%. Both ranges compare well with the 14.5% figure cited in Table 3.

Possible Biases In Our Analyses of PRA & DJA Revenue A large portion of the PRA funds are set aside by law for hunter-specific uses rather than conservation or wildlife management. For example one half of the taxes generated from handguns and archery equipment are set aside exclusively for hunter education, which is principally about firearms safety (i.e., Hunter Ed); this totaled 15.9% of the PRA revenue in fiscal 2013. While one may reasonably argue that this money is not wildlife conservation funding, we have elected to ignore this issue. This creates a small bias in favor of the hunter-funding category. Fiscal 2013 was a record-setting year for firearm and ammunition sales, based on worries in the gun community about new federal gun control legislation following the Sandy Hook shootings and the reelection of President Obama. This increased the PRA funding, both in terms of the total dollars and the PRA percentage of the combined PRA and DJA revenues. This, in turn, increased the apparent hunting allocation over a multi-year average. At the same time the types of guns and ammunition which saw the greatest sales increases in 2013 were not traditional hunting equipment but rather modern sporting rifles (or MSRs), tactical shotguns, tactical and self defense ammunition. For example, 9mm handgun ammunition sales increased to 21.4% of the total in 2013 from 14.2% in 2012 (LuckyGunner, 2012 & 2013). According to the National Shooting Sports Foundation survey, "82% of recent purchases were AR-platform rifles" (NSSF, 2013). The disproportionate increase in sales of pistols, tactical long guns, and the related ammunition decreased the apparent hunting contribution. The net affect was not estimated. We applied 40% of long gun sales in 2013 to hunting sales, though the statistics suggest that this number should be lower. If, for example, the above NSSF quote is accurate and 82% of recent sales were AR platforms, and if AR platforms are principally not used for hunting as other surveys and anecdotal evidence suggest, the actual percentage allocated to hunting could be overstated by 10 percentage points or more. A Modern Sporting Rifles is an industry term for the class of rifles sometimes referred to as assault rifles, assault weapons or tactical rifles. For the purposes of this paper the term is used for the class of rifles that include AR-10, AR-15, AK-47 and Uzi-style platforms and their variants. While many in the public and media seem to focus on the appearance, the most important features in terms of our use of this classification are the semi-automatic action, carbine length, and the use of a detachable magazine.

Wildlife Conservation & Management Funding in the U.S. Smith & Molde, Oct. 2014 10 CLOSING COMMENTS Gill (1996) concluded that the narrowly based funding of state wildlife agencies has "blurred the essential distinction between public interest and special interest and inevitably eroded both scientific credibility and public trust." We would argue that it is the perception not the reality that has blurred the distinction. For example, then director of the Nevada Department of Wildlife Ken Mayer wrote to the legislative sunset subcommittee "...the contribution to NDOW's operating budgets from sportsmen is 79 percent of total funding" (Mayer, 2012). He was assuming that all of the federal excise tax transfers were hunter-sourced. This is a misrepresentation often used to manipulate public opinion

and influence policy. This narrative "...logically encourages those who pay via licenses and permits for the privilege of using wildlife to expect greater benefits...Because [it's believed that] hunters pay the bills, it is not surprising that they are given much attention and wield a great deal of influence..." (Jacobson et al, 2010). Modern wildlife management has wandered far from the original path of the Public Trust Doctrine and the North American Wildlife Conservation Model from which it flows (SCOUS, 1842; Horner, 2000). Smith (1980) identified three criteria that need to be met for the Public Trust Doctrine to be effective: 1. The general public must be aware of their legal standing with respect to public ownership of wildlife; 2. This standing and the rights associated with it must be enforceable against the government so that the public can hold it accountable; and, 3. Interpretation of these rights must be adaptable to contemporary concerns, such as biodiversity and species extinction. All three are impaired when the basis of public debate is a myth. It's time that we call for honest dialog from our state and federal agencies and transparency in wildlife policy making.

ACKNOWLEDGEMENTS We would like to express our deepest gratitude to the many professionals who provided review, editing and critical input into the development of this paper. Especially noteworthy are Wendy Keefover of the Humane Society of the United States and Harley Shaw, retired, Arizona Game & Fish Department who provided invaluable review and editing support.

When people say, "I couldn't foster because it would be too hard to give a dog up." We say, "How can it be harder than knowing a dog died because no foster home stepped up?" and that's why we do it time and time again.

Memorandum

Date: October 14, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

**Subject: Agenda Items for the December 9-10, 2015 Fish and Game Commission Meeting
Re: Request for Notice Authorization to Amend Salmon Fishing Regulations for
2016 (two ISORs; one to amend Section 27.80(c); the second to amend 27.80(d)).**

Attached for the Fish and Game Commission's (Commission) December 9-10, 2015 meeting are two rulemaking proposals for the 2016 Ocean Salmon fishing season. The first package proposes to amend subsection 27.80(c) to establish open fishing days, bag limits and minimum size restrictions for April 2016. The second package proposes to amend subsection 27.80(d) to establish open fishing days, bag limits and minimum size restrictions for the salmon season in effect on or after May 1, 2016.

Existing Title 14 regulations specify ocean salmon recreational fishing regulations that were valid only for the 2015 season. The proposed amendments to Section 27.80(c) contained in the first ISOR would allow the Commission to adopt regulations at its March teleconference meeting that would establish any ocean salmon recreational fishing regulations for the month of April 2016, in conformance with federal rules.

The proposed amendments to Section 27.80(d) contained in the second ISOR would allow the Commission to adopt regulations at its April teleconference meeting that would establish any ocean salmon recreational fishing regulations on or after May 1, 2016, in conformance with federal rules that will be recommended by the Pacific Fishery Management Council on April 14, 2016. The range of alternatives (open fishing days/times, areas, size limits, bag limits) contained in the second ISOR are the same as those contained in the first ISOR, but the resulting regulations apply only for May 1, 2016 through the end of the year.

The Department of Fish and Wildlife (Department) requests the Commission authorize publication of notice of its intent to amend the above referenced subsections of Section 27.80, Title 14, CCR, to establish ocean salmon recreational fishing regulations for the 2016 fishing season. While the proposed rulemakings are related, they should be noticed separately to conform to timelines driven by the federal regulatory process.

Sonke Mastrup, Executive Director
Fish and Game Commission

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Amend Subsection (c) of Section 27.80, Title 14, California Code of Regulations
Re: Ocean Salmon Recreational Fishing – April 2016 Season

- I. Date of Initial Statement of Reasons: September 21, 2015
- II. Dates and Locations of Scheduled Hearings:
 - (a) Notice Hearing: Date: December 9, 2015
Location: San Diego, CA
 - (b) Discussion Hearing: Date: February 10, 2016
Location: Sacramento, CA
 - (c) Adoption Hearing: Date: March 15, 2016
Location: Teleconference
- III. Description of Regulatory Action:
 - (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

The Pacific Fishery Management Council (PFMC) coordinates west coast management of recreational and commercial ocean salmon fisheries in the federal fishery management zone (three to 200 miles offshore) along the coasts of Washington, Oregon and California. The annual PFMC ocean salmon regulation recommendations are subsequently implemented by the National Marine Fisheries Service (NMFS) effective on May 1 of each year.

California's recreational salmon fishing regulations need to conform to the federal regulations to achieve optimum yield in California under the federal Salmon Fishery Management Plan. The Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational fishery in State waters (zero to three miles offshore) which are consistent with these federal fishery management goals.

It is critical to have consistent State and federal regulations establishing season dates, bag/size limits and other management measures, and also critical that the State and federal regulations be effective concurrently in order to maintain continuity of management and enforcement. Conformance with federal regulations is also necessary to maintain continued State authority over its recreational salmon fishery and avoid federal preemption under the Magnuson-Stevens Fishery Conservation Act [16 USC §1856 (b)(1)].

On May 1, 2015, NMFS implemented the 2015 federal ocean salmon regulations, which included the PFMC's recommendation to open the California ocean salmon recreational fishing season south of Horse Mountain on April 2, 2016. While federal waters south of Horse Mountain will open on April 2, 2016, State waters in this area will not open unless the Commission takes regulatory action to do so.

The 2016 season opening dates were not adopted into the State's ocean salmon regulations in 2015 as a matter of precaution, in order to account for the possibility that these dates, along with minimum size limits, bag limits, and open fishing days, or other management measures, may be modified by NMFS and PFMC based on the most up-to-date salmon abundance information. Fishery monitoring and escapement information needed for target stocks and salmon species of special concern, including Sacramento River Winter-run Chinook which is listed as endangered under both federal and State Endangered Species Acts, is not available until the winter or early spring of 2016.

Concurrent Regulatory Action

The Commission will consider the most up-to-date information before determining if ocean salmon fishing should be authorized for April 2016. The proposed regulations would allow the Commission to adopt the April 2 opening date, or a later date in April, along with other fishery management measures for State waters that would be effective through April 30, 2016.

Two separate Commission actions are necessary to conform the State regulations to federal rules that will apply in 2016. The first action would amend subsection 27.80(c), establishing salmon fishing regulations for the month of April 2016 consistent with federal regulations for the federal fishery management zone off California. Recreational salmon fishing regulations for May 1 through the end of 2016 will be considered in the second rulemaking action, tentatively scheduled for adoption in April 2016.

Present Regulations

Regulations for 2015 [subsections 27.80(c) and (d)] authorized ocean salmon recreational fishing seven days per week north of Horse Mountain including Humboldt Bay from May 1 to September 7, 2015. Between Horse Mountain and Point Arena, ocean salmon recreational fishing was authorized seven days per week from April 4 to November 8, 2015. Between Point Arena and Pigeon Point, ocean salmon recreational fishing was authorized seven days per week from April 4 to October 31, 2015. Between Pigeon Point and Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to September 7, 2015. For areas south of Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to July 19, 2015. The bag limit for all areas in 2015 was two fish per day (all species except coho). The areas north of Point Arena had a minimum size limit of 20 inches total length. The area between Point Arena and Pigeon Point had a minimum size limit of 24 inches total length through April 30, 2015 and 20 inches total length

thereafter. Areas south of Pigeon Point had a minimum size limit of 24 inches total length through May 31, 2015 and 20 inches total length thereafter. Since the existing regulations pertained only to the 2015 season, amendment of these regulations is essential to allow for any fishing in State waters during 2016.

Proposed Regulations

For public notice purposes and to facilitate Commission discussion, the Department of Fish and Wildlife (Department) is proposing the following regulations to encompass the range of federal ocean salmon regulations that are expected to be in effect April 2 through April 30, 2016. This approach will allow the Commission to adopt State ocean salmon recreational fishing regulations to conform to those in effect in federal ocean waters shortly after the federal rules are promulgated.

- (1) North of Horse Mountain and in Humboldt Bay: The fishery shall remain closed in this area during April. The remainder of the 2016 season will be decided in April by the PFMC and Commission and the section will be amended pursuant to the regulatory process.
- (2) Between Horse Mountain and Point Arena: The season, if any, may open on a date within the range of April 2 through April 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening date, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for April 2016.
- (3) Between Point Arena and Pigeon Point: The season, if any, may open on a date within the range of April 2 through April 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening date, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for April 2016.
- (4) Between Pigeon Point and Point Sur: The season, if any, may open on a date within the range of April 2 through April 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening date, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for April 2016.
- (5) South of Point Sur: The season, if any, may open on a date within the range of April 2 through April 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening date, along with daily bag limit, minimum size, and days of the week open will be

determined by the Commission, considering federal regulations applicable to this area for April 2016.

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of the State to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use, taking into consideration the necessity of regulating individual sport fishery bag limits to the quantity that is sufficient to provide a satisfying sport. Adoption of scientifically-based ocean salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to maintain their continued existence.

The benefits of the proposed regulations are concurrence with federal law, sustainable management of ocean salmon resources, and promotion of businesses that rely on recreational ocean salmon fishing.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 220, 240, 316.5 and 2084, Fish and Game Code.

Reference: Sections 200, 202, 205, 316.5 and 2084, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None.

(d) Identification of Reports or Documents Supporting Regulation Change:

Pacific Fishery Management Council. April 2015. Preseason Report III: Council Adopted Management Measures and Environmental Assessment Part 3 for 2015 Ocean Salmon Fishery Regulations.

http://www.pcouncil.org/wp-content/uploads/2015/04/Preseason_Report_III_2015_FINAL.pdf

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are being held prior to the notice publication. The 45-day comment period provides adequate time for review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative:

The no change alternative would maintain existing regulations which do not provide an ocean salmon recreational fishing season for 2016. Federal regulations are anticipated to open the ocean salmon recreational fishing regulations south of Horse Mountain on April 2, 2016. The State must conform its ocean recreational fishing regulations for salmon in State waters (zero to three miles offshore) to the federal regulations for consistency and to avoid public confusion. Preemption of State regulatory authority by the NMFS could occur if State regulations are in conflict with federal regulations.

(c) Consideration of Alternatives:

In view of the information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are necessary.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The Department anticipates status quo fishing levels for April 2016 as compared to the April 2015 ocean salmon sport fishing season.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission does not anticipate that the proposed regulations will have any impact on the creation or elimination of jobs, the creation or elimination of businesses or the expansion of businesses in California.

The Commission anticipates benefits to the health and welfare of California residents. Salmon sport fishing contributes to increased mental health of its practitioners, provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of California's natural resources.

The Commission anticipates benefits to the State's environment in the sustainable management of salmon resources.

Additional benefits of the proposed regulations are concurrence with federal law, and promotion of businesses that rely on recreational ocean salmon fishing.

The Commission does not anticipate benefits to worker safety.

- (c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

- (e) Nondiscretionary Costs/Savings to Local Agencies:

None.

- (f) Programs Mandated on Local Agencies or School Districts:

None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

- (h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

The proposed regulatory action would conform the State regulations to federal rules that will apply for the month of April 2016.

- (a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

The Commission does not anticipate any impacts on the creation or elimination of jobs due to the proposed regulation. The Commission anticipates status quo fishing levels for April 2016 as compared to the April 2015 ocean salmon sport fishing season.

- (b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

The Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses due to the proposed regulation. The Commission anticipates status quo fishing levels for April 2016 as compared to the April 2015 ocean salmon sport fishing season.

- (c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

The Commission does not anticipate any impacts on the expansion of businesses in California due to the proposed regulation. The Commission anticipates status quo fishing levels for April 2016 as compared to the April 2015 ocean salmon sport fishing season.

- (d) Benefits of the Regulation to the Health and Welfare of California Residents:

The Commission anticipates health and welfare benefits to California residents from recreation in, and enjoyment of, a sustainable and satisfying salmon fishery.

- (e) Benefits of the Regulation to Worker Safety:

The proposed regulations conform to federal fisheries management allowable harvest levels, and ensure a sustainable fishery. As such, the agency is not aware of any consequences to worker safety that could arise from the proposed regulations.

(f) Benefits of the Regulation to the State's Environment:

The Commission anticipates benefits to the environment. Adoption of scientifically-based ocean salmon seasons, size limits, and bag and possession limits ensures sufficient residual populations of salmon and their continued existence.

(g) Other Benefits of the Regulation:

The proposed regulations will provide for resource sustainability thus ensuring the continuation and future enjoyment of the salmon fishery. Maintaining healthy populations of salmon will also translate into sustained economic contributions to the State.

The proposed regulations will ensure consistent State and federal regulations establishing season dates, bag/size limits and other management measures in order to maintain continuity of management and enforcement. Conformance with federal regulations is also necessary to maintain continued State authority over its recreational salmon fishery and avoid federal preemption under the Magnuson-Stevens Fishery Conservation Act

Informative Digest (Policy Statement Overview)

The Pacific Fishery Management Council (PFMC) coordinates west coast management of recreational and commercial ocean salmon fisheries in the federal fishery management zone (three to 200 miles offshore) along the coasts of Washington, Oregon and California. The annual PFMC ocean salmon regulation recommendations are subsequently implemented by the National Marine Fisheries Service (NMFS) effective on May 1 of each year.

California's recreational salmon fishing regulations need to conform to the federal regulations to achieve optimum yield in California under the federal Salmon Fishery Management Plan. The Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational fishery in State waters (zero to three miles offshore) which are consistent with these federal fishery management goals.

Present Regulations

Regulations for 2015 [subsections 27.80(c) and (d)] authorized ocean salmon recreational fishing seven days per week north of Horse Mountain including Humboldt Bay from May 1 to September 7, 2015. Between Horse Mountain and Point Arena, ocean salmon recreational fishing was authorized seven days per week from April 4 to November 8, 2015. Between Point Arena and Pigeon Point, ocean salmon recreational fishing was authorized seven days per week from April 4 to October 31, 2015. Between Pigeon Point and Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to September 7, 2015. For areas south of Point Sur, the ocean salmon recreational fishing season was authorized seven days per week from April 4 to July 19, 2015. The bag limit for all areas in 2015 was two fish per day (all species except coho). The areas north of Point Arena had a minimum size limit of 20 inches total length. The area between Point Arena and Pigeon Point had a minimum size limit of 24 inches total length through April 30, 2015 and 20 inches total length thereafter. Areas south of Pigeon Point had a minimum size limit of 24 inches total length through May 31, 2015 and 20 inches total length thereafter. Since the existing regulations pertained only to the 2015 season, amendment of these regulations is essential to allow for any fishing in State waters during 2016.

Proposed Regulations

Two separate Commission actions are necessary to conform State regulations to federal rules that will apply in 2016. The first action would amend subsection 27.80(c), establishing salmon fishing regulations for the month of April 2016 consistent with federal regulations for the federal fishery management zone off California. Recreational salmon fishing regulations for May 1 through the end of 2016 will be considered in the second rulemaking action, tentatively scheduled for adoption in April 2016.

For public notice purposes and to facilitate Commission discussion, the Department of Fish and Wildlife (Department) is proposing the following regulations to encompass the range of federal ocean salmon regulations that are expected to be in effect April 2 through April 30, 2016. This approach will allow the Commission to adopt State ocean salmon recreational fishing regulations to conform to those in effect in federal ocean waters shortly after the federal rules are promulgated.

- (1) North of Horse Mountain and in Humboldt Bay: The fishery shall remain closed in this area during April. The remainder of the 2016 season will be decided in April by the PFMC and Commission and the section will be amended pursuant to the regulatory process.
- (2) South of Horse Mountain: The season, if any, may open on a date within the range of April 2 through April 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening date, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to each area for April 2016 and may be different for each area.

The benefits of the proposed regulations are concurrence with federal law, sustainable management of ocean salmon resources, and promotion of businesses that rely on recreational ocean salmon fishing.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The legislature has delegated authority to the Commission to adopt sport fishing regulations in general (Sections 200, 202 and 205, Fish and Game Code) and salmon sport fishing regulations specifically (Section 316.5, Fish and Game Code). The proposed regulations are consistent with regulations for sport fishing in marine protected areas (Section 632, Title 14, CCR) and with general sport fishing regulations in Chapters 1 and 4 of Subdivision 1 of Division 1, Title 14, CCR. Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of salmon in the ocean.

Regulatory Language

Subsection (c) of Section 27.80, Title 14, CCR, is amended to read:

§ 27.80. Salmon

...

(c) Open Fishing Days, Daily Bag Limits, and Minimum Size in effect ~~April 4~~April 2 through April 30, ~~2015~~2016.

(1) North of Horse Mountain (40°05'00" N. lat.) and in Humboldt Bay.

(A) Closed to salmon fishing.

(2) Between Horse Mountain and Point Arena (38°57'30" N. lat.).

(A) Open to salmon fishing ~~from April 4 to April 30~~varied dates within the range from April 2 to April 30, may include periodic closures, ~~2015~~2016. Fishing is authorized ~~7~~0-7 days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~0-2 salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~20~~20-26 inches total length.

(3) Between Point Arena and Pigeon Point (37°11'00" N. lat.).

(A) Open to salmon fishing ~~from April 4 to April 30~~varied dates within the range from April 2 to April 30, may include periodic closures, ~~2015~~2016. Fishing is authorized ~~7~~0-7 days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~0-2 salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24~~20-26 inches total length.

(4) Between Pigeon Point and Point Sur (36°18'00" N. lat.).

(A) Open to salmon fishing ~~from April 4 to April 30~~varied dates within the range from April 2 to April 30, may include periodic closures, ~~2015~~2016. Fishing is authorized ~~7~~0-7 days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~0-2 salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24~~20-26 inches total length.

(5) South of Point Sur.

(A) Open to salmon fishing ~~from April 4 to April 30~~varied dates within the range from April 2 to April 30, may include periodic closures, ~~2015~~2016. Fishing is authorized ~~7~~0-7 days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~0-2 salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24~~20-26 inches total length.

...

Note: Authority cited: Sections 200, 202, 205, 220, 240, 316.5 and 2084, Fish and Game Code. Reference: Sections 200, 202, 205, 316.5 and 2084, Fish and Game Code.

Act [16 USC §1856 (b)(1)].

PFMC Regulatory Outlook

On March 14, 2016, the PFMC will propose a suite of ocean salmon fishery regulatory options after reviewing the most up-to-date salmon abundance information for target stocks and salmon species of special concern, including Sacramento River Winter Run Chinook which is listed as endangered under both federal and State Endangered Species Acts. These options will go out for public review and the final PFMC recommendations for federal waters will be made on April 14, 2016. The federal regulations will go into effect on or after May 1, 2016 and may include:

1. the minimum size of salmon that may be retained;
2. the number of rods anglers may use (e.g., one, two, or unlimited);
3. the type of bait and/or terminal gear that may be used (e.g., amount of weight, hook type, and type of bait or no bait);
4. the number of salmon that may be retained per angler-day or period of days;
5. the definition of catch limits to allow for combined boat limits versus individual angler limits;
6. the allowable fishing dates and areas; and
7. the overall number of salmon that may be harvested, by species and area.

The range of proposed regulatory options available for the Commission's consideration is designed to encompass the range of options that will be under consideration by the PFMC.

Commission Regulatory Outlook

Although there are no proposed PFMC regulatory options to consider until March, the ocean salmon sport fishing regulations in effect on or after May 1, 2016 could range from no fishing in all areas off the California coast to limited salmon fishing for varied areas and dates between May 1 and November 13, 2016. The final PFMC recommendations made on April 14, 2016 will serve as the basis for the State's ocean salmon sport fishery regulations for May 2016 through the end of the year.

Present Regulations

Regulations for 2015 [subsections 27.80(c) and (d)] authorized ocean salmon recreational fishing seven days per week north of Horse Mountain including Humboldt Bay from May 1 to September 7, 2015. Between Horse Mountain and Point Arena, ocean salmon recreational fishing was

authorized seven days per week from April 4 to November 8, 2015. Between Point Arena and Pigeon Point, ocean salmon recreational fishing was authorized seven days per week from April 4 to October 31, 2015. Between Pigeon Point and Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to September 7, 2015. For areas south of Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to July 19, 2015. The bag limit for all areas in 2015 was two fish per day (all species except coho). The areas north of Point Arena had a minimum size limit of 20 inches total length. The area between Point Arena and Pigeon Point had a minimum size limit of 24 inches total length through April 30, 2015 and 20 inches total length thereafter. Areas south of Pigeon Point had a minimum size limit of 24 inches total length through May 31, 2015 and 20 inches total length thereafter. Since the existing regulations pertained only to the 2015 season, amendment of these regulations is essential to allow for any fishing in State waters during 2016.

Concurrent Regulatory Action

Two separate Commission actions are necessary to conform the State regulations to federal rules that will apply in 2016. This proposed regulation will amend subsection 27.80(d), establishing ocean salmon sport fishing regulations (e.g., open/closed days, minimum size limits, bag limits) that would be effective for May 2016 through the end of the year. The Commission also will be considering ocean salmon sport fishing regulations that would be effective for the period April 2-30, 2016 in a separate rulemaking package, tentatively scheduled for adoption in March 2016.

Proposed Regulations

For public notice purposes and to facilitate Commission discussion, the Department of Fish and Wildlife (Department) is proposing the following regulations to encompass the range of federal ocean salmon regulations that are expected to be in effect on or after May 1, 2016. This approach will allow the Commission to adopt State ocean salmon recreational fishing regulations to conform to those in effect in federal ocean waters shortly after the federal rules are promulgated.

- (1) North of Horse Mountain and in Humboldt Bay: The season, if any, may occur within the range of May 1 through September 30, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for May through September 2016.
- (2) Between Horse Mountain and Point Arena: The season, if any, may occur within the range of May 1 to November 13, 2016. The proposed daily bag limit will be from zero to two fish, and the

proposed minimum size will be from 20 to 26 inches total length. The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for May through November 2016.

- (3) Between Point Arena and Pigeon Point: The season, if any, may occur within the range of May 1 to November 13, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for May through November 2016.
- (4) Between Pigeon Point and Point Sur: The season, if any, may occur within the range of May 1 to October 2, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for May through October 2016.
- (5) South of Point Sur: The season, if any, may occur within the range of May 1 to October 2, 2016. The proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length. The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined by the Commission, considering federal regulations applicable to this area for May through October 2016.

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of the State to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use, taking into consideration the necessity of regulating individual sport fishery bag limits to the quantity that is sufficient to provide a satisfying sport. Adoption of scientifically-based ocean salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

The benefits of the proposed regulations are concurrence with federal law, sustainable management of ocean salmon resources, and promotion of businesses that rely on recreational ocean salmon fishing.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 220, 240, 316.5 and 2084, Fish and Game Code.

Reference: Sections 200, 202, 205, 316.5 and 2084, Fish and Game Code.

- (c) Specific Technology or Equipment Required by Regulatory Change:

None.

- (d) Identification of Reports or Documents Supporting Regulation Change:

Pacific Fishery Management Council. The Fishery Management Plan for Commercial and Recreational Salmon Fisheries Off the Coasts of Washington, Oregon, and California as Revised Through Amendment 18. September 2014.

http://www.pcouncil.org/wp-content/uploads/FMP_through_A-18_Final.pdf

- (e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are being held prior to the notice publication. The 45-day comment period provides adequate time for review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

- (a) Alternatives to Regulation Change:

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

- (b) No Change Alternative:

The no change alternative would maintain existing regulations which do not provide an ocean salmon recreational fishing season within the May to November 2016 period. The State must conform its ocean recreational fishing regulations for salmon in State waters (zero to three miles offshore) to the federal regulations for consistency and to avoid public confusion. Preemption of State regulatory authority by the NMFS could occur if State regulations are in conflict with federal regulations.

- (c) Consideration of Alternatives:

In view of the information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are necessary.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, including the Ability of California Businesses to Compete with Businesses in Other States:

Although the recommendations of the PFMC for the 2016 ocean salmon season are unknown at this time, the Department anticipates that recreational salmon fishing effort will be similar to the 2015 season. For the purpose of evaluating potential economic impacts of the 2016 ocean salmon regulations, the Commission analyzed possible reductions in ocean salmon recreational effort ranging from zero (no change) to 100-percent. The base year used for estimating the 2016 economic impacts is the 2014 salmon season, the latest full year of economic data.

For the first two projections for 2016, representing 100-percent (120,300 angler days), and 50-percent (60,150 angler days) levels of ocean salmon angling effort, there are not likely to be significant statewide adverse economic impacts directly affecting businesses, including the ability of California businesses to compete with businesses in other states. The elimination of ocean recreational salmon angling or the 0-percent (zero angler days) projection could constitute a significant decline in revenue to a number of businesses associated with recreational ocean angling. However, such a closure would be undertaken with the intent of ensuring the health of the resource and thus prevent longer term adverse economic impacts.

Data from the Department indicate that during the 2014 salmon season, recreational fishermen participated in 120,300 angler days of ocean salmon fishing and generated an estimated \$20.2 million (2015\$) in total economic output to the State. The projected levels of fishing effort for the 2016 salmon season are 120,300 angler days, 60,150 angler days, and

zero angler days, equivalent to 100, 50, and 0-percent levels of effort, respectively. At the projected 2016 levels of angler effort, the associated fishing expenditures by fishermen would generate an estimated \$20.2 million, \$10.1 million and \$0.00 (2015\$) in total economic output for the State, respectively. Thus, relative to the 2014 salmon season, the total incremental effects (direct, indirect, and induced) of the 2016 projections on State economic output range from no change (the same \$20.2 million); a 50-percent decrease (\$10.1 million); to an 100-percent decline (-\$20.2 million) total economic output from the recreational salmon fishery.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

Approximately 164 jobs were indirectly supported by recreational ocean salmon angling during the 2014 salmon season. Thus, relative to the 2014 salmon season, the 2016 projections (100, 50, and 0-percent levels of effort) represent potential incremental effects on employment ranging from no change to a loss of 82 to 164 jobs statewide.

The Commission anticipates benefits to the health and welfare of California residents. Salmon sport fishing contributes to increased mental health of its practitioners, provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of California's natural resources.

The Commission anticipates benefits to the State's environment in the sustainable management of salmon resources.

Additional benefits of the proposed regulations are concurrence with federal law, and promotion of businesses that rely on recreational ocean salmon fishing.

The Commission does not anticipate benefits to worker safety.

- (c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

- (e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment

The PFMC coordinates west coast management of recreational and commercial ocean salmon fisheries in the federal fishery management zone (three to 200 miles offshore) along the coasts of Washington, Oregon and California. The annual PFMC ocean salmon regulation recommendations are subsequently implemented by the NMFS effective on May 1 of each year.

Although the recommendations of the PFMC for the 2016 ocean salmon season are unknown at this time, the Department anticipates that recreational salmon fishing effort will be similar to the 2015 season. For the purpose of evaluating potential economic impacts of the 2016 ocean salmon regulations, the Commission analyzed possible reductions in ocean salmon recreational effort ranging from zero (no change) to 100-percent (see Tables 1 and 2).

Table 1

Total Projected Economic Contribution Of California's Ocean Salmon Sport Fishery -- Calculations Worksheet and Summary Tables						
Projected Economic Impacts Of 2016 Salmon Fishery To California's Economy						
9/11/2015						
Ocean Salmon Angling	Number of Salmon Angler Trips (days)	Direct Impact (2015\$)	Final Economic Output Impact (2015\$)	Earnings Impact (2015\$)	Employment (# jobs)	State & Local Taxes (2015\$)
100% Seasonal Activity Level	120,300	\$ 14,178,906	\$ 20,165,572	\$ 8,037,875	164	\$ 1,463,720
50% Seasonal Activity Level	60,150	\$ 7,089,453	\$ 10,082,786	\$ 4,018,937	82	\$ 731,860
0% Seasonal Activity Level	0	\$ -	\$ -	\$ -	0	\$ -
Economic Multipliers*			1.4222	0.5669	11.5659	0.1032

Note:
 *Multipliers are derived from MIG IMPLAN economic models for the State of California.
 All dollar amounts are adjusted to year 2015 prices, denoted as 2015\$, using US Dept of Commerce Implicit Price Deflators for Gross Domestic Product - Table 1.1.9.
<http://www.bea.gov>

Table 2

Projected Incremental Change from 2014 Fishing Levels, in Angler Trips						
Impact Summary for Projected 2016 Ocean Salmon Angling Levels, Compared to 2014 Levels	Incremental Change in Number of Salmon Angler Trips (days)	Incremental Direct Impact (2015\$)	Incremental Final Economic Output Impact (2015\$)	Incremental Earnings Impact (2015\$)	Incremental Employment Impact (# jobs)	Incremental State & Local Tax Impact (2015\$)
100% Seasonal Activity Level	0	\$ -	\$ -	\$ -	0	\$ -
50% Seasonal Activity Level	(60,150)	\$ (7,089,453)	\$ (10,082,786)	\$ (4,018,937)	-82	\$ (731,860)
0% Seasonal Activity Level	(120,300)	\$ (14,178,906)	\$ (20,165,572)	\$ (8,037,875)	-164	\$ (1,463,720)

The following projections cover this expected range. The base year used for estimating the 2016 economic impacts is the 2014 salmon season, the latest full year of economic data. In 2014, the ocean salmon recreational fishery generated an estimated \$20.2 million (2015\$) in total economic output to the State. A 50-percent reduction in the fishery would amount to a \$10.1 million reduction and a closure of ocean salmon recreational angling could result in a \$20.2 million drop in total economic output for the State, relative to the 2014 season. As a general rule, for every 5,000 salmon harvested in the ocean recreational fishery, there is approximately \$1.0 million in potential total economic contribution to the State.

However, substitute fishing resources and recreational activities for anglers may offset the potential losses to fishing port business and jobs described below.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

Using the 2014 salmon season as a base year for comparison, the California ocean salmon recreational fishery supports an estimated 164 jobs in the State. Generally, for every 5,000 salmon harvested in the ocean recreational fishery, there are approximately 7.3 jobs supported in the State. Three projected fishing activity levels were evaluated, which entail various levels of restrictions on the ocean salmon recreational fishery, as follows:

Projection 1. A seasonal level of fishing activity of 120,300 angler days.

Relative to the 2014 season's estimated angler activity of 120,300 days, Projection 1 (100-percent) represents no change to the 2014 number of angler days. This projected change could result in no net change in the number of jobs in California businesses that support the salmon recreational fishery.

Projection 2. A seasonal level of fishing activity of 60,150 angler days, or approximately 50-percent of fishing activity in Projection 1.

Compared to the 2014 season, this represents a 50-percent incremental reduction in angler days. This projected change could result in the potential loss of 82 jobs to California businesses that support the salmon recreational fishery.

Projection 3. A seasonal level of fishing activity of zero angler days, or approximately 0-percent level of fishing activity in Projection 1.

Compared to the 2014 season, this represents a 100-percent incremental reduction in angler days. This projected change could result in a loss of 164 jobs in those California businesses that support the ocean salmon recreational fishery.

(See Tables 1 and 2 above for details on how employment, wages, economic output for the State of California, and effects on State and local taxes are derived.)

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

The three projections of expected fishing activity represent potential indirect impacts to businesses providing goods and services to the ocean salmon recreational fishermen, as follows:

Projection 1. A seasonal level of fishing activity of 120,300 angler days.

Relative to the 2014 season, Projection 1 represents no potential indirect impact to businesses.

Projection 2. A seasonal level of fishing activity of 60,150 angler days, or approximately 50-percent of fishing activity in Projection 1.

Relative to the 2014 season, Projection 2 represents a potential indirect impact to businesses of approximately \$10.1 million in reduced economic output statewide. This may result in reduced demand for new businesses or the potential elimination of businesses in the State in some localized areas that lack industry diversification and have a heavy reliance on recreational fishing and tourism. Many ocean fishing port businesses offer alternative, substitute, fishing resources and activities for salmon anglers.

Projection 3. A seasonal level of fishing activity of zero ocean salmon angler days, or approximately 0-percent of fishing activity in Projection 1.

Relative to the 2014 season, Projection 3 represents a potential indirect impact to businesses of approximately \$20.2 million in reduced economic output statewide. This may greatly reduce the creation of new businesses and result in the elimination of existing businesses in the State in some localized areas that lack industry diversification and have a heavy reliance on recreational fishing and tourism. Many ocean fishing port businesses offer alternative, substitute, fishing resources and activities for salmon anglers.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

Projection 1. A seasonal level of fishing activity of 120,300 angler days.

Relative to the 2014 season, Projection 1 represents no change in economic impacts to businesses.

Projection 2. A seasonal level of fishing activity of 60,150 angler days, or approximately 50-percent of fishing activity in Projection 1. Relative to the 2015 season, Projection 2 represents a potential indirect impact to businesses of approximately \$10.1 million in decreased economic output statewide. In the short term, this decrease in economic output may induce some businesses to contract their business activities in the recreational salmon fishing arena.

Projection 3. A seasonal level of fishing activity of no angler days, or approximately 0-percent of fishing activity in Projection 1. Relative to the 2014 season, Projection 3 represents a potential indirect impact to businesses of approximately \$20.2 million in reduced economic output statewide. This may affect businesses in the State, offering goods and services to ocean salmon anglers. Some level of reduced demand for terminal tackle and equipment used in ocean salmon fishing would likely occur. This may negatively affect investments and expansion by existing businesses in the State.

(d) Benefits of the Regulation to the Health and Welfare of California Residents:

The proposed regulations are to conform to federal fisheries management allowable harvest levels, intended to sustain the fishery for the enjoyment of all California residents.

(e) Benefits of the Regulation to Worker Safety:

The proposed regulations are to conform to federal fisheries management allowable harvest levels, and intended to sustain the fishery. As such, the agency is not aware of any consequences to worker safety that could arise from the proposed regulations.

(f) Benefits of the Regulation to the State's Environment:

The proposed regulations comply with federal law and sustainable management practices designed to safeguard California's ocean salmon resources.

(g) Other Benefits of the Regulation:

Concurrence with Federal Law: California's sport and commercial ocean salmon fishing regulations need to conform to the new federal regulations to achieve optimum yield in California. The PFMC annually reviews the status of west coast salmon populations. As part of that process, it recommends west coast adult salmon fisheries regulations aimed at meeting biological and fishery allocation goals specified in law or

established in the federal Salmon Fishery Management Plan. These recommendations coordinate west coast management of sport and commercial ocean salmon fisheries off the coasts of Washington, Oregon, California, and California inland sport salmon fisheries. These recommendations are subsequently implemented as ocean fishing regulations by the NMFS and as sport salmon regulations for State marine and inland waters by the Commission.

Continuation of activities dependent on the salmon fishery: Resource sustainability supports the continuation of activities dependent on the salmon fishery. Maintaining healthy populations of salmon can translate into significant economic contributions to the State: In 2014, recreational ocean salmon activities contributed as much as \$20.2 million in total economic output, \$8.0 million in wages, and 164 jobs for Californians.

Informative Digest (Policy Statement Overview)

The Pacific Fishery Management Council (PFMC) coordinates west coast management of recreational and commercial ocean salmon fisheries in the federal fishery management zone (three to 200 miles offshore) along the coasts of Washington, Oregon and California. The annual PFMC ocean salmon regulation recommendations are subsequently implemented by the National Marine Fisheries Service (NMFS) effective on May 1 of each year.

California's recreational salmon fishing regulations need to conform to the federal regulations to achieve optimum yield in California under the federal Salmon Fishery Management Plan. The Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational fishery in State waters (zero to three miles offshore) which are consistent with these federal fishery management goals.

Present Regulations

Regulations for 2015 [subsections 27.80(c) and (d)] authorized ocean salmon recreational fishing seven days per week north of Horse Mountain including Humboldt Bay from May 1 to September 7, 2015. Between Horse Mountain and Point Arena, ocean salmon recreational fishing was authorized seven days per week from April 4 to November 8, 2015. Between Point Arena and Pigeon Point, ocean salmon recreational fishing was authorized seven days per week from April 4 to October 31, 2015. Between Pigeon Point and Point Sur, ocean salmon recreational fishing was authorized seven days per week from April 4 to September 7, 2015. For areas south of Point Sur, the ocean salmon recreational fishing season was authorized seven days per week from April 4 to July 19, 2015. The bag limit for all areas in 2015 was two fish per day (all species except coho). The areas north of Point Arena had a minimum size limit of 20 inches total length. The area between Point Arena and Pigeon Point had a minimum size limit of 24 inches total length through April 30, 2015 and 20 inches total length thereafter. Areas south of Pigeon Point had a minimum size limit of 24 inches total length through May 31, 2015 and 20 inches total length thereafter. Since the existing regulations pertained only to the 2015 season, amendment of these regulations is essential to allow for any fishing in State waters during 2016.

Proposed Regulations

Two separate Commission actions are necessary to conform the State regulations to federal rules that will apply in 2016. This proposed regulation would amend subsection 27.80(d), establishing salmon fishing regulations for May 1 through the end of 2016. Recreational salmon fishing regulations for the month of April 2016 will be considered in a separate rulemaking action, tentatively scheduled for adoption in March 2016.

For public notice purposes and to facilitate Commission discussion, the Department of Fish and Wildlife is proposing the following regulations to encompass the range of federal ocean salmon regulations that are expected to be in effect on or after May 1, 2016. This approach will allow the Commission to adopt State ocean salmon recreational fishing regulations to conform to those in effect in federal ocean waters.

- (1) North of Horse Mountain and in Humboldt Bay: The season, if any, may occur within the range of May 1 through September 30, 2016.

- (2) Between Horse Mountain and Pigeon Point: The season, if any, may occur within the range of May 1 to November 13, 2016.
- (3) South of Pigeon Point: The season, if any, may occur within the range of May 1 to October 2, 2016.
- (4) For all areas, the proposed daily bag limit will be from zero to two fish, and the proposed minimum size will be from 20 to 26 inches total length.

The exact opening and closing dates, along with daily bag limit, minimum size, and days of the week open will be determined in April by the Commission considering federal regulations and may be different for each subarea.

The benefits of the proposed regulations are concurrence with federal law, sustainable management of ocean salmon resources, and promotion of businesses that rely on recreational ocean salmon fishing.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The legislature has delegated authority to the Commission to adopt sport fishing regulations in general (Sections 200, 202 and 205, Fish and Game Code) and salmon sport fishing regulations specifically (Section 316.5, Fish and Game Code). The proposed regulations are consistent with regulations for sport fishing in marine protected areas (Section 632, Title 14, CCR) and with general sport fishing regulations in Chapters 1 and 4 of Subdivision 1 of Division 1, Title 14, CCR. Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of salmon in the ocean.

Regulatory Language

Subsection (d) of Section 27.80, Title 14, CCR, is amended to read:

§27.80. Salmon.

...

(d) Open Fishing Days, Daily Bag Limits, and Minimum Size in effect on or after May 1, 2015~~2016~~.

(1) North of Horse Mountain (40°05'00" N. lat.) and in Humboldt Bay.

(A) Open to salmon fishing ~~May 1 to September 7~~[varied dates within the range from May 1 to September 30, may include periodic closures], 2015~~2016~~. Fishing is authorized ~~7~~[0-7] days per week [specify open days of week and date range as needed].

Exception: See Section 27.75 for specific fishery closure areas around the Smith, Klamath and Eel rivers.

(B) Daily Bag Limit: ~~2~~[0-2] salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~20~~[20-26] inches total length [specify date range as needed].

(2) Between Horse Mountain and Point Arena (38°57'30" N. lat.).

(A) Open to salmon fishing ~~May 1 to November 8~~[varied dates within the range from May 1 to November 13, may include periodic closures], 2015~~2016~~. Fishing is authorized ~~7~~[0-7] days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~[0-2] salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~20~~[20-26] inches total length [specify date range as needed].

(3) Between Point Arena and Pigeon Point (37°11'00" N. lat.).

(A) Open to salmon fishing ~~May 1 to October 31~~[varied dates within the range from May 1 to November 13, may include periodic closures], 2015~~2016~~. Fishing is authorized ~~7~~[0-7] days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~[0-2] salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24 inches total length through April 30, 2015 and 20 inches total length thereafter~~[20-26] inches total length [specify date range as needed].

(4) Between Pigeon Point and Point Sur (36°18'00" N. lat.).

(A) Open to salmon fishing ~~May 1 to September 7~~[varied dates within the range from May 1 to October 2, may include periodic closures], 2015~~2016~~. Fishing is authorized ~~7~~[0-7] days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~[0-2] salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24 inches total length through May 31, 2015 and 20 inches total length thereafter~~[20-26] inches total length [specify date range as needed].

(5) South of Point Sur.

(A) Open to salmon fishing ~~May 1 to July 19~~[varied dates within the range from May 1 to October 2, may include periodic closures], 2015~~2016~~. Fishing is authorized ~~7~~[0-7] days per week [specify open days of week and date range as needed].

(B) Daily Bag Limit: ~~2~~[0-2] salmon per day. See subsection (b) above and subsection (e) below.

(C) Minimum Size: ~~24 inches total length through May 31, 2015 and 20 inches total length thereafter~~ [20-26] inches total length [specify date range as needed].

Charles Friend
P.O. Box 847
Marshall, CA
94940

Dear Mr. Mastrup:

I write today asking to be placed on the Fish and Game Commission Calendar at the earliest opportunity for the purpose of amending Lease No. M-430-05 to include an oyster cultivation method not now listed as an approved method for this lease.

I specifically want to include 'FLOATS' in the list of approved methods. Further, I am suggesting that the approved methods for my outer bay lease M-430-04 be incorporated into the M-430-05 lease making both leases identical as to approved methods of cultivation.

Therefore, the approved list of cultivation methods for M-430-05 should read as follows: Longlines, rafts, stakes, rack and bag, rack and tray floats, and bottom culture.

Please advise me with respect to this request.

Sincerely,

Charles Friend

**LEASE GRANTING THE EXCLUSIVE PRIVILEGE
OF CONDUCTING AQUACULTURE AT
STATE WATER BOTTOM NO. M-000-00**

THIS LEASE GRANTING THE EXCLUSIVE PRIVILEGE OF CONDUCTING AQUACULTURE AT STATE WATER BOTTOM NO. M-000-00 ("Lease") is made and entered into as of [DATE], by and between [NAME], ("Tenant") and the California Fish and Game Commission ("State") with reference to the following facts:

RECITALS

Tenant wishes to lease a State Water Bottom for the purpose of propagating, cultivating, maintaining and harvesting aquatic plants and/or animals in marine waters of the state.

Fish and Game Code section 15400 authorizes the State to lease to any person the exclusive privilege to conduct aquaculture in any designated State Water Bottom if it determines that such lease is in the public interest.

[New lease]: On [DATE] the State awarded the lease for State Water Bottom No. M-000-00 to Tenant.

[Renewal]: On [DATE(s)] the State authorized renewal of the Lease for State Water Bottom No. M-000-00 to Tenant.

[Other]: On [DATE] [Note here any other significant events concerning the lease, e.g. amendment, assignment or designation of successor-in-interest.]

TERMS AND CONDITIONS

- LEASE.** The State hereby grants to Tenant the exclusive privilege to conduct aquaculture upon State Water Bottom No. M-000-00, subject to the terms and conditions of this Lease.
- DESCRIPTION.** This Lease covers that area comprising approximately 000.00 acres designated as State Water Bottom No. M-000-00 and shown on the Map and Description attached as **Exhibit A**, which is made a part of this Lease by this reference.

3. TERM. This Lease is for a period of 0.00 years commencing on [START DATE] and ending on [END DATE], unless renewed or sooner terminated in accordance with its terms.

4. ANNUAL RENT. The base rent for the Lease area is \$000.00 per acre, calculated to recover Tenant's share of the State's operational costs of the aquaculture bottom leasing program attributable to shellfish cultivation. The base rent shall be annually adjusted in the following manner:

The Department of Fish and Game shall determine the change in the "Implicit Price Deflator for State and Local government Purchases of Goods and Services," as published by the U.S. Department of Commerce, for the quarter ending March 31 of the current year compared to the quarter ending March 31 of the previous year. The relative amount of the change shall be multiplied by the amount of the annual rent.

No more frequently than at five-year intervals, the State, in its sole discretion, may recalculate the productivity classification by which the annual rent is calculated for Tenant to reflect changes in the State's operational costs of the aquaculture bottom leasing program attributable to shellfish cultivation. The 10-year average oyster production values fall into three productivity classifications:

- High productivity = >100,000 oysters/acre = \$150.00 per acre/year
- Moderate productivity = >20,000-99,000 oysters/acre = \$100.00 per acre/year
- Low productivity = >2,000-19,999 oysters/acre = \$50.00 per acre/year

Whenever such formula is updated, the annual rent first charged Tenant thereafter shall become the new base rent, subject to the foregoing adjustments for inflation thereafter.

Notice of the annual adjusted rent for the upcoming calendar year shall be given to Tenant by December 1. Until the notice of the annual adjustment is provided, Tenant remains obligated to pay rent at the previous rate. Pursuant to Fish and Game Code section 15407, the annual rent shall be paid within 30 days of the commencement date in Section 3, and within 30 days of each anniversary. Tenant shall remit such rent to: Department of Fish and Game, Fiscal and Administrative Services Branch, 1416 Ninth Street, 12th Floor, Sacramento, California 95814 RE: State Water Bottom Lease No. M-000-00.

Payment shall be made to the State in lawful money of the United States, provided that, if any payment made by a check, draft or money order is returned to The State due to insufficient funds or otherwise, the State shall have the right, upon written notice to Tenant, to require Tenant to make all subsequent payments in cash, or by cashier's or certified check.

5. LATE PAYMENT. Annual payment of rent is due and payable on the commencement date of this Lease or any anniversary thereafter, and is timely if received by the State within thirty (30) days of such commencement date or anniversary. Any annual payment not received by the State within thirty (30) days of the Lease commencement date or anniversary thereof, regardless of whether the 30th day falls on a Saturday, Sunday or holiday, will be subject to a late penalty consisting

of an administrative charge on the late amount, calculated at the rate of five percent (5%) of the amount of the late payment. The parties agree that the late charge represents a fair and reasonable estimate of the costs the State will incur because of late payment. Acceptance of the late charge by the State shall not constitute a waiver of Tenant's default for the overdue amount, nor prevent the State from exercising other rights and remedies granted under this Lease. Tenant shall pay the late charge as additional rent within 30 days of the due date of the original payment.

Any annual payment not received by the State within ninety (90) days of the commencement date of the Lease or within ninety (90) days of any anniversary thereof shall constitute a breach of Lease, giving rise to the State's remedies as set forth herein.

Annual rent due to the State, if not received by the State within ninety (90) days following the due date, will bear interest from the due date until paid at the rate of ten percent (10%) per year or, if a higher rate is legally permissible, at the highest rate legally permitted. Interest shall not be payable on late charges incurred by Tenant nor on any amounts on which late charges are paid by Tenant to the extent this interest would cause the total interest to be in excess of that legally permitted. Payment of interest shall not excuse nor cure any default by Tenant.

Upon written request by Tenant to the State, demonstrating unusual or extenuating circumstances causing the late payment, the State, in its sole discretion, may waive the late charge.

6. INSURANCE. Tenant shall furnish to the State certificate(s) of insurance stating that Public Liability Insurance is presently in effect for the Tenant and will be in effect throughout the period of this Lease with a combined single liability limit of not less than One Million Dollars (\$1,000,000.00) per occurrence, and shall insure against all liability of Tenant and its employees and agents arising out of or in connection with Tenant's use and occupancy of the leased Lease area. The certificate(s) of insurance shall:

(a) Be furnished to the State by the insurance companies, and no such policy shall be cancelable or subject to reduction of coverage or other modification except after 30 days prior written notice to the State.

(b) Include the State of California, its officers, agents, employees and servants are included as additional insured but only insofar as the operations under the Lease are concerned.

(c) Provide that the State shall not be responsible for any premiums or assessments on any policy of insurance hereunder.

(d) Comply with those standards as determined by the State of California, Department of General Services, Office of Risk and Insurance Management.

Tenant agrees that the insurance required herein shall be in effect at all times during the term of this Lease, at the cost of Tenant. In the event said insurance, or any of it, expires or lapses at any time during the term of this Lease, the Tenant agrees to provide, no later than fifteen (15) days after said expiration or lapse, written evidence of required insurance coverage from the date of loss of the earlier insurance and continuing for not less than the remainder of the term of the Lease. Tenant's failure to

keep in effect at all times all insurance required by this Lease shall be grounds for termination of the Lease, in addition to any other remedies available to the State.

Where Tenant has any employees, a program of workers' compensation insurance, in an amount and form to meet all applicable requirements of the Labor Code of California, shall be in place throughout the term of this Lease. Such insurance shall include employer's liability coverage of One Million Dollars (\$1,000,000.00) and shall specifically cover all persons providing services by or on behalf of Tenant and shall cover all risks to such persons under this Lease.

7. INDEMNITY AND WAIVER. (For purposes of this Section 7, the term, "State", shall include the Department of Fish and Game as well as the Fish and Game Commission.) Tenant hereby waives all claims and recourse against the State, including the right to contribution for loss or damage to persons or property arising from, or in any way connected with or incident to this Lease, except claims arising from, and only to the extent of the gross negligence or willful misconduct of the State, its officers, agents or employees. Tenant shall notify the Department of Fish and Game Aquaculture Coordinator immediately in case of any serious accident, injury, or casualty on, or potentially related to, the Lease area.

Tenant shall protect, indemnify, hold harmless, and defend the State, its officers, agents or employees, against any and all claims, demands, damages, costs, expenses or liability costs arising out of the use by Tenant, including its employees and agents, of the Lease area, except for liability arising out of, and to the extent of, the gross negligence or willful misconduct of the State, its officers, agents or employees for which the State is found liable by a court of competent jurisdiction.

Should the State be named as a defendant in any claim or legal action arising out of the use by Tenant, including its employees and agents, of the Lease area, upon tender of the claim or action by the State to Tenant, the Tenant shall assume the State's defense and represent the State in such legal action at Tenant's expense, subject to the provisions herein.

In lieu of tender to Tenant of the claim or action against the State, the State may elect to represent itself, in which event, the State shall bear its own litigation costs, expenses and attorney fees. Notwithstanding the foregoing, in the event the State is required to represent itself because of a conflict of interest by counsel representing Tenant, then Tenant, upon demand by the State, shall reimburse the State for the State's litigation costs, expenses and attorney fees. Costs shall include, without limitation, all attorney fees and costs, court costs, if any, costs of mediators or arbitrators, experts and consultants, and any other costs reasonably incurred in response to any claim.

In the event the State is found to be concurrently liable with Tenant by a court of competent jurisdiction for loss or damage to persons or property arising out of the use by Tenant, its employees and agents, of the Lease area, the State and Tenant shall cooperate and use their best efforts to seek and obtain an apportionment of liability from the court and neither party shall request a jury apportionment.

In the event the State is found to be liable for any other wrongful act, for which liability to another is determined by a court of competent jurisdiction for loss or damage to persons or property arising out of the use by Tenant, its employees and agents, of the

Lease area, the State shall bear its own litigation costs, expenses and attorney fees. If Tenant has paid for any such costs which are the responsibility of the the State under this provision, the State shall reimburse Tenant at Tenant's request. The State, in its sole discretion, may provide any reimbursement required in the form of a credit against any other money due the State under this Lease.

8. RENEWAL. Tenant may provide written notice to the Department of Fish and Game Aquaculture Coordinator that it is exercising its right to seek renewal of this lease at least 120 days and not more than 364 days (one year) prior to the expiration date in Section 3 pursuant to Fish and Game Code section 15406. So long as Tenant, during the period specified herein, is still actively engaged in aquaculture, as determined by the State, Tenant shall have a prior right to renew for a period of 0.00 years on terms to be agreed upon between the State, in consultation with the Department of Fish and Game Aquaculture Coordinator, and Tenant. If Tenant fails to give such notice of its right to seek renewal during the period specified herein, the Lease, including any remaining right to seek renewal, shall terminate upon expiration of the then-current term. Moreover, if Tenant is in default on the date of giving such notice, the notice shall be ineffective; if Tenant cures the default and provides a new notice thereafter all within the period specified herein for giving notice, that new notice shall be sufficient to exercise Tenant's prior right to renew. Provided, further, that if on the date a renewal term is to commence Tenant is in default, the renewal term shall not commence and this Lease shall expire at the end of the current term. However, if the State continues negotiating renewal terms after the prior term expires, then the holdover provisions of Section 9 may apply. In no event shall the term of this Lease, or the term of any renewal thereof, extend beyond 25 years each.

9. HOLDOVER. If the Term in Section 3 expires and the Lease has not been renewed pursuant to Section 8, and Tenant remains in possession of the Lease area with State's express or implied permission, Tenant shall become a tenant from month to month only, subject to all the provisions of this Lease except Sections 3, 4 and 5. During this holdover tenancy, a monthly rent representing one-twelfth of the current adjusted annual rent shall be payable on or before the first day of each month. It is expressly understood that a holdover tenancy does not create any right of renewal beyond that provided by Fish and Game Code section 15406 as set forth in Section 8, and that the only purpose of a holdover tenancy is to allow continuity of use of the property while the State continues to negotiate renewal terms or undertakes to issue a new lease to the highest responsible bidder pursuant to Fish and Game Code section 15406, or to allow the holdover tenant time to terminate and remove the aquaculture operation consistent with Fish and Game Code section 15409(a). If either party desires to terminate such holdover tenancy, it shall give the other party not less than thirty days advance written notice of the date of termination.

10. POSSESSORY INTEREST. Tenant understands and acknowledges that, pursuant to Revenue and Taxation Code section 107.6(a), any possessory interest created by this Lease may be subject to the payment of property taxes levied on that possessory interest.

Tenant agrees to pay, before delinquency, all lawful taxes, assessments, license fees and any other charges of any type whatsoever which at any time may be levied by the State, County, City or any tax or assessment-levying body upon any interest in or

created by this Lease, or any possessory right which Tenant may have in or to the Lease area covered hereby.

11. USE. Tenant shall use the Lease area only for the purpose stated in this Lease, and such use shall be continuous from commencement of the Lease term until its expiration or termination. Pursuant to Fish and Game Code section 15414, the State may require the Tenant to submit any periodic reports it deems necessary for the proper administration of State Water Bottom M-000-00.

The Lease area shall be continuously used by Tenant to conduct aquaculture operations, as aquaculture is defined in Fish and Game Code section 17. Tenant shall not use or permit the Lease area to be used in whole or in part during the term of this Lease for any purpose, other than as set forth herein, without the prior written consent of the State.

The possessory interest herein given to the Tenant does not exclude the general public from the Lease area, and Tenant may not unreasonably impede public access to state waters for purpose of fishing, navigation, commerce or recreation or other public trust values. However, Tenant may limit public access to the extent necessary to avoid damage to the Lease area and the aquatic life culture therein. This Lease is not intended to confer third party beneficiary status to anyone benefiting from the terms of this Lease. The possessory interest is further subject to all valid and existing contracts, leases, licenses, encumbrances, and claims of title which may affect the Lease area.

This Lease provides a tenancy of a temporary nature. The parties to this Lease agree that no Relocation Payment or Relocation Advisory Assistance will be sought or provided in any form as a consequence of this tenancy.

This Lease is of no force or effect until signed by both parties and all approvals are secured. Tenant may not commence performance until such approval has been obtained. Any commencement of performance prior to Lease approval shall be done at the Tenant's own risk. Nothing in this Lease may be waived, modified, amended or discharged except by a writing signed by the State and Tenant and approved by the State in a public meeting.

12. SHELLFISH PRODUCTION IMPROVEMENTS.

[Oyster Cultivation.

[(A) Bottom culture: leases must be improved at an average rate of at least two cases of seed-bearing shell (160 pounds of seed-bearing shell) or 30 bushels of shellfish one or more years of age per acre over the allotted acreage per year. Improvements by unattached, single seed (less than one year old) shall consist of planting an average rate of 10,000 single seed per acre per year over the allotted acreage. Term of improvement shall be four years for seed-bearing shell and three years for oysters one or more years of age.

[(B) Off-bottom culture: leases must be improved at an average rate of at least one case of seed-bearing shell (80 pounds of seed-bearing shell), or 15 bushels of oysters one or more years of age per acre over the allotted acreage per year. Improvement by unattached single seed (less than one year old) shall consist of planting an average

rate of 5,000 single seed per acre per year over the allotted acreage. Term of improvement shall be four years for seed-bearing shell and three years for oysters one or more years of age.

[(C) Production requirements: the annual harvest rate shall be an average of 2,000 oysters per acre (over one year of age) over the allotted acreage effective three years after the effective date of the lease. Harvest reports shall be recorded in the form of a receipt in quadruplicate furnished by the Department of Fish and Game. The triplicate copy shall be delivered to the Department of Fish and Game on or before the first and sixteenth day of each month.

[(2) Miscellaneous Aquatic Species.

[(A) A lease for the cultivation of species other than oysters will include minimum planting and harvesting requirements for the species to be cultivated to insure that water bottoms so encumbered will be used for the purpose intended.

[(B) Harvest amounts shall be recorded in the form of a receipt in quadruplicate furnished by the Department of Fish and Game. The triplicate copy shall be delivered to the Department of Fish and Game on or before the first and sixteenth day of each month.]

13. NO WARRANTY. This Lease is made without warranty of title, condition or fitness of State Water Bottom M-000-00 for the Tenant's intended purpose or use.

Tenant agrees to accept the Lease area in its presently existing condition, "As Is", and that the State shall not be obligated to make any alterations, additions or betterments thereto except as otherwise provided in the Lease.

14. COMPLIANCE. As a necessary condition for this Lease, Tenant must obtain and maintain all necessary registrations, permits and any other entitlements. Tenant shall comply with all applicable federal, state and local laws, including laws relating to public health and safety, zoning, resource conservation and environmental protection including, but not limited to, the Coastal Zone Act, the Porter-Cologne Water Quality Act, and the California Environmental Quality Act.

Tenant shall comply with all applicable resource management and preservation mandates in the conduct of all activities that impact cultural, natural, or scenic resources. These mandates include, but are not limited to, those found in Public Resources Code sections 5024 and 5097 and the United States Secretary of the Interior's Guidelines for Historic Preservation. Tenant's operations under this Lease shall ensure that the State's goals of ensuring historical preservation and proper cultural, scenic and natural resource management are continually achieved in a manner consistent with applicable law.

15. RECORD KEEPING. The State may require periodic reports from Tenant as the State deems necessary for the proper administration of the State's water bottoms.

Tenant agrees that the Fish and Game Commission, Department of Fish and Game, and the Bureau of State Audits, or their designated representative, shall have the right to review and copy any records and supporting documentation pertaining to the

performance of this Lease. Tenant agrees to maintain such records for possible audit for a minimum of three years after final payment. Tenant agrees to allow the auditor(s) prompt access to such records during normal business hours and similarly to allow interviews of any employees who might reasonably have information related to such records. Tenant agrees to include a similar right of the State to audit records and to interview staff in any sublease or contract related to performance of this Lease.

16. WAIVER AND CONSENT. Unless expressly acknowledged by the State in writing, no term, covenant, or condition of this Lease and no default or breach is waived by the acceptance of a late or nonconforming performance. The State's consent for one transaction or event under this Lease is not consent to any subsequent occurrence of the same or any other transaction or event.

17. BREACH. The occurrence of any one of the following shall constitute a breach of this Lease by Tenant: (1) Failure of Tenant to make any annual Lease payment within ninety (90) days of the commencement date of the Lease or within ninety (90) days of any anniversary thereof; (2) Failure of Tenant to make any other payment more than thirty (30) days after such payment is due; (3) abandonment of the Lease area determined after the State has followed the procedures set forth in Civil Code section 1951.3; or (4) any failure by Tenant to comply with laws applicable to the conduct of aquaculture.

Should a threat to public health or safety or to the environment be created or exist on the Lease area, the State may declare an emergency event and, unless an alternative arrangement is preferable in the State's discretion, may enter upon and take possession of the Lease area to remedy the emergency without prior notice and/or demand an assignment of the right to operate the Lease area. Upon entering the Lease area under this Section, the State shall provide immediate notice of such action by hand delivery or fax of its declaration to Tenant. The State may retain possession of the Lease area until the emergency event has been completely and adequately addressed to the State's satisfaction. Where a breach of this Lease has caused or exacerbated the emergency event, or where the Tenant is non-cooperative in allowing or addressing any remedial action necessary because of the emergency event, the State may terminate the Lease. The State shall not be liable in any manner for any inconvenience, disturbance, loss of business, nuisance or other damage arising out of the State's entry in the Lease area as provided herein, except damage resulting from the active negligence or willful misconduct of the State or its authorized representatives.

Any failure by Tenant to observe or perform another provision of this Lease where such failure continues for twenty (20) days after written notice thereof by the State to Tenant; any such notice shall be deemed to be the notice required under Code of Civil Procedure section 1161. However, if the nature of Tenant's breach is such that it cannot reasonably be cured within the twenty (20) day period, Tenant shall not be deemed to be in breach if Tenant shall commence such cure within the twenty (20) day period and thereafter diligently prosecutes such cure to completion.

Neither this Lease nor any interest of Tenant hereunder in the Lease area shall be subject to involuntary assignment or transfer by operation of law in any manner whatsoever, including, without limitation, the following: (a) transfer by testacy or intestacy; (b) assignments or arrangements for the benefit of creditors; (c) levy of a writ

of attachment or execution on this Lease; (d) the appointment of a receiver with the authority to take possession of the Lease area in any proceeding or action in which the Tenant is a party; or (e) the filing by or against Tenant of a petition to have Tenant adjudged a bankrupt, or of a petition for reorganization or arrangement under any law relating to bankruptcy. Any such involuntary assignment or transfer by operation of law shall constitute a breach by Tenant and the State shall have the right to elect to take immediate possession of the Lease area, to terminate this Lease and/or invoke other appropriate remedies, in which case this Lease shall not be treated as an asset of Tenant.

Notices of breach shall specify the alleged breach and the applicable Lease provision and shall demand that Tenant perform the provisions of this Lease within the applicable time period or quit the Lease area. No such notice shall be deemed a forfeiture or a termination of this Lease unless the State specifically so states in the notice.

18. REMEDIES. In the event of breach by Tenant, the State shall have the following remedies. These remedies are not exclusive; they are cumulative and are in addition to any other right or remedy of the State at law or in equity.

Collection of Rent: In any case where the State has a cause of action for damages, the State shall have the privilege of splitting the cause to permit the institution of a separate suit for rent due hereunder, and neither institution of any suit, nor the subsequent entry of judgment shall bar the State from bringing another suit for rent; it being the purpose of this provision to provide that the forbearance on the part of the State in any suit or entry of judgment for any part of the rent reserved under this Lease, to sue for, or to include in, any suit and judgment the rent then due, shall not serve as defense against, nor prejudice a subsequent action for, rent or other obligations due under the Lease. The claims for rent may be regarded by the State, if it so elects, as separate claims capable of being assigned separately.

Continued Performance: At the State's option, Tenant shall continue with its responsibilities under this Lease during any dispute.

Termination of Tenant's Right to Possession: Upon an event of breach of this Lease by Tenant, in addition to any other rights or remedies it may have, the State may give Tenant a three-day notice to cure the breach or quit the Lease area. If Tenant fails to do either, the State may bring a statutory proceeding in unlawful detainer to regain possession of the Lease area. Any notice give by the State pursuant to this Section does not constitute a termination of this Lease unless expressly so declared by the State in the notice. In the absence of written notice from the State, no act by the State, including, but not limited to, acts of maintenance, efforts to re-let and/or assign rights to possession of the Lease area, or the appointment of a receiver on the State's initiative to protect the State's interest under this Lease shall constitute an acceptance of Tenant's surrender of the Lease area, or constitute a termination of this Lease or of Tenant's right to possession of the Lease area. Upon such termination, the State has the right to recover from Tenant: (a) the worth, at the time of the award, of the unpaid rent that had been earned at the time of termination of this Lease; (b) the worth, at the time of the award, of the amount by which the unpaid rent that would have been earned after the date of termination of this Lease until the time of the award exceeds the amount of loss of rent that Tenant proves could have reasonably been avoided; (c) the worth, at the time of the award, of the amount by which the unpaid rent for the balance

of the term after the time of the award exceeds the amount of the loss of rent that Tenant proves could have been reasonably avoided; and (d) any other amount necessary to compensate the State for all the detriment proximately caused by Tenant's failure to perform its obligations under this Lease, and costs of clearing the State's title of any interest of Tenant, commissions, attorneys' fees, and any other costs necessary or appropriate to make the Lease area operational by a new Tenant.

"The worth, at the time of the award," as used herein above shall be computed by allowing interest at the lesser of a rate of ten percent (10%) per annum or the maximum legal rate.

Receiver: If Tenant is in breach of this Lease, the State shall have the right to have a receiver appointed to collect rent and conduct Tenant's business or to avail itself of any other pre-judgment remedy. Neither the filing of a petition for the appointment of a receiver nor the appointment itself shall constitute an election by the State to terminate this Lease.

Right to Cure Tenant's Breach: At any time after Tenant commits a breach, the State can cure the breach at Tenant's cost. If the State, at any time by reason of Tenant's breach, pays any sum or does any act that requires the payment of any sum, the sum paid by the State shall be due immediately from Tenant to the State, and if paid at a later date shall bear interest at the rate of ten percent (10%) per annum from the date the sum is paid by the State until the State is reimbursed by Tenant.

Personal Property of Tenant: In the event any personal property or trade fixtures of Tenant remain at the Lease area after the State has regained possession, that property or those fixtures shall be dealt with in accordance with the provisions for Surrender of the Lease area provided below.

State's Obligations After Breach: The State shall be under no obligation to observe or perform any covenant of this Lease on its part to be observed or performed that accrues after the date of any breach by Tenant. Such nonperformance by the State shall not constitute a termination of Tenant's right to possession nor a constructive eviction.

No Right of Redemption: Tenant hereby waives its rights under California Code of Civil Procedure sections 1174 and 1179 or any present or future law that allows Tenant any right of redemption or relief from forfeiture in the event the State takes possession of the Lease area by reason of any breach by Tenant.

Other Relief: The State shall have such rights and remedies for failure to pay any and all monetary obligations under this Lease as the State would have if Tenant failed to pay rent due. The remedies provided in this Lease are in addition to any other remedies available to the State at law, in equity, by statute, or otherwise.

Attorney's Fees and Costs: Tenant shall reimburse the State on demand for all reasonable attorney fees and expenses incurred by the State as a result of a breach under this Lease, provided that, in any litigation between the parties to this Lease concerning it, the prevailing party shall be entitled to recover court costs, reasonable attorney fees, and other costs reasonably incurred to secure the remedy obtained in the action.

The State shall not be in breach of the performance of any obligation required of it under this Lease unless and until it has failed to perform such obligation for more than thirty (30) days after written notice by Tenant to the State specifying the alleged breach and the applicable Lease provision giving rise to the obligation. However, if the nature of the State's obligation is such that more than thirty (30) days is required for its performance, then the State shall not be deemed in breach if it shall commence performance within such 30-day period and thereafter diligently prosecute the same to completion.

19. ASSIGNMENT AND SUBLEASES. Pursuant to Fish and Game Code section 15412, this Lease may not be assigned, in whole or in part, by Tenant, either voluntarily or by operation of law, and no subleases or other rights may be granted under it by Tenant without the prior written approval of the State, subject to the conditions that it prescribes. At the election of the State, any attempted assignment or subletting without such prior approval of the State shall terminate this Lease.

20. TERMINATION. In the event the Lease area becomes unsuitable for the practical cultivation or harvest of shellfish, or in the event the Tenant becomes unable to continue operating the Lease for aquaculture for reasons beyond Tenant's ability to control, Tenant may terminate the Lease after thirty (30) days written notice to the State. Tenant may terminate the Lease for any other reason through a written request presented to and approved by the State at a public hearing held for purposes of consideration of Tenant's termination request. Such termination shall be effective thirty (30) days after State approval.

On expiration of or within thirty (30) days after earlier termination of the Lease, Tenant shall surrender the Lease area to the State. Tenant shall remove all of its personal property as well as all man-made material deposited during Tenant's occupancy within the above stated time unless otherwise agreed to in writing.

If Tenant fails to surrender the Lease area to the State on the expiration, or within thirty (30) days after earlier termination of the term as provided by this Section, Tenant shall hold the State harmless for all damages resulting from Tenant's failure to surrender the Lease area.

21. QUITCLAIM. Tenant shall, within ninety (90) days of the expiration or sooner termination of this Lease, execute, acknowledge and deliver to the State in a recordable form provided by the State a release of all rights under this Lease. Should Tenant fail or refuse to deliver such a release, a written notice by the State reciting such failure or refusal shall, from the date of its recordation, be conclusive evidence against Tenant of the expiration or termination of this Lease.

22. TIME OF THE ESSENCE. Time is of the essence of this Lease and any term, covenant or condition in which performance is a factor.

23. CHANGES. Nothing in this Lease may be waived, modified, amended, or discharged except by an instrument in writing signed by Tenant and the State, in consultation with the Department of Fish and Game Aquaculture Coordinator. At its discretion, the Department of Fish and Game may charge Tenant for any and all costs it incurs in any lease amendment requested by Tenant.

24. SEVERABILITY. If a court of competent jurisdiction determines that a Lease provision is legally invalid, illegal or unenforceable, and such decision becomes final, the provision shall be severed and deleted from the Lease and the remainder reasonably interpreted to achieve its intent. Tenant and the State agree to replace such void or unenforceable provision with a valid and enforceable provision that will achieve, to the extent possible, the purpose of the original provision.

25. SITE CLEANUP. Tenant shall provide to the State financial assurance sufficient to ensure that, upon termination or abandonment of this Lease, the Lease area is surrendered in a condition that is in accordance with Section 20, to the satisfaction of the State.

The financial assurance amount shall be calculated based on an analysis of the physical activities and materials necessary to surrender the site in the required condition; the unit costs or costs for third party contracting, for each of the identified activities as applicable; the number of units of these activities; and a contingency amount not to exceed ten percent (10%) of the costs of the activities.

Financial assurances may take the form of surety bonds executed by an admitted surety insurer, as defined in subdivision (a) of section 995.120 of the Code of Civil Procedure, irrevocable letters of credit, trust funds, or other forms of financial assurances specified by the State which it reasonably determines to be adequate to perform restoration of the site. Personal surety bonds cannot provide financial assurance under this requirement. The financial assurance shall be payable to the State and shall remain in effect throughout the duration of the tenancy under the Lease, and until the State accepts surrender of the Lease area or until replaced by an equivalent financial assurance.

The financial assurance shall be applied by the State to place the Lease area in the condition required for surrender under Section 20, whenever the Tenant fails or refuses to accomplish such activities, and to reimburse the State for all its costs of achieving that condition of the Lease area. Any assets remaining from the financial assurance after all costs to the State, including administrative costs to secure the funds, have been reimbursed therefrom, shall be returned to the Tenant.

26. NON-DISCRIMINATION. In its use of the Lease area, Tenant shall not discriminate against, harass, or allow harassment against any person or class of persons on the basis of race, color, creed, religion, national origin, ancestry, sex, sexual orientation, age, marital status, medical condition or disability. Tenant shall ensure that the evaluation and treatment of its employees and applicants for employment are free from such discrimination and harassment.

Tenant shall comply with the provisions of the Fair Employment and Housing Act (Government Code section 12900 et seq.) and the applicable regulations promulgated thereunder (California Code of Regulations, Title 2, section 7285.0 et seq.). Tenant shall give written notice of their obligations under this clause to labor organizations with which they have a collective bargaining or other agreement. Tenant shall include the non-discrimination and compliance provisions of this clause in all contracts to perform work under and/or in connection with this Lease.

Tenant shall be solely responsible for complying with the requirements of the Americans With Disabilities Act of 1990 (P.L. 101-336, commencing at section 12101 of Title 42, United States Code and including Titles I, II and III), the Rehabilitation Act of 1973, and all related regulations, guidelines and amendments to both laws.

27. DRUG-FREE WORKPLACE. Tenant will comply with the requirements of the Drug-Free Workplace Act of 1990, as amended, and will provide a drug-free workplace by taking the following actions:

(a) Publish a statement notifying employees that unlawful manufacture, distribution, dispensation, possession or use of a controlled substance is prohibited and specifying actions to be taken against employees for violations.

(b) Establish a Drug-Free Awareness Program to inform employees about: (1) the dangers of drug abuse in the workplace; (2) the Tenant's policy of maintaining a drug-free workplace; (3) any available counseling, rehabilitation and employee assistance programs; and, (4) penalties that may be imposed upon employees for drug abuse violations.

(c) Provide that every employee who works on the Lease area will: (1) receive a copy of the Tenant's drug-free policy statement; and, (2) agree to abide by the terms of the Tenant's statement as a condition of employment on the Lease area.

Failure to comply with these requirements may result in suspension or termination of this Lease, and Tenant may be ineligible for award of any future State Water Bottom Leases if the State determines that any of the following has occurred: (1) the Tenant has made false certification, or (2) violated the certification by failing to carry out the requirements as noted above.

28. ENTIRE AGREEMENT. This Lease contains the entire agreement between the parties, and an agreement hereafter shall be ineffective to change, modify or discharge it in whole or in part, unless such agreement is in writing and contains the authorized signature of the party against whom enforcement of the change, modification or discharge is sought.

29. CONSTRUCTION. This Lease shall be governed by and construed in accordance with the laws of the State of California. The Section titles in this Lease are inserted only as a matter of convenience and for reference, and in no way define, limit, or describe the scope or intent of this Lease or in any way affect this Lease.

Tenant shall maintain annual registration of its aquaculture facility in accordance with Fish and Game Code sections 15101 and 15103 and shall keep current with all fees and surcharges, including any penalties for late payment of same, required by those statutes.

30. INCORPORATION BY REFERENCE. The provisions of Chapters 1 through 8 of Division 12 of the Fish and Game Code (commencing with section 15000) and the provisions of Chapter 9 of Division 1 of Title 14, California Code of Regulations (commencing with section 235), as may be amended from time to time, are made part of this Lease by this reference. If there is a conflict between any term or condition of

this Lease and any of the provisions incorporated by reference in it, the incorporated provisions shall control.

31. CONFLICTS OF INTEREST. Tenant warrants that no official, employee in the state civil service or other appointed state official, or any person associated with same by blood, adoption, marriage, cohabitation, and/or business relationship: (a) has been employed or retained to solicit or aid in the procuring of this Lease; or (b) will be employed in the performance of this Lease without the immediate divulgence of such fact to the State. In the event the State determines that the employment of any such official, employee, associated person, or business entity is not compatible, Tenant shall terminate such employment immediately. For breaches or violations of this Section, the State shall have the right to annul this Lease without liability.

32. EXPATRIATE CORPORATION. Tenant hereby declares that it is not an expatriate corporation or subsidiary of an expatriate corporation, within the meaning of Public Contract Code sections 10286 and 10286.1 and is eligible to contract with the State.

33. NO AGENCY. The Tenant, and the agents and employees of the Tenant in the performance of the Lease, shall act in an independent capacity and not as officers or agents of the State of California.

34. CLOSURE. Neither the State nor the Department of Fish and Game shall have any liability arising from a closure of waters by the Department of Fish and Game Director pursuant to Fish and Game Code section 5654, where aquaculture operations are taking place.

35. NOTICES. Notices to the parties to this Lease shall be made in writing and may be given by delivery in person, by U.S. Mail with postage prepaid, or by receipt-confirmed facsimile to:

FISH AND GAME COMMISSION Executive Director 1416 Ninth Street, 13 TH Floor Sacramento, CA 95814 Telephone: (916) 653-4899 Facsimile: (916) 653-5040	[BUSINESS NAME] [PERSON/TITLE] [ADDRESS] [CITY/STATE/ZIP] Telephone: (000) 000-0000 Facsimile: (000) 000-0000
---	--

Notices shall be deemed given upon delivery to the addressee. Any notice given by facsimile shall also be given to the addressee by U.S. Mail, with postage prepaid. If a notice given by facsimile is delivered to the addressee after 5:00 p.m. Pacific time, or on a Saturday, Sunday or State of California or national holiday, the notice shall be deemed given on the next business day. Either party may change its address for notice purposes by giving written notice to the other party in the manner provided in this Section.

36. SPECIAL CONDITIONS. [THIS SPACE RESERVED FOR ANY SITE-SPECIFIC PROVISIONS OR EXCEPTIONS/MODIFICATIONS TO THE PRECEDING SECTIONS.]

SIGNATURE PAGE

This Lease and any amendment(s) may be executed in counterparts, each of which, when executed and delivered by the State and Tenant, shall be an original and together shall constitute one instrument, with the same force and effect as though all signatures appeared on a single document.

Each signatory attests he or she is duly authorized to execute this Lease on behalf of the principal he or she represents.

Where Tenant is a corporation, the signature of the Tenant on this Lease will be verifying that Tenant is currently qualified to do business in the State of California, as defined in Revenue and Taxation Code section 23101, in order to ensure that all obligations to the State are fulfilled. Both domestic and foreign corporations (those incorporated outside the State of California) must be in good standing in order to be qualified to do business in California.

EXHIBIT A

LEASE OF STATE WATER BOTTOMS FOR AQUACULTURE, LEASE NO. M-430-15

This aquaculture lease made and entered into as of this 1st day of March, 1990, by and between the State of California, acting by and through its Department of Fish and Game, hereinafter referred to as "Lessor", and Shellfresh International, hereinafter referred to as "Lessee".

WITNESSETH:

WHEREAS, Lessee is presently the holder of a valid license to cultivate marine life for profit in the waters of the State of California as provided in Fish and Game Code Section 15101, and

WHEREAS, Lessee has heretofore filed with Lessor a bid application for the exclusive privilege of cultivating oysters, mussels and clams in the hereinafter described waters of the State of California, and has accompanied said application with the required filing fee of one hundred dollars (\$100.00), and

WHEREAS, Lessor has heretofore published notice of the hearing of said application, has been advised by the State Lands Commission of the State of California that the area applied for is available for leasing, and it has been determined by the Fish and Game Commission that it is in the best interest of the State of California that such lease be made, and

NOW, THEREFORE, THIS INDENTURE WITNESSETH:

That, in consideration of the payment of the monies hereinafter stated in accordance with the bid made by Lessee and accepted at a duly called and noticed hearing of the Fish and Game Commission of the State of California, pursuant to law and in consideration of the covenants contained herein on the part of the Lessee, the Lessor does hereby lease the California state water bottom hereinafter described and does hereby grant to Lessee the exclusive privilege to cultivate oysters, mussels and clams thereon, and in those certain waters of the State of California described as follows, to wit:

All that certain real property situated in the County of Marin, State of California as described as follows:

In Tomales Bay, Marin County, State of California, starting from Bench Mark 8, located at approximately 38°12'38.7" North latitude, and 122°55'22" West longitude, on the Tomales Bay Quadrangle, Marin County, California, U.S. Dept. of the Interior, Geological Survey 7.5 minute series topographic map; thence North 83°31' West for a distance of 2,749.3 feet to the top of Preston Point Rock lying off the northwest tip of Preston Point; thence North 59°41'20" West, 655.05 feet; thence North 6°56'04" West, 648.54 feet; thence North 36°02'6"51" West, 454.15 feet; thence North 35°32'16" West, 449.04 feet; thence North 51°34'55" West, 322.02 feet; thence North 44°01'44" West, 363.01 feet to the true point of beginning; thence North 45° West 221.47 feet; thence North

28°48'39" West, 397.16 feet; thence South 54°42'25" West, 127.91 feet; thence North 36°35'53" West, 189.70 feet; thence North 68°37'46" West, 214.87 feet; thence North 53°50'31" West, 280.16 feet; thence North 81°20'51" West, 404.81 feet; thence South 79°06'52" West, 230.34 feet; thence South 62°43'24" West, 626.46 feet; thence South 39°09'48" West, 1391.37 feet; thence South 33°41'24" East, 62.74 feet; thence South 59°22'34" West, 1127.21 feet; thence South 30°49'40" East, 628.15 feet; thence South 36°20'51" East, 572.48 feet; thence North 84°16'04" East, 131.16 feet; thence North 58°07'41", 3764.82 feet to the true point of beginning.

This area of water bottom, containing an area of 128.2+ acres more or less, comprises Aquaculture Lease No. M-430-15 (Appendix 1).

This lease, in accordance with provisions of Fish and Game Code Section 15400, as may from time to time be amended or changed by the State Legislature, is for the sole purpose of cultivating Pacific oyster (Crassostrea gigas), Manila clam (Tapes japonica), and bay mussel (Mytilus edulis) in the previously designated area.

The cultivation of additional species of aquatic plants and animals requires the approval of the Fish and Game Commission. Seed stocks must be certified before planting in compliance with Fish and Game Code Section 15201, and must be planted by Lessee in a manner and at a size approved by Lessor to assure that harvested animals are a product of the lease. A request for certification of planting stock will be submitted by Lessee to the Lessor at least ten (10) days prior to the proposed date of inspection.

All shellfish cultivation methods on the lease shall be confined to racks and bags and bottom trays within the area approved by the Commission. No other mode of operation or culture method is authorized, unless Lessee shall first obtain approval from the Fish and Game Commission.

Notice of intent to plant shellfish on the lease shall be given to the Department of Fish and Game, Marine Resources Division, 411 Burgess Drive, Menlo Park, CA 94025. In addition to the required ten (10) day notice, at least a 24-hour notice shall be given to the Marine Unit Manager, Mr. Paul Reilly, telephone (415) 688-6362, giving details on where the shellfish seed can be inspected.

This lease is for a term of twenty-five (25) years commencing on the 1st day of March, 1990, and ending on February 28, 2015, for a total rental of four thousand nine hundred and ninety-nine dollars and eighty cents (\$4,999.80) per year, and a privilege tax on all products harvested as provided by Fish and Game Code Section 8045. Said annual rental will be payable to Lessor on a fiscal year basis, July 1 - June 30, and within thirty (30) days of the commencement of the lease, or after receipt of the consummated lease agreement. If said annual rental

is not paid within sixty (60) days after the close of the month in which it is due an additional 10 percent penalty shall be paid. Lessor, at its option, may declare the lease abandoned for failure to pay such rental fees within 90 days from the beginning of the rental period; although such abandonment shall not relieve Lessee of his obligation to pay such rental and penalty which are due and owing. Lessee agrees to pay Lessor reasonable attorney fees and costs incurred in collecting any amounts and/or penalties due and owing from Lessee under the provisions of this lease. Lessee agrees to pay said rent to Lessor at its office in the City of Sacramento, State of California, or at such other place as Lessor may, from time to time, designate.

Lessee expressly recognizes and acknowledges that any payments by Lessee as provided for herein, are subject to the provisions of Fish and Game Code Section 15410, which provides that all leases shall be subject to the power of the Legislature to increase or decrease the rents, fees, taxes, and other charges relating to the lease, but no increase in rent shall be applicable to an existing lease until it is renewed.

This lease is made upon the following terms, conditions and covenants, to wit:

A. This lease may, at the option of the Lessee, be renewed for additional periods not to exceed 25 years each. If Lessee desires to enter into a new lease for a period commencing after expiration of the initial 25-year term, Lessee shall give notice to Lessor one (1) year prior to termination of the lease. The lease may be renewed if, during the notification period, terms for a new lease are agreed upon by Lessee and the Commission.

B. Lessee shall keep records as required in accordance with Fish and Game Code Section 15414, on forms to be supplied by Lessor, and shall maintain adequate accounting records sufficient to determine monies due to Lessor by the 10th day of each month, for all shellfish harvested during the preceding calendar month. Lessor reserves the right to inspect Lessee's premises, equipment, and all books at any time and records of Lessee pertaining to Lessee's cultivation on the leased premises.

C. In order to provide assurance to lessor that this aquaculture lease is utilized for the purpose stated in the lease application, the lease shall be improved at no less than the minimum rate established by Commission regulations (Appendix 2). This annual rate of planting for shellfish shall be:

Off-bottom culture: 641,000 single seed less than 1 year old (@ 5,000/acre)
or 128 cases (@ 80 lbs shellstock/case) of seed-bearing shell.

The term of improvement for this lease shall be three years, with the minimum rate of planting for the entire acreage being reached by July 1, 1992. The minimum annual rate of planting for the entire acreage will be maintained thereafter until the end of the lease.

The minimum annual harvest requirement for the lease will be an average of 2,000 oysters, clams or other shellfish per acre, effective July 1, 1992.

A minimum rate of planting shall be negotiated for option periods. Lessor may declare this lease terminated if Lessee fails to meet these cultivation and harvesting requirements and if Lessee, at any time, is proven to be failing in good faith, to pursue the purpose of this lease.

D. If, at any time subsequent to the beginning date of this lease, the use of cultural devices authorized herein shall fall into a state of disrepair or otherwise become an environmental or aesthetic degradation, as determined by Lessor, then upon written notice by Lessor, Lessee shall have sixty (60) days to repair and correct conditions cited by Lessor. Failure to comply with written notice shall be grounds for termination of this lease and Lessee shall, at the option of Lessor, remove all improvements located on lands covered by this lease.

As a financial guarantee of growing structure removal and/or clean-up expense in the event a lease is abandoned or otherwise terminated, Lessee shall place on deposit, pursuant to the "Escrow Agreement For Cleanup of Aquaculture Leases, Tomales Bay, California", a sum in a proportion that the Lessee's individual acreage bears to the total acreage of specified leased parcels of State water bottoms in Tomales Bay, Marin County, California, until the sum of five thousand dollars (\$5,000.00) is reached. This escrow deposit is established in compliance with Section 7 of the Fish and Game Commission Policy, Awarding of Tomales Bay Aquaculture Leases, adopted January 7, 1989 (Appendix 3). Such money shall be deposited over a two-year period payable one-half upon entering upon the lease and one-half upon the first anniversary of such inception date. The escrow deposit shall be increased if the Fish and Game Commission determines that, if abandoned, any particular culture operation is likely to be more expensive to remove. The escrow deposit may be reduced by the Commission upon demonstration that the probable cost of removal of all improvements would be less than the deposit previously required. In its annual proof of use report, the Lessor shall advise the Commission of its best estimate of the probable cost of removal of each lease operation. The escrow agreement, escrow holder, and escrow depository shall be agreed upon by the Executive Secretary of the Fish and Game Commission, the Lessor and Tomales Bay Shellfish Growers Association.

It shall be the responsibility of the Lessee to maintain the specified security balance at the level established by the Commission, regardless of the number of lessees who continue in aquaculture operations within the bay.

If Lessee abandons this lease without removing growing structures therefrom, the escrow deposit shall be expended to remove growing structures, or otherwise clean up the lease, or in the alternative, the remaining lessees in Tomales Bay and the Tomales Bay Shellfish Growers Association may undertake the clean-up leaving the secured amount whole.

In order to assure compliance with the escrow provisions of this lease, Lessee shall place in the agreed upon escrow account specified in the "Escrow Agreement For Cleanup of Aquaculture Leases, Tomales Bay, California (Addendum 1)", hereby attached to and made part of this agreement, a total of nine hundred thirty dollars (\$930.00), a sum (rounded to the nearest dollar amount) proportional to Lessee's total lease acreage of one hundred twenty-eight and two-tenths (128.2) acres, which bears to the total acreage of 688.9 acres of State water bottoms leased in Tomales Bay for aquaculture purposes. Certification that the first half of the specified deposit has been made, a total of four hundred sixty-five dollars (\$465.00), must be received by Lessor prior to final approval of this lease agreement. Proof that the second half of the required security deposit (\$465.00) has been made must be furnished to Lessor on or before February 28, 1991, or this lease shall be subject to termination.

E. Lessee shall observe and comply with all rules and regulations now or hereinafter promulgated by any governmental agency having authority by law, including but not limited to, State Water Resources Control Board, State Coastal Commission, State Lands Commission, U.S. Coast Guard, and U.S. Army Corps of Engineers. Any other permits or licenses required by such agencies will be obtained by Lessee at his own sole cost and expense.

F. Lessee recognizes and understands in accepting this lease, that his interest therein may be subject to a possible possessory interest tax that the county may impose on such interest, and that such tax payment shall not reduce any rent or royalty due to the Lessor hereunder, and any such tax shall be the liability of, and be paid by, Lessee.

G. Any modification of natural or existing features of the real property described in this lease, which is not consistent with the authorized uses under this lease, is expressly prohibited without prior written consent of the Lessor.

H. As evidence of progress in aquaculture, Lessee shall submit each year to the State at the Marine Resources Division office, 411 Burgess Drive, Menlo Park, CA 94025, a written declaration under penalty of perjury, showing the date and amount of each type of aquaculture development and date and amount of designated species comprising each planting, including a diagram showing area, amounts, and dates planted. Such declaration shall be submitted on or before July 15, of each year for the previous year, July 1 - June 30, inclusive.

I. This lease shall be canceled at any time Lessee fails to possess a valid aquaculture registration issued pursuant to Fish and Game Code Section 15101. Lessee agrees not to commit, suffer or permit any waste on said premises, or any act to be done thereon in violation of any laws or ordinances. This lease shall be subject to termination by Lessee at any time during the term thereof, by giving Lessor notice in writing at least ninety (90) days prior to the date when such termination shall become effective. In the event of such termination by Lessee, any unearned rental shall be forfeited to the Lessor.

J. This lease of state water bottom only grants Lessee the exclusive right to cultivate and harvest the specified species of oysters, mussels and clams as described in Lessee's lease bid.

K. The lease shall be clearly marked with buoys or stakes to prevent interference with boating or fishing activities that may take place in the area. Minimum marking of the lease shall include: One (1) buoy or stake on each of the four corners of the lease. All buoys or stakes used to define the boundaries of the lease shall be marked in conformance with the International Association of Lighthouse Authorities Maritime Buoyage System regulations (33 CFR Section 62.33 and 66.01-10). Lessee shall make application to the U.S. Coast Guard, Aids to Navigation Branch, 400 Ocean Gate, Long Beach, CA 90822, for approval of the buoys and stakes to be established on this lease. Each buoy or stake shall be set and maintained to extend at least three (3) feet above the surface of the water at mean higher high water. All buoys or stakes shall bear the Aquaculture Lease No. M-430-15.

If buoys or stakes used to mark this lease are lost, displaced or otherwise removed from the lease area, they must be replaced within a two-week period, weather conditions permitting, or the lease may be subject to abandonment proceedings.

L. In compliance with Sections 1, 2, and 3 of the Policy, Awarding of Tomales Bay Aquaculture Leases, adopted by the Fish and Game Commission at its meeting on January 12, 1989 (Appendix 3), Lessee agrees to cooperate with the Lessor in the monitoring of the health of eel grass beds located on the lease and in conducting a study to gather baseline sedimentation data on eel grass beds lying within the lease boundary. Lessee further agrees to participate with the Lessor in the design, implementation, and operation of a study to collect baseline information on sedimentation occurring within the leasehold during the period March 1, 1990 and June 30, 1994, and the monitoring of wintering shorebirds during the period November 1 to February 28 each year, adequate to measure any population or use changes due to lease operations.

If any of the environmental monitoring programs discussed above indicate, or any other reliable information leads the Lessor to conclude that Lessee's aquaculture operation is directly associated with a significant adverse change in the Tomales Bay ecosystem, Lessor shall notify the Executive Secretary of the Fish and Game Commission and the Lessee of such findings. Upon receipt of notice, Lessee shall take all necessary steps to modify, relocate or discontinue the operation in accordance with the Lessor's advice, unless Lessee demonstrates that its aquaculture operations are not a substantial factor, directly or cumulatively, causing the adverse environmental change. Failure to promptly respond shall be grounds for termination of the lease.

M. In addition to the conditions and restrictions herein provided for in this lease, and any right or privilege granted, conveyed or leased hereunder shall be subject to, and Lessee agrees to comply with all applicable provisions of the California Fish and Game Code, and regulations of the Fish and Game Commission, in particular Fish and Game Code Sections 15400-15415, inclusive, and expressly recognizes the right of the Legislature and the Fish and Game Commission to enact new laws and regulations. In the event of any conflict between the provisions of this lease and any law or regulation enacted in the future, the latter will control.

N. This lease is personal to the Lessee and shall not be transferred, assigned, hypothecated, or subleased, either voluntarily or by operation of law, without prior approval of the Fish and Game Commission.

O. In the event of any breach by Lessee of any of the provisions hereof, other than the payment of any sum due from Lessee to Lessor hereunder, which breach is not remedied, abated and cured by Lessee within 60 days after notice in writing, shall cause this lease to thereupon cease and terminate.

P. The attached Nondiscrimination Clause (OCP-1) is hereby made a part of this agreement.

Q. All notices herein provided to be given or which may be given by either party to the other, shall be deemed to have been fully given when made in writing and deposited in the United State Mail, certified and postage prepaid and addressed as follows:

To the Lessor

DEPARTMENT OF FISH AND GAME
1416 Ninth Street
Sacramento, CA 95814

To the Lessee

Jim K. Wilson
Shellfresh International
5850 Fredricks Road
Sebastopol, CA 95472

Nothing herein contained shall preclude the giving of any such written notice by personal service. The address to which notices shall be mailed as aforesaid to either party may be changed by written notice given by such party to the other, as hereinbefore provided.

R. Lessee hereby indemnifies and holds harmless the Lessor, its officers, agents, and employees against any and all claims and demands of every kind and nature whatsoever, arising out of, or in anyway connected with the use by Lessee of said lease, or the exercise of the privilege herein granted.

IN WITNESS WHEREOF, the parties have caused this amendment to said aquacultur lease to be executed as of the day and year first above written.

NONDISCRIMINATION CLAUSE

(OCP - 1)*

1. During the performance of this contract, contractor* and its subcontractors shall not unlawfully discriminate against any employee or applicant for employment because of race, religion, color, national origin, ancestry, physical handicap, medical condition, marital status, age (over 40) or sex. Contractors and subcontractors shall insure that the evaluation and treatment of their employees and applicants for employment are free of such discrimination. Contractors and subcontractors shall comply with the provisions of the Fair Employment and Housing Act (Government Code, Section 12900 et seq.) and the applicable regulations promulgated thereunder (California Administrative Code, Title 2, Section 7285.0 et seq.). The applicable regulations of the Fair Employment and Housing Commission implementing Government Code, Section 12990, set forth in Chapter 5 of Division 4 of Title 2 of the California Administrative Code are incorporated into this contract by reference and made a part hereof as if set forth in full. Contractor and its subcontractors shall give written notice of their obligations under this clause to labor organizations with which they have a collective bargaining or other agreement.
2. This contractor shall include the nondiscrimination and compliance provisions of this clause in all subcontracts to perform work under the contract.

* All references to "contractor" shall be deemed to be Lessee.

**AMENDMENT NO. 2
TO LEASE OF STATE WATER BOTTOMS
FOR AQUACULTURE LEASE NO. M-430-15**

This amendment to aquaculture lease made and entered into as of the first day of September, 1992, by and between the State of California, acting by and through its Department of Fish and Game, hereinafter referred to as "Lessor", and Shellfresh International Inc., and Hog Island Oyster Co., Inc., hereinafter jointly referred to as "Lessee".

W I T N E S S E T H:

WHEREAS, Shellfresh International, Inc., and Lessor did on March 1, 1991, enter into amended Lease Agreement No. M-430-15, for the purpose of cultivating oysters, mussels and clams, and

WHEREAS, Shellfresh International, Inc., has applied to Lessor to amend said lease to authorize the operation of the leasehold as a joint venture, known as "Tom's Point Shellfish", with Hog Island Oyster Co., Inc., and

WHEREAS, the Fish and Game Commission has considered the request of Shellfresh International Inc., to amend said lease and has found that such an amendment is in the best interest of the State of California.

NOW, THEREFORE, it is mutually agreed by and between the parties hereto that this lease is hereby amended to provide that the Lessee shall henceforth be known as Shellfresh International, Inc., and Hog Island Oyster Co., Inc., joint tenants as to an undivided one-half interest.

This lease is for a term of twenty-five (25) years commencing on the 1st day of March 1991, and ending on February 28, 2016.

All notices provided to be given in said lease or which may be given by either party to the other, shall be deemed to have been fully given when made in writing and deposited in the United States Mail, certified and postage-prepaid and addressed as follows:

To the Lessor

Department of Fish and Game
1416 Ninth Street
Sacramento, CA 95814

To the Lessee

John Finger, President
Hog Island Oyster Co., Inc.
P.O. Box 829
Marshall, CA 94940

Except as herein amended, all other terms of said aquaculture lease remain unchanged and in full force and effect.

IN WITNESS WHEREOF, the parties have caused this Amendment to Indenture of Lease to be executed as of the day and year first written above.

**AMENDMENT NO. 3
TO
INDENTURE OF LEASE**

This amendment of Aquaculture Lease made and entered into as of the 1st day of April 1996, by and between the State of California, acting by and through its Department of Fish and Game, hereinafter referred to as "Lessor", and Hog Island Oyster Company, Inc., hereinafter referred to as "Lessee."

WITNESSETH:

WHEREAS, on March 1, 1989, Lessor did enter into Lease Agreement No. M-430-15 with Shellfresh International for the purpose of cultivating oysters, mussels and clams, and

WHEREAS, on March 1, 1991 said lease was amended to change the beginning date from March 1, 1989 to March 1, 1991, and the ending date was extended to February 28, 2016, and

WHEREAS, on September 1, 1992 said lease was amended to provide that the lessee shall henceforth be known as Shellfresh International, Inc. and Hog Island Oyster Company, Inc., joint tenants as to an undivided one-half interest, and

WHEREAS, the Fish and Game Commission at its meeting on October 7, 1994 adopted new administrative procedures to standardize annual proof-of-use reporting and the rental period for aquaculture leaseholds, and approved revision of the Escrow Agreement for Cleanup of Aquaculture Leases in Tomales Bay (Addendum 1), and

WHEREAS, on June 26, 1995 the Fish and Game Commission was notified that Hog Island Oyster Company had assumed the full rights and responsibilities of the lease, as per stipulations in the joint venture agreement between Shellfresh International, Inc. and Hog Island Oyster Company, Inc., and determined that the amendment of this aquaculture agreement would be in the best interest of the State.

NOW THEREFORE, THIS AMENDMENT WITNESSETH:

That, in accordance with actions taken by the Fish and Game Commission of the State of California, pursuant to Fish and Game Code Section 15400, Lessor does hereby amend said lease for such consideration, specific purposes and subject to covenants, terms, conditions, reservations, restrictions and limitations as are set forth herein.

This amended lease falls within the authorized term of the initial lease, twenty-five (25) years, which commenced on the 1st day of March 1989, and ends on February 29, 2016, for a total rental of four thousand nine hundred and ninety-nine dollars and eighty cents (\$4,999.80) per year, and a privilege tax on all products harvested as provided by Fish and Game Code sections 8051, 18406.5, and 15406.7. Beginning January 1, 1997, said annual rental fee will be payable to Lessor on a calendar year basis, January 1 -- December 31. The next annual rental

fee will be due July 1, 1996, and will cover the period July 1, 1996 to December 31, 1996 in the amount of two thousand four hundred ninety-nine dollars and ninety cents (\$2,499.90). If said annual rental fee is not paid within sixty (60) days after the close of the month in which it is due, an additional 10 percent penalty shall be paid. Lessor, at its option, may declare the lease abandoned for failure to pay such rental fees within 90 days from the beginning of the rental period; although such abandonment shall not relieve Lessee of its obligation to pay such rental and penalty which are due and owing. Lessee agrees to pay Lessor reasonable attorney fees and costs incurred in collecting any amounts and/or penalties due and owing from Lessee under the provisions of this lease. Lessee agrees to pay said fee(s) to Lessor at its office in the City of Sacramento, State of California, or at such other place as Lessor may, from time to time, designate.

This lease is made upon the following additional terms, conditions, and covenants, to wit:

H. As evidence of progress in aquaculture, Lessee shall submit each year to the State at the Marine Resources Division office, P. O. Box 1560, Bodega Bay, California 94923, a written declaration under penalty of perjury, showing the date and amount of each type of aquaculture development and date and amount of designated species comprising each planting, including a diagram (map) showing area, amounts, and dates planted. Such annual proof-of-use shall be submitted on or before February 1 of each year for the previous year, January 1 -- December 31, inclusive.

Q. All notices herein provided to be given or which may be given by either party to the other, shall be deemed to have been fully given when made in writing and deposited in the United States Mail, certified and postage prepaid and addressed as follows:

To the Lessor	DEPARTMENT OF FISH AND GAME 1416 Ninth Street Sacramento, CA 95814
To the Lessee	MR. JOHN FINGER HOG ISLAND OYSTER CO., INC. P. O. Box 829 Marshall, CA 93940

Nothing herein contained shall preclude the giving of any such written notice by personal service. The address to which notices shall be mailed as aforesaid to either party may be changed by written notice given by such party to the other, as hereinbefore provided.

Except as herein amended, all other terms of said lease agreement shall remain unchanged and in full force and effect.

IN WITNESS WHEREOF, the parties have caused this amendment to said aquaculture lease to be executed as of the day and year first above written.

State Water Bottom Lease M-430-15 Tomales Bay, Marin County, CA

Map prepared by
CA Dept. Fish and Game
30 January 2012

ADDENDUM TO
AQUACULTURE LEASE
BETWEEN
DEPARTMENT OF FISH AND GAME, LESSOR
AND
HOG ISLAND OYSTER COMPANY, INC.
ESCROW AGREEMENT FOR
CLEANUP OF AQUACULTURE LEASES
TOMALES BAY, CALIFORNIA

(Addendum 1)

This Escrow Agreement is being entered into as of the 1st day of December 1994, between the State of California, acting by and through its Department of Fish and Game, hereinafter referred to as "Lessor", and Hog Island Oyster Company, Inc. hereinafter referred to as "Lessee", and California Aquaculture Association a California Nonprofit Corporation, hereinafter referred to as the "Association."

Lessee has entered into an agreement for the lease of State water bottoms for aquaculture situated in Tomales Bay, Marin County, State of California, more particularly described as Lease No. M-430-15.

This Escrow Agreement is subject to Lease No. M-430-15 and in accordance with Paragraph D thereof.

As a financial guarantee of growing structure or other lease improvement removal and/or cleanup expense in the event that the aforementioned aquaculture lease is abandoned or otherwise terminated, the parties agree as follows:

1. Lessee will deposit or cause to be deposited in escrow in cash or by certified check, funds totaling \$929.00, which funds will consist of the following:

- (a) \$464.50 deposited upon entering upon the lease;
- (b) \$464.50 deposited upon the first anniversary of such inception date.

In the event that Lessee fails to deposit funds as required by Subparagraphs (a) or (b) herein, Lessor may terminate Lessee's aquaculture lease by giving sixty days notice to Lessee by registered or certified mail.

2. The Treasurer of the California Aquaculture Association shall act as Escrow Agent for Lessees who are association members in good standing and shall place the escrow deposits in an interest-bearing account in the Union Bank Branch, at Brawley, California, subject to disposition as hereinafter provided. Such deposits shall be retained in a separate account designated "Tomales Bay Cleanup Fund" by Escrow Agent as trustee for Lessor, and shall designate the Association as the beneficial owners.

3. The Tomales Bay Lessees contributing to the "Tomales Bay Cleanup Fund" shall be responsible for paying all fees and expenses incurred by Escrow Agent in administering the escrow account. These expenses and payment terms shall be determined by the Tomales Bay Lessees and Escrow Agent.

4. The interest earned on the trust account held in escrow and all interest earned on that interest shall be for the sole account of the Tomales Bay Lessees and may be withdrawn by the Escrow Agent at any time for distribution to Association members, who are Tomales Bay Lessees, without notice to Lessor.

5. Lessees shall make payments to the Escrow Agent on account of the Tomales Bay Cleanup Fund in the manner prescribed in paragraph 1(a) and (b) until the sum of five thousand dollars (\$5,000.00) is reached. Thereafter, the Tomales Bay Cleanup Fund shall be maintained by the Lessees at Five Thousand Dollars (\$5,000.00) as hereinafter provided, regardless of the number of lessees who continue in aquaculture operations in Tomales Bay.

6. When Lessees deposit funds into escrow, Escrow Agent shall notify Lessor in writing within ten days of receipt thereof.

7. Escrow Agent shall notify Lessor and Association in writing when two thousand five hundred dollars (\$2,500.00) has been deposited to the escrow account and provide written verification from the bank of such deposit. Thereafter, on the anniversary date of such initial notification, Escrow Agent shall report and certify the balance of funds on deposit accompanied by the accounting records provided by the banking institution of deposit.

8. The Lessor may increase or decrease the security amount held in escrow upon cause shown therefor and sixty days notice to the Tomales Bay Lessees. Lessee's annual Proof of Use Report shall contain a reasonable estimate of the cost of removal of growing structures from each operation. Any increase required by the Lessor shall be deposited by the Lessees in the same proportion as provided in Paragraph 1; and any decrease shall be returned to the Lessees by the Escrow Agent in the same proportion provided in Paragraph 1.

9. Should Lessee transfer his interest under the lease with the approval of the California Fish and Game Commission, Escrow Agent shall transfer such escrow deposit to the successor in interest, and thereafter notify all parties hereto of such transfer. The successor in interest shall have all of the rights and obligations of Lessee with respect to such escrow deposit.

10. If, on termination of an aquaculture lease, Lessee removes all growing structures and improvements within sixty days, Lessee's escrow deposit shall be returned to Lessee by Escrow Agent no later than two weeks after receipt of written notice by Escrow Agent from Lessor authorizing such return.

11. If at any time during the lease term, any Lessee abandons a lease without removing growing structures and improvements, Lessor and/or Association shall do one of the following acts:

- (a) The Association may undertake the cleanup, within sixty days of written notification from Lessor that said lease is abandoned, and Lessor shall not resort to the escrow security account.
- (b) Lessor, after sixty days have elapsed, as defined in paragraph 11(a), may appropriate and apply any portion of the escrow security account as may be reasonably necessary to fund the cleanup;
- (c) Lessor may elect to have growing structures and improvements remain in place and return Lessee's escrow deposit as provided in Paragraph 10.

12. Lessor shall have a right to draw upon the escrow account in the event of default by the Lessees. Upon seven days written notice to the Escrow Agent from the Lessor of the default, Escrow Agent must immediately distribute funds as instructed by Lessor.

13. Should Lessor actually resort to any monies contained within the escrow account under any of the above applicable provisions, Lessees agree to deposit to the escrow account, in the same proportion as provided in Paragraph 1, the amount for which resort to the escrow security was had and necessary to restore

the escrow security to the original sum required hereunder in thirty days after written demand by Lessor, except upon disbursement on account of return of escrow security to any Lessee as provided in Paragraph 10.

Restoration of escrow security shall be postponed during any period that Lessor re-advertises for bid and subsequently re-awards any Tomales Bay aquaculture lease. Upon Lessor granting a lease to a successful bidder, the Lessee thereunder shall assume the obligations and rights of his predecessor Lessee, including, but not limited to, the deposit of funds as prescribed in Paragraph 1(a) and (b).

Lessor shall not award or re-award a lease until the notice of deposit required by Paragraph 6 is received.

14. Escrow Agent shall rely on the written notifications from the Lessor and the Association, and the Lessor and the Tomales Bay Lessees shall hold Escrow Agent and Association harmless when Escrow Agent releases and disburses funds and interest pursuant to such a written notification.

15. In the event that any legal action is pursued in relation to this Escrow Agreement, the parties hereby agree to pay their own attorney's fees and legal costs regardless of who prevails.

16. Any notice required to be given under this Escrow Agreement may be given by personal delivery in writing or by registered or certified mail, postage prepaid, return receipt requested. Notice shall be deemed communicated as of mailing. Mailed notices shall be addressed as set forth below, but each party may change its address by written notice in accordance with this paragraph.

To the Lessor:	DEPARTMENT OF FISH AND GAME 1416 Ninth Street Sacramento, California 95814
To the Association:	CALIFORNIA AQUACULTURE ASSOCIATION P. O. Box 1004 Niland, California 92257
To the Escrow Agent:	THE TREASURER CALIFORNIA AQUACULTURE ASSOCIATION P. O. Box 1004 Niland, California 92257
To the Lessee:	John Finger Hog Island Oyster Company P. O. Box 829 Marshall, California 94940

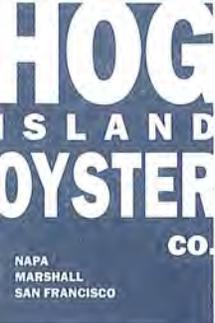

17. At the time this Escrow Agreement is executed by all parties, the Lessor shall deliver to the Escrow Agent a fully executed counterpart of this agreement.

In witness whereof, the parties have executed this Agreement by their proper officers on the date first set forth above.

Re: Hog Island Oyster Co. Tomales Bay Lease M-430-15

Dear Mr. Mastrup:

This letter is to notify you of Hog Island Oyster Company's intent to renew lease M-430-15 located in Tomales Bay expiring February 28, 2016.

We look forward to hearing from you regarding our renewal request.

Respectfully,

A handwritten signature in blue ink, appearing to read "Terry Sawyer", is written over the word "Respectfully,".

Department of Fish and Wildlife

Memorandum

Date: November 23, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015, Fish and Game Commission Meeting Regarding Proposed Renewal of State Water Bottom Lease, M-430-10, Hog Island Oyster Company, Tomales Bay, Marin**

The Department of Fish and Wildlife (Department) is providing the following comments in regard to a request by Mr. John Finger, Hog Island Oyster Company, for Fish and Game Commission (Commission) approval to renew state water bottom lease M-430-15 for a period of 15 years. The existing lease encompasses 128 acres of state water bottom tidelands in Tomales Bay and is set to expire on February 28, 2016.

The original 1990 lease was created with the expressed intent to cultivate Pacific oysters (*Crassostrea gigas*), Manila clams (*Venerupis philippinarum*), and bay mussels (*Mytilus edulis*) and has been used for this purpose by Hog Island Oyster Company since 1992. There are no proposed changes in the culture methods or species currently approved by the Commission for the lease. However, if the lease renewal is approved, the lease will require the Lessee to establish financial assurances of growing structure removal and/or cleanup in the event the lease is abandoned or otherwise terminated.

Upon staff review, it was determined that the proposed project is subject to the "Class 1" or "Existing Facilities" categorical exemption pursuant to CEQA Guidelines section 15301 (Cal. Code Regs., tit. 14, § 15301). In general, the Class 1 exemption consists of the leasing of existing facilities, involving negligible or no expansion of use beyond that existing at the time of the lead agency's determination. All provisions of the lease are identical to the original lease, with the only exception being the 15 year renewal of the lease term. This lease does not increase, decrease, or change existing operations in any way or allow for any new activities by the lessee.

Sonke Mastrup, Executive Director
Fish and Game Commission
November 5, 2015
Page 2

The Department recommends approval of the request to renew state water bottom lease, M-430-15, Hog Island Oyster Company, to Mr. John Finger for a period of 15 years.

If you have any questions regarding this item, please contact Dr. Craig Shuman, Regional Manager of the Department's Marine Region, at (805) 568-1246.

MARINE RESOURCES COMMITTEE

Committee Co-Chairs: Commissioner Sklar and Commissioner Williams

Meeting Summary

November 4, 2015, 9:30 a.m.

**Four Points by Sheraton Ventura Harbor Resort
1050 Schooner Dr., Ventura**

Following is a summary of the meeting as prepared by staff.

1. **Call to order / roll call to establish quorum**

The meeting was called to order at 9:30 a.m. by Commissioner Sklar, who established a quorum. Commissioner Sklar introduced Fish and Game Commission (FGC) staff and California Department of Fish and Wildlife (DFW) staff.

Committee Chairs

Eric Sklar	Present
Anthony Williams	Absent

Commission Staff

Sonke Mastrup	Executive Director
Susan Ashcraft	Marine Advisor
Mary Brittain	Administrative Assistant

DFW Staff

Steve Riske	Assistant Chief, Law Enforcement Division
Bob Puccinelli	Captain, Law Enforcement Division
Craig Shuman	Regional Manager, Marine Region
Tom Barnes	Program Manager, State Managed Fisheries, Marine Region
Ian Taniguchi	Senior Environmental Scientist Specialist, Marine Region
Steve Wertz	Senior Environmental Scientist Supervisor, Marine Region
Alisan Amrhein	Sea Grant Fellow, Marine Region

Susan Ashcraft outlined meeting procedures and guidelines for participating in Committee discussions, noting that the Committee is a non-decision making body that provides

recommendations to FGC on marine items. She reminded participants that the meeting was being audio-recorded for posting to the website with a meeting summary prepared by staff.

2. Approve agenda

Commissioner Sklar approved the agenda without changes.

3. Public forum for items not on agenda

Public comments were received.

A comment was received from Everard Ashworth, Ventura Port District Commissioner, to introduce a new project called the Ventura Shellfish Enterprise. The enterprise was formed to establish several shellfish aquaculture leases in state waters within the Santa Barbara Channel. The group has received a grant from NOAA Sea Grant to explore development of the project, including required state and federal permitting, and invited FGC/DFW partnering.

Several commenters expressed concern over reports that the commercial and recreational Dungeness crab season openers may be delayed, and commercial rock crab season closed, due to elevated levels of domoic acid (see agency update for DFW below).

4. Agency updates

California Ocean Protection Council (OPC)

Valerie Termini, OPC Project Manager, provided an update on recent and upcoming activities of OPC; this included a list of recently-approved OPC/DFW projects related to revision of the Marine Life Management Act (MLMA) Master Plan, and adoption of the Marine Protected Areas Statewide Leadership Team Work Plan. OPC is soliciting applicants for Proposition 1 funding; the deadline to submit letters of intent is December 1, 2015.

DFW

Marine Region: Dr. Craig Shuman provided an overview of recent public and working group meetings held to discuss ways to reduce the risk of whale entanglements in the California Dungeness crab fishery, resulting in best management practices. Dr. Shuman also provided more information related to interagency coordination of crab sampling and testing for domoic acid. He emphasized that any possible commercial fishery closures under DFW director authority would only be considered if the California Department of Public Health (CDPH) determines that crab pose a significant risk to the public if consumed, and if the Office of Environmental Health Hazard Assessment (OEHHA), in consultation with CDPH, recommends the fisheries be closed. FGC staff clarified that the same would be necessary for FGC to consider similar action for the recreational crab fishery under FGC authority.

Law Enforcement Division: Bob Puccinelli detailed multiple enforcement actions, most notably several related to illegal commercialization of recreationally-harvested abalone.

5. Update on Red Abalone Fishery Management Plan

Ian Taniguchi and Alisan Amrhein gave a joint presentation on the background of abalone management, and progress to develop a red abalone fishery management plan (FMP). The presentation included a summary of key public input received through a month-long online angler survey held in spring of 2015, management principles and goals for the FMP based on input, an overview of the FMP management framework under development, and a review of the timeline and next steps.

Public discussion: Meeting attendees expressed enthusiasm and support for the management principles and goals stated, and for DFW openness to building in new data streams from volunteer/public efforts. The Nature Conservancy will be hosting a workshop with DFW to explore how externally-collected data may be integrated into abalone management.

MRC expects to receive an update and overview of specific proposals in a draft FMP at its next meeting.

6. Update on master plan for marine protected areas review and revision process

Steve Wertz presented an overview of the background, focus of the draft master plan adopted by FGC in 2008, and purpose and approach to revising the master plan to focus on management. He highlighted key components of the draft updated master plan, notably how it operationalizes the Marine Life Protection Program, clarifies governance and partnerships, provides statewide network guidance and emphasizes adaptive management. The draft updated master plan was released to tribes upon request in late summer, and will be submitted to FGC for consideration in December. While the Fish and Game Code only requires two hearings before adoption, DFW recommends scheduling a three-meeting public process, with discussion in February 2016 and possible adoption in April 2016.

Public discussion: Attendees indicated their interest in reviewing the draft updated master plan, particularly sections discussing adaptive management and co-management. MRC emphasized that if the master plan recognizes the possibility of these management concepts at a high level, it would provide opportunities for further development over time.

Committee Recommendation: MRC supports providing additional opportunity for public review and input through a 3-meeting process. Thus, MRC recommends that FGC support DFW's proposed meeting schedule.

7. Overview of Marine Life Management Act master plan review and revision process

Tom Barnes presented an overview of the goals and objectives for amending the Master Plan for Fisheries under the Marine Life Management Act (MLMA), the opportunity to address several issues not included in the current master plan that will benefit fisheries management, and the approach being employed. The approach relies on collaboration with outside partners and funders to utilize new tools and expertise. Mr. Barnes highlighted over a dozen external project areas that would server as "stakeholder building blocks." These provide opportunities for stakeholder input along the way. This is the beginning of a long journey and it is still very early in the process; the timeline will cover over two years.

Public discussion: A broad discussion of needs, opportunities, and ideas for the master plan was held. Fishermen highlighted that there are long-standing requests to update existing FMPs and expressed strong views about what is “fair and equitable.” That said, commenters supported development of other approaches to fishery management within the master plan, including new approaches to managing data-poor stocks, and giving “credit” for MPAs, such as through reducing level of precaution in harvest control rules. The master plan may offer the possibility to discuss/expand options for experimental permits, fishing community considerations, emerging fisheries, unmanaged forage species, and to contemplate alternative management approaches (e.g., fishing co-ops) in a manner that would hold the space open to develop them without needing to amend the master plan. Commenters expressed their willingness and interest in contributing input into the various project areas. While guidance and input was offered, no clear suggestions emerged to change the proposed direction of the effort.

MRC encouraged DFW to explore a broad range of opportunities within the master plan that would open the door to future development, and noted that there will be many opportunities at future MRC meetings to receive an update on progress and provide input.

8. California’s fishing communities: Initial scoping

Susan Ashcraft presented an overview of California’s fishing communities in the context of changes in fishing opportunity and management and their effects over the past 15 years, legislative guidance under the MLMA as well as federal law, and provided examples of current efforts, opportunities, and resources that may inform MRC discussion. She opened the exploratory discussion by asking for input on fishing community interests and goals, and potential opportunities to support them.

Public discussion: Fishing representatives discussed the importance of diversification across many fisheries for port vitality and keeping adequate product to support infrastructure. There was a recognition that sometimes diversification across the port may not necessarily translate into opportunity for individual fishermen. Representatives from northern California ports discussed limitations on their ability as local fishermen to diversify based on restricted access programs in place, using market squid as a key example of a fishery resource becoming locally-available but inaccessible to local fishermen. Others commented that there are different vantage points to the equation of vitality and that supporting port economic vitality as a whole might not support individual fishermen. Many examples of opportunities and needs emphasized local effort, forming local business/fishing cooperatives, and the commitment and involvement of local community and governmental representatives (e.g., city council, harbor district, elected officials). Some needs may be legislative in nature. The MRC co-chair recognized that local involvement at the community level may be necessary to further develop and carry out some of the ideas shared. It would be useful for community members to develop the ideas to bring to FGC, to see if or where FGC may play a role.

Committee recommendation: MRC recommends that FGC consider hosting an exploratory discussion on fishing communities at or in conjunction with a future FGC meeting.

9. Update on approach to amending kelp and algae harvest regulations

Steve Wertz presented an overview of the three-phase approach approved by FGC in 2011 to improve kelp and algae harvest management: (1) Clarify the regulations; (2) ensure funding;

and (3) improve management. Phase 1 was completed and implemented in 2014. Research on Phase 2 (fees) is underway. However, based on a review of phases 2 and 3, and the potential for management changes to influence appropriate funding levels, DFW recommended that phases 2 and 3 be reversed.

Public discussion: A kelp harvester noted that the current kelp harvesters directly use the product for aquaculture farms as feed for abalone, as opposed to large-volume harvesters whose product is intended for secondary applications such as converting to agar or biofuel. Current kelp harvesters harvest substantially smaller amounts, and he questioned the need for DFW to invest this much time and effort into reviewing management and fees given the current users. DFW clarified that larger-volume harvesters are not precluded from returning in the future, and that the intent is to proactively plan for future industry needs, not just current needs. The harvester recommended that, at a minimum, management measures and fees should be structure separately for these different types.

Committee recommendation: MRC recommends that FGC support DFW’s proposal to reverse the order of Phase 2 and Phase 3, and undertake management review before reevaluating appropriate fees to cover management.

10. Update on topics previously before the Committee

(A) Fisheries Bycatch Workgroup

Susan Ashcraft provided an update on progress toward establishing a fisheries bycatch workgroup to review existing guidance, evaluate available data, and provide input on possible changes to bycatch guidance for the master plan for fisheries amendment. Staff is working with partners to develop a draft work plan, and participation in the workgroup will be solicited via FGC electronic mailing lists later this year. The workgroup will have the opportunity to contribute to the draft work plan for MRC/FGC consideration. The committee encouraged staff to initiate a workgroup planning meeting by end of year to clarify the group charge and review the draft work plan to propose to MRC, and possibly solicit some external funding support for its efforts.

(B) Pier and Jetty Fishing Review

Susan Ashcraft provided a brief update on collaborative efforts to review pier and jetty fishing concerns and interests in Southern California, as endorsed by FGC in December 2014. A “Santa Monica Bay Pier Stakeholders Summit” was held on May 7, 2015 by Heal the Bay in coordination with FGC staff. While progress on this project has been hampered by staff capacity limitations, staff has now been assigned to support this project, and will be sending a letter to all municipalities with public piers in Southern California.

(C) Other

The committee and meeting participants discussed a series of previous topics of interest and options to include related topics on future MRC agendas. Based on the input and discussion, MRC expressed interest in possible follow-up on several of the topics (see below).

Committee Recommendation: MRC recommends that FGC consider the following potential future agenda topics:

MRC meetings

- OPC update on ocean acidification
- Informational item on plastic pollution and marine debris (by Plastic Pollution Coalition, and possibly OPC)
- DFW update on sea cucumber fishery

FGC meeting

- Marine Region update on federal process to protect unmanaged forage species

11. Adjournment

The Marine Resources Committee meeting adjourned at 3:45 p.m.

Marine Resources Committee (MRC) 2015-16 Work Plan: Scheduled topics and timeline for items referred to MRC
 (Updated for Dec 9-10, 2015 FGC meeting)

Topic	Type of Topic	2015			2016

Subject: Proposal for Community Based Squid Fishing

Commissioners,

We wish to submit our draft proposal for community based squid fishing for the area north of Point Arena. This proposal is a result of dialogue with commission staff and recent MRC meetings. We would ask staff to consider this draft proposal via a meeting with staff and various interested parties, to see if there is a consensus for going forward with this draft plan.

Sincerely,

Ken Bates, Linda Hildebrand

Community based Squid Fishing Proposal for Coastal Communities North of Point Arena

Dan Yoakum, Bob Juntz, Mary Fairbanks, Linda Hildebrand, Ken Bates

October 24, 2015

The following proposal is an attempt to address the health and viability of North Coast fishing communities by providing limited, local opportunity to local small boat fishermen, development of shore side processing jobs and assisting California Fish and Wildlife Department in their efforts to comply with certain requirements of the Federal Magnuson/Stevenson Fisheries Act. The authors hope that this will be the beginning of a policy to foster community based sustainable fishing opportunity on the North Coast of California.

Background

The California Market squid management (limited entry) plan, which was heavily influenced by a handful of major squid fishermen and three major processors has effectively concentrated squid fishing opportunity in to the hands of a small minority of fishermen and corporations which now control a majority of the squid fishing permits and in turn, the squid resource itself. The existing squid management plan has allowed fleet capacity to expand by half again via an influx of larger Canadian built purse seiners and lengthened / sponsoned domestic vessels. Some of these "enlarged" boats have increased hold capacity by a factor of three. Further modifications to the squid management plan have now made it illegal for any non-permitted fishermen to have even one California Market Squid in his possession.

Squid has been present in harvestable concentrations north of Point Arena for millennia. During the Fall of 2015 nearly five million pounds of market squid was landed in the Port of Eureka – all by boats from southern or central California. No local boats had any opportunity to participate at any level in this fishery off the Eureka Coast. As of this month (October 2015) squid are again present off Eureka. Last week, two central California seiners arrived off of Noyo Harbor to catch 160,000 pounds of market squid overnight, then left . Local Noyo fishermen had been monitoring this squid for over a month with no chance to access this fishing opportunity literally right in front of their harbor.

Goals

1. To develop opportunity for local sustainable community based squid fishing for the major ports of:

- ☐ Crescent City
- Eureka
- Noyo/ Fort Bragg
- with inclusion of the minor ports of Trinidad, shelter Cove, Albion, Point Arena

2. To provide a separate squid fisheries plan to:
- Allow fishing opportunity for small local boats north of Point Arena
 - Remove financial burdens of Limited Entry permit purchases by young fishermen starting their fishing careers
 - Restrict the possibility of increased effort shift and fishing capacity by limiting individual landing per 24 hour period.
 - Promote the creation of local squid processing employment in the Ports of Crescent City, Eureka and Noyo.
 - Provided for an equitable distribution and turnover of fishing opportunity through the management of non-transferable vessel permits by a Community Fisheries Trust Organization

How We Might Get There

The Federal Magnuson / Stevens Fisheries Act expressly addresses sustainable Community based fisheries requirements as part of any Federal Fisheries Management Plan. That being said, the chance of any of this proposal being seriously considered is based on the evaluation by both the California fish and Game Commission and staff and the long term vision by the Department of Fish and Wildlife as that vision relates to the Health and preservation of Coastal fishing Communities in California.

Here are the Basics

A local community fishing trust is formed to administer the following:

- Who qualifies for "local" status and fishing opportunity
- How long each "fishing opportunity" lasts (duration)
- Daily landing limits for each fishing gear type to allow maximum participation and an orderly fishery over the season
- re-issuance of "fishing opportunity" both in-season and seasonally
- Co-operative in-season management with other community fishery trusts to deal with geographic shift
- Determination of landing fee rate (to local municipality) and "opportunity" fee rate to fund "Community Fishing Trust Management expense"

Some Details

A. Community Fishery Trust

- Port based (Crescent City, Eureka, Noyo)
- Made up of three fishermen, two buyers, one representative of local city government, and one department biologist
- Organizational model probably based on present efforts in Morro Bay and Monterey with some modifications.

B. Fishery Details

- Major port based squid quota, for example: ! 10,000 short ton quota per port

managed by community fishing trust, quota to be separate from the limited entry quota
-- Maximum of three purse seine vessel permits per port with a 24 hour landing cap of 25 to 50 short tons determined in-season

- fluctuating number of small vessel non-transferable permit permits based on resource availability, weather and port processing capacity with a 24 hour landing cap of 3 to 10 short tons determined in-season.

- non-transferable in this case meaning not sellable from the trust but transferable to vessels of different owners/operators with no size restriction so as to serve the harbor fleet equally. The landing cap will serve to limit capacity .

IN REPLY REFER TO:

Executive Direction

AUG 15 2012

Sonke Mastrup, Executive Director
California Fish and Game Commission
PO Box 944209
Sacramento, CA 94244-2090

Dear Mr. Mastrup:

At the request of the Resighini Rancheria, this correspondence is in support of the Tribe's position that the Resighini Rancheria should be identified as eligible for "tribal take" as defined in the California Marine Life Protection Act, Marine Protected Areas.

Resighini Rancheria is a Federally Recognized Tribe comprised of Yurok people, and is aboriginal to the area within the North Coast Study Area. Further, the Resighini Rancheria has been listed on the Department of Interior, Bureau of Indian Affairs, list of Indian Entities Recognized to Receive Services From the Bureau of Indian Affairs, published annually in the Federal Register, since its inception. The original list, Federal Register, Vol. 44, No. 26 – Tuesday, February 6, 1979, Indian Tribal Entities that Have a Government-to-Government Relationship with the United States, lists the Resighini Rancheria as Resighini Rancheria, Coast Indian Community of Yurok Indians, California.

The Northern California Agency is unaware of any Federal Law that grants any state agency the authority to exclude the Resighini Rancheria under the current circumstances.

If there is a question, please contact me, at (530) 246-5141, Ext. 31, or you may write to the above address.

Sincerely,

Dr. Virgil Akins
Superintendent

RESIGHINI RANCHERIA

August 13, 2012

Sonke Mastrup, Executive Director
California Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Dear Mr. Mastrup:

The Resighini Rancheria would like to respectfully request to be included on the October 3-2012 agenda of the California Fish and Game Commission (Commission) to reconsider the exclusion of our Tribe on Marine Protected Areas within our ancestral waters within the North Coast Study Region.

Problem Statement: On June 6th, 2012, the Commission adopted regulations that designated a network of marine protected areas (MPAs) within the North Coast Study Region under the California Marine Life Protection Act (MLPA). Those adopted regulations included the identification of certain federally-recognized Tribes that could continue to harvest for traditional, non-commercial purposes under the newly adopted definition of "tribal take" within specific MPAs. For a Tribe to be identified as eligible for "tribal take" within specific MPAs, a Factual Record had to be submitted that demonstrated a current or historic use within that geography and that the Tribe was federally-recognized.

Resighini Rancheria submitted a brief factual record affirming that we are a federally-recognized Indian Tribe of Yurok Indians, eligible to receive services from the United States Bureau of Indian Affairs (Federal Register Vol. 75, No. 190) and that our citizens have current or historic uses within specific MPAs and Special Closures proposed in the North Coast Study Region. Subsequently, we were included in the Initial Statement of Reasons for Regulatory Action in the following MPAs: Pyramid Point SMCA, Point St. George Reef SMCA, and the Redding Rock SMCA/SMR Complex.

Although we do maintain current or historic uses within those MPAs and reserve all rights to continue to rely on the ocean and marine resources in all usual and customary fishing places, due to the implied/perceived jurisdictional concerns that the State associated with this process,

we signed on to a joint multi-tribal letter that was sent to the Commission, requesting to be removed from the Pyramid Point SMCA and Point St. George Reef SMCA, out of respect for the Smith River Rancheria and Elk Valley Rancheria. However, Resighini Rancheria should have remained on the Redding Rock SMCA/SMR complex for the Commission's consideration at your June 6th meeting in Eureka.

In the interim, Chairman McCovey contacted Mr. Mastrup to confirm that no other information was required by the Commission to ensure our inclusion at Redding Rock and that the Tribe was included in the draft regulations as required for adoption consideration. Mr. Mastrup confirmed that no other information was required and the item would proceed accordingly. Then at the June 6th meeting Mr. Mastrup made the erroneous statement for the Motion of only including the Yurok Tribe as a Tribe eligible of "tribal take" within the Redding Rock MPAs, which the Commission ultimately adopted. We understand this may have been a misunderstanding and thus, we request this to be amended appropriately.

On July 26, 2012, in a meeting with Resighini Rancheria, Mr. Mastrup suggested a request be made of the Commission to reconsider our Tribe as eligible for "tribal take" at the Redding Rock SMCA/SMR complex to resolve this misunderstanding. This request for reconsideration should include substantiating from a federal entity that we are a federally-recognized Tribe of Yurok people. The following is a factual basis demonstrating that the United States federal government recognizes us as a federally-recognized Tribe of Yurok people.

Factual Basis: The Yurok people are aboriginal to Northern California and are dispersed among several distinct federally recognized Tribes located within their ancestral territory, including the Resighini Rancheria. The Resighini Rancheria is a federally recognized Indian Tribe that is formally organized under the authority of the Indian Reorganization Act of 1934.

By deed dated January 7, 1938, Gus Resighini deeded to the United States in trust approximately 228 acres¹ of land that constitutes the Resighini Rancheria, under the authority of the Indian Reorganization Act. By Proclamation dated October 21, 1939, the Secretary of the Interior declared the land purchased to be an Indian reservation. All of the lands that comprise the Reservation are located within the exterior boundaries of the original Klamath River Reservation and are located at the intersection of Highway 101 and the Klamath River.

After the establishment of the Reservation, two disastrous floods occurred, one in 1955 and another in 1964. The tragic flood of 1964 swept away all but two homes, forcing thirteen families to evacuate and move. Despite this, the people of the Resighini Rancheria stood together and remained a structured Indian organization with a strong desire to return to the

¹ The 1973 survey map of the Reservation recorded by Richard B. Davis shows the original lands purchased from Gus Resighini that because the Resighini Rancheria as containing 238.78 acres.

reservation. On April 4, 1975, the people of the Resighini Rancheria formed a Tribal government and adopted a Constitution.

Since 1975, when members adopted a Constitution, the Tribe has been actively involved in developing a tribal government and in protecting its land base and advocating for our traditional rights as Yurok Indians. In 1988, Congress enacted the Hoopa-Yurok Settlement Act, which partitioned the extended Hoopa Valley Reservation into the present Hoopa Valley Reservation, consisting of the original twelve-mile square bisected by the Trinity River and established under Executive Order in 1864, and the Yurok Reservation, consisting of the area along the Klamath River within the old Klamath River Reservation, including the 1892 Extension,² and excluding the Resighini Rancheria. The Resighini Rancheria is the only Indian Reservation in California situated within the exterior boundaries of lands granted to a separate federally recognized Indian Tribe.

The fact that members of the Resighini Rancheria are Yurok is indisputable. The first federally-published list in the Federal Register of Indian Tribes that maintain a government-to-government relationship with the United States and are eligible to receive related services was on January 31, 1979. It includes the “*Resighini Rancheria, Coast Indian Community of Yurok Indians, California*” (see Exhibit A). As Exhibit B demonstrates, all subsequent lists from 1979 to 2003 also recognize that the Resighini Rancheria are Yurok. After 2003, the Tribe changed our name to simply the *Resighini Rancheria* for solely simplification purposes (see Exhibit C). This is reflected in the Federal Register from 2005 to the most recent list published in 2010.

Under Article of the Tribe’s Secretari ally-approved Constitution, the jurisdiction of the Tribe, acting through its Tribal Council, extends to: (a) all land encompassing the ancestral territory of the Klamath River Tribe; (b) all lands, water, and other resources within the exterior boundaries of those lands constituting what is commonly known as the Resighini Rancheria purchased by the Secretary of the Interior on January 7, 1938, under the authority of the Wheeler Howard Act,³ June 18, 1934; (c) all of the lands, water, and resources as may hereinafter be acquired by the Tribe, whether within or without said boundary lines, under any grant, transfer, purchase, adjudication, treaty, Executive Order, Act of Congress, or other acquisitions; (d) all persons within any territory under the jurisdiction of the tribe; and (e) all tribal members, wherever located.

The Yurok people of the Resighini Rancheria historically and currently have exercised our rights to hunt, fish, and gather foods and materials for subsistence, ceremonial, and customary uses throughout our ancestral lands. We also maintain that we have unceded rights that have never

² The “Extension” included a stretch, one-mile on each side of the Klamath River, connecting the old Klamath River Reservation to the Hoopa Square.

³ Also referred to as the Indian Reorganization Act.

been extinguished, to continue to fish in all usual and customary traditional fishing places as identified by our members. We reserve all rights to continue these practices that are inherent to use as Yurok. Like our ancestors, we have continued to practice traditional Yurok customs, traditions, and religious practices. We are committed to our culture and language. Tribal members are recognized as skilled basket weavers and makers of ceremonial regalia and many participate in local Yurok ceremonies and dances.

Request: To agendize this request at your October 3-4, 2012 meeting in Sacramento in order to resolve this issue of extreme importance to our members and include the Resighini Rancheria within the Redding Rock SMCA/SMR complex at this time.

Please contact us to confirm whether we will be included on the October 3-4, 2012 agenda. We wish to deal with this issue expeditiously before the regulatory review process concludes for the North Coast Study Region.

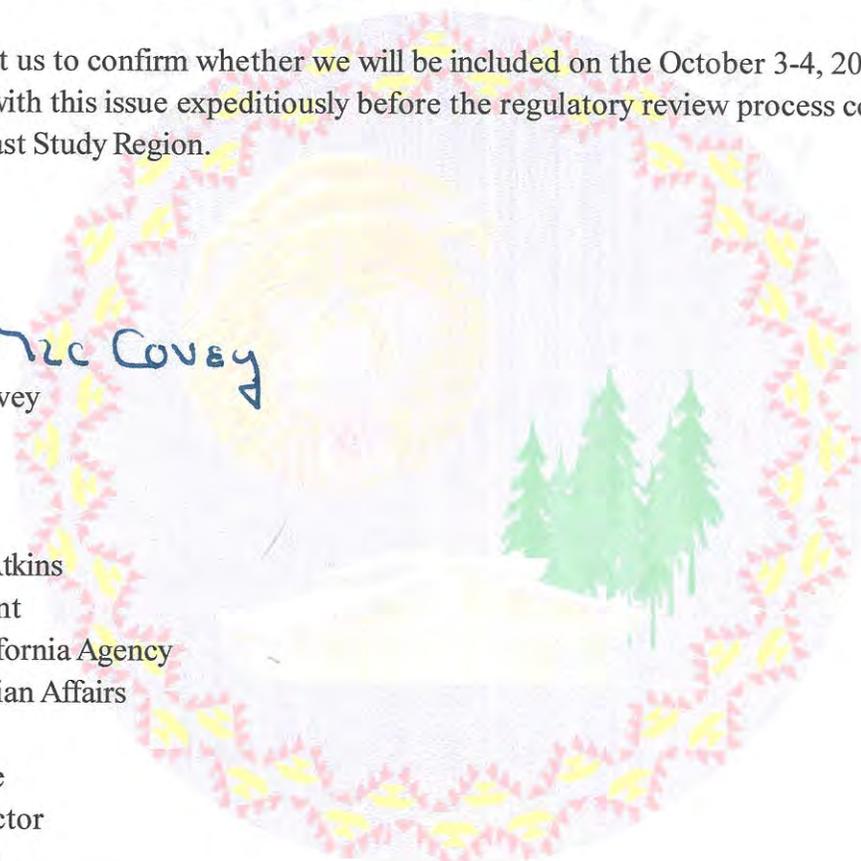

Sincerely,

A handwritten signature in blue ink that reads "Donald McCovey". The signature is written in a cursive, slightly slanted style.

INDIAN TRIBAL ENTITIES THAT HAVE A GOVERNMENT-TO-GOVERNMENT RELATIONSHIP WITH THE UNITED STATES

Delegation of Authority

JANUARY 31, 1979.

This notice is published in exercise of authority delegated by the Assistant Secretary—Indian Affairs under 5 U.S.C. 2 and 9; and 230 DM 1 and 2.

Notice is hereby given in accordance with 25 CFR 54.6(b) by the Bureau of Indian Affairs of the tribal entities that have a government-to-government relationship with the United States. The United States recognizes its trust responsibility to these Indian entities and, therefore, acknowledges their eligibility for programs administered by the Bureau of Indian Affairs. The listed entities are not necessarily eligible for programs administered by other Federal Agencies. The list of eligible Alaskan entities will be published at a later date.

INDIAN TRIBAL ENTITIES THAT HAVE A GOVERNMENT-TO-GOVERNMENT RELATIONSHIP WITH THE UNITED STATES

DEPARTMENT OF THE INTERIOR

Bureau of Indian Affairs

Indian Entities Recognized and Eligible To Receive Services From the United States Bureau of Indian Affairs

AGENCY: Bureau of Indian Affairs, Interior.

ACTION: Notice.

SUMMARY: This notice publishes the current list of 561 tribal entities recognized and eligible for funding and services from the Bureau of Indian Affairs by virtue of their status as Indian tribes. The list is updated from the notice published on December 5, 2003 (68 FR 68180).

FOR FURTHER INFORMATION CONTACT: Daisy West, Bureau of Indian Affairs, Division of Tribal Government Services, Mail Stop 320-SIB, 1951 Constitution Avenue, NW., Washington, DC 20240. Telephone number: (202) 513-7641.

SUPPLEMENTARY INFORMATION: This notice is published pursuant to Section 104 of the Act of November 2, 1994 (Pub. L. 103-454; 108 Stat. 4791, 4792), and in exercise of authority delegated to the Assistant Secretary—Indian Affairs under 25 U.S.C. 2 and 9 and 209 DM 8.

Published below is a list of federally acknowledged tribes in the contiguous 48 states and in Alaska.

The Delaware Tribe of Indians, Oklahoma, was removed from the list in response to a final judgment and order sought by the Cherokee Nation of Oklahoma in the United States District Court for the Northern District of Oklahoma in *Cherokee Nation of Oklahoma v. Norton, et al.*, Case No. 98-CV-903-TCK-FHM on remand from the Tenth Circuit Court of Appeals in *Cherokee Nation of Oklahoma v. Norton*, 389 F.3d 1074 (10th Cir. 2004), as amended, 2005 U.S. App. LEXIS 2773 (10th Cir. Feb. 16, 2005).

The list does not include any additional new tribes. The updates are limited to several tribal name changes. To aid in identifying tribal name changes, the tribe's former name is included with the new tribal name. We will continue to list the tribe's former name for several years before dropping the former name from the list. We have also made several corrections. To aid in identifying corrections, the tribe's previously listed name is included with the tribal name.

The listed entities are acknowledged to have the immunities and privileges available to other federally acknowledged Indian tribes by virtue of their government-to-government relationship with the United States as

well as the responsibilities, powers, limitations and obligations of such tribes. We have continued the practice of listing the Alaska Native entities separately solely for the purpose of facilitating identification of them and reference to them given the large number of complex Native names.

Dated: November 14, 2005.

Michael D. Olsen,

Acting Principal Deputy Assistant Secretary—Indian Affairs.

Indian Tribal Entities Within the Contiguous 48 States Recognized and Eligible To Receive Services From the United States Bureau of Indian Affairs

- Absentee-Shawnee Tribe of Indians of Oklahoma

Cher-Ae Heights Indian Community of the Trinidad Rancheria

August 14, 2013

Sonke Mastrup
Executive Director
CA Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Director Mastrup:

On behalf of the Cher-Ae Heights Indian Community of the Trinidad Rancheria, please accept this letter to clarify an error made in the August 9, 2013 Trinidad Rancheria letter to you requesting formal Government to Government Consultation with the CA Fish and Game Commission. I inadvertently noted Trinidad Rancheria CEO Jacque Hostler-Carmesin as the point of contact for the Trinidad Rancheria in regards to this consultation request. As Mrs. Hostler-Carmesin was recently appointed to serve on the CA Fish and Game Commission, she has requested recusal from any interactions between the Tribe and the Commission in order to avoid any potential conflict of interest due to her due positions.

Please contact Trinidad Rancheria Executive Manager Amy Atkins at (707) 677-0211 ext. 2702 or Tribal Historic Preservation Officer Rachel Sundberg at (707) 677-0211 ext. 2726 to plan and coordinate meeting dates and times for a Government to Government Consultation of Reading Rock as originally requested in the August 9, 2013 letter.

Sincerely,

Garth Sundberg
Tribal Chairman
Trinidad Rancheria

P.O. Box 944209
Sacramento, CA 94244-2090

RE: Santa Ynez Band of Chumash Indians Request for Exemption for Cultural and Ceremonial Fishing in Marine Protected Areas (MPAs) pursuant to the Marine Life Protection Act (MLPA)

Dear Mr. Kellogg:

The Santa Ynez Band of Chumash Indians (Chumash) makes this request for an exemption from the Fish and Game Commission for cultural and ceremonial fishing and gathering within State Marine Conservation Areas and Marine Parks in Santa Barbara County under the MLPA.

In support of such exemption, the Chumash provide the attached: *“Factual Record of Current and Historical Uses by the Santa Ynez Band of Chumash Indians within the proposed State Marine Conservation Areas and Marine Parks of Santa Barbara County.”* In addition, this request for exemption incorporates by reference the following documents which have been previously delivered to Mr. Sonke Mastrup, F&GC Executive Director:

1. Summary of our August 5, 2011 meeting regarding an exemption;
2. Santa Barbara County Marine Conservation Areas and Parks;
3. Chumash cultural and ceremonial gathering list;
4. Possible additional provisions to gathering list;
5. Chumash fishing and gathering text from the Santa Barbara Museum of Natural History website;
6. Chumash towns at the time of European settlement;
7. “The Origins of a Pacific Coast Chiefdom, The Chumash of the Channel Islands”;
8. “Ethnohistoric and Archaeological Evidence for Chumash Use of Marine Plants”;
9. “A Review of the Analysis of Fish Remains in Chumash Sites”;
10. “The Economics of Island Chumash Fishing Practices”; and
11. Summary of Chumash Coastal Sites—January 2011.

Sincerely,

Vincent P. Armenta, Tribal Chairman

CC: Mr. Richard B. Rogers, Vice President
Mr. Michael Sutton, Member

Mr. Jack Baylis, Member

Factual Record of Current and Historical Uses by the Santa Ynez Band of Chumash Indians within the proposed State Marine Conservation Areas and Marine Parks of Santa Barbara County

The Santa Ynez Band of Chumash Indians have been actively engaged in the Marine Life Protection Act (MLPA) process since 2007. It started with Chumash attempts to get any Tribal consultation in the South Central Coast Marine Protected Area (MPA) from Pointe Conception north. Our letters from 2007 remain unresponded to even after we personally attended Fish and Game Commission meetings and requested a response.

After the South Central Coast MPA, the Chumash began demanding Tribal consultation in the South Coast MPA from Point Conception south to the border of Mexico. All Tribes in this long stretch of coast we given two representatives in the South Coast Regional Stakeholders Group, Louis Guassac and Roberta Cordero. Again we requested consultation with the federally recognized tribes in this region and were told to contact "our" stakeholders. Ultimately, the Tribal South Coast Regional Stakeholders Committee recommended an elaborate system of co-management and co-enforcement, which also included cultural and ceremonial MPA access, none of which were accepted by the Blue Ribbon Task Force (BRTF) nor included in the final regulations.

During 2009 we also learned of a Memorandum of Understanding (MOU) between the Department of Fish and Game and Vandenberg Air Force Base pursuant to the MLPA restricting Chumash historical fishing rights at the Base. After multiple California Public Records Act (CPRA) requests beginning in 2009 we are pleased to have just received a copy of the MOU in 2011.

Upon the completion of the South Central and South Coast MPAs without any recognition of Tribal rights, we then learned of the North Coast MPA process. We read with interest the motion made by Jacque Hostler in the North Coast Regional Stakeholders Group (NCRSG) and the emergency subsistence regulations proposed for the Kashia Band of Pomo Indians. We wrote letters to Ms. Hostler offering our assistance and to work together with the Northern Tribes in October of 2010. We also saw the response of the BRTF to Ms. Hostler and the NCRSG that the legal authority for tribal cultural and ceremonial MPA access needed to be clarified. To date, we are informed that federally recognized Tribes within the North Coast MPA have been invited to submit a factual record upon which an exception can be considered for Tribal cultural, ceremonial and subsistence fishing in State Marine Conservation Areas and Marine Parks but not Marine Reserves.

The Santa Ynez Band of Chumash Indians hereby introduce this factual record the South Coast and South Central Coast MPAs upon which an exception can be considered for Tribal cultural, ceremonial and subsistence fishing in State Marine Conservation Areas and Marine Parks but not Marine Reserves in Santa Barbara County.

Chumash Historical Summary

The Chumash occupied the region from San Luis Obispo County to Malibu Canyon on the coast, and inland as far as the western edge of the San Joaquin Valley, and the four northern Channel Islands (Grant 1978). The Chumash are subdivided into factions based on distinct dialects.

Chumash society developed over the course of some 9,000 years and achieved a level of social, political and economic complexity not ordinarily associated with hunting and gathering groups (Morrato, 1984). The prehistoric Chumash are believed to have maintained one of the most elaborate bead money systems in the world, as well as one of the most complex non-agricultural societies (King, 1990).

The archaeological record indicates that Chumash populations occupied the coastal regions of California more than 9,000 years ago (Greenwood 1972). Several chronological frameworks have been developed for the Chumash region. One of the most definitive works on Chumash chronology is that of King (1990). King postulates three major periods; Early, Middle and Late. Based on artifact typologies from a great number of sites, he was able to discern numerous style changes within each of the major periods.

The Early Period (8000 to 3350 Before Present [B.P.]) is characterized by a primarily seed processing subsistence economy. The Middle Period (3350 to 800 B.P.) is marked by a shift in the economic/subsistence focus from plant gathering and the use of hard seeds, to a more generalized hunting-maritime gathering adaptation, with an increased focus on acorns. The full development of the Chumash culture, one of the most socially and economically complex hunting and gathering groups in North America, occurred during the Late Period (800 to 150 B.P.).

The Chumash aboriginal way of life ended with Spanish colonization. As neophytes were brought into the mission system, they were transformed from fishermen, hunters and gatherers into agricultural laborers and exposed to diseases from which they had no resistance. By the end of the Mission Period in 1834, the Chumash population had been decimated by disease and declining birthrates. Population loss as a result of disease and economic deprivation continued into the next century.

The Mission Era

The Spanish built five Catholic missions among the Chumash people. Mission Santa Ines was established in 1804 as a halfway point between the Santa Barbara and La Purisma (Lompoc) missions. Each mission was granted about seven square leagues of land surrounding it for the use and support of the local Indian communities.

In practice, the missionaries and soldiers were brutal men who enslaved the local Chumash people and nearly decimated them through disease, starvation and harsh treatment. Despite this, the sentiment of the Spanish and Mexican governments and the Catholic Church was that the land of the missions essentially were what we know of today as reservations, for the use and upkeep of the Indians. The tribal members forced to live and work near the missions were considered to be neophytes or Christianized Indians.

The Church viewed the land to be held in trust for the Indians, who had a "natural" right of occupancy. The Church and Spain considered title to the land to be with the Indians as decreed from the "laws of nature and imminent occupation." The priests were just the administrators of the land on behalf of their Indian "wards."

The slave-like conditions at the mission led to the Chumash Revolt of 1824. It started when soldiers flogged an Indian from La Purisma mission who was at Santa Ines. The revolt spread to the Santa Barbara and La Purisma missions and led to the burning of the Santa Ines mission. Many Chumash feared the soldiers would kill them and fled to the San Joaquin Valley. The priests and military knew they couldn't keep the missions going without the Indian slave labor. Soldiers rounded up the Chumash and brought them back to the mission.

A decade after the revolt, the Mexican government secularized the missions and intended to disperse the lands to the Indians and settlers. The goal never was fully accomplished. The missionaries still were regarded as the guardians of the Indians and the tribal lands.

Many Chumash after the secularization efforts did flee the mission and ended up in the area around Zanja de Cota Creek in the Canada de la Cota. The area still was considered to be within the lands of the Catholic Church.

Significance of Refugio Bay

The marine environment of the Santa Barbara Channel supports a wide variety of habitats that include kelp beds, sandy beaches, rocky intertidal, bays, estuaries, and lagoons. Historically, the largest kelp beds on the California coast occurred between Point Conception and Rincon Point. Kelp beds support a large invertebrate community including abalone, crabs, clams, oysters, shrimp, lobster, and squid. Kelp beds also feed and provide shelter for numerous species of fish. Seals and sea lions feed in the kelp beds and haul out and breed on adjacent sandy beaches. The bays, estuaries, and lagoons are important habitats for resident bird species as well as migrating waterfowl. The Mediterranean climate of the project area is typified by long, hot summers, and wet, mild winters. Perennial and seasonal drainages run down the slopes of the Santa Ynez Mountains and foothills to the coast.

The rich plant and animal resources of the surrounding terrestrial and marine environments, availability of fresh water, and Mediterranean climate combined

to make the Santa Barbara Channel region a desirable location for prehistoric habitation and supported one of the highest prehistoric population densities among hunter-gatherers anywhere in the world. These same attributes would later encourage settlement of the Santa Barbara Channel region by the Spanish, Mexican, and American cultures.

In 1769, Gaspar de Portola and Father Junipero Serra departed the newly established San Diego settlement and marched northward toward Monterey, with the objective to secure that port and establish five missions along the route. The combined sea and land 1769-1770 Portola expedition, which passed through Santa Barbara County on its way to Monterey, was the prelude to systematic Spanish colonization of Alta California.

In 1795, Jose Francisco Ortega (the original founder of the Santa Barbara Presidio) was granted six leagues known as the *Rancho Nuestra Senora del Refugio* (Cowan, 1977). This was the only land grant licensed under Spanish Rule in what today is known as Santa Barbara County. The Ortegas built adobes at Refugio and later at Tajiguas Canyon, Arroyo Hondo, and Cañada del Corral. They grew wheat, maintained a vineyard, and ran large herds of cattle and horses on the rancho.

By the early 1800's Refugio Bay was a well-known port to ships visiting the California coast, as the captains could trade at the Ortega settlement free of the duties imposed by the Spanish colonial government (Bancroft 1886, Tomkins 1960). However, the pirate Bouchard effectively ended the bay's era as a trading/smuggling port when he sacked and burned the Refugio hacienda in 1818.

In 1822, Mexico gained its independence from Spain, and in 1834 the Missions were secularized and their lands granted as rewards for loyal service or in response to an individual's petition.

Significance of the Goleta Slough

According to Dr. John Johnson at the Santa Barbara Museum of Natural History, the Goleta Slough villages had the highest population density in the Santa Barbara region at the time of European settlement." Dr. John Johnson, personal communication, April 9, 2008.

This is due to the great diversity of habitat and wildlife within this setting providing for a wide variety of subsistence adaptations.

One example of such villages within the prehistoric time frame of the Goleta Slough was the village of heló or Mescalitan Island. It was occupied continuously for thousands of years by the early Chumash.

There has been study after study by over a dozen accredited, credentialed archaeological specialists/professors regarding the Goleta Slough. No matter what was their particular expertise, all agree that these villages are significant and tell much about the prehistory of the Chumash.

Professor Jon Erlandson, along with David Stone, described the entire Goleta Slough as the sociopolitical nexus of the Chumash world:

Subsequent archaeological studies of Rogers' sites have contributed to our growing understanding of the past in the Santa Barbara Channel area. Radiocarbon dating of sites excavated by Rogers, when combined with the development of calibration programs for ¹⁴C dates, has allowed us to place his cultural stages—Oak Grove, Hunting People, and Canaliño—in real time, and a probable cultural continuum that may span more than 9000 years. In the process, archaeologists working in the Chumash area have constructed one of the longest and best documented coastal sequences in the world. Unfortunately, the past 75 years have also seen phenomenal population growth and unprecedented development along the California Coast, destroying or damaging countless archaeological sites. These include many of the 100 or so sites Rogers (1929) described along the Santa Barbara Coast. Among the hardest hit was the remarkable complex of sites that formed a nearly continuous ring around the Goleta Slough, the sociopolitical nexus of the Chumash world. Fortunately, there are still intact remnants of many of these Goleta Slough sites, including some key sites once thought to have been completely destroyed. Many of these site remnants have also been investigated by archaeologists using methods more advanced than Rogers' relatively crude techniques.

Erlandson, et al., CA-SBA-56: An "Oak Grove" and "Canaliño" Site on Goleta Lagoon, California, p. 1 (emphasis added.)

Conclusion

There is a clear factual basis for an exception for Tribal cultural, ceremonial and subsistence fishing in State Marine Conservation Areas and Marine Parks in the South Coast and South Central Coast MPAs in Santa Barbara County for the Santa Ynez Band of Chumash Indians, a federally recognized Indian Tribe.

The historical record demonstrates that the Chumash have taken finfish, invertebrates, mammals, and marine plants within this region since time immemorial, and should be included as traditional uses protected under the proposed state regulations. This factual record is being submitted as an act of good faith by the Chumash, who wish to establish a collaborative relationship with the State of California, to work towards our mutual respective goal to protect the marine resources that are of such significance to all of us. Given the time constraints, if necessary, the Chumash reserve the right to supplement the record at a later date.

Historical Connections of the Santa Ynez Chumash
to Refugio Beach, Goleta Beach, and Santa Rosa Island

John R. Johnson, Ph.D.
Santa Barbara Museum of Natural History

October, 2011

Refugio Beach

The ethnohistoric ranchería of *Qasil* (spelled “Casil” in the mission registers) was located at Refugio Beach. Not long after Mission Santa Bárbara was established, the missionaries wrote that a number of native people from the Santa Ynez Valley had established themselves at *Qasil* and its nearest neighbor *Shish'uchi* at Arroyo Quemada. Indeed, the mission registers record a number of marriages and family relationships between the citizens of these two coastal towns and the principal ranchería of *Kalawashaq'* (spelled “Calahuasa” in the mission books). After Mission Santa Inés was founded in 1804, most of the people who came from *Qasil* and *Shish'uchi* became affiliated with that mission, including their chiefs, showing the close social and political relationships that existed between the peoples who had lived in these two coastal towns and those who inhabited the Santa Ynez rancherías.

Those rancherías in the central Santa Ynez Valley that have been investigated by archaeologists show that there had been abundant access to marine resources by their indigenous inhabitants. In particular, the skeletal elements of many species of marine fishes and shells of marine mollusks are quite common in archaeological assemblages from inland sites. These material remains demonstrate that the close social connections documented through mission records also extended to economic exchange and/or that periodic visits over Refugio Pass by inland peoples to fish and gather shellfish were permitted by the rancherías on the coast.

The social, political, and economic connections documented in mission records and archaeological excavations are not the only evidence that we have of the connections of the Santa Ynez Chumash to the Refugio area. There are also direct links revealed in the genealogies of most residents of the Santa Ynez Reservation today. One of the family lineages that has many descendants who are tribal members is the direct descendant of a woman from *Qasil* named Policarpa, who had been born at that ranchería about 1751. Policarpa's second husband was Bernabé Pilaljaut, who was listed as the capitán (chief) of *Qasil* in a 1796 census prepared by the *comandante* of the Santa Bárbara Presidio, Felipe de Goycochea. Bernabé Pilaljaut originally had been born in *Kalawashaq'*. Another family connection pertains to the ancestry of María Solares, whose grandparents, Estevan and Eulalia, although originally from *Kalawashaq'*, had lived for a time at *Qasil*, where one of their children was born.

Goleta Beach

The Goleta lagoon, referred to as “Mescalitán” by the Spanish, was perhaps the most densely settled region in all of the territory where Chumash languages were spoken. While most of the citizens of the Goleta Chumash towns were baptized at Mission Santa Bárbara, there exist nonetheless numerous connections to the Santa Ynez Chumash. Some of these links include marriages revealed in mission records between people from the four principal towns that existed in the Goleta Valley (*S'axpilil*, *Helo'*, *Heliyik*, and *'Alkash*) and spouses who came from rancherías in the Santa Ynez Valley.

In 1798, Comandante Goycochea conducted a reconnaissance of the valley in order to select a suitable site for the future mission of Santa Inés. When he visited two of the largest Santa Ynez Valley rancherías, *Kalawashaq'* and *Teqepsh*, he reported that many of the residents were absent because they were attending a fiesta at one of the Goleta Chumash towns.

One family with Goleta Chumash connections that was historically associated with the Santa Ynez tribe was that of Francisca Flores (aka Francisca Solares). Francisca had been born at the Santa Barbara Chumash community of La Cieneguita, but her mother married a man from Mission Santa Inés and the family moved to Zanja de Cota when she was a small girl. On her mother's side, Francisca was descended from Pedro Yanonali, the chief of *Syuxtun* on the Santa Barbara waterfront. On her father's side, both of her paternal grandparents were descended from citizens of *Helo'*, the famous Goleta Chumash town that once existed on what later became known as Mescalitan Island. After moving to Zanja de Cota, Francisca became a lifelong member of the Santa Ynez Indian community. She was a member of the Santa Ynez Reservation when it was established in 1901, and her children Frank Flores and Gus Flores, and granddaughter Juanita (“Jennie”) Espinosa Wilson were all Santa Ynez tribal members listed on reservation rolls until their deaths.

Santa Rosa Island

The Santa Ynez Chumash tribal connections to Santa Rosa Island extend back to the days of the missions. A large number of people from rancherías on Santa Rosa Island were baptized at Mission Santa Inés in 1815-1816. These islanders continued to intermarry and reside among Santa Ynez Chumash families when the community became established at Zanja de Cota in 1855. María Solares's second husband was named Nicomedes, whose mother had come from *Qshiwqshiw*, the largest ranchería on Santa Rosa Island. The daughter Nicomedes and María Solares was Clara Miranda, who is the direct ancestor of many Santa Ynez tribal members today.

Proposed rulemaking to address tribal take requests for MPAs

10/19/2015

(6) Reading Rock State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

41° 20.100' N. lat. 124° 04.911' W. long.;

41° 20.100' N. lat. 124° 10.000' W. long.;

41° 17.600' N. lat. 124° 10.000' W. long.; and

41° 17.600' N. lat. 124° 05.497' W. long.

(B) Take of all living marine resources is prohibited except:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; surf smelt [Section 28.45] by dip net or Hawaiian type throw net [Section 28.80]; and Dungeness crab by trap, hoop net or hand is allowed.

2. The commercial take of salmon with troll fishing gear [subsection 182.1(l)]; surf smelt by dip net; and Dungeness crab by trap is allowed.

3. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(6) of these regulations and shall comply with all other existing regulations and statutes:

Yurok Tribe of the Yurok Reservation

Cher-Ae Heights Indian Community of the Trinidad Rancheria
Resighini Rancheria

(97) Kashtayit State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

34° 28.13' N. lat. 120° 14.46' W. long.;

34° 27.30' N. lat. 120° 14.46' W. long.;

34° 27.30' N. lat. 120° 12.47' W. long.; and

34° 28.23' N. lat. 120° 12.47' W. long.

(B) Take of all living marine resources is prohibited except:

1. Only the following species may be taken recreationally: finfish [subsection 632(a)(2)], invertebrates except rock scallops and mussels, and giant kelp (*Macrocystis pyrifera*) by hand harvest.

2. Take pursuant to activities authorized under subsection 632(b)(97)(C) is allowed.

3. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(16) of these regulations and shall comply with all other existing regulations and statutes:

Santa Ynez Band of Chumash Indian

(C) Maintenance of artificial structures and operation and maintenance of existing facilities is allowed inside the conservation area pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(98) Naples State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

34° 26.51' N. lat. 119° 58.00' W. long.;

34° 25.00' N. lat. 119° 58.00' W. long.;

34° 25.00' N. lat. 119° 56.00' W. long.; and

34° 26.13' N. lat. 119° 56.00' W. long.

(B) Take of all living marine resources is prohibited except:

1. The recreational take by spearfishing [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)] is allowed.

2. The commercial take of giant kelp (*Macrocystis pyrifera*) by hand harvest or by mechanical harvest is allowed.

3. Take pursuant to activities authorized under subsection 632(b)(98)(C) is allowed.

4. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(16) of these regulations and shall comply with all other existing regulations and statutes:

Santa Ynez Band of Chumash Indian

(C) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(99) Campus Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

34° 25.20' N. lat. 119° 53.60' W. long.;

34° 21.48' N. lat. 119° 53.60' W. long.; thence eastward along the three nautical mile offshore boundary to

34° 21.21' N. lat. 119° 50.65' W. long.; and

34° 24.30' N. lat. 119° 50.65' W. long.

(B) Take of all living marine resources is prohibited except; ~~for take pursuant to activities authorized under subsection 632(b)(99)(C).~~

1. Take pursuant to activities authorized under subsection 632(b)(99)(C).

2. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(16) of these regulations and shall comply with all other existing regulations and statutes:

Santa Ynez Band of Chumash Indian

(C) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(100) Goleta Slough State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Goleta Slough northward of latitude 34° 25.02' N.

(B) Take of all living marine resources is prohibited except for; ~~take pursuant to activities authorized under subsection 632(b)(100)(D).~~

1. Take pursuant to activities authorized under subsection 632(b)(100)(D).

2. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(16) of these regulations and shall comply with all other existing regulations and statutes:

Santa Ynez Band of Chumash Indian

(C) In waters below the mean high tide line inside the Goleta Slough Ecological Reserve as defined within Section 630, the following restrictions apply:

1. Boating, swimming, wading, and diving are prohibited.

2. No person shall enter this area and remain therein except on established trails, paths or other designated areas except department employees or designated employees of Santa Barbara Airport, City of Santa Barbara, Goleta Sanitary District and Goleta Valley Vector Control District for the purposes of carrying out official duties.

(D) Routine maintenance, dredging, habitat restoration, research and education, maintenance of artificial structures, and operation and maintenance of existing facilities in the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

RE: Santa Ynez Band of Chumash Indians;
Marine Life Protection Act (MLPA) and Marine Protected Areas (MPAs);
Request for MPA exemption for Cultural and Ceremonial fishing and gathering;
Request for Tribal Consultation

Dear Mr. Mastrup:

The Santa Ynez Band of Chumash Indians (“Chumash” or “Tribe”) re-states its request for an MPA exemption for cultural and ceremonial fishing and gathering and formally requests Tribal consultation.

BACKGROUND FROM 2007 TO COMPLETION OF NORTH COAST MPA

The Chumash have been actively engaged in the Marine Life Protection Act (MLPA) process since 2007. It started with attempts by the Chumash to request tribal consultation in the South Central Coast Marine Protected Area (MPA) from Pointe Conception north. Our letters from 2007 remain unresponded to even after we personally attended Fish and Game Commission meetings and requested a response.

After the South Central Coast MPA, the Chumash requested tribal consultation in the South Coast MPA from Point Conception south to the border of Mexico. All Tribes in this long stretch of coast we given two representatives in the South Coast Regional Stakeholders Group, Louis Guassac and Roberta Cordero. Again we requested consultation with the federally recognized tribes in this region and were told to contact “our” stakeholders. Ultimately, the Tribal South Coast Regional Stakeholders Committee recommended an elaborate system of co-management and co-enforcement, which also included cultural and ceremonial MPA access, all of which were neither accepted by the Blue Ribbon Task Force (BRTF) nor included in the final regulations.

During 2009 we also learned of a Memorandum of Understanding (MOU) between the Department of Fish and Game and Vandenberg Air Force Base pursuant to the MLPA restricting Chumash historical

fishing rights at the Base. After multiple California Public Records Act (CPRA) requests beginning in 2009 we are pleased to have just received a copy of the MOU in 2011.

The MLPA process having completed the South Central and South Coast MPAs without much recognition of Tribal concerns, we then learned of the North Coast MPA process. We read with interest the motion made by Jacque Hostler in the North Coast Regional Stakeholders Group (NCRSG) and the emergency subsistence regulations proposed for the Kashia Band of Pomo Indians. We wrote letters to Ms. Hostler offering our assistance and to work together with the Northern Tribes in October of 2010. We are pleased to see that final regulations for the North Coast MPA with tribal provisions have been recently adopted this June of 2012.

CHUMASH MPA EXCEPTION AFTER COMPLETION OF NORTH COAST MPA

The Chumash provided its historical record and request for exemption for cultural and ceremonial fishing to the FGC on November 1, 2011. The Chumash then made a presentation before the FGC at its Santa Barbara meeting on November 17, 2011. By letter dated November 23, 2011, FGC Executive Director Sonke Mastrup informed the Chumash that its presentation "meets the standard set for by the Commission for requests related to tribal specific gathering in specified MPAs."

The staff summary of the November 17, 2011 FGC meeting noted that a so-called Chumash exemption might be considered after the North Coast MPA regulations were completed:

17. RECEIPT AND DISCUSSION OF REQUEST OF THE SANTA YNEZ BAND OF CHUMASH INDIANS FOR EXEMPTIONS TO REGULATIONS FOR SOUTHERN CALIFORNIA MARINE PROTECTED AREAS FOR CULTURAL AND CEREMONIAL PURPOSES.

Received presentations from Sam Cohen, Kathy Conti, Reggie Pagaling, and Willie Wyatt. Received public testimony. Commission directed staff/Department to reach out to other tribes and indicated it would consider a rulemaking package after completion of the North Coast MPA rulemaking.

<http://www.fgc.ca.gov/meetings/2011/111711summary.pdf>

Chumash representatives would like to restart and complete this process with the FGC as to a Chumash MPA exemption.

Please contact our Government and Legal Specialist Sam Cohen (cell: 805-245-9083) so that we can further coordinate our efforts.

Sincerely,

Vincent Armenta
Tribal Chairman

State of California
Department of Fish and Wildlife

Memorandum

Date: July 16, 2015

To: Sonke Mastrup
Executive Director
Fish and Wildlife Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the August 4-5, 2015, Fish and Game Commission Meeting Regarding Proposed Amendments to Section 632, Title 14, California Code of Regulations, Marine Protected Areas, Marine Managed Areas, and Special Closures**

The Department of Fish and Wildlife (Department) is proposing to clarify and correct errors and inconsistencies within Section 632, as follows:

- Clarify the origin of Marine Protected Area and Marine Managed Area (MMA) definitions.
- Clarify the allowed and prohibited take for marine resources in state marine reserves (SMRs), state marine conservation areas (SMCAs), state marine parks (SMPs), and state marine recreational management areas (SMRMAs).
- Remove the allowance for aquaculture within Drakes Estero SMCA.
- Clarify aquaculture use in Morro Bay SMRMA.
- Update obsolete commercial troll gear references.
- Change Año Nuevo's designation from an SMCA to an SMR.
- Simplify the names of twenty-one MMAs.
- Adjust the shared boundary between Laguna Beach SMR and Laguna Beach no-take SMCA to address municipality concerns.
- Replace the coordinate boundary at Goleta Slough SMCA with the mean high tide line.
- Delete unnecessary text pertaining to the mean high tide line for three offshore MMAs.
- Refine boundaries to improve geographic accuracy for 106 MMAs and special closures by: adding a third decimal place to increase precision for all current coordinates ending at 1/100th of a minute; moving coordinates closer to an intended point of reference; adding additional coordinates to existing boundaries; and anchoring offshore boundaries on the 3 nautical mile state line.
- Correct a printing error in subsection 632(b)(120) and make other nonsubstantive changes for clarity and consistency.

If you have any questions regarding this item, please contact Dr. Craig Shuman, Regional Manager in the Department's Marine Region at (805) 568-1246. The public notice for this rulemaking should identify Environmental Scientist, Ms. Amanda Van

Sonke Mastrup, Executive Director

| | Location: | San Diego, CA |

III. Description of Regulatory Action:

- (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

Background Information

The Marine Life Protection Act (MLPA) (Fish and Game Code Sections 2850-2863) established a programmatic framework for designating Marine Protected Areas (MPAs) in the form of a statewide network. The Marine Managed Areas Improvement Act (Public Resources Code [PRC] Sections 36600-36900) standardized the designation of marine managed areas (MMAs), which include MPAs. The overriding goal of these acts is to protect, conserve, and help sustain California's valuable marine resources including maintaining natural biodiversity through adaptive management.

Since implementation of MPA regulations Section 632, Title 14, California Code of Regulations, the Fish and Game Commission (Commission), Department of Fish and Wildlife (Department), and the public, have identified opportunities to clarify the regulations in subsequent administrative regulatory packages. This regulatory package proposes: an MMA designation change, renaming MMAs, correcting aquaculture allowances, refining MMA boundaries to improve compliance and enforceability, and correcting errors and inconsistencies in regulations. For a complete listing of proposed changes to specific MMAs and special closures refer to Attachment 1: Table 1- Summary of proposed language amendments to Title 14, Section 632, California Code of Regulations, and Attachment 2: Table 2- Summary of proposed boundary refinement

amendments to Title 14, Section 632, California Code of Regulations. To view proposed boundary refinement images refer to Attachment 3: California State Marine Protected Areas Proposed Boundary Refinements.

Proposed Amendment to Subsection 632(a):

The proposed regulation identifies the origin of the MMA definitions by adding the following text to subsection 632(a)(1): “in MPAs and MMAs, as defined in Public Resources Code Section 36710:”

Necessity and Rationale: The current definitions within subsection 632(a)(1) were placed there verbatim from PRC, Section 36710, for each type of MMA, so users of MMAs could quickly reference what type of protection is afforded to a given marine area. For the accessibility of users, it is necessary to add the citation to help clarify the origin of the definitions.

Proposed Amendment to Subsection 632(b), Generally:

The MMAs indicated on Attachment 1, within the “Allowable Activities” column, are proposed for the following amendment.

The existing regulations of subsection 632(b) specify that the take of any living marine resource is prohibited in state marine reserves (SMRs), and that the take of any living marine resource is prohibited, except species explicitly listed, for the remaining MMA designations.

In an effort to clarify the intent of the MMA designations and avoid confusion regarding allowable uses, the proposed regulation amendment replaces the existing text with new text, as follows:

Area	Existing text	New text
State Marine Reserve	“Take of all living marine resources is prohibited”	“Area restrictions defined in subsection 632(a)(1)(A) apply”
State Marine Park (SMP)	“Take of all living marine resources is prohibited except...”	“Area restrictions defined in subsection 632(a)(1)(B) apply with the following specified exceptions...”
State Marine Conservation Area (SMCA)		“Area restrictions defined in subsection 632(a)(1)(C) apply with the following specified exceptions...”

State Marine Recreational Management Area (SMRMA)	“Take of all living marine resources is prohibited”	“Area Restrictions defined in subsection 632(a)(1)(D) apply”
	OR “Take of all living marine resources is prohibited except...”	OR “Area restrictions defined in subsection 632(a)(1)(D) apply with the following specified exceptions...”

Necessity and Rationale: According to PRC, Section 36710, SMRs and SMCAs prohibit the take of any living, geological, or cultural marine resource; SMPs prohibit the take of any living or nonliving marine resource; and in SMRMAs it is unlawful to perform any activity that would compromise the recreational values for which the area may be designated. To better reflect the intent of PRC 36710 for protecting both living and non-living marine resources there is a need to clarify allowed and prohibited uses under subsection 632(b), as proposed above.

Proposed Amendments to Subsection 632(b), Specifically:

The following subsections of subsection 632(b) are proposed for amendments to clarify the restrictions and allowable activities in these MMAs or special closures; provide greater clarity and enforcement; or correct boundary descriptions.

The MMAs indicated on Attachment 1, within the “Clarify Take” column, are proposed for the following amendments.

1. In an effort to streamline language and reduce redundancies within the regulatory text, the following MMAs are proposed to have their current regulations rewritten:

MacKerricher SMCA, subsection 632(b)(22)(B), Russian Gulch SMCA, subsection 632(b)(24)(B), and VanDamme SMCA, subsection 632(b)(26)(B) are proposed to have the existing text “All other commercial and recreational take is allowed in accordance with current regulations” deleted. These MMAs are also proposed to have two subsections added identifying allowable recreational and commercial take as follows: “1. All recreational take is allowed in accordance with current regulations. 2. All commercial take is allowed in accordance with current regulations, except the commercial take of bull kelp (*Nereocystis luetkeana*) and giant kelp (*Macrocystis pyrifera*) is prohibited”.

Arrow Point to Lion Head Point (Catalina Island) SMCA, 632(b)(123)(B) is proposed to have the existing text “Take of other living marine resources is allowed” deleted. This MMA is also proposed to have two subsections added to the regulations identifying allowable recreational and commercial

take as follows: “1. All recreational take is allowed in accordance with current regulations, except the recreational take of invertebrates is prohibited. 2. All commercial take is allowed in accordance with current regulations.”

Necessity and Rationale: The regulatory text for these four MMAs, regarding allowable activities within their respective areas, was written with a different approach than the other 132 MMAs in subsection 632(b). Specifically, these areas indicate the prohibited activities rather than the allowable activities. Therefore, the Department is proposing to rewrite the language for these MMAs to increase consistency, while retaining the original allowable activities for these respective areas.

2. Excluding the four aforementioned MMAs. The Department is proposing to add the text “is allowed” to the regulations of the remaining 41 MMAs identified on Attachment 1, within the “Clarify Take” column.

Necessity and Rationale: When rewriting the regulatory text as outlined in the previous “Allowable Activities” category, the 41 abovementioned MMAs allowable activities would lose their original intent if the text “is allowed” is not added to the same subsection. Therefore, in order to maintain the original regulatory intent, it is necessary to add “is allowed” to the allowable activities text.

3. The Department is proposing to clarify text for Point Lobos SMCA, subsection 632(b)(82), and Big Creek SMCA, subsection 632(b)(86), to clarify that albacore may be taken both recreationally and commercially.

Necessity and Rationale: The regulatory text is unclear whether albacore may be taken commercially, recreationally or both commercially and recreationally in these MMAs. Therefore, to maintain the original regulatory intent, the regulations have been simplified, and now stipulate which species are permitted for either recreational or commercial harvest.

The MMAs indicated on Attachment 1, within the “Aquaculture” column, are proposed for the following amendment.

1. The Department is proposing to remove the allowance for aquaculture activities within Drakes Estero SMCA, subsection 632(b)(47)(B). To do so, the existing subsection 632(b)(47)(B)2. with the text “2. Aquaculture of shellfish, pursuant to a valid State water bottom lease and stocking permit.” would be deleted. The text “the recreational take of clams” would then be integrated into subsection 632(b)(47)(B), dissolving subsection 632(b)(47)(B)1. along with the remaining text. Finally, the text “is allowed” would be added to finish the newly structured regulation.

Necessity and Rationale: In 1972, the Johnson Oyster Company (JOC) sold its property to the U.S. Government subject to a 40 year reservation of use and occupancy. In 1976, Congress designated Drakes Estero as potential

wilderness under the 1976 Point Reyes Wilderness Act (Public Law 94-544). In 2005, the JOC sold the aquaculture operation to the Drakes Bay Oyster Company (DBOC). On January 1, 2015 DBOC closed its business permanently, and the National Park Service proceeded with the conversion to wilderness area. Since commercial activities are prohibited in the wilderness area, the reference to aquaculture operations is outdated and needs to be deleted.

2. The Department is proposing to make the aquaculture activities language for Morro Bay SMRMA, subsection 632(b)(91)(C)2., dependent upon lease conditions rather than a set list of species by deleting the text “of oysters” from subsection 632(b)(91)(C)2.

Necessity and Rationale: Currently, there are two companies in Morro Bay operating under three state water bottom leases which were in place at the time of MMA designation. The SMRMA regulations were designed to accommodate these pre-existing lease agreements, but only specified the aquaculture of Pacific oyster, the only actively-grown species at the time, as permitted in the SMRMA. However, these lease agreements are approved for the production of Pacific oysters, quahog and Manila clams, mussels, ghost shrimp, and innkeeper worms. To legally allow the lease to continue as intended, subsection 632(b)(91)(C)2. needs be amended to include the aquaculture of the additional species allowed identified in the current leases. Therefore, the Department is proposing to generalize the language for aquaculture to be dependent upon the lease conditions, rather than a set list of species.

The MMAs indicated on Attachment 1, within the “Troll Gear” column, are proposed for the following amendment.

1. The Department is proposing to delete the outdated troll gear reference, subsection 182.1(l) from the existing regulations for Bodega Head SMCA, subsection 632(b)(40)(B).

Necessity and Rationale: The current regulation referenced in the regulatory text, subsection 182.1(l), was repealed as of April 30, 1989. An updated reference for commercial troll fishing gear for pelagic finfish has not been drafted. Therefore, the Department is proposing to delete the obsolete reference.

2. Excluding the previously mentioned Bodega Head SMCA, the Department is proposing to update the regulation reference pertaining to the commercial take of salmon by troll fishing gear for the remaining nine MMAs indicated on Attachment 1, within the “Troll Gear” column. This update will occur by replacing the outdated regulation reference, subsection 182.1(l), with the correct regulation reference, subsection 182(c)(4).

Necessity and Rationale: The current regulatory text pertaining to the commercial take of salmon with troll fishing gear was repealed as of

April 30, 1989. This obsolete reference, subsection 182.1(l), needs to be replaced with the current salmon troll gear reference, subsection 182(c)(4), to maintain consistency and enforceability of the regulations.

The one MMA indicated on Attachment 1, within the “Designation” column, is proposed for the following amendment.

The Department is proposing to remove the commercial harvest of kelp as an allowable activity from Año Nuevo SMCA, subsection 632(b)(67). The Department is also proposing to change the designation of the Año Nuevo SMCA to a SMR.

Necessity and Rationale: During the central coast planning process, the regional stakeholders intended to establish a SMR around Año Nuevo. However, before the MMAs were implemented, it was learned that a kelp bed was being leased within the boundaries of the proposed Año Nuevo SMR permitting commercial take of giant kelp (*Macrocystis pyrifera*) by hand harvest. During MMA adoption, the Commission voted to change Año Nuevo from the proposed SMR to a SMCA to allow for the commercial take of kelp by hand harvest. However, the commercial harvest was only for the existing leaseholder in the area until the lease expired. With the expiration of the commercial kelp lease in 2010, the Department is proposing to change the MMA designation from an SMCA to the originally planned SMR.

The MMAs indicated on Attachment 1, within the “Name Change” column, are proposed for the following amendment.

In order to simplify the names of the 21 MMAs indicated on Attachment 1 within the “Name Change” column, the Department is proposing to strike the parenthesized text within the MMA’s name.

Necessity and Rationale: The naming format for 21 MMAs includes the geographic location of the MMA within parentheses. The geographic location does not make the MMA name any more or less unique, and is not consistent with the naming format for the rest of the statewide network. To make the regulations consistent, and simplify the names of the 22 MMAs, the Department is proposing to strike the geographic location from each MMA name.

The MMAs and special closures indicated on Attachment 2, within the “1/100th to 1/1000th” column, are proposed for the following amendment.

In an effort to improve consistency and accuracy, the 76 MMAs and 8 special closures with coordinates currently ending at 1/100th of a minute are proposed to be refined by adding a third decimal place to the current coordinates so they then end at 1/1000th of a minute.

Necessity and Rationale: During the MLPA planning process MMA boundaries were selected remotely using satellite imagery in a Geographical Information System and/or similar mapping programs. The MMAs and special closures

identified on Attachment 2 within the “1/100th to 1/1000th” column have coordinates which end at two decimal places (1/100th of a minute), equating to an accuracy of plus/minus 60 feet for Global Positioning System (GPS) users in the field. By amending the current boundary coordinates to end at three decimal places (1/1000th of a minute), boundary accuracy increases to plus/minus 6 feet for GPS users in the field; thereby improving the clarity, compliance and enforceability of regulations.

The MMAs and special closures indicated on Attachment 2, within the “Point of Reference” column, are proposed for the following amendment.

In an effort to improve accuracy and enforceability, 61 MMAs and 3 special closures within subsection 632(b) are proposed to have one or more of the coordinates moved towards an intended point of reference established during the planning process. The proposed movements are depicted in Attachment 3.

Necessity and Rationale: Department staff visited all MMAs and special closures in the statewide network to confirm the location of boundary coordinates. Going out to each location with a handheld GPS, Department staff assessed where a boundary coordinate landed, and compared that coordinate to where the boundary was proposed to land during the planning process. Upon groundtruthing each MMA, it was found that not all coordinates were set as accurately as possible to their intended point of reference. These proposed amendments will move the boundary coordinates of the 61 MMAs and 3 special closures closer to their intended point of reference, such as a headland, bridge, or mean high tide line, and make it easier for a user to identify whether they are within an MMA.

Most MMAs proposed to undergo this boundary refinement will have a net change in area of 0.00 square miles (Attachment 2). Any point of reference boundary amendment that yields a percent area change greater than plus/minus 0.00 percent to 0.01 percent, or a change in area larger than 0.00 square miles is explained below.

1. Big River Estuary SMCA, subsection 632(b)(25), is proposed to have a minor shape change at its southwest coordinate (Attachment 3). The coordinate currently lands on the river bank next to the bridge. However, in order to capture fluctuations in the river, this coordinate has been moved upslope, onto more stable ground, and ensures that the MMA captures the mean high tide line during flood events. This proposed change would increase the MMA by 0.07 percent, but yield a change in area of 0.00 square miles.
2. Navarro River Estuary SMCA, subsection 632(b)(27), is proposed to have a small shape change at its southwestern boundary to anchor the coordinates on more prominent features and encompass the mouth of the estuary (Attachment 3). This proposed change would decrease the MMA by 0.10 percent, but yield a change in area of 0.00 square miles. Of the MMA’s two

southern coordinates, the more northwestern coordinate is proposed to move to a prominent rock nearer the ocean, while the southeastern coordinate is proposed to move up shore near the parking lot as an easier reference location for constituents. Changes to the two northern coordinates yielding an area change less than 0.01 percent are also proposed for this SMCA.

3. Estero de Limantour SMR, subsection 632(b)(46), will increase in size by 0.03percent, but have a 0.00 square mile change in area, if the proposed amendments are adopted. This increase is caused by the relocation of current boundaries, which land subtidally near shore (Attachment 3). These coordinates are proposed to be relocated closer to the mean high tide line to capture the extent of the MMA originally proposed by stakeholders during the planning process.
4. Natural Bridges SMR, subsection 632(b)(69), will decrease in size by 0.07percent, with a 0.00 change in square miles, if the proposed amendments are adopted. This decrease occurs due to the movement of the eastern boundary of Natural Bridges SMR to a more distinguishable shore location (Attachment 3). The current boundary lands due east of a prominent sand stone bluff. The Department is proposing to move the current coordinate onto the sand stone bluff to provide users with an identifiable reference point, so they know if they are within or outside of the SMR. This proposed move will shift the boundary slightly west and slightly decrease the overall SMR size. A change to the western coordinate yielding an area change less than 0.01 percent is also proposed for this SMR.
5. Edward F. Ricketts SMCA, subsection 632(b)(75), will decrease in size by 0.74percent, with a 0.00 square mile change in area, if the proposed amendments are adopted. The eastern most coordinate currently lands beyond the coast guard jetty. However, when this SMCA was designed this eastern coordinate was supposed to land at the end of the coast guard jetty. Therefore, the Department is proposing to relocate said coordinate from beyond the jetty, and anchor it to the end of the jetty as originally designed (Attachment 3). A change to the western most coordinate yielding an area change less than 0.01 percent is also proposed for this SMCA.
6. Carmel Bay SMCA, subsection 632(b)(80), is proposed to have its northern coordinate anchored on the mainland, as this coordinate currently lands in the subtidal zone (Attachment 3). In order to meet the original design criteria provided by the regional stakeholders during the planning process, this coordinate needs to be moved northwest, and anchored on shore to capture the mean high tide line. The proposed amendment to move this coordinate out of the subtidal zone, would anchor the coordinate just north of noticeable wash rocks, and would increase the size of Carmel Bay SMCA by 0.54 percent, or add 0.01 square miles to the SMCA due to the angle of the boundary.

7. Bolsa Bay SMCA, subsection 632(b)(121), is proposed to have all four of its current coordinates relocated in order to capture the mean high tide within the bay (Attachment 3). This proposed change would increase the size of the MMA by 0.20 percent, with a change in area of 0.00 square miles. The two northern most boundaries of Bolsa Bay SMCA are anchored under an overpass for a road way. These two boundaries are proposed to move up on the bank of the bay beneath this overpass in order to capture the actual size of the MMA beneath this roadway. The two southern most boundaries are proposed to undergo similar changes to encompass the true extent of the bay, but the new coordinates will be anchored beneath the overlying pedestrian bridge which is the current point of reference.
8. If the proposed boundary refinement is adopted for Cat Harbor (~~Catalina Island~~) SMCA, subsection 632(b)(131), the MMA will increase by 0.86 percent, but yield a 0.00 change in square miles. When this boundary was reassessed, Department staff found that the northeastern coordinate landed more inland than the stakeholders intended when designing the MMA (Attachment 3). In order to set this boundary as accurately as possible, the Department is proposing to relocate the coordinate to the southern end of a bluff, and closer to the water to both encompass the mean high tide line, and provide a discernable point of reference.
9. Four of the current coordinates defining Upper Newport Bay SMCA, subsection 632(b)(132), are proposed to be amended to improve the accuracy of the SMCA's boundaries (Attachment 3). The two southern most coordinates were proposed to land just before Pacific Coast Highway. However, when groundtruthed the current coordinates landed north of the intended location. The Department is proposing to move these two coordinates closer to Pacific Coast Highway, on the bank of the bay, in order to maintain the original shape designed by the stakeholders. Similarly, the northeast boundary was designed to land just before Jamboree Road, but the current boundary lands due east, beneath the road. Therefore the Department is proposing to move both of the coordinates which define the northeastern boundary slightly west, so the boundary lines up along the bay before meeting the roadway. These proposed changes would increase the size of the MMA by 0.04 percent, with a 0.00 square mile change in area.

The MMAs indicated on Attachment 2, within the “Mean High Tide Line” column, are proposed for the following amendment.

1. The existing regulations of subsections 632(b)(79)(A), 632(b)(84)(A), and 632(b)(88)(A) define the boundaries for Carmel Pinnacles SMR, Point Sur SMCA, and Piedras Blancas SMCA, respectively. The proposed regulation change will delete unnecessary text pertaining to the “mean high tide line” currently used to describe the boundaries for these three MMAs.

Necessity and Rationale: Each of these three MMAs occurs offshore, and their boundaries are not influenced by the tide. However, the current

regulatory text defining the boundaries for these MMAs states: “This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed”. Given the offshore location of Carmel Pinnacles SMR, Point Sur SMCA, and Piedras Blancas SMCA, the Department is proposing to delete the text “the mean high tide line and” due to its irrelevance.

2. The existing regulations of subsection 632(b)(100)(A) define the boundaries for Goleta Slough SMCA. The existing Goleta Slough State Marine Conservation Area boundary is proposed to be removed and replaced by the mean high tide line.

Necessity and Rationale: This is the only remaining MMA slough in the statewide network to not have its tidally influenced boundary defined by the mean high tide line. Due to the transient nature of water and tidal cycles, it is more effective to have slough boundaries set by the mean high tide line than a distinct set of coordinates. Additionally, this particular slough is an embayment with only one entrance and exit point for water transfer. By using the mean high tide as a boundary any future fluctuations in the Slough’s water level will be protected, while set coordinates cannot successfully encompass the Slough’s waters consistently. For these reasons the Department is proposing to replace the sole coordinate boundary of this MMA with the mean high tide line.

The MMAs indicated on Attachment 2, within the “Shift” column, are proposed for the following amendment.

The existing regulations of subsections 632(b)(134)(A) and 632(b)(135)(b) define the boundaries for the Laguna Beach SMR and Laguna Beach no-take SMCA, respectively. The proposed regulations adjust the boundary between Laguna Beach SMR and Laguna Beach no-take SMCA south to the city beach/county beach line near Aliso Creek to address municipality concerns. The proposed movements are depicted in Attachment 3.

Necessity and Rationale: During the south coast planning process, it became apparent that the proposed Laguna Beach SMR had an outfall pipe running through the MMA which would require maintenance. A regulatory package was created to address this issue (and others) in 2010. The Department presented the Commission with five distinct amendment options to account for the outfall pipe. Four of the amendment options were intended to have the southern boundary of the Laguna Beach SMR at the city beach/county beach line near Aliso Creek just north of an outfall pipe. However, when presented to the Commission, the agreed upon southern Laguna Beach SMR boundary was erroneously only addressed in three of the five proposal options. When adopted, the option selected by the Commission did not have the southern Laguna Beach SMR boundary at the city beach/county beach line. Instead the boundary coordinates were placed north of the city beach/county beach boundary. This placement split a prominent location, Treasure Island, in half

creating city and county jurisdictional concerns for Laguna Beach. Pursuant to requests from representatives of local agencies, the Department is now proposing to shift the shared boundary between the Laguna Beach SMR and the Laguna Beach no-take SMCA south to align with the city beach/county beach line.

This proposed amendment would move 0.38 square miles from the Laguna Beach no-take SMCA into the Laguna Beach SMR, however the overall size of the protected areas together would remain the same (see Attachment 2). As indicated in Attachment 2, this shift of area would result in a change in the individual size of each area relative to their original sizes, with a 6.08 percent increase in size of the Laguna Beach SMR, and an 11.07 percent decrease in size of the Laguna Beach no-take SMCA. These size changes will not impact fishermen, enforcement, or science guidelines as the shift is between two no-take MMAs.

The MMAs indicated on Attachment 2, within the “NOAA State Line” column, are proposed for the following amendment.

To improve offshore boundary accuracy, 25 MMA boundaries within subsection 632(b) are proposed to have one or more of their coordinates moved to the National Oceanic and Atmospheric Administration’s (NOAA) revised 3 nautical mile (nm) state line to improve clarity, compliance, and enforceability of regulations. The proposed movements are depicted in Attachment 3.

Necessity and Rationale: When Department staff reassessed all MMA coordinates for accuracy, a subset of MMAs which reach offshore revealed discrepancies between reported MMA coordinates and NOAA’s 3 nm state line. For many of the central coast MMAs this misplacement of the coordinate to NOAA’s 3 nm state line occurred during the central coast planning process. When the central coast MMAs were designed, regional stakeholders used the then-current 3 nm state line generated by NOAA to establish MMAs’ western most boundaries. However, just as the central coast MMAs were implemented, NOAA released updated navigational charts, which relocated the state’s 3 nm line in some areas. Due to the timing overlap, the western boundaries of the central coast MMAs were anchored to the previous reporting of the state’s 3 nm line. To ensure accuracy, the Department is now proposing to anchor these coordinates to NOAA’s current 3 nm state line as originally intended during the central coast planning process. If implemented, the area for a given MMA will not change because the Department has always used NOAA’s 3 nm state line as the western boundary. While it may appear that a large area is now made unavailable for fishing within the central coast MMAs, the Department has always used the 3 nm state line as the western boundary when describing these locations, and is proposing to anchor these coordinates to the new 3 nm state line location to maintain accuracy and consistency.

The remaining statewide MMA adjustments to the 3nm state line will undergo minimal movement in order to anchor the coordinates more accurately on

NOAA's 3 nm state line thereby increasing accuracy and enforceability of these MMAs throughout the state.

With the exception of Judith Rock (~~San Miguel Island~~) SMR, subsection 632(b)(104), all MMAs within the "NOAA State Line" column of Attachment 2 have a net area change of 0.00 square miles which means there is no significant change in the size of the given MMA. However, if the proposed amendments are adopted, Judith Rock SMR will decrease in size by , 0.39 percent of its original size, or 0.02 square miles, because the current extent of the MMA lies beyond NOAAs 3 nm state line (Attachment 3). If the new coordinates are adopted as proposed, the coordinates will be moved onto the 3 nm state line, closer to San Miguel Island, which will cause a slight decrease in the reported area of the MMA. However, the MMA was designed to have the 3 nm state line be the furthest offshore boundary so this size decrease will not impact the condition of the SMR in any way.

The MMAs indicated on Attachment 2, within the "Added Position" column, are proposed for the following amendments.

1. The Department is proposing to add two additional coordinates to the existing regulations of Stewarts Point SMR, subsection 632(b)(34)(A) to improve clarity, compliance, and enforceability of regulations. One added coordinate will be placed at the same coordinate location of Stewarts Point SMCA's southern mainland location, and the other additional proposed coordinate will be placed at the same location as Stewart's Point SMCA's southern offshore coordinate. These added coordinates will make Stewarts Point SMR independent of Stewarts Point SMCA, as the boundaries of these two MMAs currently overlap. The new proposed coordinates are depicted in Attachment 3, as positions 34_1 and 34_2.

In addition to these proposed additional coordinates, to make Stewarts Point SMCA and Stewarts Point SMR independent of one another, the text: "except that Stewarts Point State Marine Conservation Area as described in subsection 632(b)(33)(A) is excluded" will be deleted from the current regulations of subsection 632(b)(34)(A).

Necessity and Rationale: Currently, the boundaries of Stewarts Point SMCA and Stewarts Point SMR overlap one another. The Department is proposing to make these two MMAs independent of one another, mirroring the approach used for Big Creek SMR, subsection 632(b)(85)(A) and Big Creek SMCA, subsection 632(b)(86)(A). Separating the Stewarts Point SMR and Stewarts Point SMCA will simplify the regulations, and improve the overall consistency of designating boundaries throughout the statewide network. To make these two MMAs independent of one another, Stewarts Point SMR will gain two additional coordinate positions, both of which will be identical to Stewarts Point SMCA's two southern most coordinates. Thus, allowing these two MMAs to now share a boundary rather than overlapping one another.

2. The existing regulations of subsection 632(b)(66)(A) define the boundaries for Pillar Point SMCA. The Department is proposing to increase the current number of coordinates for Pillar Point SMCA by adding one position to the MMA's existing boundary regulations. The added coordinate will be placed southeast of the southernmost mainland coordinate to protect a rocky cove. The new proposed coordinate is depicted in Attachment 3, as position 66_6.5.

Necessity and Rationale: When Department staff reassessed all MMA coordinates for accuracy, it was found that the original coordinate, proposed to land on this rocky headland, landed due west in a subtidal zone. In order to include the mean high tide line and the small alcove within this area of the MMA, an additional point should be added. This will allow the alcove to be within the protection of the MMA, while maintaining the current offshore boundary and line of sight through this rocky headland. This proposed additional position maintains the size and shape of the MMA originally designed by the regional stakeholders during the planning process.

3. The existing regulations of subsection 632(b)(67)(A) and subsection 632(b)(68)(A) define the boundaries for Año Nuevo ~~SMCA~~ SMR and Greyhound Rock SMCA, respectively. The Department is proposing to increase the current number of coordinates for Año Nuevo ~~SMCA~~ SMR and Greyhound Rock SMCA by adding one position to each MMA's boundary regulations. The added coordinate will be anchored on Greyhound Rock which lies on the shared boundary of the two MMAs. The new proposed coordinate is depicted in Attachment 3, as position 67_4.5 and position 68_1.5.

Necessity and Rationale: When Department staff reassessed all MMA coordinates for accuracy, it was found that the original coordinate, proposed to land on Greyhound Rock, landed due west of the intended location. To maintain the shape originally proposed by the regional stakeholders during the central coast planning process, the current coordinate is being relocated from the water to the mainland shore, and an additional coordinate will be added to Greyhound Rock. Both MMAs which share this boundary will not change in size or shape, but will instead have more accurate and enforceable boundaries to aid users.

4. The existing regulations of subsection 632(b)(77)(A) and subsection 632(b)(78)(A) define the boundaries for Pacific Grove Marine Gardens SMCA and Asilomar SMR, respectively. The Department is proposing to increase the current number of coordinates for Asilomar SMR and Pacific Grove Marine Gardens SMCA by adding one position to each MMA's boundary regulations. The added coordinate will be placed on the rocky point, which currently resides in Asilomar SMR, causing a shift in the shared boundary of Pacific Grove Marine Gardens SMCA and Asilomar SMR. The new proposed coordinate is depicted in Attachment 3, as position 77_4.5 and position 78_1.5.

Necessity and Rationale: When Department staff reassessed all MMA coordinates for accuracy, this location stood out as an area that could be refined to aid users in determining their location within a given MMA. The proposed location for this added position is on a very prominent rocky outcropping which would be easy to spot from shore or when out in the water. Using this outcropping as a point of reference, individuals could quickly identify if they were in Asilomar SMR (to the south or west of the point), or if they were within Pacific Grove Marine Gardens SMCA (to the north or east of the point). By adding this position the shared boundary would change in shape of these MMAs. The size of Pacific Grove Marine Gardens SMCA would increase by 0.03 square miles (3.00 percent of its original size), while Asilomar SMR would decrease by 0.03 square miles (1.87 percent of its original size), as indicated on Attachment 2.

5. The existing regulations of subsection 632(b)(133)(A) and subsection 632(b)(134)(A) define the boundaries for Crystal Cove SMCA and Laguna Beach SMR, respectively. The Department is proposing to add an additional boundary coordinate at the shared boundary between Crystal Cove SMCA and Laguna Beach SMR. The added coordinate will be located on a headland, northeast of the nearest existing coordinate and is depicted in Attachment 3, as position133_4.5 and position 134_0.5.

Necessity and Rationale: When Department staff reassessed all MMA coordinates for accuracy, it was found that the original coordinate, proposed to land on the rocky mainland point, landed due west of the intended location in the intertidal zone, rather than on the mainland. The Department's intent is to minimize boundary changes made to the MMAs as much as possible. Therefore, this additional boundary position allows the offshore longitude to remain on 2/10ths of a minute (a simple coordinate for fishermen use), while maintaining the line of sight through the prominent rocky outcropping, and anchors the boundary to shore. This proposed additional position yields a net area change of 0.00 square miles (0.0 percent) (Attachment 2) for both MMAs while providing more accurate and enforceable boundaries to aid users.

The proposed regulations correct a printing error in subsection 632(b)(120)(B)1., Abalone Cove SMCA.

Necessity and Rationale: The regulatory text as approved by the Office of Administrative Law (OAL) in rulemaking file 2014-0703-03s is not accurately reflected in the printed version of Title 14, causing ambiguity as to what recreational fishing activities are allowed in this SMCA. The proposed change reflects the language adopted by the Commission and approved by OAL.

Various nonsubstantive changes are also proposed for clarity and consistency.

Goals and Benefits of the Proposed Regulations

The proposed regulations will provide clarity and consistency within the regulations and will provide consistency with current fishing practices.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205(c), 220, 240, 1590, 1591, 2860, 2861, and 6750, Fish and Game Code; and Sections 36725(a) and 36725(e), Public Resources Code.

Reference: Sections 200, 202, 205(c), 220, 240, 2861, 5521, 6653, 8420(e), and 8500, Fish and Game Code; and Sections 36700(e), 36710(e), 36725(a) and 36725(e), Public Resources Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None

(d) Identification of Reports or Documents Supporting Regulation Change:

Attachment 1: Table 1- Summary of proposed language amendments to Title 14, Section 632, California Code of Regulations

Attachment 2: Table 2- Summary of proposed boundary refinement amendments to Tile 14, Section 632, California Code of Regulations

Attachment 3: California State Marine Protected Areas Proposed Boundary Refinements

Attachment 4: Comparison of NOAA Nautical Charts

Attachment 5: North Coast Planning Process Intent

Attachment 6: North Central Coast Planning Process Intent

Attachment 7: Central Coast Planning Process Intent

Attachment 8: South Coast Planning Process Intent

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings were held prior to the notice publication. The 45-day comment period provides adequate time for public review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

(b) No Change Alternative:

The no-change alternative would leave existing MMA regulations with decreased boundary accuracy and inconsistencies, and would not provide for better public understanding and enforcement of MMA regulations.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states because the proposed amendments make clarification and consistency changes to the current regulations; make minor boundary adjustments; re-designate and rename existing MMAs; and add specified methods of take consistent with existing commercial fishing regulations.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission does not anticipate any impacts on creation or elimination of jobs, the creation of new businesses, the elimination of existing businesses or

the expansion of businesses in California because these changes will neither increase nor decrease recreational or commercial fishing opportunities within MMAs.

The Commission does not anticipate any benefits to the health and welfare of California residents or to worker safety.

The proposed amendments may benefit the environment by clarifying the administration of the protection of habitat and biodiversity in MMAs.

(c) Cost Impacts on a Representative Private Person or Business:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

(e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

The proposed amendments will not create or eliminate jobs within the state because the proposed amendments make clarification and consistency changes to the current regulations; make minor boundary adjustments; re-designate and rename existing MMAs; and add specified methods of take consistent with commercial fishing practices. These changes will neither

increase nor decrease recreational or commercial fishing opportunities within MMAs.

- (b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

The proposed amendments will not create any new businesses or eliminate existing businesses because the proposed regulations will neither increase nor decrease recreational or commercial fishing opportunities within MMAs.

- (c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

The proposed amendments are not expected to result in the expansion of businesses currently doing business within the state because the proposed regulations will neither increase nor decrease recreational or commercial fishing opportunities within MMAs.

- (d) Benefits of the Regulation to the Health and Welfare of California Residents:

The proposed amendments will not result in benefits to the health and welfare of State residents.

- (e) Benefits of the Regulation to Worker Safety:

The proposed amendments do not have foreseeable benefits to worker safety because the regulations do not affect working conditions.

- (f) Benefits of the Regulation to the State's Environment:

The proposed amendments may benefit the state's environment by clarifying and improving the understanding and enforcement of recreational and commercial fishing regulations in California MMAs.

Informative Digest/Policy Statement Overview

The Marine Life Protection Act (Fish and Game Code Sections 2850-2863) established a programmatic framework for designating Marine Protected Areas (MPAs) in the form of a statewide network. The Marine Managed Areas Improvement Act (Public Resources Code [PRC] Sections 36600-36900) standardized the designation of marine managed areas (MMAs), which include MPAs. The overriding goal of these acts is to protect, conserve, and help sustain California’s valuable marine resources. Unlike previous laws, which focused on individual species, these acts focus on maintaining the health of marine ecosystems and natural biodiversity in order to sustain resources.

Existing regulations in Section 632, Title 14, California Code of Regulations (CCR), provide general provisions, definitions, and site-specific area classifications, boundary descriptions, commercial and recreational take restrictions, and other restricted/allowed uses for MPAs, MMAs and special closures.

The proposed regulatory changes will clarify the allowed and prohibited uses for all MMA designations; amend aquaculture activities for two MMAs; and amend troll gear references for ten MMAs. In addition, the proposed regulations change the designation of one MMA; change the names of 21 MMAs; and refine boundary coordinates for 106 MMAs.

The following is a summary of the proposed changes to Section 632, Title 14, CCR.

Amendment to Subsection 632(a):

1. The proposed regulations add a citation to the statute (Public Resources Code Section 36710) which established the MMA definitions in subsection 632(a)(1).

Amendments to Subsection 632(b):

1. The proposed regulations clarify regulatory language, correct existing errors, and update allowable activities within MMAs.
 - a. The proposed regulation replaces the existing text with new text, as follows:

Area	Existing text	New text
State Marine Reserve (SMR)	“Take of all living marine resources is prohibited”	“Area restrictions defined in subsection 632(a)(1)(A) apply”
State Marine Park	“Take of all living marine resources is prohibited except...”	“Area restrictions defined in subsection 632(a)(1)(B) apply with the following specified exceptions...”
State Marine Conservation Area (SMCA)		“Area restrictions defined in subsection 632(a)(1)(C) apply with the following specified exceptions...”

State Marine Recreational Management Area (SMRMA)	<p>“Take of all living marine resources is prohibited”</p> <p>OR</p> <p>“Take of all living marine resources is prohibited except...”</p>	<p>“Area Restrictions defined in subsection 632(a)(1)(D) apply”</p> <p>OR</p> <p>“Area restrictions defined in subsection 632(a)(1)(D) apply with the following specified exceptions...”</p>
---	---	--

- b. The proposed regulations restructure the regulatory text for MacKerricher SMCA, subsection 632(b)(22)(B), Russian Gulch SMCA, subsection 632(b)(24)(B), Van Damme SMCA, subsection 632(b)(26)(B), and Arrow Point to Lion Head Point (Catalina Island) SMCA, subsection 632(b)(123)(B), in order for their activities language to resemble the remaining MMA descriptions, listing allowable activities instead of prohibited activities.
 - c. The proposed regulations add the text “is allowed” to the current regulatory text for 41 MMAs.
 - d. The proposed regulations delete the allowance for aquaculture in Drakes Estero SMCA, subsection 632(b)(47)(B).
 - e. The proposed regulations amend the current species list for aquaculture within Morro Bay SMRMA, subsection 632(b)(91)(C), to be dependent upon lease conditions rather than a designated list of species.
 - f. The proposed regulations replace obsolete salmon troll gear reference with the current salmon troll gear reference for nine MMAs.
 - g. The proposed regulations delete the obsolete pelagic finfish troll gear reference from Bodega Head SMCA, subsection 632(b)(40)(B).
 - h. The proposed regulations remove commercial harvest of kelp as an allowed activity in Año Nuevo SMCA, subsection 632(b)(67), and redesignate this SMCA as a SMR.
 - i. The proposed regulations simplify the names of 21 MMAs by striking the parenthesized text which identifies the geographic location of a given MMA.
 - j. The proposed regulations amend text for Point Lobos SMCA, subsection 632(b)(82), and Big Creek SMCA, subsection 632(b)(86), to clarify that albacore may be taken both recreationally and commercially.
2. The proposed regulations improve boundary accuracy and ease of enforcement for numerous MMAs.
- a. The proposed regulations add a third decimal place to the current coordinates for 76 MMAs and eight special closures.

- b. The proposed regulations move one or more of the existing coordinates toward an intended point of reference, such as a headland, bridge or mean high tide line, for 61 MMAs and three special closures.
 - c. The proposed regulations delete text pertaining to the mean high tide line for Carmel Pinnacles SMR, subsection 632(b)(79)(A), Point Sur SMCA, subsection 632(b)(84)(A), and Piedras Blancas, SMCA 632(b)(88)(A).
 - d. The proposed regulations replace the sole coordinate boundary at Goleta Slough SMCA, subsection 632(b)(100)(A), with the mean high tide line.
 - e. The proposed regulations move the shared boundary between the Laguna Beach SMR, subsection 632(b)(134)(A), and Laguna Beach no-take SMCA, subsection 632(b)(135)(A), south to the city beach/county beach line near Aliso Creek.
 - f. The proposed regulations anchor coordinates for 25 MMAs to the current National Oceanic and Atmospheric Administration's three nautical mile state line.
 - g. The proposed regulations add one or two positions to the list of coordinates for eight MMAs.
3. The proposed regulations correct a printing error in subsection 632(b)(120)(B)1., Abalone Cove SMCA, and make other nonsubstantive changes for clarity and consistency.

The proposed amendments to section 632 will clarify the restrictions and allowable activities in these MMA's; provide greater ease of public understanding and enforceability; and correct boundary descriptions.

The proposed regulations are consistent with regulations concerning sport and commercial fishing and kelp harvest found in Title 14, CCR. The State Water Resources Control Board may designate State Water Quality Protection Areas and the State Park and Recreation Commission may designate State Marine Reserves, State Marine Conservation Areas, State Marine Recreational Management Areas, State Marine Parks and State Marine Cultural Preservation Areas; however, only the Fish and Game Commission has authority to regulate commercial and recreational fishing and any other taking of marine species in Marine Managed Areas. Department staff has searched the California Code of Regulations and has found no other regulations pertaining to authorized activities in marine protected areas and therefore has determined that the proposed amendments are neither inconsistent, nor incompatible, with existing state regulations.

Regulatory Language

Section 632, Title 14, CCR, is amended to read:

632. Marine Protected Areas (MPAs), Marine Managed Areas (MMAs), and Special Closures.

(a) General Rules and Regulations:

The areas specified in this section have been declared by the commission to be marine protected areas, marine managed areas, or special closures. Public use of marine protected areas, marine managed areas, or special closures shall be compatible with the primary purposes of such areas. MPAs, MMAs, and special closures are subject to the following general rules and regulations in addition to existing Fish and Game Code statutes and regulations of the commission, except as otherwise provided for in subsection 632(b), areas and special regulations for use. Nothing in this section expressly or implicitly precludes, restricts or requires modification of current or future uses of the waters identified as marine protected areas, special closures, or the lands or waters adjacent to these designated areas by the Department of Defense, its allies or agents.

(1) ~~Protection of Resources.~~ Resources in MPAs and MMAs, as defined in Public Resources Code Section 36710:

(A) State Marine Reserves: In a state marine reserve, it is unlawful to injure, damage, take, or possess any living, geological, or cultural marine resource, except under a scientific collecting permit issued by the department pursuant to Section 650 or specific authorization from the commission for research, restoration, or monitoring purposes.

(B) State Marine Parks: In a state marine park, it is unlawful to injure, damage, take, or possess any living or nonliving marine resource for commercial purposes. Any human use that would compromise protection of the species of interest, natural community or habitat, or geological, cultural, or recreational features, may be restricted by the commission as specified in subsection 632(b), areas and special regulations for use.

The department may issue scientific collecting permits pursuant to Section 650. The commission may authorize research, monitoring, and educational activities and certain recreational harvest in a manner consistent with protecting resource values.

(C) State Marine Conservation Areas: In a state marine conservation area, it is unlawful to injure, damage, take, or possess any living, geological, or cultural marine resource for commercial or recreational purposes, or a combination of commercial and recreational purposes except as specified in subsection 632(b), areas and special regulations for use. The department may issue scientific collecting permits pursuant to Section 650. The commission may authorize research, education, and recreational activities, and certain commercial and recreational harvest of marine resources, provided that these uses do not compromise protection of the species of interest, natural community, habitat, or geological features.

(D) State Marine Recreational Management Areas: In a state marine recreational management area, it is unlawful to perform any activity that would compromise the recreational values for which the area may be designated. Recreational opportunities may be protected, enhanced, or restricted, while preserving basic resource values of the area. No other use is restricted unless specified in subsection 632(b), areas and special regulations for use.

[No changes to current regulatory text in subsections 632(a)(2) through (a)(12)]

(b) Areas and Special Regulations for Use. Pursuant to the commission's authority in Fish and Game Code Section 2860 to regulate commercial and recreational fishing and any other taking of marine species in MPAs, Fish and Game Code Sections 10500(f), 10500(g), 10502.5, 10502.6, 10502.7, 10502.8, 10655, 10655.5, 10656, 10657, 10657.5, 10658, 10660, 10661, 10664, 10666, 10667, 10711, 10801, 10900, 10901, 10902, 10903, 10904, 10905, 10906, 10907, 10908, 10909, 10910, 10911, 10912, 10913, and 10932 are superseded as they apply to designations in Subsection 632(b). All geographic coordinates listed use the North American Datum 1983 (NAD83) reference datum:

(1) Pyramid Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

42° 00.000' N. lat. 124° 12.735' W. long.;

42° 00.000' N. lat. 124° 19.814' W. long.; thence southward along the three nautical mile offshore boundary to

41° 57.500' N. lat. 124° 17.101' W. long.; and

41° 57.500' N. lat. 124° 12.423' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of surf smelt [Section 28.45] by dip net or Hawaiian type throw net [Section 28.80] is allowed.

2. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(1) of these regulations and shall comply with all other existing regulations and statutes:

Smith River Rancheria.

(2) Point St. George Reef Offshore State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

41° 52.000' N. lat. 124° 23.189' W. long.;

41° 52.000' N. lat. 124° 25.805' W. long.; thence southward along the three nautical mile offshore boundary to

41° 49.000' N. lat. 124° 26.252' W. long.;

41° 49.000' N. lat. 124° 23.189' W. long.; and

41° 52.000' N. lat. 124° 23.189' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; and Dungeness crab by trap is allowed.

2. The commercial take of salmon with troll fishing gear [subsection ~~182.1(A);~~ 182(c)(4)] Dungeness crab by trap is allowed.

3. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(2) of these regulations and shall comply with all other existing regulations and statutes:

Elk Valley Rancheria, and

Smith River Rancheria.

(6) Reading Rock State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

- 41° 20.100' N. lat. 124° 04.911' W. long.;
- 41° 20.100' N. lat. 124° 10.000' W. long.;
- 41° 17.600' N. lat. 124° 10.000' W. long.; and
- ~~41° 17.600' N. lat. 124° 05.497' W. long.~~
- 41° 17.600' N. lat. 124° 05.399' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; surf smelt [Section 28.45] by dip net or Hawaiian type throw net [Section 28.80]; and Dungeness crab by trap, hoop net or hand is allowed.
2. The commercial take of salmon with troll fishing gear [subsection ~~482.1(A)~~182(c)(4)]; surf smelt by dip net; and Dungeness crab by trap is allowed.
3. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(6) of these regulations and shall comply with all other existing regulations and statutes:
Yurok Tribe of the Yurok Reservation.

(7) Reading Rock State Marine Reserve.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

- 41° 20.100' N. lat. 124° 10.000' W. long.;
- 41° 20.100' N. lat. 124° 14.655' W. long.; thence southward along the three nautical mile offshore boundary to
- 41° 17.600' N. lat. 124° 11.963' W. long.;
- 41° 17.600' N. lat. 124° 10.000' W. long.; and
- 41° 20.100' N. lat. 124° 10.000' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(8) Samoa State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

- 40° 55.000' N. lat. 124° 08.432' W. long.;
- 40° 55.000' N. lat. 124° 12.677' W. long.; thence southward along the three nautical mile offshore boundary to
- 40° 52.000' N. lat. 124° 14.225' W. long.; and
- 40° 52.000' N. lat. 124° 09.803' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; surf smelt [Section 28.45] by dip net or Hawaiian type throw net [Section 28.80]; and Dungeness crab by trap, hoop net or hand is allowed.
2. The commercial take of salmon with troll fishing gear [subsection ~~482.1(A)~~182(c)(4)]; surf smelt by dip net; and Dungeness crab by trap is allowed.

3. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(8) of these regulations and shall comply with all other existing regulations and statutes:
Wiyot Tribe.

(9) South Humboldt Bay State Marine Recreational Management Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

40° 43.000' N. lat. 124° 15.527' W. long.;

40° 43.000' N. lat. 124° 15.000' W. long.;

40° 42.000' N. lat. 124° 15.000' W. long.; and

40° 42.000' N. lat. 124° 16.141' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(D) apply, with the following specified exceptions:

1. The following federally recognized tribe is exempt from the area and take regulations found in subsection 632(b)(9) of these regulations and shall comply with all other existing regulations and statutes:

Wiyot Tribe.

(C) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

[No changes to current regulatory text in subsection (b)(10)]

(11) South Cape Mendocino State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~40° 26.100' N. lat. 124° 24.353' W. long.;~~

40° 26.100' N. lat. 124° 24.340' W. long.;

40° 26.100' N. lat. 124° 31.958' W. long.; thence southward along the three nautical mile offshore boundary to

40° 24.900' N. lat. 124° 31.084' W. long.; and

~~40° 24.900' N. lat. 124° 23.813' W. long.~~

40° 24.900' N. lat. 124° 23.800' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

[No changes to current regulatory text in subsection (b)(12)]

(13) Mattole Canyon State Marine Reserve.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

40° 20.000' N. lat. 124° 22.500' W. long.;

40° 20.000' N. lat. 124° 25.902' W. long.; thence southward along the three nautical mile offshore boundary to

40° 17.000' N. lat. 124° 25.869' W. long.;

40° 17.000' N. lat. 124° 22.500' W. long.; and

40° 20.000' N. lat. 124° 22.500' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(14) Sea Lion Gulch State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

40° 14.400' N. lat. 124° 19.983' W. long.;

40° 14.400' N. lat. 124° 25.943' W. long.; thence southward along the three nautical mile offshore boundary to

40° 12.800' N. lat. 124° 24.809' W. long.; and

40° 12.800' N. lat. 124° 18.155' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(15) Big Flat State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

40° 09.400' N. lat. 124° 12.671' W. long.;

40° 09.400' N. lat. 124° 19.366' W. long.; thence southward along the three nautical mile offshore boundary to

40° 07.500' N. lat. 124° 16.203' W. long.; and

40° 07.500' N. lat. 124° 10.313' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; and Dungeness crab by trap, hoop net or hand is allowed.

2. The commercial take of salmon with troll fishing gear [subsection ~~182.1(A);~~182(c)(4)] Dungeness crab by trap is allowed.

3. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(15) of these regulations and shall comply with all other existing regulations and statutes:

Bear River Band of the Rohnerville Rancheria,

Big Valley Band of Pomo Indians of the Big Valley Rancheria,

Cahto Indian Tribe of the Laytonville Rancheria,

Coyote Valley Band of Pomo Indians,

Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,

Guidiville Rancheria,

Habematolel Pomo of Upper Lake,

Hopland Band of Pomo Indians of the Hopland Rancheria,

Lower Lake Rancheria,

Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,

Middletown Rancheria of Pomo Indians,

Pinoleville Pomo Nation,

Potter Valley Tribe,

Redwood Valley Rancheria of Pomo Indians,

Robinson Rancheria of Pomo Indians,

Round Valley Indian Tribes of the Round Valley Reservation,

Scotts Valley Band of Pomo Indians, and

Sherwood Valley Rancheria of Pomo Indians.

(16) Double Cone Rock State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

39° 48.500' N. lat. 123° 50.713' W. long.;

39° 48.500' N. lat. 123° 55.875' W. long.; thence southward along the three nautical mile offshore boundary to

39° 44.300' N. lat. 123° 54.178' W. long.; and

39° 44.300' N. lat. 123° 50.055' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)]; and Dungeness crab by trap, hoop net or hand is allowed.

2. The commercial take of salmon with troll fishing gear [subsection ~~182.1(A);~~ 182(c)(4)] and Dungeness crab by trap is allowed.

3. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(16) of these regulations and shall comply with all other existing regulations and statutes:

Big Valley Band of Pomo Indians of the Big Valley Rancheria,

Cahto Indian Tribe of the Laytonville Rancheria,

Coyote Valley Band of Pomo Indians,

Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,

Guidiville Rancheria,

Habematolel Pomo of Upper Lake,

Hopland Band of Pomo Indians of the Hopland Rancheria,

Lower Lake Rancheria,

Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,

Middletown Rancheria of Pomo Indians,

Pinoleville Pomo Nation,

Potter Valley Tribe,

Redwood Valley Rancheria of Pomo Indians,

Robinson Rancheria of Pomo Indians,

Round Valley Indian Tribes of the Round Valley Reservation,

Scotts Valley Band of Pomo Indians, and

Sherwood Valley Rancheria of Pomo Indians.

[No changes to current regulatory text in subsection (b)(17) through (b)(18)]

(19) Ten Mile State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

39° 35.900' N. lat. 123° 47.243' W. long.;

39° 35.900' N. lat. 123° 51.479' W. long.; thence southward along the three nautical mile offshore boundary to

39° 33.300' N. lat. 123° 50.559' W. long.; and

39° 33.300' N. lat. 123° 46.015' W. long.

~~(B) Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(20) Ten Mile Beach State Marine Conservation Area.

(A) This area is bounded by the mean high tide and straight lines connecting the following points in the order listed except where noted:

39° 33.300' N. lat. 123° 46.015' W. long.;

39° 33.300' N. lat. 123° 50.559' W. long.; thence southward along the three nautical mile offshore boundary to

39° 32.500' N. lat. 123° 50.418' W. long.;

~~39° 32.500' N. lat. 123° 46.227' W. long.;~~

39° 32.500' N. lat. 123° 46.242' W. long.; thence northward along the mean high tide line onshore boundary to

39° 33.098' N. lat. 123° 46.003' W. long.;

39° 33.199' N. lat. 123° 45.966' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of Dungeness crab by trap, hoop net or hand is allowed.
2. The commercial take of Dungeness crab by trap is allowed.
3. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(20) of these regulations and shall comply with all other existing regulations and statutes:

Big Valley Band of Pomo Indians of the Big Valley Rancheria,

Cahto Indian Tribe of the Laytonville Rancheria,

Coyote Valley Band of Pomo Indians,

Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,

Guidiville Rancheria,

Habematolel Pomo of Upper Lake,

Hopland Band of Pomo Indians of the Hopland Rancheria,

Lower Lake Rancheria,

Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,

Middletown Rancheria of Pomo Indians,

Pinoleville Pomo Nation,

Potter Valley Tribe,

Redwood Valley Rancheria of Pomo Indians,

Robinson Rancheria of Pomo Indians,

Round Valley Indian Tribes of the Round Valley Reservation,

Scotts Valley Band of Pomo Indians, and

Sherwood Valley Rancheria of Pomo Indians.

(21) Ten Mile Estuary State Marine Conservation Area.

(A) This area consists of waters below the mean high tide line within the Ten Mile Estuary, eastward of a line connecting the following two points:

39° 33.199' N. lat. 123° 45.966' W. long.; and

39° 33.098' N. lat. 123° 46.003' W. long.

~~and~~ westward of a line connecting the following two points:

39° 32.400' N. lat. 123° 44.785' W. long.; and

39° 32.382' N. lat. 123° 44.769' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(21) of these regulations and shall comply with all other existing regulations and statutes:

Big Valley Band of Pomo Indians of the Big Valley Rancheria,
 Cahto Indian Tribe of the Laytonville Rancheria,
 Coyote Valley Band of Pomo Indians,
 Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,
 Guidiville Rancheria,
 Habematolel Pomo of Upper Lake,
 Hopland Band of Pomo Indians of the Hopland Rancheria,
 Lower Lake Rancheria,
 Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,
 Middletown Rancheria of Pomo Indians,
 Pinoleville Pomo Nation,
 Potter Valley Tribe,
 Redwood Valley Rancheria of Pomo Indians,
 Robinson Rancheria of Pomo Indians,
 Round Valley Indian Tribes of the Round Valley Reservation,
 Scotts Valley Band of Pomo Indians, and
 Sherwood Valley Rancheria of Pomo Indians.

2. Take pursuant to activities authorized in subsection 632(b)(21)(D) is allowed.

(C) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

(D) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(22) MacKerricher State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~39° 30.100' N. lat. 123° 47.390' W. long.;~~

~~39° 30.100' N. lat. 123° 47.327' W. long.;~~

39° 30.100' N. lat. 123° 49.000' W. long.;

39° 27.120' N. lat. 123° 49.000' W. long.; and

39° 27.120' N. lat. 123° 48.830' W. long.

(B) Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. All recreational take is allowed in accordance with current regulations.

2. All commercial take is allowed in accordance with current regulations, except the ~~Commercial~~ commercial take of bull kelp (*Nereocystis luetkeana*) and giant kelp (*Macrocystis pyrifera*) is prohibited. ~~All other commercial and recreational take is allowed in accordance with current regulations.~~

(23) Point Cabrillo State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

39° 21.400' N. lat. 123° 49.418' W. long.;

39° 21.400' N. lat. 123° 50.000' W. long.;

39° 20.600' N. lat. 123° 50.000' W. long.; and

39° 20.600' N. lat. 123° 49.266' W. long.

~~Take of all living marine resources is prohibited.~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(24) Russian Gulch State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

39° 19.860' N. lat. 123° 48.840' W. long.;

39° 19.860' N. lat. 123° 49.000' W. long.;

39° 19.470' N. lat. 123° 49.000' W. long.; and

39° 19.470' N. lat. 123° 48.500' W. long.

(B) Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. All recreational take is allowed in accordance with current regulations.

2. All commercial take is allowed in accordance with current regulations, except the Commercial commercial take of bull kelp (*Nereocystis luetkeana*) and giant kelp (*Macrocystis pyrifera*) is prohibited. All other commercial and recreational take is allowed in accordance with current regulations.

(25) Big River Estuary State Marine Conservation Area.

(A) This area consists of waters below the mean high tide line within the Big River Estuary, eastward of a line connecting the following two points:

39° 18.134' N. lat. 123° 47.517' W. long.; and

~~39° 18.079' N. lat. 123° 47.540' W. long.~~

39° 18.070' N. lat. 123° 47.543' W. long.

~~And~~ and westward of a line connecting the following two points:

39° 18.222' N. lat. 123° 46.242' W. long.; and

39° 18.150' N. lat. 123° 46.240' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of surfperch (family Embiotocidae) by hook and line from shore only; and Dungeness crab by hoop net or hand is allowed.

2. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(25) of these regulations and shall comply with all other existing regulations and statutes:

Big Valley Band of Pomo Indians of the Big Valley Rancheria,

Cahto Indian Tribe of the Laytonville Rancheria,

Coyote Valley Band of Pomo Indians,

Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,

Guidiville Rancheria,

Habematolel Pomo of Upper Lake,

Hopland Band of Pomo Indians of the Hopland Rancheria,

Lower Lake Rancheria,

Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,

Middletown Rancheria of Pomo Indians,

Pinoleville Pomo Nation,

Potter Valley Tribe,

Redwood Valley Rancheria of Pomo Indians,

Robinson Rancheria of Pomo Indians,

Round Valley Indian Tribes of the Round Valley Reservation,

Scotts Valley Band of Pomo Indians, and

Sherwood Valley Rancheria of Pomo Indians.

3. Take pursuant to activities authorized in subsection 632(b)(25)(D) is allowed.
(C) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).
(D) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(26) Van Damme State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and a straight line connecting the following points:

~~39° 16.335' N. lat. 123° 47.712' W. long.;~~ and

~~39° 16.147' N. lat. 123° 47.429' W. long.~~

(B) Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. All recreational take is allowed in accordance with current regulations.

2. All commercial take is allowed in accordance with current regulations, except the ~~Commercial~~ commercial take of bull kelp (*Nereocystis luetkeana*) and giant kelp (*Macrocystis pyrifera*) is prohibited. ~~All other commercial and recreational take is allowed in accordance with current regulations.~~

(27) Navarro River Estuary State Marine Conservation Area.

(A) This area consists of waters below the mean high tide line within the Navarro River Estuary, eastward of a line connecting the following two points:

~~39° 11.575' N. lat. 123° 45.653' W. long.;~~ and

~~39° 11.415' N. lat. 123° 45.487' W. long.~~

39° 11.536' N. lat. 123° 45.685' W. long.; and

39° 11.489' N. lat. 123° 45.516' W. long.

And westward of a line connecting the following two points

~~39° 11.849' N. lat. 123° 44.808' W. long.;~~ and

~~39° 11.807' N. lat. 123° 44.842' W. long.~~

39° 11.846' N. lat. 123° 44.809' W. long.; and

39° 11.803' N. lat. 123° 44.843' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmonids by hook and line is allowed consistent with salmonid regulations in Section 7.50.

2. The following federally recognized tribes (listed alphabetically) are exempt from the area and take regulations found in subsection 632(b)(27) of these regulations and shall comply with all other existing regulations and statutes:

Big Valley Band of Pomo Indians of the Big Valley Rancheria,

Cahto Indian Tribe of the Laytonville Rancheria,

Coyote Valley Band of Pomo Indians,

Elem Indian Colony of Pomo Indians of the Sulphur Bank Rancheria,

Guidiville Rancheria,

Habematolel Pomo of Upper Lake,

Hopland Band of Pomo Indians of the Hopland Rancheria,

Lower Lake Rancheria,

Manchester Band of Pomo Indians of the Manchester-Point Arena Rancheria,

Middletown Rancheria of Pomo Indians,

Pinoleville Pomo Nation,
Potter Valley Tribe,
Redwood Valley Rancheria of Pomo Indians,
Robinson Rancheria of Pomo Indians,
Round Valley Indian Tribes of the Round Valley Reservation,
Scotts Valley Band of Pomo Indians, and
Sherwood Valley Rancheria of Pomo Indians.

(C) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

(28) Point Arena State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~38° 57.35' N. lat. 123° 44.50' W. long;~~
~~38° 59.00' N. lat. 123° 44.50' W. long;~~
~~38° 59.00' N. lat. 123° 46.00' W. long;~~
~~38° 56.40' N. lat. 123° 46.00' W. long; and~~
~~38° 56.40' N. lat. 123° 43.82' W. long.~~
38° 57.350' N. lat. 123° 44.500' W. long;
38° 59.000' N. lat. 123° 44.500' W. long;
38° 59.000' N. lat. 123° 46.000' W. long;
38° 56.400' N. lat. 123° 46.000' W. long; and
38° 56.400' N. lat. 123° 43.820' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(29) Point Arena State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~38° 59.00' N. lat. 123° 46.00' W. long.;~~
~~38° 59.00' N. lat. 123° 48.16' W. long.;~~
38° 59.000' N. lat. 123° 46.000' W. long.;
38° 59.000' N. lat. 123° 48.162' W. long.; thence southward along the three nautical mile offshore boundary to
~~38° 56.40' N. lat. 123° 48.35' W. long.;~~
~~38° 56.40' N. lat. 123° 46.00' W. long.;~~ and
~~38° 59.00' N. lat. 123° 46.00' W. long.~~
38° 56.400' N. lat. 123° 48.350' W. long.;
38° 56.400' N. lat. 123° 46.000' W. long.; and
38° 59.000' N. lat. 123° 46.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)] is allowed.
2. The commercial take of salmon with troll fishing gear [subsection ~~182.1(A);~~182(c)(4)] is allowed.

(30) Sea Lion Cove State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~38° 56.40' N. lat. 123° 43.82' W. long.;~~
~~38° 56.40' N. lat. 123° 44.00' W. long.;~~
~~38° 55.79' N. lat. 123° 44.00' W. long.; and~~
~~38° 55.79' N. lat. 123° 43.74' W. long.~~
38° 56.400' N. lat. 123° 43.820' W. long.;
38° 56.400' N. lat. 123° 44.000' W. long.;
38° 55.790' N. lat. 123° 44.000' W. long.; and
38° 55.790' N. lat. 123° 43.740' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational and commercial take of finfish [subsection 632(a)(2)] is allowed.

(31) Saunders Reef State Marine Conservation Area

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~38° 51.80' N. lat. 123° 39.23' W. long.;~~
~~38° 51.80' N. lat. 123° 44.78' W. long.;~~
38° 51.800' N. lat. 123° 39.230' W. long.;
38° 51.800' N. lat. 123° 44.780' W. long.; thence southward along the three nautical mile offshore boundary to
~~38° 50.00' N. lat. 123° 42.58' W. long.; and~~
~~38° 50.00' N. lat. 123° 37.60' W. long.~~
38° 50.000' N. lat. 123° 42.580' W. long.; and
38° 50.000' N. lat. 123° 37.600' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [~~subsection 27.80(a)(3)~~] is allowed.
2. The commercial take of salmon with troll fishing gear [~~subsection 182.1(A);~~182(c)(4)] and urchin is allowed.

(32) Del Mar Landing State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~38° 44.70' N. lat. 123° 31.00' W. long.;~~
~~38° 44.20' N. lat. 123° 31.00' W. long.;~~
~~38° 44.20' N. lat. 123° 30.30' W. long.; and~~
~~38° 44.43' N. lat. 123° 30.30' W. long.~~
38° 44.706' N. lat. 123° 31.000' W. long.;
38° 44.200' N. lat. 123° 31.000' W. long.;
38° 44.200' N. lat. 123° 30.300' W. long.; and
38° 44.430' N. lat. 123° 30.300' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(33) Stewarts Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~38° 40.500' N. lat. 123° 25.370' W. long.;~~
38° 40.500' N. lat. 123° 25.345' W. long.;

38° 40.500' N. lat. 123° 25.500' W. long.;
38° 37.500' N. lat. 123° 23.500' W. long.;
~~38° 37.535' N. lat. 123° 23.027' W. long.~~
38° 37.543' N. lat. 123° 22.924' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the following may be taken recreationally from shore only: marine aquatic plants other than sea palm, marine invertebrates, finfish [subsection 632(a)(2)] by hook and line, surf smelt by beach net, and species authorized in Section 28.80 of these regulations by hand-held dip net.

(34) Stewarts Point State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

38° 37.543' N. lat. 123° 22.924' W. long.
38° 37.500' N. lat. 123° 23.500' W. long.;
~~38° 40.50' N. lat. 123° 25.37' W. long.;~~
~~38° 40.50' N. lat. 123° 30.24' W. long.;~~
38° 40.500' N. lat. 123° 25.500' W. long.;

38° 40.500' N. lat. 123° 30.243' W. long.; thence southward along the three nautical mile offshore boundary to

~~38° 35.60' N. lat. 123° 26.01' W. long.;~~ and

~~38° 35.60' N. lat. 123° 20.80' W. long.;~~

38° 35.600' N. lat. 123° 26.018' W. long.; and

38° 35.600' N. lat. 123° 20.800' W. long. ~~except that Stewarts Point State Marine Conservation Area as described in subsection 632(b)(33)(A) is excluded.~~

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(35) Salt Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~38° 35.60' N. lat. 123° 20.80' W. long.;~~

~~38° 35.60' N. lat. 123° 21.00' W. long.;~~

~~38° 33.50' N. lat. 123° 21.00' W. long.;~~ and

~~38° 33.50' N. lat. 123° 18.91' W. long.;~~

38° 35.600' N. lat. 123° 20.800' W. long.;

38° 35.600' N. lat. 123° 21.000' W. long.;

38° 33.500' N. lat. 123° 21.000' W. long.; and

38° 33.500' N. lat. 123° 18.910' W. long., except that Gerstle Cove as described in subsection 632(b)(36)(A) is excluded.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of abalone and finfish [subsection 632(a)(2)] is allowed.

(36) Gerstle Cove State Marine Reserve.

(A) This area lies within the Salt Point State Marine Conservation Area and is bounded by the mean high tide line and a straight line connecting the following points:

~~38° 33.95' N. lat. 123° 19.92' W. long.;~~ and

~~38° 33.95' N. lat. 123° 19.76' W. long.~~
38° 33.950' N. lat. 123° 19.920' W. long.; and
38° 33.950' N. lat. 123° 19.760' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(37) Russian River State Marine Recreational Management Area.

(A) This area includes the waters below the mean high tide line eastward of the mouth of the Russian River estuary defined as a line connecting the following two points:

~~38° 27.16' N. lat. 123° 07.91' W. long.;~~
~~38° 27.01' N. lat. 123° 07.74' W. long.~~
38° 27.160' N. lat. 123° 07.910' W. long.;
38° 27.010' N. lat. 123° 07.740' W. long.

~~And~~and westward of the Highway 1 Bridge.

(B) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

~~(C) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(D) apply.

(38) Russian River State Marine Conservation Area.

(A) This area is bounded by the mean high tide line, the mouth of the Russian River estuary as defined in subsection 632(b)(37)(A), and straight lines connecting the following points in the order listed:

~~38° 27.38' N. lat. 123° 08.58' W. long.;~~
~~38° 26.38' N. lat. 123° 08.58' W. long.;~~
~~38° 26.38' N. lat. 123° 07.70' W. long.~~
38° 27.380' N. lat. 123° 08.580' W. long.;
38° 26.380' N. lat. 123° 08.580' W. long.;
38° 26.380' N. lat. 123° 07.700' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

- ~~1. Only the following species may be taken recreationally:~~The recreational take of Dungeness crab by trap, and surf smelt using hand-held dip net or beach net is allowed.
- ~~2. Only the following species may be taken commercially:~~The commercial take of Dungeness crab by trap is allowed.

(39) Bodega Head State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~38° 20.10' N. lat. 123° 04.04' W. long.;~~
~~38° 20.10' N. lat. 123° 08.38' W. long.;~~
38° 20.100' N. lat. 123° 04.123' W. long.;
38° 20.100' N. lat. 123° 08.448' W. long.; thence southward along the three nautical mile offshore boundary to
~~38° 18.00' N. lat. 123° 08.08' W. long.;~~ and
~~38° 18.00' N. lat. 123° 03.64' W. long.~~
38° 18.000' N. lat. 123° 08.140' W. long.; and
38° 18.000' N. lat. 123° 03.680' W. long.

~~(B) Take of all living marine resources is prohibited except for~~Area restrictions defined in subsection 632(a)(1)(A) apply, with the following specified exceptions: take pursuant to Fish and Game Code Section 10661 is allowed, and the director of the Bodega Marine Life Refuge may authorize certain activities in the formerly designated Bodega Marine Life Refuge (Section 10903, Fish and Game Code) pursuant to subsections (b) and (c) of Section 10502.7 and Section 10656 of the Fish and Game Code.

(40) Bodega Head State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~38° 18.00' N. lat. 123° 03.64' W. long.;~~

~~38° 18.00' N. lat. 123° 08.08' W. long.;~~

38° 18.000' N. lat. 123° 03.680' W. long.;

38° 18.000' N. lat. 123° 08.140' W. long.; thence southward along the three nautical mile offshore boundary to

~~38° 13.34' N. lat. 123° 03.51' W. long.;~~ and

~~38° 17.93' N. lat. 123° 03.51' W. long.~~

38° 13.340' N. lat. 123° 03.510' W. long.; and

38° 17.930' N. lat. 123° 03.510' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of pelagic finfish [subsection 632(a)(3)] by trolling [subsection 27.80(a)(3)], Dungeness crab by trap, and market squid by hand-held dip net, is allowed.

2. The commercial take of pelagic finfish [subsection 632(a)(3)] by troll fishing gear [~~subsection 182.1(l)~~] or round haul net [Section 8750, Fish and Game Code], Dungeness crab by trap, and market squid by round haul net [Section 8750, Fish and Game Code], is allowed. Not more than five percent by weight of any commercial pelagic finfish or market squid catch landed or possessed shall be other incidentally taken species.

(41) Estero Americano State Marine Recreational Management Area.

(A) This area includes the waters below the mean high tide line within Estero Americano westward of longitude ~~122° 59.25' W~~ 122° 59.250' W.

(B) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

~~(C) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(D) apply.

(42) Estero de San Antonio State Marine Recreational Management Area.

(A) This area includes the waters below the mean high tide line within Estero de San Antonio westward of longitude ~~122° 57.40' W~~ 122° 57.400' W.

(B) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

~~(C) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(D) apply.

(43) Point Reyes State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~37° 59.90' N. lat. 123° 01.29' W. long.;~~

~~37° 59.90' N. lat. 123° 02.00' W. long.;~~

~~37° 59.00' N. lat. 123° 02.00' W. long.;~~

~~37° 59.00' N. lat. 122° 57.34' W. long.; and~~

~~38° 01.75' N. lat. 122° 55.00' W. long.;~~

37° 59.900' N. lat. 123° 01.278' W. long.;

37° 59.900' N. lat. 123° 02.000' W. long.;

37° 59.000' N. lat. 123° 02.000' W. long.;

37° 59.000' N. lat. 122° 57.340' W. long.; and

38° 01.750' N. lat. 122° 55.000' W. long.; thence westward along the mean high tide line onshore boundary to

38° 01.783' N. lat. 122° 55.286' W. long.; and

~~38° 01.954' N. lat. 122° 56.451' W. long.~~

38° 01.941' N. lat. 122° 56.364' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(44) Point Reyes State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~37° 59.00' N. lat. 123° 02.00' W. long.;~~

~~37° 56.71' N. lat. 123° 02.00' W. long.;~~

37° 59.000' N. lat. 123° 02.000' W. long.;

37° 56.712' N. lat. 123° 02.000' W. long.; thence eastward along the three nautical mile offshore boundary to

~~37° 56.36' N. lat. 122° 57.34' W. long.;~~

~~37° 59.00' N. lat. 122° 57.34' W. long.; and~~

~~37° 59.00' N. lat. 123° 02.00' W. long.~~

37° 56.370' N. lat. 122° 57.340' W. long.;

37° 59.000' N. lat. 122° 57.340' W. long.; and

37° 59.000' N. lat. 123° 02.000' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)] and Dungeness crab by trap is allowed.

2. The commercial take of salmon with troll fishing gear [subsection ~~482.1(l);~~182(c)(4)] and Dungeness crab by trap is allowed.

(45) Point Reyes Headlands Special Closure. Special restrictions on boating and access apply to the Point Reyes headlands as follows.

(A) A special closure is designated on the south side of the Point Reyes Headlands from the mean high tide line to a distance of 1000 feet seaward of the mean lower low tide line of any shoreline between lines extending due south from each of the following two points:

~~37° 59.65' N. lat. 123° 01.00' W. long.; and~~

~~37° 59.39' N. lat. 122° 57.80' W. long.~~

37° 59.650' N. lat. 123° 01.000' W. long.; and

37° 59.390' N. lat. 122° 57.800' W. long.

(B) No person except department employees or employees of the United States Fish and Wildlife Service, National Park Service, or United States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter this area at any time.

(46) Estero de Limantour State Marine Reserve.

(A) This area consists of waters below the mean high tide line within Estero de Limantour and within Drakes Estero, southward of a line connecting the following two points:

~~38° 02.66' N. lat. 122° 56.89' W. long.;~~ and

~~38° 02.66' N. lat. 122° 56.15' W. long.~~

38° 02.660' N. lat. 122° 56.900' W. long.; and

38° 02.660' N. lat. 122° 56.150' W. long.

And northward of a line connecting the following two points:

~~38° 01.783' N. lat. 122° 55.286' W. long.;~~ and

~~38° 01.954' N. lat. 122° 56.451' W. long.~~

38° 01.941' N. lat. 122° 56.364' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(47) Drakes Estero State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Drakes Estero northward of a line connecting the following two points:

~~38° 02.66' N. lat. 122° 56.89' W. long.;~~ and

~~38° 02.66' N. lat. 122° 56.15' W. long.~~

38° 02.660' N. lat. 122° 56.900' W. long.; and

38° 02.660' N. lat. 122° 56.150' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exception:

~~1. The recreational take of clams is allowed.;~~ and

~~2. Aquaculture of shellfish, pursuant to a valid State water bottom lease and stocking permit.~~

(48) Point Resistance Rock Special Closure. Special restrictions on boating and access apply to Point Resistance Rock as follows:

(A) A special closure is designated from the mean high tide line to a distance of 300 feet seaward of the mean lower low tide line of any shoreline of Point Resistance Rock, located in the vicinity of ~~37° 59.92' N. lat. 122° 49.75' W. long.~~37° 59.916' N. lat. 122° 49.759' W. long.

(B) No person except department employees or employees of the United States Fish and Wildlife Service, National Park Service, or United States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter this area at any time.

(49) Double Point/Stormy Stack Rock Special Closure. Special restrictions on boating and access apply to Stormy Stack Rock as follows.

(A) A special closure is designated from the mean high tide line to a distance of 300 feet seaward of the mean lower low tide line of any shoreline of Stormy Stack Rock, located

in the vicinity of ~~37° 56.83' N. lat. 122° 47.14' W. long.~~ 37° 56.830' N. lat. 122° 47.140' W. long.

(B) No person except department employees or employees of the United States Fish and Wildlife Service, National Park Service, or United States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter this area at any time.

(50) Duxbury Reef State Marine Conservation Area.

(A) This area is bounded by the mean high tide line, a distance of 1000 feet seaward of mean lower low water, and the following points:

~~37° 55.52' N. lat. 122° 44.17' W. long.;~~

~~37° 55.42' N. lat. 122° 44.31' W. long.;~~

~~37° 53.65' N. lat. 122° 41.91' W. long.; and~~

~~37° 53.77' N. lat. 122° 42.02' W. long.~~

37° 55.514' N. lat. 122° 44.179' W. long.;

37° 55.420' N. lat. 122° 44.310' W. long.;

37° 53.650' N. lat. 122° 41.910' W. long.; and

37° 53.770' N. lat. 122° 42.020' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of finfish [subsection 632(a)(2)] from shore and abalone is allowed.

(51) North Farallon Islands State Marine Reserve

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~37° 45.70' N. lat. 122° 59.08' W. long.;~~

37° 45.700' N. lat. 122° 59.085' W. long.; thence northwestward along the three nautical mile offshore boundary to

~~37° 49.34' N. lat. 123° 7.00' W. long.;~~

~~37° 45.70' N. lat. 123° 7.00' W. long.; and~~

~~37° 45.70' N. lat. 122° 59.08' W. long.~~

37° 49.344' N. lat. 123° 7.000' W. long.;

37° 45.700' N. lat. 123° 7.000' W. long.; and

37° 45.700' N. lat. 122° 59.085' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(52) North Farallon Islands Special Closure. Special regulations on boating and access apply to the North Farallon Islands as follows.

(A) A special closure is established at the islets comprising the North Farallon Islands.

(B) Except as permitted by federal law or emergency caused by hazardous weather, or as authorized by subsection 632(b)(52)(C), no vessel shall be operated or anchored at any time from the mean high tide line to a distance of 1000 feet seaward of the mean lower low tide line of any shoreline of North Farallon Island, or to a distance of 300 feet seaward of the mean lower low tide line of any shoreline of the remaining three southern islets, including the Island of St. James, in the vicinity of ~~37° 46.00' N. lat. 123° 06.00' W. long.~~ 37° 46.025' N. lat. 123° 06.018' W. long.

(C) No person except department employees or employees of the United States Fish and Wildlife Service, National Oceanic and Atmospheric Administration, or United

States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter the area defined in subsection 632(b)(52)(B).

(D) All vessels shall observe a five (5) nautical mile per hour speed limit within 1,000 feet seaward of the mean lower low tide line of any shoreline of the islets defined in subsection 632(b)(52)(B).

(E) In an area bounded by the mean high tide line and a distance of one nautical mile seaward of the mean lower low tide line of any of the four islets comprising the North Farallon Islands, the following restrictions apply:

1. All commercial diving vessels operating in the defined area shall have their vessel engine exhaust system terminate either through a muffler for dry exhaust systems, or below the vessel waterline for wet exhaust systems.
2. All commercial diving vessels equipped with an open, deck-mounted air compressor system, while operating in the defined area, shall have their air compressor's engine exhaust system terminate below the vessel waterline.

(53) Southeast Farallon Island State Marine Reserve.

(A) This area is bounded by straight lines connecting the following points in the order listed:

~~37° 42.60' N. lat. 122° 59.50' W. long.;~~
~~37° 42.60' N. lat. 123° 02.00' W. long.;~~
~~37° 40.50' N. lat. 123° 02.00' W. long.;~~
~~37° 40.50' N. lat. 122° 59.50' W. long.;~~ and
~~37° 42.60' N. lat. 122° 59.50' W. long.~~
37° 42.600' N. lat. 122° 59.500' W. long.;
37° 42.600' N. lat. 123° 02.000' W. long.;
37° 40.500' N. lat. 123° 02.000' W. long.;
37° 40.500' N. lat. 122° 59.500' W. long.; and
37° 42.600' N. lat. 122° 59.500' W. long.

~~(B) Take of all living marine resources is prohibited.~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(54) Southeast Farallon Island State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~37° 42.60' N. lat. 123° 02.00' W. long.;~~
~~37° 42.60' N. lat. 123° 05.46' W. long.;~~
37° 42.600' N. lat. 123° 02.000' W. long.;
37° 42.600' N. lat. 123° 05.461' W. long.; thence southeastward along the three nautical mile offshore boundary to
~~37° 38.66' N. lat. 122° 59.50' W. long.;~~
~~37° 40.50' N. lat. 122° 59.50' W. long.;~~
~~37° 40.50' N. lat. 123° 02.00' W. long.;~~ and
~~37° 42.60' N. lat. 123° 02.00' W. long.~~
37° 38.654' N. lat. 122° 59.500' W. long.;
37° 40.500' N. lat. 122° 59.500' W. long.;
37° 40.500' N. lat. 123° 02.000' W. long.; and
37° 42.600' N. lat. 123° 02.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of salmon by trolling [subsection 27.80(a)(3)] is allowed.
2. The commercial take of salmon with troll fishing gear [subsection ~~182.1(l)~~182(c)(4)] is allowed.

(55) Southeast Farallon Island Special Closure. Special regulations on boating and access apply to the island and islets comprising the Southeast Farallon Island as follows.

(A) A special closure is established at the Southeast Farallon Island.

(B) Except as permitted by federal law or emergency caused by hazardous weather, or as authorized by subsection 632(b)(55)(D), no vessel shall be operated or anchored at any time from the mean high tide line to a distance of 300 feet seaward of the mean lower low tide line of any shoreline of the Southeast Farallon Island year-round,

EXCEPT:

1. The area north of Fisherman's Bay, from a line extending due west from ~~37° 42.26' N. lat. 123° 00.16' W. long.~~37° 42.260' N. lat. 123° 00.160' W. long., following clockwise around the island (including Fisherman's Bay), to a line extending due east from ~~37° 42.05' N. lat. 123° 00.07' W. long.~~37° 42.050' N. lat. 123° 00.070' W. long.

2. At East Landing, from a line extending due east from ~~37° 41.83' N. lat. 122° 59.98' W. long.~~37° 41.830' N. lat. 122° 59.980' W. long., following clockwise around the island, to a straight line connecting the following two points:

~~37° 41.72' N. lat. 123° 00.05' W. long.;~~ and

~~37° 41.68' N. lat. 123° 00.07' W. long.~~

37° 41.720' N. lat. 123° 00.050' W. long.; and

37° 41.680' N. lat. 123° 00.070' W. long.

(C) This closure as defined in subsection 632(b)(55)(B) exists year round, except for the following areas, which are closed only from December 1 through September 14 of each year:

1. From Fisherman's Bay to East Landing, from a line extending due east from ~~37° 42.05' N. lat. 123° 00.07' W. long.~~37° 42.050' N. lat. 123° 00.070' W. long., following clockwise around the island to a line extending due east from ~~37° 41.83' N. lat. 122° 59.98' W. long.~~37° 41.830' N. lat. 122° 59.980' W. long.

2. The area southwest of East Landing, from a straight line connecting the following two points:

~~37° 41.72' N. lat. 123° 00.05' W. long.;~~ and

~~37° 41.68' N. lat. 123° 00.07' W. long.~~

37° 41.720' N. lat. 123° 00.050' W. long.; and

37° 41.680' N. lat. 123° 00.070' W. long.

Following clockwise around the main island to a straight line extending due south from ~~37° 41.76' N. lat. 123° 00.16' W. long.~~ to ~~37° 41.64' N. lat. 123° 00.16' W. long.~~37° 41.760' N. lat. 123° 00.160' W. long. to ~~37° 41.640' N. lat. 123° 00.160' W. long.~~, and on the southeast side of Saddle (Seal) Rock, from a straight line extending due south from ~~37° 41.76' N. lat. 123° 00.16' W. long.~~37° 41.760' N. lat. 123° 00.160' W. long., following clockwise around Saddle (Seal) Rock, to a line extending due west from ~~37° 41.60' N. lat. 123° 00.26' W. long.~~37° 41.600' N. lat. 123° 00.260' W. long.

(D) No person except department employees or employees of the United States Fish and Wildlife Service, National Oceanic and Atmospheric Administration, or United States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter the area defined in subsection 632(b)(55)(B) or 632(b)(55)(C) during the closure period.

(E) All vessels shall observe a five (5) nautical mile per hour speed limit 1,000 feet seaward of the mean lower low tide line of any shoreline of the Southeast Farallon Island.

(F) In an area bounded by the mean high tide line and a distance of one nautical mile seaward of the mean lower low tide line of any of the islands and islets comprising the Southeast Farallon Island, the following restrictions apply:

1. All commercial diving vessels operating in the defined area shall have their vessel engine exhaust system terminate either through a muffler for dry exhaust systems, or below the vessel waterline for wet exhaust systems.
2. All commercial diving vessels equipped with an open, deck-mounted air compressor system, while operating in the defined area, shall have their air compressor's engine exhaust system terminate below the vessel waterline.

(56) Fagan Marsh State Marine Park.

(A) This area consists of waters below the mean high tide line within the Fagan Marsh Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants is allowed.

(C) Only lightweight, hand-carried boats may be launched or operated within the park.

(57) Peytonia Slough State Marine Park.

(A) This area consists of waters below the mean high tide line within the Peytonia Slough Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants is allowed.

(C) Only lightweight, hand-carried boats may be launched or operated within the park.

(58) Corte Madera Marsh State Marine Park.

(A) This area consists of waters below the mean high tide line within the Corte Madera Marsh Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants from shore only is allowed.

(C) Only lightweight, hand-carried boats may be launched or operated within the park.

(D) Swimming, wading, and diving are prohibited within the park.

(59) Marin Islands State Marine Park.

(A) This area consists of waters below the mean high tide line within the Marin Islands Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants from shore only is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the park.

(60) Albany Mudflats State Marine Park.

(A) This area consists of waters below the mean high tide line within the Albany Mudflats Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants from shore only is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the park.

(61) Robert W. Crown State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and a distance of 150 feet seaward of mean lower low water, between the following points:

~~37° 45.97' N. lat. 122° 16.84' W. long.; and~~

~~37° 45.95' N. lat. 122° 16.52' W. long.~~

37° 45.970' N. lat. 122° 16.840' W. long.; and

37° 45.950' N. lat. 122° 16.520' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. ~~Finfish may be taken recreationally~~ The recreational take of finfish by hook and line only is allowed.

2. ~~Finfish~~ The commercial take of finfish and kelp may be taken commercially is allowed.

(62) Redwood Shores State Marine Park.

(A) This area consists of waters below the mean high tide line within the Redwood Shores Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than marine aquatic plants is allowed.

(C) Only lightweight, hand-carried boats may be launched or operated within the park.

(63) Bair Island State Marine Park.

(A) This area consists of waters below the mean high tide line within the Bair Island Ecological Reserve.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(B) apply, with the following specified exceptions: the recreational hook and line take of species other than kelp from shore only is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the park.

(D) No person, except state and local law enforcement officers, fire suppression agencies and employees of the department in the performance of their official duties or persons possessing written permission from the department, shall enter this park during the period February 15 through May 20.

(E) Waterfowl may be taken in accordance with the general waterfowl regulations (Sections 502, 550, 551, and 552).

(64) Egg (Devil's Slide) Rock to Devil's Slide Special Closure. Special restrictions on boating and access apply as follows.

(A) A special closure is designated from the mean high tide line to a distance of 300 feet seaward of the mean lower low tide line of any shoreline of any of the three rocks comprising Egg (Devil's Slide) Rock, located in the vicinity of ~~37° 34.64' N. lat. 122° 31.29' W. long.; 37° 34.66' N. lat. 122° 31.32' W. long.; and 37° 34.63' N. lat. 122° 31.29'~~

W. long.; 37° 34.640' N. lat. 122° 31.290' W. long.; 37° 34.660' N. lat. 122° 31.320' W. long.; and 37° 34.630' N. lat. 122° 31.290' W. long.; and the area bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~37° 34.74' N. lat. 122° 31.08' W. long.;~~
~~37° 34.72' N. lat. 122° 31.31' W. long.;~~
~~37° 34.60' N. lat. 122° 31.33' W. long.;~~ and
~~37° 34.52' N. lat. 122° 31.21' W. long.~~
37° 34.740' N. lat. 122° 31.080' W. long.;
37° 34.720' N. lat. 122° 31.310' W. long.;
37° 34.600' N. lat. 122° 31.330' W. long.; and
37° 34.520' N. lat. 122° 31.210' W. long.

(B) Transit in between the rock and the mainland between these points is prohibited at any time.

(C) No person except department employees or employees of the United States Fish and Wildlife Service, U.S. Bureau of Land Management, National Oceanic and Atmospheric Administration, or United States Coast Guard, in performing their official duties, or unless permission is granted by the department, shall enter this area.

(65) Montara State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~37° 32.70' N. lat. 122° 31.00' W. long.;~~
~~37° 32.70' N. lat. 122° 34.91' W. long.;~~
37° 32.700' N. lat. 122° 31.000' W. long.;
37° 32.700' N. lat. 122° 34.908' W. long.; thence southward along the three nautical mile offshore boundary to
~~37° 30.00' N. lat. 122° 34.61' W. long.;~~ and
~~37° 30.00' N. lat. 122° 29.93' W. long.~~
37° 30.000' N. lat. 122° 34.608' W. long.; and
37° 30.000' N. lat. 122° 29.920' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(66) Pillar Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~37° 30.00' N. lat. 122° 29.93' W. long.;~~
~~37° 30.00' N. lat. 122° 34.61' W. long.;~~
37° 30.000' N. lat. 122° 29.920' W. long.;
37° 30.000' N. lat. 122° 34.608' W. long.; thence southward along the three nautical mile offshore boundary to
~~37° 28.33' N. lat. 122° 33.47' W. long.;~~
~~37° 28.33' N. lat. 122° 30.83' W. long.;~~
~~37° 29.18' N. lat. 122° 30.36' W. long.;~~ and
~~37° 29.74' N. lat. 122° 29.97' W. long.~~
37° 28.330' N. lat. 122° 33.489' W. long.;
37° 28.330' N. lat. 122° 30.830' W. long.;
37° 29.180' N. lat. 122° 30.360' W. long.;
37° 29.740' N. lat. 122° 29.970' W. long.; and

37° 29.733' N. lat. 122° 29.950' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of pelagic finfish [subsection 632(a)(3)] by trolling [subsection 27.80(a)(3)], Dungeness crab by trap, and market squid by hand-held dip net is allowed.
2. The commercial take of pelagic finfish [subsection 632(a)(3)] by troll or round haul net [Section 8750, Fish and Game Code], Dungeness crab by trap, and market squid by round haul net [Section 8750, Fish and Game Code], is allowed. Not more than five percent by weight of any commercial pelagic finfish or market squid catch landed or possessed shall be other incidentally taken species.

(67) Año Nuevo State Marine ~~Conservation Area~~Reserve.

(A) This area is bounded by the mean high tide line and a distance of 200 feet seaward of mean lower low water between the following two points:

~~37° 10.00' N. lat. 122° 21.80' W. long.; and~~

~~37° 08.70' N. lat. 122° 21.00' W. long.~~

37° 10.000' N. lat. 122° 21.800' W. long.; and

37° 08.725' N. lat. 122° 21.000' W. long.

The area then continues southward bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~37° 08.70' N. lat. 122° 21.00' W. long.;~~

~~37° 04.70' N. lat. 122° 21.00' W. long.;~~ and

~~37° 08.725' N. lat. 122° 21.000' W. long.;~~

37° 04.700' N. lat. 122° 21.000' W. long.;

37° 04.700' N. lat. 122° 16.062' W. long.; and

~~37° 04.70' N. lat. 122° 16.20' W. long.~~

37° 04.742' N. lat. 122° 16.026' W. long.

~~(B) Take of all living marine resources is prohibited except the commercial take of giant kelp (*Macrocystis pyrifera*) by hand harvest only~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(68) Greyhound Rock State Marine Conservation Area.

(A) This area is bounded by the mean high tide line, the three nautical mile offshore boundary and straight lines connecting the following points in the order listed except where noted:

~~37° 04.70' N. lat. 122° 16.20' W. long.;~~

37° 04.742' N. lat. 122° 16.026' W. long.;

37° 04.700' N. lat. 122° 16.062' W. long.;

~~37° 04.70' N. lat. 122° 21.00' W. long.;~~

~~37° 03.55' N. lat. 122° 21.00' W. long.;~~

37° 04.700' N. lat. 122° 21.000' W. long.;

37° 03.520' N. lat. 122° 21.000' W. long.; thence southward along the three nautical mile offshore boundary to

~~37° 02.57' N. lat. 122° 19.10' W. long.;~~ and

~~37° 02.57' N. lat. 122° 14.00' W. long.~~

37° 02.570' N. lat. 122° 18.963' W. long.; and

37° 02.570' N. lat. 122° 13.989' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. ~~Only the following species may be taken recreationally:~~The recreational take of giant kelp (*Macrocystis pyrifera*) by hand harvest only, market squid, salmon, and, by hook-and-line from shore only, other finfish is allowed.

2. ~~Only the following species may be taken commercially:~~The commercial take of giant kelp (*Macrocystis pyrifera*) by hand harvest only, salmon, and market squid is allowed. Not more than five percent by weight of any commercial market squid catch landed or possessed shall be other incidentally taken species.

(69) Natural Bridges State Marine Reserve.

(A) This area is bounded by the mean high tide line and a distance of 200 feet seaward of mean lower low water between the following two points:

~~36° 57.90' N. lat. 122° 07.65' W. long.;~~ and

~~36° 57.00' N. lat. 122° 03.50' W. long.~~

36° 57.912' N. lat. 122° 07.650' W. long.; and

36° 57.015' N. lat. 122° 03.504' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(70) Elkhorn Slough State Marine Reserve.

(A) This area includes the waters below mean high tide within Elkhorn Slough lying east of longitude ~~121° 46.40' W.~~121° 46.400' W. and south of latitude ~~36° 50.50' N.~~36° 50.500' N.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(71) Elkhorn Slough State Marine Conservation Area.

(A) This area includes the waters below mean high tide within Elkhorn Slough east of the Highway 1 Bridge and west of longitude ~~121° 46.40' W.~~121° 46.400' W.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. ~~Only the following species may be taken recreationally:~~The recreational take of finfish by hook-and-line only and clams is allowed. Clams may only be taken on the north shore of the slough in the area adjacent to the Moss Landing State Wildlife Area [subsection 550(a)].

(72) Moro Cojo Slough State Marine Reserve.

(A) This area includes the waters within Moro Cojo Slough below mean high tide and east of the Highway 1 Bridge and west of the crossing of the Southern Pacific Railroad tracks.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(73) Soquel Canyon State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed:

~~36° 51.00' N. lat. 121° 56.00' W. long.;~~

~~36° 51.00' N. lat. 122° 03.80' W. long.;~~

~~36° 48.00' N. lat. 122° 02.88' W. long.;~~

~~36° 48.00' N. lat. 121° 56.00' W. long.;~~ and

~~36° 51.00' N. lat. 121° 56.00' W. long.~~
36° 51.000' N. lat. 121° 56.000' W. long.;
36° 51.000' N. lat. 122° 03.652' W. long.;
36° 48.000' N. lat. 122° 02.767' W. long.;
36° 48.000' N. lat. 121° 56.000' W. long.; and
36° 51.000' N. lat. 121° 56.000' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial and recreational take of pelagic finfish [subsection 632(a)(3)] is allowed. Not more than five percent by weight of any commercial pelagic finfish catch landed or possessed shall be other incidentally taken species.

(74) Portuguese Ledge State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed:

~~36° 43.00' N. lat. 121° 56.00' W. long.;~~
~~36° 43.00' N. lat. 122° 01.30' W. long.;~~
~~36° 41.00' N. lat. 122° 00.80' W. long.;~~
~~36° 41.00' N. lat. 121° 56.00' W. long.; and~~
~~36° 43.00' N. lat. 121° 56.00' W. long.~~
36° 43.000' N. lat. 121° 56.000' W. long.;
36° 43.000' N. lat. 122° 01.294' W. long.;
36° 41.000' N. lat. 122° 00.706' W. long.;
36° 41.000' N. lat. 121° 56.000' W. long.; and
36° 43.000' N. lat. 121° 56.000' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial and recreational take of pelagic finfish [subsection 632(a)(3)] is allowed. Not more than five percent by weight of any commercial pelagic finfish catch landed or possessed shall be other incidentally taken species.

(75) Edward F. Ricketts State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 36.50' N. lat. 121° 53.37' W. long.;~~
~~36° 37.25' N. lat. 121° 53.78' W. long.; and~~
~~36° 37.10' N. lat. 121° 54.09' W. long.~~
36° 36.508' N. lat. 121° 53.379' W. long.;
36° 37.250' N. lat. 121° 53.780' W. long.; and
36° 37.100' N. lat. 121° 54.093' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish by hook-and-line is allowed.
2. The commercial take of giant kelp (*Macrocystis pyrifera*) and bull kelp (*Nereocystis spp.*) is allowed by hand in the area defined by subsection 165(c)(4)(D) under the following conditions:
 - a. A kelp harvester with a valid license issued pursuant to Section 165 may take no more than 12 tons of kelp from the portion of Administrative Kelp Bed 220 within the Edward F. Ricketts State Marine Conservation Area in any calendar month.

b. Duplicate landing records must be kept on board the harvest vessel in accordance with the requirements of Section 165.

(76) Lovers Point - Julia Platt State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 37.10' N. lat. 121° 54.09' W. long.;~~
~~36° 37.25' N. lat. 121° 53.78' W. long.;~~
~~36° 37.38' N. lat. 121° 53.85' W. long.;~~
~~36° 37.60' N. lat. 121° 54.75' W. long.;~~ and
~~36° 37.60' N. lat. 121° 54.91' W. long.~~
36° 37.100' N. lat. 121° 54.093' W. long.;
36° 37.250' N. lat. 121° 53.780' W. long.;
36° 37.380' N. lat. 121° 53.850' W. long.;
36° 37.600' N. lat. 121° 54.750' W. long.; and
36° 37.600' N. lat. 121° 54.919' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(77) Pacific Grove Marine Gardens State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 37.60' N. lat. 121° 54.91' W. long.;~~
~~36° 37.60' N. lat. 121° 54.75' W. long.;~~
~~36° 38.70' N. lat. 121° 55.40' W. long.;~~
~~36° 38.90' N. lat. 121° 56.60' W. long.;~~ and
36° 37.600' N. lat. 121° 54.919' W. long.;
36° 37.600' N. lat. 121° 54.750' W. long.;
36° 38.700' N. lat. 121° 55.400' W. long.;
36° 38.900' N. lat. 121° 56.600' W. long.;
36° 38.314' N. lat. 121° 56.292' W. long.; and
~~36° 38.22' N. lat. 121° 56.15' W. long.~~
36° 38.226' N. lat. 121° 56.159' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish is allowed.
2. The commercial take of giant kelp (*Macrocystis pyrifera*) and bull kelp (*Nereocystis spp.*) by hand is allowed under the following conditions:
 - a. A kelp harvester with a valid license issued pursuant to Section 165 may take no more than 44 tons of kelp from the portion of Administrative Kelp Bed 220 within the Pacific Grove Marine Gardens State Marine Conservation Area in any calendar month.
 - b. Duplicate landing records must be kept on board the harvest vessel in accordance with the requirements of Section 165.

(78) Asilomar State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 38.22' N. lat. 121° 56.15' W. long.;~~
36° 38.226' N. lat. 121° 56.159' W. long.;

36° 38.314' N. lat. 121° 56.292' W. long.;
~~36° 38.90' N. lat. 121° 56.60' W. long.;~~ and
~~36° 36.60' N. lat. 121° 57.50' W. long.~~
36° 38.900' N. lat. 121° 56.600' W. long.; and
36° 36.554' N. lat. 121° 57.518' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(79) Carmel Pinnacles State Marine Reserve.

(A) This area is bounded by ~~the mean high tide line and~~ straight lines connecting the following points in the order listed:

~~36° 33.65' N. lat. 121° 57.60' W. long.;~~
~~36° 33.65' N. lat. 121° 58.50' W. long.;~~
~~36° 33.10' N. lat. 121° 58.50' W. long.;~~
~~36° 33.10' N. lat. 121° 57.60' W. long.;~~ and
~~36° 33.65' N. lat. 121° 57.60' W. long.~~
36° 33.650' N. lat. 121° 57.600' W. long.;
36° 33.650' N. lat. 121° 58.500' W. long.;
36° 33.100' N. lat. 121° 58.500' W. long.;
36° 33.100' N. lat. 121° 57.600' W. long.; and
36° 33.650' N. lat. 121° 57.600' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(80) Carmel Bay State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 33.65' N. lat. 121° 57.10' W. long.;~~
~~36° 31.70' N. lat. 121° 56.30' W. long.;~~ and
~~36° 31.70' N. lat. 121° 55.55' W. long.~~
36° 33.663' N. lat. 121° 57.117' W. long.;
36° 31.700' N. lat. 121° 56.300' W. long.; and
36° 31.700' N. lat. 121° 55.550' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish is allowed.
2. The commercial take of giant kelp (*Macrocystis pyrifera*) and bull kelp (*Nereocystis spp.*) by hand is allowed under the following conditions:
 - a. A kelp harvester with a valid license issued pursuant to Section 165 may take no more than 44 tons of kelp from the portion of Administrative Kelp Bed 219 within the Carmel Bay State Marine Conservation Area in any calendar month.
 - b. Duplicate landing records must be kept on board the harvest vessel in accordance with the requirements of Section 165.

(81) Point Lobos State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 31.70' N. lat. 121° 55.55' W. long.;~~
~~36° 31.70' N. lat. 121° 58.25' W. long.;~~

~~36° 28.88' N. lat. 121° 58.25' W. long.;~~ and
~~36° 28.88' N. lat. 121° 56.30' W. long.~~
36° 31.700' N. lat. 121° 55.550' W. long.;
36° 31.700' N. lat. 121° 58.250' W. long.;
36° 28.880' N. lat. 121° 58.250' W. long.; and
36° 28.880' N. lat. 121° 56.285' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(C) Within the portion of the Point Lobos State Marine Reserve which also falls within the boundary of the Point Lobos State Reserve (State Park Unit), restrictions on boating and diving activities exist. Contact the California Department of Parks and Recreation for current restrictions.

(82) Point Lobos State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~36° 31.70' N. lat. 121° 58.25' W. long.;~~
~~36° 31.70' N. lat. 122° 01.30' W. long.;~~
36° 31.700' N. lat. 121° 58.250' W. long.;
36° 31.700' N. lat. 122° 01.267' W. long.; thence southward along the three nautical mile offshore boundary to

~~36° 28.88' N. lat. 122° 00.55' W. long.;~~
~~36° 28.88' N. lat. 121° 58.25' W. long.;~~ and
~~36° 31.70' N. lat. 121° 58.25' W. long.~~
36° 28.880' N. lat. 122° 00.490' W. long.;
36° 28.880' N. lat. 121° 58.250' W. long.; and
36° 31.700' N. lat. 121° 58.250' W. long.

~~(B) Take of all living marine resources is prohibited except the~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational and commercial take of salmon, albacore, and the salmon and albacore is allowed.
2. The commercial take of salmon, albacore, and spot prawn is allowed.

(83) Point Sur State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~36° 18.40' N. lat. 121° 54.10' W. long.;~~
~~36° 18.40' N. lat. 121° 56.00' W. long.;~~
~~36° 15.00' N. lat. 121° 52.50' W. long.;~~ and
~~36° 15.00' N. lat. 121° 50.25' W. long.~~
36° 18.400' N. lat. 121° 54.150' W. long.;
36° 18.400' N. lat. 121° 56.000' W. long.;
36° 15.000' N. lat. 121° 52.500' W. long.; and
36° 15.000' N. lat. 121° 50.250' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(84) Point Sur State Marine Conservation Area.

(A) This area is bounded by ~~the mean high tide line and~~ straight lines connecting the following points in the order listed except where noted:

~~36° 18.40' N. lat. 121° 56.00' W. long.;~~

~~36° 18.40' N. lat. 121° 58.33' W. long.;~~

36° 18.400' N. lat. 121° 56.000' W. long.;

36° 18.400' N. lat. 121° 57.932' W. long.; thence southward along the three nautical mile offshore boundary to

~~36° 15.00' N. lat. 121° 55.10' W. long.;~~

~~36° 15.00' N. lat. 121° 52.50' W. long.;~~ and

~~36° 18.40' N. lat. 121° 56.00' W. long.~~

36° 15.000' N. lat. 121° 55.955' W. long.;

36° 15.000' N. lat. 121° 52.500' W. long.; and

36° 18.400' N. lat. 121° 56.000' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial and recreational take of salmon and albacore is allowed.

(85) Big Creek State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~36° 07.20' N. lat. 121° 38.00' W. long.;~~

~~36° 07.20' N. lat. 121° 39.00' W. long.;~~

~~36° 05.20' N. lat. 121° 38.00' W. long.;~~

~~36° 05.20' N. lat. 121° 41.25' W. long.;~~

36° 07.200' N. lat. 121° 37.968' W. long.;

36° 07.200' N. lat. 121° 39.000' W. long.;

36° 05.200' N. lat. 121° 38.000' W. long.;

36° 05.200' N. lat. 121° 41.222' W. long.; thence southward along the three nautical mile offshore boundary to

~~36° 02.65' N. lat. 121° 39.70' W. long.;~~ and

~~36° 02.65' N. lat. 121° 35.13' W. long.~~

36° 02.650' N. lat. 121° 39.654' W. long.; and

36° 02.650' N. lat. 121° 35.130' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(C) Anchoring. Except as pursuant to Federal law or emergency caused by hazardous weather, it is unlawful to anchor or moor a vessel in waters shallower than 10 fathoms in the Big Creek State Marine Reserve.

(86) Big Creek State Marine Conservation Area.

(A) This area is bounded by the three nautical mile offshore boundary and straight lines connecting the following points in the order listed except where noted:

~~36° 07.20' N. lat. 121° 39.00' W. long.;~~

~~36° 07.20' N. lat. 121° 42.90' W. long.;~~

36° 07.200' N. lat. 121° 39.000' W. long.;

36° 07.200' N. lat. 121° 42.869' W. long.; thence southward along the three nautical mile offshore boundary to

~~36° 05.20' N. lat. 121° 41.25' W. long.;~~

~~36° 05.20' N. lat. 121° 38.00' W. long.;~~ and

~~36° 07.20' N. lat. 121° 39.00' W. long.~~
~~36° 05.200' N. lat. 121° 41.222' W. long.;~~
~~36° 05.200' N. lat. 121° 38.000' W. long.;~~ and
~~36° 07.200' N. lat. 121° 39.000' W. long.~~

~~(B) Take of all living marine resources is prohibited except the commercial and~~
~~restrictions defined in subsection 632(a)(1)(C) apply, with the following specified~~
~~exceptions:~~

- ~~1. The recreational take of salmon, albacore, and the~~salmon and albacore is allowed.
- ~~2. The commercial take of salmon, albacore, and spot prawn~~is allowed.

(87) Piedras Blancas State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~35° 42.85' N. lat. 121° 18.95' W. long.;~~
~~35° 42.85' N. lat. 121° 21.00' W. long.;~~
~~35° 39.15' N. lat. 121° 18.50' W. long.;~~ and
~~35° 39.15' N. lat. 121° 14.45' W. long.~~
35° 42.850' N. lat. 121° 18.950' W. long.;
35° 42.850' N. lat. 121° 21.000' W. long.;
35° 39.150' N. lat. 121° 18.500' W. long.; and
35° 39.150' N. lat. 121° 14.519' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in
subsection 632(a)(1)(A) apply.

(88) Piedras Blancas State Marine Conservation Area.

(A) This area is bounded by ~~the mean high tide line and~~ straight lines connecting the following points in the order listed except where noted:

~~35° 42.85' N. lat. 121° 21.00' W. long.;~~
~~35° 42.85' N. lat. 121° 22.85' W. long.;~~
~~35° 42.850' N. lat. 121° 21.000' W. long.;~~
35° 42.850' N. lat. 121° 22.763' W. long.; thence southward along the three nautical mile offshore boundary to
~~35° 39.15' N. lat. 121° 20.90' W. long.;~~
~~35° 39.15' N. lat. 121° 18.50' W. long.;~~ and
~~35° 42.85' N. lat. 121° 21.00' W. long.~~
35° 39.150' N. lat. 121° 20.913' W. long.;
35° 39.150' N. lat. 121° 18.500' W. long.; and
35° 42.850' N. lat. 121° 21.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in
subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial
and recreational take of salmon and albacore is allowed.

(89) Cambria State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~35° 37.10' N. lat. 121° 09.20' W. long.;~~
~~35° 37.10' N. lat. 121° 10.70' W. long.;~~
~~35° 32.85' N. lat. 121° 06.70' W. long.;~~ and
~~35° 32.85' N. lat. 121° 05.85' W. long.~~

35° 37.100' N. lat. 121° 09.225' W. long.;
35° 37.100' N. lat. 121° 10.700' W. long.;
35° 32.850' N. lat. 121° 06.700' W. long.; and
35° 32.850' N. lat. 121° 05.855' W. long.

(B) ~~The commercial take of all living marine resources is prohibited.~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: ~~Recreational~~recreational take is allowed.

(90) White Rock (~~Cambria~~) State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~35° 32.85' N. lat. 121° 05.85' W. long.;~~
~~35° 32.85' N. lat. 121° 06.70' W. long.;~~
~~35° 30.50' N. lat. 121° 05.00' W. long.; and~~
~~35° 30.50' N. lat. 121° 03.40' W. long.~~
35° 32.850' N. lat. 121° 05.855' W. long.;
35° 32.850' N. lat. 121° 06.700' W. long.;
35° 30.500' N. lat. 121° 05.000' W. long.; and
35° 30.500' N. lat. 121° 03.423' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial take of giant kelp (*Macrocystis pyrifera*) and bull kelp (*Nereocystis spp.*) is allowed under the following conditions:

1. A kelp harvester with a valid license issued pursuant to Section 165 and holding a valid lease to Administrative Kelp Bed 208 may take no more than 125 tons of kelp from the portion of Administrative Kelp Bed 208 within the White Rock (~~Cambria~~) State Marine Conservation Area in any calendar month.
2. Duplicate landing records must be kept on board the harvest vessel in accordance with the requirements of Section 165.

(91) Morro Bay State Marine Recreational Management Area.

(A) This area includes the area below mean high tide within Morro Bay east of the Morro Bay entrance breakwater and west of longitude ~~120° 50.34' W.~~120° 50.340' W.

(B) Recreational hunting of waterfowl is allowed unless otherwise restricted by hunting regulations (sections 502, 550, 551, and 552).

(C) ~~Take of all living marine resources is prohibited except the following activities are~~ Area restrictions defined in subsection 632(a)(1)(D) apply, with the following specified exceptions allowed north of latitude ~~35° 19.70' N.~~35° 19.700' N:

1. The recreational take of finfish.
2. Aquaculture of ~~oysters~~ pursuant to a valid ~~State~~state water bottom lease and permit.
3. Storing finfish taken outside the Morro Bay State Marine Recreational Management Area in a receiver for bait purposes.
4. Dredging for the purpose of harbor and channel operations and pursuant to required and valid permits and approvals.
5. Harbor operations and maintenance and cleaning of vessel hulls and other man-made structures, including removal of living marine resources for these purposes.

(92) Morro Bay State Marine Reserve.

(A) This area includes the area below mean high tide line within Morro Bay east of longitude ~~120° 50.34' W~~120° 50.340' W.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(93) Point Buchon State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~35° 15.25' N. lat. 120° 54.00' W. long.;~~

~~35° 15.25' N. lat. 120° 56.00' W. long.;~~

~~35° 11.00' N. lat. 120° 52.40' W. long.;~~ and

~~35° 13.30' N. lat. 120° 52.40' W. long.~~

35° 15.250' N. lat. 120° 53.817' W. long.;

35° 15.250' N. lat. 120° 56.000' W. long.;

35° 11.000' N. lat. 120° 52.400' W. long.; and

35° 13.348' N. lat. 120° 52.400' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(94) Point Buchon State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~35° 15.25' N. lat. 120° 56.00' W. long.;~~

~~35° 15.25' N. lat. 120° 57.80' W. long.;~~

~~35° 15.250' N. lat. 120° 56.000' W. long.;~~

~~35° 15.250' N. lat. 120° 57.878' W. long.;~~ thence southward along the three nautical mile offshore boundary to

~~35° 11.00' N. lat. 120° 55.20' W. long.;~~

~~35° 11.00' N. lat. 120° 52.40' W. long.;~~ and

~~35° 15.25' N. lat. 120° 56.00' W. long.~~

35° 11.000' N. lat. 120° 55.149' W. long.;

35° 11.000' N. lat. 120° 52.400' W. long.; and

35° 15.250' N. lat. 120° 56.000' W. long.

(B) ~~Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the commercial and recreational take of salmon and albacore is allowed.

(95) Vandenberg State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~34° 44.65' N. lat. 120° 37.75' W. long.;~~

~~34° 44.65' N. lat. 120° 40.00' W. long.;~~

~~34° 33.25' N. lat. 120° 40.00' W. long.;~~ and

~~34° 33.25' N. lat. 120° 37.25' W. long.~~

34° 44.650' N. lat. 120° 37.750' W. long.;

34° 44.650' N. lat. 120° 40.000' W. long.;

34° 33.250' N. lat. 120° 40.000' W. long.; and

34° 33.250' N. lat. 120° 37.407' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(A) apply, with the following specified exceptions: take incidental to base operations and commercial space launch operations identified by the Vandenberg Air Force Base Commander as mission critical is allowed.

(C) Public Entry. Public entry into the Vandenberg State Marine Reserve may be restricted at the discretion of the department to protect wildlife, aquatic life, or habitat, or by the Commander of Vandenberg Air Force Base to protect and provide safety for base operations.

(D) The Department shall enter into a Memorandum of Understanding (MOU) with the Commander of Vandenberg Air Force Base for the mutually beneficial management and administration of the Vandenberg State Marine Reserve. The MOU shall include, but not be limited to, the identification of Vandenberg Air Force Base's national defense mission activities that are unrestricted by the subject regulations and details on management and administrative roles and responsibilities.

(96) Point Conception State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 27.00' N. lat. 120° 28.28' W. long.;~~

~~34° 27.00' N. lat. 120° 32.15' W. long.;~~

34° 27.000' N. lat. 120° 28.280' W. long.;

34° 27.000' N. lat. 120° 32.151' W. long.; thence southeastward along the three nautical mile offshore boundary to

~~34° 23.96' N. lat. 120° 25.00' W. long.;~~ and

~~34° 27.19' N. lat. 120° 25.00' W. long.~~

34° 23.961' N. lat. 120° 25.000' W. long.; and

34° 27.211' N. lat. 120° 25.000' W. long.

~~(B) Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(97) Kashtayit State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~34° 28.13' N. lat. 120° 14.46' W. long.;~~

~~34° 27.30' N. lat. 120° 14.46' W. long.;~~

~~34° 27.30' N. lat. 120° 12.47' W. long.;~~ and

~~34° 28.23' N. lat. 120° 12.47' W. long.~~

34° 28.130' N. lat. 120° 14.460' W. long.;

34° 27.300' N. lat. 120° 14.460' W. long.;

34° 27.300' N. lat. 120° 12.470' W. long.; and

34° 28.230' N. lat. 120° 12.470' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. ~~Only the following species may be taken recreationally:~~ The recreational take of finfish [subsection 632(a)(2)], invertebrates except rock scallops and mussels, and giant kelp (*Macrocystis pyrifera*) by hand harvest is allowed.

2. Take pursuant to activities authorized under subsection 632(b)(97)(C) is allowed.

(C) Maintenance of artificial structures and operation and maintenance of existing facilities is allowed inside the conservation area pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(98) Naples State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~34° 26.51' N. lat. 119° 58.00' W. long.;~~

~~34° 25.00' N. lat. 119° 58.00' W. long.;~~

~~34° 25.00' N. lat. 119° 56.00' W. long.; and~~

~~34° 26.13' N. lat. 119° 56.00' W. long.~~

34° 26.517' N. lat. 119° 58.000' W. long.;

34° 25.000' N. lat. 119° 58.000' W. long.;

34° 25.000' N. lat. 119° 56.000' W. long.; and

34° 26.140' N. lat. 119° 56.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take by spearfishing [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)] is allowed.

2. The commercial take of giant kelp (*Macrocystis pyrifera*) by hand harvest or by mechanical harvest is allowed.

3. Take pursuant to activities authorized under subsection 632(b)(98)(C) is allowed.

(C) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(99) Campus Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 25.20' N. lat. 119° 53.60' W. long.;~~

~~34° 21.48' N. lat. 119° 53.60' W. long.;~~

34° 25.207' N. lat. 119° 53.600' W. long.;

34° 21.475' N. lat. 119° 53.600' W. long.; thence eastward along the three nautical mile offshore boundary to

~~34° 21.21' N. lat. 119° 50.65' W. long.; and~~

~~34° 24.30' N. lat. 119° 50.65' W. long.~~

34° 21.212' N. lat. 119° 50.650' W. long.; and

34° 24.300' N. lat. 119° 50.650' W. long.

~~(B) Take of all living marine resources is prohibited except for~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(99)(C) is allowed.

(C) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(100) Goleta Slough State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Goleta Slough northward of latitude ~~34° 25.02' N.~~

~~(B) Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(100)(D) is allowed.

(C) In waters below the mean high tide line inside the Goleta Slough Ecological Reserve as defined within Section 630, the following restrictions apply:

1. Boating, swimming, wading, and diving are prohibited.
2. No person shall enter this area and remain therein except on established trails, paths or other designated areas except department employees or designated employees of Santa Barbara Airport, City of Santa Barbara, Goleta Sanitary District and Goleta Valley Vector Control District for the purposes of carrying out official duties.

(D) Routine maintenance, dredging, habitat restoration, research and education, maintenance of artificial structures, and operation and maintenance of existing facilities in the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(101) Richardson Rock ~~(San Miguel Island)~~ State Marine Reserve.

(A) This area is bounded by the mean high tide line of Richardson Rock and straight lines connecting the following points in the order listed except where noted:

34° 07.905' N. lat. 120° 28.200' W. long.;

34° 02.211' N. lat. 120° 28.200' W. long.;

34° 02.211' N. lat. 120° 31.467' W. long.; thence northward along the three nautical mile offshore boundary to

34° 07.905' N. lat. 120° 28.200' W. long.

~~(B) Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(102) San Miguel Island Special Closure. Special restrictions on boating and access apply to San Miguel Island as follows.

(A) Boating is allowed at San Miguel Island except west of a line drawn between Judith Rock (~~34° 01.50' N. lat. 120° 25.30' W. long.~~ 34° 01.500' N. lat. 120° 25.300' W. long.) and Castle Rock (~~34° 03.30' N. lat. 120° 26.30' W. long.~~ 34° 03.300' N. lat. 120° 26.300' W. long.) where boats are prohibited closer than 300 yards from shore.

1. Notwithstanding the 300-yard boating closure between Judith Rock and Castle Rock, the following shall apply:

- a. Boats may approach San Miguel Island no nearer than 100 yards from shore during the period(s) from March 15 through April 30, and October 1 through December 15; and
- b. Boats operated by commercial sea urchin divers may enter waters of the 300- yard area between the western boundary of the Judith Rock State Marine Reserve at 120° 26.60' W. long. and Castle Rock for the purpose of fishing sea urchins during the period(s) from March 15 through April 30, and October 1 through December 15.

2. The department may rescind permission for boats to enter waters within 300 yards between Judith Rock and Castle Rock upon finding that impairment to the island marine mammal resource is imminent. Immediately following such closure, the department will request the commission to hear, at its regularly scheduled meeting, presentation of documentation supporting the need for such closure.

(B) Other Requirements:

1. Boats traveling within 300 yards of the shoreline or anchorages shall operate with a minimum amount of noise and shall not exceed speeds of five miles per hour.

2. Except as permitted by federal law or emergency caused by hazardous weather, boats may be anchored overnight only at Tyler Bight and Cuyler Harbor.
3. Landing is allowed on San Miguel Island only at the designated landing beach in Cuyler Harbor.
4. No person shall have access to all other offshore rocks and islands at San Miguel Island.

(103) Harris Point (~~San Miguel Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 03.160' N. lat. 120° 23.300' W. long.;~~

~~34° 09.285' N. lat. 120° 23.300' W. long.;~~ thence southeastward along the three nautical mile offshore boundary to

~~34° 06.322' N. lat. 120° 18.400' W. long.;~~ and

~~34° 01.755' N. lat. 120° 18.400' W. long.~~

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(C) An exemption to the reserve, where commercial and recreational take of living marine resources is allowed, exists between the mean high tide line in Cuyler Harbor and a straight line between the following points:

~~34° 03.554' N. lat. 120° 21.311' W. long.;~~ and

~~34° 02.908' N. lat. 120° 20.161' W. long.~~

(104) Judith Rock (~~San Miguel Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 01.802' N. lat. 120° 26.600' W. long.;~~

~~33° 58.508' N. lat. 120° 26.600' W. long.;~~

33° 58.513' N. lat. 120° 26.600' W. long.; thence eastward along the three nautical mile offshore boundary to

~~33° 58.510' N. lat. 120° 25.300' W. long.;~~ and

~~34° 01.618' N. lat. 120° 25.300' W. long.~~

33° 58.518' N. lat. 120° 25.300' W. long.; and

34° 01.689' N. lat. 120° 25.300' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(105) Carrington Point (~~Santa Rosa Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~34° 01.296' N. lat. 120° 05.200' W. long.;~~

34° 01.280' N. lat. 120° 05.200' W. long.;

~~34° 04.000' N. lat. 120° 05.200' W. long.;~~

~~34° 04.000' N. lat. 120° 01.000' W. long.;~~

~~34° 00.500' N. lat. 120° 01.000' W. long.;~~ and

~~34° 00.500' N. lat. 120° 02.930' W. long.~~

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(106) Skunk Point (~~Santa Rosa Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 59.000' N. lat. 119° 58.808' W. long.;~~

33° 59.000' N. lat. 119° 58.985' W. long.;

33° 59.000' N. lat. 119° 58.000' W. long.;

33° 57.100' N. lat. 119° 58.000' W. long.; and

33° 57.100' N. lat. 119° 58.257' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(107) South Point (~~Santa Rosa Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

33° 55.014' N. lat. 120° 10.000' W. long.

33° 51.506' N. lat. 120° 10.000' W. long.; thence eastward along the three nautical mile offshore boundary to

33° 50.657' N. lat. 120° 06.500' W. long.;

33° 53.800' N. lat. 120° 06.500' W. long.; and

33° 53.800' N. lat. 120° 06.544' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(108) Painted Cave (~~Santa Cruz Island~~) State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

34° 04.492' N. lat. 119° 53.000' W. long.;

34° 05.200' N. lat. 119° 53.000' W. long.; thence eastward along a line one nautical mile offshore to

34° 05.000' N. lat. 119° 51.000' W. long.; and

34° 04.034' N. lat. 119° 51.000' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of spiny lobster and pelagic finfish [subsection 632(a)(3)] is allowed.

(109) Gull Island (~~Santa Cruz Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

33° 58.065' N. lat. 119° 50.967' W. long.;

33° 58.000' N. lat. 119° 51.000' W. long.;

33° 58.000' N. lat. 119° 53.000' W. long.;

33° 55.449' N. lat. 119° 53.000' W. long.; thence eastward along the three nautical mile offshore boundary to

33° 54.257' N. lat. 119° 48.000' W. long.; and

~~33° 57.756' N. lat. 119° 48.000' W. long.~~

33° 57.769' N. lat. 119° 48.000' W. long.

(B) ~~Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(110) Scorpion (~~Santa Cruz Island~~) State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 02.958' N. lat. 119° 35.500' W. long.;~~

~~34° 06.202' N. lat. 119° 35.500' W. long.;~~ thence eastward along the three nautical mile offshore boundary to

~~34° 06.245' N. lat. 119° 32.800' W. long.;~~ and

~~34° 02.700' N. lat. 119° 32.800' W. long.~~

(B) ~~Take of all living marine resources is prohibited.~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(111) Anacapa Island Special Closure.

(A) No net or trap may be used in waters less than 20 feet deep off the Anacapa Islands commonly referred to as Anacapa Island.

(B) A brown pelican fledgling area is designated from the mean high tide mark seaward to a water depth of 20 fathoms (120 feet) on the north side of West Anacapa Island between a line extending 000° True off Portuguese Rock (~~34° 00.91' N. lat. 119° 25.26' W. long.~~ 34° 00.910' N. lat. 119° 25.260' W. long.) to a line extending 000° True off the western edge of Frenchy's Cove (~~34° 00.417' N. lat. 119° 24.600' W. long.~~ 34° 00.411' N. lat. 119° 24.600' W. long.), a distance of approximately 4,000 feet. No person except department employees or employees of the National Park Service in the performance of their official duties shall enter this area during the period January 1 to October 31.

(112) Anacapa Island State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 00.828' N. lat. 119° 26.623' W. long.;~~

~~34° 00.800' N. lat. 119° 26.700' W. long.;~~

~~34° 03.940' N. lat. 119° 26.700' W. long.;~~ thence eastward along the three nautical mile offshore boundary to

~~34° 04.002' N. lat. 119° 24.600' W. long.;~~ and

~~34° 00.417' N. lat. 119° 24.600' W. long.~~

34° 00.411' N. lat. 119° 24.600' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of spiny lobster and pelagic finfish [subsection 632(a)(3)] and the commercial take of spiny lobster is allowed.

(113) Anacapa Island State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 00.417' N. lat. 119° 24.600' W. long.;~~

34° 00.411' N. lat. 119° 24.600' W. long.;

~~34° 04.002' N. lat. 119° 24.600' W. long.;~~ thence eastward along the three nautical mile offshore boundary to

~~34° 04.033' N. lat. 119° 21.400' W. long.;~~

~~34° 01.000' N. lat. 119° 21.400' W. long.;~~ and

~~34° 00.960' N. lat. 119° 21.449' W. long.~~

34° 00.960' N. lat. 119° 21.463' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(114) Footprint (~~Anacapa Channel~~) State Marine Reserve.

(A) This area is bounded by the straight lines connecting the following points in the order listed except where noted:

~~33° 59.300' N. lat. 119° 30.965' W. long.;~~

~~33° 57.510' N. lat. 119° 30.965' W. long.;~~ thence eastward along the three nautical mile offshore boundary to

~~33° 57.264' N. lat. 119° 25.987' W. long.;~~

~~33° 59.300' N. lat. 119° 25.987' W. long.;~~ and

~~33° 59.300' N. lat. 119° 30.965' W. long.~~

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(115) Begg Rock (~~San Nicolas Island Quad~~) State Marine Reserve.

(A) This area includes all state waters below the mean high tide line surrounding Begg Rock, located in the vicinity of ~~33° 21.71' N. lat. 119° 41.76' W. long.~~33° 21.743' N. lat. 119° 41.718' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(116) Santa Barbara Island State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~33° 28.500' N. lat. 119° 01.847' W. long.;~~

33° 28.500' N. lat. 119° 01.813' W. long.;

~~33° 28.500' N. lat. 118° 58.051' W. long.;~~ thence along the three nautical mile offshore boundary to

~~33° 24.842' N. lat. 119° 02.200' W. long.;~~ and

~~33° 27.973' N. lat. 119° 02.200' W. long.~~

33° 27.911' N. lat. 119° 02.200' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(117) Point Dume State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 02.28' N. lat. 118° 53.00' W. long.;~~

~~33° 59.14' N. lat. 118° 53.00' W. long.;~~

34° 02.306' N. lat. 118° 53.000' W. long.;

33° 59.140' N. lat. 118° 53.000' W. long.; thence southeastward along the three nautical mile offshore boundary to

~~33° 56.96' N. lat. 118° 49.20' W. long.;~~ and

~~34° 00.76' N. lat. 118° 49.20' W. long.~~

33° 56.960' N. lat. 118° 49.200' W. long.; and

34° 00.780' N. lat. 118° 49.200' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take by spearfishing [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)] is allowed.
2. The commercial take of swordfish by harpoon [subsection 107(f)(1)]; and coastal pelagic species [Section 1.39] by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species.
3. Take pursuant to activities authorized under subsection 632(b)(117)(C) is allowed.

(C) Beach nourishment and other sediment management activities are allowed inside the conservation area pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(118) Point Dume State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~34° 00.76' N. lat. 118° 49.20' W. long.;~~

~~33° 56.96' N. lat. 118° 49.20' W. long.;~~

34° 00.780' N. lat. 118° 49.200' W. long.;

33° 56.960' N. lat. 118° 49.200' W. long.; thence eastward along the three nautical mile offshore boundary to

~~33° 57.06' N. lat. 118° 47.26' W. long.;~~ and

~~34° 01.20' N. lat. 118° 47.26' W. long.~~

33° 57.061' N. lat. 118° 47.260' W. long.; and

34° 01.178' N. lat. 118° 47.260' W. long.

~~(B) Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(119) Point Vicente State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~33° 44.80' N. lat. 118° 24.82' W. long.;~~

~~33° 44.80' N. lat. 118° 28.93' W. long.;~~

33° 44.800' N. lat. 118° 24.807' W. long.;

33° 44.800' N. lat. 118° 28.931' W. long.; thence southeastward along the three nautical mile offshore boundary to

~~33° 41.16' N. lat. 118° 23.80' W. long.;~~ and

~~33° 44.19' N. lat. 118° 23.80' W. long.~~

33° 41.155' N. lat. 118° 23.800' W. long.; and

33° 44.198' N. lat. 118° 23.800' W. long.

~~(B) Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(119)(C) is allowed.

(C) Remediation activities associated with the Palos Verdes Shelf Operable Unit of the Montrose Chemical Superfund Site are allowed inside the conservation area pursuant to the Interim Record of Decision issued by the United States Environmental Protection Agency and any subsequent Records of Decision.

(120) Abalone Cove State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~33° 44.19' N. lat. 118° 23.80' W. long.;~~

~~33° 41.16' N. lat. 118° 23.80' W. long.;~~

33° 44.198' N. lat. 118° 23.800' W. long.;

33° 41.155' N. lat. 118° 23.800' W. long.; thence southeastward along the three nautical mile offshore boundary to

~~33° 40.85' N. lat. 118° 22.50' W. long.;~~ and

~~33° 44.24' N. lat. 118° 22.50' W. long.~~

33° 40.851' N. lat. 118° 22.500' W. long.; and

33° 44.240' N. lat. 118° 22.500' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. ~~The recreational take by spearfishing; and market squid by hand-held dip net [Section 1.42] [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)]; and market squid by hand-held dip net [Section 1.42] is allowed.~~

2. The commercial take of swordfish by harpoon [subsection 107(f)(1)]; and coastal pelagic species [Section 1.39] and Pacific bonito by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species or Pacific bonito catch landed or possessed shall be other incidentally taken species.

3. Take pursuant to activities authorized under subsection 632(b)(120)(C) is allowed.

(C) Remediation activities associated with the Palos Verdes Shelf Operable Unit of the Montrose Chemical Superfund Site are allowed inside the conservation area pursuant to the Interim Record of Decision issued by the United States Environmental Protection Agency and any subsequent Records of Decision.

(121) Bolsa Bay State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Bolsa Bay estuary southward of a line that approximates the Warner Avenue bridge located between the following two points:

~~33° 42.70' N. lat. 118° 03.63' W. long.;~~ and

~~33° 42.70' N. lat. 118° 03.61' W. long.;~~

33° 42.700' N. lat. 118° 03.633' W. long.; and

33° 42.700' N. lat. 118° 03.604' W. long.;

and northward of a line that approximates the pedestrian bridge located between the following two points:

~~33° 42.22' N. lat. 118° 03.17' W. long.;~~ and

~~33° 42.19' N. lat. 118° 03.18' W. long.~~

33° 42.219' N. lat. 118° 03.167' W. long.; and

33° 42.177' N. lat. 118° 03.186' W. long.

(B) ~~Take of all living marine resources is prohibited except the~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish [subsection 632(a)(2)] by hook and line from shore in designated areas only, or take only is allowed.

2. Take pursuant to activities authorized under subsection 632(b)(121)(F) is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the conservation area.

(D) No person, except state and local law enforcement officers, fire suppression agencies and employees of the department in the performance of their official duties or persons possessing written permission from the department or employees of Signal Corporation and its invitees for the purpose of carrying out oil and gas operations, shall enter this conservation area and remain therein except on established trails, paths, or other designated areas.

(E) No person shall enter this conservation area between the hours of 8:00 p.m. and 6:00 a.m.

(F) Routine operation and maintenance, habitat restoration, maintenance dredging, research and education, and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(122) Bolsa Chica Basin State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within the Bolsa Chica Basin estuary northeastward of the Pacific Coast Highway Bridge, approximated by a straight line between the following two points:

~~33° 41.02' N. lat. 118° 02.15' W. long.;~~ and

~~33° 40.98' N. lat. 118° 02.11' W. long.;~~

33° 41.028' N. lat. 118° 02.153' W. long.; and

33° 40.981' N. lat. 118° 02.109' W. long.;

and southeastward of a straight line between the following two points:

~~33° 42.22' N. lat. 118° 03.17' W. long.;~~ and

~~33° 42.19' N. lat. 118° 03.18' W. long.~~

33° 42.219' N. lat. 118° 03.167' W. long.; and

33° 42.177' N. lat. 118° 03.186' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(122)(F) is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the conservation area.

(D) No person, except state and local law enforcement officers, fire suppression agencies and employees of the department in the performance of their official duties or persons possessing written permission from the department or employees of Signal Corporation and its invitees for the purpose of carrying out oil and gas operations, shall enter this conservation area and remain therein except on established trails, paths, or other designated areas.

(E) No person shall enter this conservation area between the hours of 8:00 p.m. and 6:00 a.m.

(F) Routine operation and maintenance, habitat restoration, maintenance dredging, research and education, and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(123) Arrow Point to Lion Head Point (~~Catalina Island~~) State Marine Conservation Area.

(A) This area is bounded by the mean high tide line to a distance of 1000 feet seaward of the mean lower low tide line of any shoreline southeastward of a line connecting the following two points:

~~33° 28.660' N. lat. 118° 32.310' W. long.;~~ and

33° 28.652' N. lat. 118° 32.310' W. long.; and

33° 28.820' N. lat. 118° 32.310' W. long.

And ~~and~~ northwestward of a line connecting the following two points:

33° 27.240' N. lat. 118° 29.900' W. long.; and

~~33° 27.170' N. lat. 118° 30.100' W. long.~~

33° 27.174' N. lat. 118° 30.089' W. long.

(B) Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. All recreational take is allowed in accordance with current regulations, except the ~~Recreational~~recreational take of invertebrates is prohibited. Take of other living marine resources is allowed.

2. All commercial take is allowed in accordance with current regulations.

(124) Blue Cavern (~~Catalina Island~~) Onshore State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 25.96' N. lat. 118° 27.00' W. long.; and~~

~~33° 27.50' N. lat. 118° 27.00' W. long.;~~

~~33° 27.50' N. lat. 118° 29.30' W. long.; and~~

~~33° 26.64' N. lat. 118° 29.30' W. long.~~

33° 25.960' N. lat. 118° 27.000' W. long.; and

33° 27.500' N. lat. 118° 27.000' W. long.;

33° 27.500' N. lat. 118° 29.300' W. long.; and

33° 26.640' N. lat. 118° 29.300' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsections 632(b)(124)(D) and 632(b)(124)(E) is allowed.

(C) Except as pursuant to Federal law, emergency caused by hazardous weather, or as provided in subsection 632(b)(124)(D), it is unlawful to anchor or moor a vessel in the formerly designated Catalina Marine Science Center Marine Life Refuge (Section 10932, Fish and Game Code).

(D) The director of the Catalina Marine Science Center Marine Life Refuge, or any person that the director of the refuge has authorized may anchor or moor a vessel or take, for scientific purposes, any fish or specimen of marine plant life in the formerly designated Catalina Marine Science Center Marine Life Refuge under the conditions prescribed in a scientific collecting permit issued by the department (Section 10655, Fish and Game Code).

(E) Maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(125) Blue Cavern (~~Catalina Island~~) Offshore State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~33° 27.50' N. lat. 118° 27.00' W. long.;~~

~~33° 29.97' N. lat. 118° 27.00' W. long.;~~

33° 27.500' N. lat. 118° 27.000' W. long.;

33° 29.970' N. lat. 118° 27.000' W. long.; thence northwestward along the three nautical mile offshore boundary to

~~33° 30.81' N. lat. 118° 29.30' W. long.;~~

~~33° 27.50' N. lat. 118° 29.30' W. long.;~~ and
~~33° 27.50' N. lat. 118° 27.00' W. long.~~
33° 30.810' N. lat. 118° 29.300' W. long.;
33° 27.500' N. lat. 118° 29.300' W. long.; and
33° 27.500' N. lat. 118° 27.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of pelagic finfish [subsection 632(a)(3)], by hook and line or by spearfishing [Section 1.76], white seabass by spearfishing [Section 1.76] and market squid by hand-held dip net [Section 1.42] is allowed.
2. The commercial take of pelagic finfish [subsection 632(a)(3)] by hook and line and swordfish by harpoon [subsection 107(f)(1)] is allowed.

(126) Long Point (Catalina Island)-State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 24.38' N. lat. 118° 21.98' W. long.;~~
~~33° 25.50' N. lat. 118° 21.98' W. long.;~~
~~33° 25.50' N. lat. 118° 24.00' W. long.;~~ and
~~33° 25.11' N. lat. 118° 24.00' W. long.~~
33° 24.380' N. lat. 118° 21.980' W. long.;
33° 25.500' N. lat. 118° 21.980' W. long.;
33° 25.500' N. lat. 118° 24.000' W. long.; and
33° 25.102' N. lat. 118° 24.000' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(127) Casino Point (Catalina Island)-State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 20.90' N. lat. 118° 19.43' W. long.;~~
~~33° 20.90' N. lat. 118° 19.42' W. long.;~~
~~33° 20.92' N. lat. 118° 19.38' W. long.;~~
~~33° 20.95' N. lat. 118° 19.42' W. long.;~~
~~33° 20.97' N. lat. 118° 19.47' W. long.;~~
~~33° 21.00' N. lat. 118° 19.52' W. long.;~~ and
~~33° 20.96' N. lat. 118° 19.56' W. long.~~
33° 20.900' N. lat. 118° 19.430' W. long.;
33° 20.900' N. lat. 118° 19.420' W. long.;
33° 20.920' N. lat. 118° 19.380' W. long.;
33° 20.950' N. lat. 118° 19.420' W. long.;
33° 20.970' N. lat. 118° 19.470' W. long.;
33° 21.000' N. lat. 118° 19.520' W. long.; and
33° 20.960' N. lat. 118° 19.560' W. long.

~~(B) Take of all living marine resources is prohibited, except for~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(127)(C) is allowed.

(C) Maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(D) Feeding of fish for marine life viewing is allowed.

(128) Lover's Cove (~~Catalina Island~~) State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 20.460' N. lat. 118° 18.900' W. long.;~~

~~33° 20.711' N. lat. 118° 18.900' W. long.;~~ and

~~33° 20.711' N. lat. 118° 19.321' W. long.~~

(B) ~~Take of all living marine resources is prohibited, except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take by hook and line from the Cabrillo Mole is allowed. ~~or take~~

2. Take pursuant to activities authorized under subsection 632(b)(128)(C) is allowed.

(C) Maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(D) Feeding of fish for marine life viewing is allowed.

(129) Farnsworth (~~Catalina Island~~) Onshore State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 21.00' N. lat. 118° 29.08' W. long.;~~

~~33° 21.00' N. lat. 118° 30.00' W. long.;~~

~~33° 19.00' N. lat. 118° 29.00' W. long.;~~

~~33° 19.00' N. lat. 118° 27.90' W. long.;~~ and

~~33° 19.56' N. lat. 118° 27.90' W. long.~~

33° 21.000' N. lat. 118° 29.080' W. long.;

33° 21.000' N. lat. 118° 30.000' W. long.;

33° 19.000' N. lat. 118° 29.000' W. long.;

33° 19.000' N. lat. 118° 27.900' W. long.; and

33° 19.560' N. lat. 118° 27.900' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take by spearfishing [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)]; marlin, tunas, and dorado (dolphinfish) (*Coryphaena hippurus*) by trolling [subsection 27.80(a)(3)]; and market squid by hand-held dip net [Section 1.42] is allowed.

2. The commercial take of swordfish by harpoon [subsection 107(f)(1)]; and coastal pelagic species [Section 1.39] by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species.

(130) Farnsworth (~~Catalina Island~~) Offshore State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

~~33° 21.00' N. lat. 118° 30.00' W. long.;~~

~~33° 21.00' N. lat. 118° 32.88' W. long.;~~
~~33° 21.000' N. lat. 118° 30.000' W. long.;~~
33° 21.000' N. lat. 118° 32.878' W. long.; thence southward along the three nautical mile offshore boundary to
~~33° 19.00' N. lat. 118° 31.98' W. long.;~~
~~33° 19.00' N. lat. 118° 29.00' W. long.;~~ and
~~33° 21.00' N. lat. 118° 30.00' W. long.~~
33° 19.000' N. lat. 118° 31.978' W. long.;
33° 19.000' N. lat. 118° 29.000' W. long.; and
33° 21.000' N. lat. 118° 30.000' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of pelagic finfish [subsection 632(a)(3)] by hook and line or by spearfishing [Section 1.76]; white seabass by spearfishing [Section 1.76]; marlin, tunas and dorado (dolphinfish) (*Coryphaena hippurus*) by trolling [subsection 27.80(a)(3)] and market squid by hand-held dip net [Section 1.42] is allowed.
2. The commercial take of swordfish by harpoon [subsection 107(f)(1)]; and coastal pelagic species [Section 1.39] by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species.

(131) ~~Cat Harbor (Catalina Island)~~ State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line on the west side of Catalina Island northward of a straight line connecting Pin Rock (~~33° 25.50' N. lat. 118° 30.28' W. long.~~33° 25.486' N. lat. 118° 30.294' W. long.) and Cat Head Point (~~33° 25.32' N. lat. 118° 30.76' W. long.~~33° 25.320' N. lat. 118° 30.760' W. long.).

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish [subsection 632(a)(2)] by hook and line or by spearfishing [Section 1.76], market squid by hook and line, and spiny lobster and sea urchin is allowed.
2. The commercial take of sea cucumbers by diving only, and spiny lobster and sea urchin is allowed.
3. Aquaculture of finfish [subsection 632(a)(2)] pursuant to any required state permits is allowed.
4. Take pursuant to activities authorized under subsection 632(b)(131)(C) is allowed.

(C) Maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(132) Upper Newport Bay State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Upper Newport Bay northeastward of Pacific Coast Highway approximated by a line between the following two points:

~~33° 37.02' N. lat. 117° 54.24' W. long.;~~
~~33° 37.02' N. lat. 117° 54.32' W. long.;~~
33° 37.014' N. lat. 117° 54.237' W. long.;

33° 37.014' N. lat. 117° 54.336' W. long.; and southwestward of Jamboree Road approximated by a line between the following two points:

~~33° 39.07' N. lat. 117° 52.02' W. long.;~~ and

~~33° 39.03' N. lat. 117° 52.01' W. long.~~

33° 39.071' N. lat. 117° 52.021' W. long.; and

33° 39.027' N. lat. 117° 52.014' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish [subsection 632(a)(2)] by hook and line from shore only, or take only is allowed.

2. Take pursuant to activities authorized under subsection 632(b)(132)(D), is allowed.

(C) In waters below the mean high tide line inside the Upper Newport Bay Ecological Reserve, northeastward of a line connecting Shellmaker Island (~~33° 37.20' N. lat. 117° 53.51' W. long.~~33° 37.200' N. lat. 117° 53.510' W. long.) and North Star Beach (~~33° 37.38' N. lat. 117° 53.60' W. long.~~33° 37.380' N. lat. 117° 53.600' W. long.) the following restrictions apply:

(1) Swimming is allowed only in the area between North Star Beach and mid-channel.

(2) Boats are limited to speeds less than five miles per hour.

(3) Shoreline access is limited to established trails, paths, or other designated areas.

(D) Maintenance dredging, habitat restoration, research and education programs, maintenance of artificial structures, and operation and maintenance of existing facilities inside the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(133) Crystal Cove State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 35.373' N. lat. 117° 52.648' W. long.;~~

33° 35.372' N. lat. 117° 52.645' W. long.;

33° 35.065' N. lat. 117° 52.692' W. long.;

~~33° 32.400' N. lat. 117° 49.200' W. long.;~~ and

~~33° 33.233' N. lat. 117° 49.200' W. long.~~

33° 33.211' N. lat. 117° 49.200' W. long.; and

33° 33.224' N. lat. 117° 49.184' W. long.

~~(B) Take of all living marine resources is prohibited except~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish [subsection 632(a)(2)] by hook and line or by spearfishing [Section 1.76], and spiny lobster and sea urchin is allowed.

2. The commercial take of sea urchin; spiny lobster by trap; and coastal pelagic species [Section 1.39] by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species.

3. Take pursuant to activities authorized under subsection 632(b)(133)(C) is allowed.

(C) Beach nourishment and other sediment management activities, and operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(D) Take of all living marine resources from inside tidepools is prohibited. For purposes of this section, tidepools are defined as the area encompassing the rocky pools that are filled with seawater due to retracting tides between the mean higher high tide line and the mean lower low tide line.

(134) Laguna Beach State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 33.224' N. lat. 117° 49.184' W. long.;~~

~~33° 33.233' N. lat. 117° 49.200' W. long.;~~

~~33° 30.800' N. lat. 117° 49.200' W. long.;~~ and

~~33° 30.800' N. lat. 117° 45.631' W. long.~~

33° 33.211' N. lat. 117° 49.200' W. long.;

33° 30.713' N. lat. 117° 49.200' W. long.; and

33° 30.713' N. lat. 117° 45.264' W. long.

~~(B) Take of all living marine resources is prohibited.~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(135) Laguna Beach State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~33° 30.800' N. lat. 117° 45.631' W. long.;~~

~~33° 30.800' N. lat. 117° 49.200' W. long.;~~

33° 30.713' N. lat. 117° 45.264' W. long.;

33° 30.713' N. lat. 117° 49.200' W. long.;

~~33° 30.050' N. lat. 117° 49.200' W. long.;~~ and

~~33° 30.050' N. lat. 117° 44.771' W. long.~~

33° 30.050' N. lat. 117° 44.762' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(135)(C) is allowed.

(C) Operation and maintenance of artificial structures and facilities, beach grooming, maintenance dredging, and habitat restoration inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(136) Dana Point State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting and the following points in the order listed:

~~33° 30.050' N. lat. 117° 44.771' W. long.;~~

33° 30.050' N. lat. 117° 44.762' W. long.;

~~33° 30.050' N. lat. 117° 46.000' W. long.;~~

~~33° 30.000' N. lat. 117° 46.000' W. long.;~~

~~33° 27.300' N. lat. 117° 43.300' W. long.;~~

~~33° 27.478' N. lat. 117° 42.276' W. long.;~~ and

~~33° 27.622' N. lat. 117° 42.425' W. long.~~

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of finfish [subsection 632(a)(2)] by hook and line or by spearfishing [Section 1.76], and spiny lobster and sea urchin is allowed.
2. The commercial take of sea urchin, spiny lobster by trap, and coastal pelagic species [Section 1.39] by round haul net [Section 8750, Fish and Game Code], brail gear [Section 53.01(a)], and light boat [Section 53.01(k)] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species.
3. Take pursuant to activities authorized under subsection 632(b)(136)(C) is allowed.
 - (C) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.
 - (D) Take of all living marine resources from inside tidepools is prohibited. For purposes of this section, tidepools are defined as the area encompassing the rocky pools that are filled with seawater due to retracting tides between the mean higher high tide line and the mean lower low tide line.

(137) Batiquitos Lagoon State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Batiquitos Lagoon eastward of the Interstate Highway 5 Bridge, approximated by a line between the following two points:

- 33° 05.44' N. lat. 117° 18.12' W. long.; and
 33° 05.46' N. lat. 117° 18.13' W. long.
33° 05.440' N. lat. 117° 18.120' W. long.; and
33° 05.460' N. lat. 117° 18.130' W. long.

~~(B) Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(137)(D) is allowed.

- (C) Boating, swimming, wading, and diving are prohibited within the conservation area.
- (D) Operation and maintenance, habitat restoration, research and education, maintenance dredging and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(138) Swami's State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

- 33° 02.900' N. lat. 117° 17.927' W. long.;
 33° 02.900' N. lat. 117° 21.743' W. long.; thence southward along the three nautical mile offshore boundary to
 33° 00.000' N. lat. 117° 20.398' W. long.; and
 33° 00.000' N. lat. 117° 16.698' W. long.; thence northward along the mean high tide line onshore boundary to
 33° 00.962' N. lat. 117° 16.850' W. long.; and
 33° 00.980' N. lat. 117° 16.857' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. Recreational take by hook and line from shore is allowed.

2. The recreational take by spearfishing [Section 1.76] of white seabass and pelagic finfish [subsection 632(a)(3)] is allowed.
3. Take pursuant to activities authorized under subsection 632(b)(138)(C) is allowed.
(C) Beach nourishment and other sediment management activities and operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(139) San Elijo Lagoon State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within San Elijo Lagoon southeastward of a straight line between the following two points:

33° 00.980' N. lat. 117° 16.857' W. long.; and

33° 00.962' N. lat. 117° 16.850' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(139)(D) is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the conservation area.

(D) Operation and maintenance, maintenance dredging, habitat restoration including sediment deposition, research and education, and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or activities pursuant to Section 630, or as otherwise authorized by the department.

(140) San Dieguito Lagoon State Marine Conservation Area.

(A) This area consists of waters below the mean high tide line within the San Dieguito Lagoon Ecological Reserve southeastward of a straight line between the following two points:

32° 58.066' N. lat. 117° 15.579' W. long.; and

32° 58.072' N. lat. 117° 15.548' W. long.

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of finfish by hook and line from shore is allowed.

(C) Boating, swimming, wading, and diving are prohibited within the conservation area.

(D) No person, except state and local law enforcement officers, fire suppression agencies and employees of the department in the performance of their official duties or persons possessing written permission from the department, shall be permitted on the California least tern nesting island.

(E) No person, except state and local law enforcement officers, fire suppression agencies and employees of the department in the performance of their official duties or persons possessing written permission from the department, shall enter this conservation area between 8:00 p.m. and 5:00 a.m.

(F) The County of San Diego, after consultation with the department, may carry out management activities for fish and wildlife, flood control and vector control. Authorized operation and maintenance activities shall include, but shall not be limited to, use of chemicals, vegetation control, water control and use of associated equipment.

(G) Collections of fish, wildlife, water and soil may be made by the department for the purposes of fish and wildlife management or by San Diego County for the purposes of water quality testing and vector control.

(141) San Diego-Scripps Coastal State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

32° 53.000' N. lat. 117° 15.166' W. long.;

32° 53.000' N. lat. 117° 16.400' W. long.;

32° 51.964' N. lat. 117° 16.400' W. long.; and

~~32° 51.964' N. lat. 117° 15.233' W. long.~~

32° 51.964' N. lat. 117° 15.252' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of coastal pelagic species [Section 1.39], except market squid, by hook and line only is allowed and take

2. Take pursuant to activities authorized under subsection 632(b)(141)(D) is allowed.

(C) Licensees of the Regents of the University of California and all officers, employees, and students of such university may take, for scientific purposes, invertebrates, fish, or specimens of marine plant or algae under the conditions prescribed in a scientific collecting permit issued by the department.

(D) Operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(142) Matlahuayl State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~32° 51.964' N. lat. 117° 15.233' W. long.;~~

32° 51.964' N. lat. 117° 15.252' W. long.;

32° 51.964' N. lat. 117° 16.400' W. long.; and

32° 51.067' N. lat. 117° 16.400' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(C) Boats may be launched and retrieved only in designated areas and may be anchored within the reserve only during daylight hours.

(143) South La Jolla State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

32° 49.573' N. lat. 117° 16.781' W. long.;

32° 49.573' N. lat. 117° 19.000' W. long.;

32° 47.945' N. lat. 117° 19.000' W. long.; and

32° 47.945' N. lat. 117° 15.495' W. long.

~~(B) Take of all living marine resources is prohibited~~Area restrictions defined in subsection 632(a)(1)(A) apply.

(144) South La Jolla State Marine Conservation Area.

(A) This area is bounded by straight lines connecting the following points in the order listed except where noted:

32° 49.573' N. lat. 117° 19.000' W. long.;

32° 49.573' N. lat. 117° 20.528' W. long.; thence southward along the three nautical mile offshore boundary to

~~32° 47.945' N. lat. 117° 20.068' W. long.;~~

~~32° 47.945' N. lat. 117° 19.000' W. long.; and~~

~~32° 49.573' N. lat. 117° 19.000' W. long.~~

(B) ~~Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: the recreational take of pelagic finfish [subsection 632(a)(3)] by hook and line only is allowed.

(145) Famosa Slough State Marine Conservation Area.

(A) This area includes the waters below the mean high tide line within Famosa Slough estuary southward of the San Diego River channel, located at approximately ~~32° 45.43'~~ 32° 45.430' N. lat. 117° 13.75' W. long.

(B) ~~Take of all living marine resources is prohibited except for~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions: take pursuant to activities authorized under subsection 632(b)(145)(C) is allowed.

(C) Habitat restoration, maintenance dredging and operation and maintenance of artificial structures is allowed inside the conservation area pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

(146) Cabrillo State Marine Reserve.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed:

~~32° 40.60' N. lat. 117° 14.82' W. long.;~~

~~32° 40.60' N. lat. 117° 15.00' W. long.;~~

~~32° 39.70' N. lat. 117° 15.00' W. long.;~~

~~32° 39.70' N. lat. 117° 14.30' W. long.; and~~

~~32° 40.00' N. lat. 117° 14.30' W. long.~~

32° 40.600' N. lat. 117° 14.820' W. long.;

32° 40.600' N. lat. 117° 15.000' W. long.;

32° 39.700' N. lat. 117° 15.000' W. long.;

32° 39.700' N. lat. 117° 14.300' W. long.; and

32° 40.000' N. lat. 117° 14.300' W. long.

(B) ~~Take of all living marine resources is prohibited~~ Area restrictions defined in subsection 632(a)(1)(A) apply.

(147) Tijuana River Mouth State Marine Conservation Area.

(A) This area is bounded by the mean high tide line and straight lines connecting the following points in the order listed except where noted:

~~32° 34.00' N. lat. 117° 07.98' W. long.;~~

~~32° 34.00' N. lat. 117° 09.00' W. long.;~~

~~32° 31.97' N. lat. 117° 09.00' W. long.;~~

32° 34.000' N. lat. 117° 07.980' W. long.;

32° 34.000' N. lat. 117° 09.000' W. long.;

32° 31.970' N. lat. 117° 09.000' W. long.; thence eastward along the U.S./Mexico Border to

~~32° 32.06' N. lat. 117° 07.48' W. long.~~

32° 32.064' N. lat. 117° 07.428' W. long.

~~(B) Take of all living marine resources is prohibited except~~ Area restrictions defined in subsection 632(a)(1)(C) apply, with the following specified exceptions:

1. The recreational take of coastal pelagic species [Section 1.39], except market squid, by hand-held dip net [Section 1.42] only is allowed.
 2. The commercial take of coastal pelagic species [Section 1.39], except market squid, by round haul net [Section 8750, Fish and Game Code] is allowed. Not more than five percent by weight of any commercial coastal pelagic species catch landed or possessed shall be other incidentally taken species, including market squid.
 3. Take pursuant to activities authorized under subsection 632(b)(147)(C) is allowed.
- (C) Beach nourishment and other sediment management activities and operation and maintenance of artificial structures inside the conservation area is allowed pursuant to any required federal, state and local permits, or as otherwise authorized by the department.

Note: Authority cited: Sections 200, 202, 205(c), 220, 240, 1590, 1591, 2860, 2861 and 6750, Fish and Game Code; and Sections 36725(a) and 36725(e), Public Resources Code. Reference: Sections 200, 202, 205(c), 220, 240, 2861, 5521, 6653, 8420(e) and 8500, Fish and Game Code; and Sections 36700(e), 36710(e), 36725(a) and 36725(e), Public Resources Code.

Table 1. Summary of proposed language amendments to Title 14, Section 632, California Code of Regulations.

Table 1 is meant to complement the proposed language changes outlined in the Initial Statement of Reasons (ISOR). Each column identifies a specific type of regulatory amendment detailed in the ISOR, and an “X” denotes a proposed regulation amendment applies to the identified area: marine managed area or special closure. Areas are arranged geographically from north to south. Abbreviations: state marine reserve (SMR), state marine park (SMP), state marine conservation area (SMCA), state marine recreational management area (SMRMA), and special closure (SC).

Subject: December MPA PreAdopt Assesement

Hi Sonke:

There are no significant comments or any additional changes for the December adoption of the proposed amendments to Section 632, Marine Protected Areas.

This e-mail is instead of a Preadopt statement or memo pursuant to RU procedures.

Proposed Regulation Amendments for Marine Managed Areas Update

Photo Credit: Paulo Serpa

California Fish and Game Commission

December 9, 2015 • Los Angeles, CA

Amanda Van Diggelen

California Department of Fish and Wildlife

Regulatory Timeline

- February, 2015: Contacted California Tribal Governments
 - March 4, 2015: Update to Marine Resources Committee
 - April 8, 2015: Presentation of Proposed Changes to Fish and Game Commission
 - August 4, 2015: Notice Hearing
 - October 7, 2015: Discussion Hearing
-
- **December, 2015: Adoption Hearing**
-

Summary of Proposed Amendments

- One overarching amendment to identify the origin of MMA allowable activities
- One general provision amendment addressing allowed activities for all MMAs
 - 45 MMAs will have their activities clarified to maintain their original intent
- Amending aquaculture regulations for Drakes Estero and Morro Bay

Summary of Proposed Amendments Continued

- Amending outdated troll gear references
- Changing designation of Año Nuevo from state marine conservation area to state marine reserve
- Changing the names of 21 MMAs
- Refining 106 MMA boundaries

Thank You Questions

State of California
Department of Fish and Wildlife

Memorandum

Date: October 7, 2015

To: Sonke Mastrup
Executive Director
Fish and Wildlife Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting, Request to Publish Notice of the Commission's Intent to Amend Section 28.20, Title 14, California Code of Regulations, Re: Pacific Halibut**

The Department of Fish and Wildlife (Department) requests that the Fish and Game Commission (Commission) authorize publication of notice of its intent to consider amending existing regulations for the recreational Pacific halibut (*Hippoglossus stenolepis*) fishery (Section 28.20, Title 14, CCR).

An Initial Statement of Reasons (ISOR) is attached, which proposes regulatory changes needed to align state regulations with federal regulations. This will allow for discussion and adoption at the February 10, 2016 and April 18, 2016 Commission meetings, respectively.

If you have any questions regarding this item, please contact Dr. Craig Shuman, Regional Manager, Marine Region, at (805) 568-1246. The public notice for this rulemaking should identify Environmental Scientist, Melanie Parker as the Department's point of contact. Ms. Parker can be reached at (831) 649-2814 or Melanie.Parker@wildlife.ca.gov.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Amend Section 28.20
Title 14, California Code of Regulations
Re: Pacific Halibut

I. Date of Initial Statement of Reasons: October 13, 2015

II. Dates and Locations of Scheduled Hearings:

(a) Notice Hearing: Date: December 9, 2015
Location: San Diego

(b) Discussion Hearing: Date: February 10, 2016
Location: Sacramento

(c) Adoption Hearing: Date: April 13, 2016
Location: Santa Rosa

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

Pacific halibut is internationally managed under the authority of the Northern Pacific Halibut Act of 1982 (the "Act"; Title 16, Chapter 10, Subchapter IV, Sections 773 to 773k, U.S. Code) pursuant to the Convention between the United States of America and Canada for the Preservation of the [Pacific] Halibut Fishery of the Northern Pacific Ocean and Bering Sea (Convention). Provisions of the Convention establish the International Pacific Halibut Commission (IPHC) and outline general administrative and enforcement requirements.

Convention waters as defined include "... the waters off the west coasts of the United States and Canada ... within the respective maritime areas in which either Party exercises exclusive fisheries jurisdiction. For the purposes of this Convention, the "maritime area" in which a Party exercises exclusive fisheries jurisdiction includes without distinction areas within and seaward of the territorial sea or internal waters of the Party" (Article I).

The IPHC was established to conduct research and coordinate management activities in the waters of the parties to the Act. Pacific halibut along the United States west coast is jointly managed through authorities of the IPHC, Pacific Fishery Management Council (PFMC), and the National Marine Fisheries Service (NMFS), in conjunction with west coast state agencies. The IPHC sets the annual Total Allowable Catch (TAC) for each of the Pacific halibut management areas (including the west coast – Area 2A) using stock assessment and research survey results.

The PFMC coordinates west coast management of all recreational and commercial Pacific halibut fisheries in United States waters through the Area 2A Pacific Halibut Catch Sharing Plan (CSP), which constitutes a framework for recommending annual management measures to NMFS. The CSP framework also establishes the sharing formula used for allocating the Area 2A TAC among west coast fisheries, including the California recreational fishery. NMFS is responsible for specifying the final CSP language and management measures in federal regulation (50 CFR Part 300, Subpart E and Federal Register) and reporting season specifications on its halibut telephone hotline.

For species managed under federal fishery management plans or regulations, the Fish and Game Commission (Commission) has usually taken concurrent action to conform State recreational regulations to federal regulations. This is done in recognition of federal jurisdiction and to ensure consistency and ease of use for constituents who are subject to both State and federal laws while fishing for or in possession of sport fish. Pacific halibut federal regulations are applicable in federal waters (three to 200 miles offshore) off Washington, Oregon and California. Each state adjacent to federal waters adopts corresponding fishery regulations for their own waters (zero to three miles off shore).

PFMC Action Re: Pacific Halibut Fishing Off California

At its November 2015 meeting, the PFMC will recommend changes to the 2016 CSP and recreational Pacific halibut fishery in California. Federal regulations are expected to become effective prior to May 1, 2016.

Pacific Halibut Quota Management

The established quota management system for the Pacific halibut recreational fishery ensures catches stay within the allowable quota.

Following the determination of the 2016 Area 2A TAC by the IPHC (in late January 2016), the Department may conduct additional public outreach to

gather input to inform the NMFS decision on a preferred 2016 fishing season expected to keep catches within the allowable quota. After consideration of the input received, the Department will recommend a preferred 2016 season structure to NMFS for approval. The approved season will be included in the final federal regulations and on the NMFS halibut hotline prior to the start of the season.

During the 2016 fishing season, the Department will actively monitor the fishery and coordinate with NMFS and the IPHC weekly on the status of catches relative to the Pacific halibut quota. If catches are projected to meet and/or exceed the California quota, NMFS and the IPHC could take action to close or modify the fishery following consultation with the Department. The NMFS will provide notice of any inseason action to close the season in California via its halibut hotline; this is similar to the process used for recreational fisheries in Oregon and Washington.

The Department shall also inform the Commission and the public via a press release of any inseason changes in regulations triggered by achieving or expecting to exceed the quota. The latest fishing rules will be posted on the Department's website, the Recreational Groundfish Fishing Regulations Hotline, the NMFS Area 2A halibut hotline, and made available by contacting a Department office.

Present Regulations

Current regulations for Pacific halibut authorize recreational fishing in waters off California from May 1 through 15, June 1 through 15, July 1 through 15, August 1 through 15, and September 1 through October 31 or until the quota is reached, whichever comes first. The 2015 quota amount was 25,220 pounds. The State and federal daily bag limit is one fish per angler and there is no minimum size limit.

Present regulations also establish methods of take and include the use of hook and line, harpoons, spears, and bow and arrow gear.

Proposed Amendments

The Department is proposing the following regulatory changes to be consistent with PFMC recommendations and the CSP for Pacific halibut regulations in 2016. This approach will allow the Commission to adopt State recreational Pacific halibut regulations to conform in a timely manner to those taking effect in federal ocean waters on or before May 1, 2016.

The proposed regulatory changes to Section 28.20 would modify the season to include a range from May 1 to October 31 which may include periodic closures, and replace the text regarding the 2015 quota with a reference to the Federal Register specifying the 2016 federal quota

amount. The final regulation will conform to the season, established by federal regulations, which begins in May 2016.

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of the State to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the ocean and other waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use, taking into consideration the necessity of regulating individual sport fishery bag limits to the quantity that is sufficient to provide a satisfying sport. Adoption of scientifically-based seasons and other regulations provides for the maintenance of sufficient populations of Pacific halibut to ensure their continued existence.

The benefits of the proposed regulations are consistency with international and federal regulations and the sustainable management of California's Pacific halibut resources.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 219, 220, 240 and 316, Fish and Game Code

Reference: Sections 200, 202, 203.1, 205, 207, 215, 219, 220, and 316, Fish and Game Code, 50 CFR Part 300, Subpart E; and 50 CFR 300.66.

- (c) Specific Technology or Equipment Required by Regulatory Change:

None.

- (d) Identification of Reports or Documents Supporting Regulation Change:

Convention between the United States of America and Canada for the Preservation of the Halibut Fishery of the Northern Pacific Ocean and Bering Sea.

Northern Pacific Halibut Act of 1982:

<http://www.gpo.gov/fdsys/pkg/USCODE-2010-title16/html/USCODE-2010-title16-chap10-subchapIV.htm>

Environmental Assessment and Regulatory Impact Review for Continuing Implementation of the Catch Sharing Plan for Pacific Halibut in Area 2A, 2014-2016:

<http://www.westcoast.fisheries.noaa.gov/publications/nepa/halibut/ea-halibut-2014.pdf>

- (e) Public Discussions of Proposed Regulations Prior to Notice Publication:
- September 16, 2015 PFMC meeting in Sacramento, CA.
 - November 19, 2015 PFMC meeting in Garden Grove, CA.

IV. Description of Reasonable Alternatives to Regulatory Action:

- (a) Alternatives to Regulation Change:

No alternatives were identified by or brought to the attention of Commission staff that would have the same desired regulatory effect.

- (b) No Change Alternative:

Under the No-Change Alternative, status quo management of the Pacific halibut resource would continue for 2016. This would result in misalignment between federal and State regulations when NMFS establishes new regulations for the California fishery for 2016 or if NMFS takes inseason action to modify or close the fishery. Inconsistency in regulations will create confusion among the public and may result in laws that are difficult to enforce.

It is critical to have consistent State and federal regulations establishing season dates, depth constraints and other management measures, and also critical that the State and federal regulations be effective concurrently. Consistency with federal regulations is also necessary to maintain State authority over its recreational Pacific halibut fisheries and avoid federal or international preemption.

- (c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which

the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states because the regulatory action does not substantially alter existing conditions.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission does not anticipate any impacts on the creation or elimination of jobs in California.

The Commission does not anticipate any impacts on the creation of new businesses, the elimination of existing businesses, or the expansion of businesses in California because the regulatory action does not substantially alter existing conditions.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities to participate in sport fisheries fosters conservation through education and appreciation of fish and wildlife.

The Commission anticipates benefits to the environment by the sustainable management of California's Pacific halibut resources.

The Commission does not anticipate any benefits to worker safety.

Additional benefits of the proposed regulations are consistency with federal regulations and promotion of businesses that rely on recreational Pacific halibut fishing.

(c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

(e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

Recreational fisheries are broadly sub-divided between private anglers and commercial passenger fishing vessels. The economic impact of regulatory changes for recreational fisheries may be estimated by tracking the resulting changes in fishing effort, angler trips and length of stay in the

fishery areas. Distance traveled affects gas and other travel expenditures. Daytrips and overnight trips involve different levels of spending for gas, food and accommodations at area businesses as well as different levels of sales tax impacts. Direct expenditures ripple through the economy, as receiving businesses buy intermediate goods from suppliers who then spend that revenue again. Business spending on wages is received by workers who then spend that income, some of which goes to local businesses. Spending associated with recreational fisheries thus multiplies throughout the economy with the indirect and induced effects of the initial direct expenditure.

In the aftermath of a one-month Pacific halibut fishing closure in 2014, surveys^a of anglers and businesses were conducted to gauge the importance of the Pacific halibut fishery to anglers and local communities. Of 265 angler respondents, about 20 percent of Pacific halibut anglers traveled from outside of coastal northern California, while the majority of survey respondents were from California's north coast. The Department's 2014 surveys similarly found that 70 percent of anglers reported residing within California's three north coast counties (Mendocino, Humboldt, and Del Norte). Of the total reported trips (6,589), the respondent anglers each took on average more than 30 trips in the 2013/2014 seasons, and 34 percent included Pacific halibut as a primary target. Results indicated an even higher number (89 percent) pursued Pacific halibut as one of their primary target species, and 70 percent also pursued other species on trips for Pacific halibut. The average angler traveled 119 miles on land and 23 miles on water on their most recent Pacific halibut trip. Overall, angler expenditures averaged about \$250 per angler trip and both surveys concluded that recreational fishing for Pacific halibut is economically important to charter boat businesses, tackle and marine supply businesses, lodging establishments near fishing access points, and businesses that provide traveler services such as: gas stations, markets, convenience stores, and restaurants.

The adoption of scientifically-based regulations provides for the maintenance of sufficient populations of sport fish to ensure their continued existence and future sport fishing opportunities that in turn support local and regional economies. In a 2012 Fisheries Economics Report by the NMFS, trip-related and equipment expenditures for all

^a Hesselgrave, T., N. Enelow, and K. Sheeran, 2014. The Estimated Economic Impact of the Northern California Pacific Halibut Closure of August 2014 (recreational and charter boats), conducted by Ecotrust, funded by Humboldt Area Saltwater Anglers.

Takada, M., 2014. Analysis of the Economic Effects of the August Pacific Halibut Closure on California's North Coast Businesses, conducted by Humboldt State University, funded by California Department of Fish and Wildlife.

marine recreational anglers sum to approximately \$1.7 billion in California. Coupled with the indirect and induced effects of this \$1.7 billion direct revenue contribution, the total realized economic benefit to California is estimated at \$2.7 billion in annual total economic output. This corresponds with about \$630 million in total wages to Californians, which affects about 13,000 jobs in the State, annually. The portion of this benefit derived from or related to the Pacific halibut fishery is unknown.

The proposed regulations will modify State recreational Pacific halibut regulations to conform to federal rules. Currently, State regulations for Pacific halibut provide for an annual quota, season length, authorized methods of take, and bag limit.

In adopting these conforming regulations, the State relies on information provided in the federal Draft Environmental Impact Statement which includes analysis of impacts to California. (Environmental Assessment and Regulatory Impact Review for Continuing Implementation of the Catch Sharing Plan for Pacific Halibut in Area 2A, 2014-2016)
<http://www.westcoast.fisheries.noaa.gov/publications/nepa/halibut/ea-halibut-2014.pdf>.

For public notice purposes to facilitate Commission discussion, the Department is proposing regulatory changes to encompass the range of federal Pacific halibut regulations that are expected to be in effect for 2016. The proposed regulatory changes may modify season length and replace the text regarding the 2015 quota with a reference to the Federal Register specifying the 2016 federal quota amount.

The estimated impacts on angler trips are anticipated to be close to status quo. Economic impacts are not expected to change compared to 2015 because the 2016 fishery season is expected to be similar to the previous year.

- (a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

The cumulative effects of the changes statewide are estimated to be neutral to job elimination and potentially positive to job creation in California. No significant changes in fishing effort and recreational fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

- (b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

The cumulative effects of the changes statewide are expected to be neutral to business elimination and have potentially positive impacts to the creation of businesses in California. No significant changes in fishing effort and recreational fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

- (c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

The cumulative effects of the changes statewide are expected to be neutral to positive to the expansion of businesses currently doing business in California. No significant changes in fishing effort and recreational fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

- (d) Benefits of the Regulation to the Health and Welfare of California Residents:

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities to participate in sport fisheries fosters conservation through education and appreciation of California's wildlife.

- (e) Benefits of the Regulation to Worker Safety:

The proposed regulations are not anticipated to impact worker safety conditions.

- (f) Benefits of the Regulation to the State's Environment:

It is the policy of this State to encourage the conservation, maintenance, and utilization of living marine resources under the jurisdiction and influence of the State for the benefit of all citizens (Section 1700, Fish and Game Code). Benefits of the proposed regulations include continuation of fishing opportunity, along with the continuation of the reasonable and sustainable management of recreational finfish resources. Adoption of scientifically-based seasons provides for the maintenance of sufficient populations of Pacific halibut to ensure their continued existence and recreational use.

- (g) Other Benefits of the Regulation:

Concurrence with Federal Law:

Pacific halibut along the United States west coast is jointly managed through authorities of the IPHC, PFMC, and the NMFS, in conjunction with west coast state agencies. The PFMC annually reviews the status of Pacific halibut regulations. As part of that process, it recommends regulations aimed at meeting biological and fishery allocation goals specified in law or established in the Pacific Halibut CSP. These recommendations coordinate management of recreational Pacific halibut in State (zero to three miles) and federal waters (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. These recommendations are subsequently implemented as ocean fishing regulations by the NMFS.

California's sport fishing regulations need to conform to federal regulations to ensure that biological and fishery allocation goals are not exceeded and to provide uniformity in management and enforcement activities across jurisdictions.

Informative Digest/Policy Statement Overview

Pacific halibut is internationally managed under the authority of the Northern Pacific Halibut Act of 1982 between the United States of America and Canada. Pacific halibut along the United States west coast is jointly managed through authorities of the International Pacific Halibut Commission (IPHC), Pacific Fishery Management Council (PFMC), and the National Marine Fisheries Service (NMFS), in conjunction with the west coast state agencies. The PFMC coordinates west coast management of all recreational and commercial Pacific halibut fisheries in United States waters through the Pacific Halibut Catch Sharing Plan (CSP), which constitutes a framework for recommending annual management measures. The NMFS is responsible for specifying the final CSP language and management measures in federal regulations (50 CFR Part 300, Subpart E and the Federal Register) and noticing them on their halibut telephone hotline. Federal regulations for Pacific halibut are applicable in federal waters (three to 200 miles offshore) off Washington, Oregon, and California. Each state adjacent to federal waters adopts corresponding fishery regulations for their own waters (zero to three miles off shore).

For consistency, the California Fish and Game Commission (Commission) routinely adopts regulations to bring State law into conformance with federal and international law for Pacific halibut.

The November PFMC regulatory recommendation and NMFS final rule will be considered by the Commission when it takes its own regulatory action to establish the State's recreational Pacific halibut fishery regulations for 2016.

Summary of Proposed Amendments

The Department is proposing the following regulatory changes to be consistent with PFMC recommendations and the CSP for Pacific halibut regulations in 2016. This approach will allow the Commission to adopt State recreational Pacific halibut regulations to conform in a timely manner to those taking effect in federal ocean waters on or before May 1, 2016.

The proposed regulatory changes modify Pacific halibut regulations to allow for timely conformance to federal fisheries regulations and inseason changes. The proposed regulatory changes would modify the seasons to include a range from May 1 to October 31 which may include periodic closures, and replace the text regarding the 2015 quota with a reference to the Federal Register specifying the 2016 federal quota amount. The final regulation will conform to the season established by federal regulations in May 2016.

The benefits of the proposed regulations are: consistency with federal regulations, the sustainable management of California's Pacific halibut resources, and health and

welfare of California residents.

The proposed regulations are neither inconsistent nor incompatible with commercial fishing regulations (Chapter 6, Title 14 CCR), State Coastal Conservancy regulations for experimental fishing gear loan programs (Section 13862, Title 14, CCR), and State Board of Equalization tax regulations (Section 1602, Title 18, CCR). The Legislature has delegated authority to the Commission to adopt sport fishing regulations (Fish and Game Code, Sections 200, 202, and 205) and Pacific halibut fishing regulations specifically (Fish and Game Code, Section 316). The proposed regulations are consistent with regulations for sport fishing in marine protected areas (Section 632, Title 14, CCR) and with general sport fishing regulations in Chapters 1 and 4 of Subdivision 1 of Division 1, Title 14, CCR. Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of Pacific halibut.

Regulatory Language

Section 28.20, Title 14, CCR, is Amended to Read:

§28.20. Halibut, Pacific.

(a) Season:

(1) Pacific halibut may be taken only from [varied dates within the range from May 1 to October 31, and may include periodic closures]~~May 1 through 15, June 1 through 15, July 1 through 15, August 1 through 15, and September 1 through October 31~~, or until the quota is reached, whichever is earlier. Pacific halibut take is regulated by a quota that is closely monitored each year in alignment with federal regulations.

(2) The ~~2015~~ Pacific halibut quota is ~~25,220 pounds~~published in the Federal Register [Volume and Date to be inserted by OAL]. The department shall inform the commission, and the public via a press release, prior to any implementation of restrictions triggered by achieving or expecting to exceed the quota. Anglers and divers are advised to check the current rules before fishing. The latest fishing rules may be found on the department's website at: wildlife.ca.gov/Fishing/Ocean, or by calling the Recreational Groundfish Fishing Regulations Hotline (831) 649-2801 or the National Marine Fisheries Service Area 2A Halibut Hotline (800) 662-9825 for recorded information, or by contacting a department office.

(b) Limit: One.

(c) Minimum size: None.

(d) Methods of Take:

(1) When angling, no more than one line with two hooks attached may be used.

(2) A harpoon, gaff, or net may be used to assist in taking a Pacific halibut that has been legally caught by angling. See Section 28.95 of these regulations for additional restrictions on the use of harpoons.

(3) Take by spearfishing is allowed pursuant to Section 28.90 of these regulations.

Note: Authority cited: Sections 200, 202, 205, 219, 220, 240 and 316, Fish and Game Code. Reference: Sections 200, ~~201, 202, 203.1, 205, 207, 210, 215, 219, 220 and 316~~, Fish and Game Code, 50 CFR Part 300, Subpart E; and 50 CFR 300.66.

Proposed Amendments to §28.20, Title 14, CCR

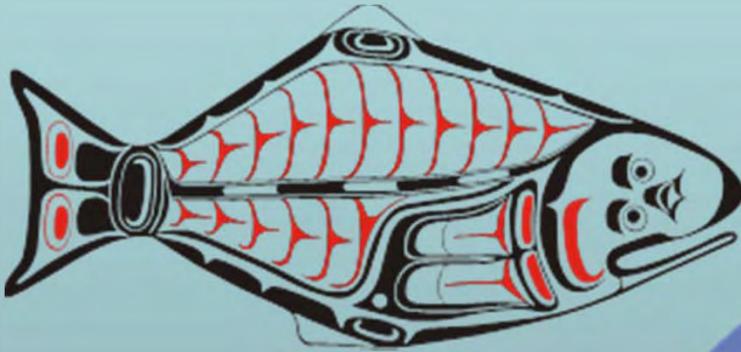

Fish and Game Commission Meeting
December 9, 2015
Marine Region

Summary

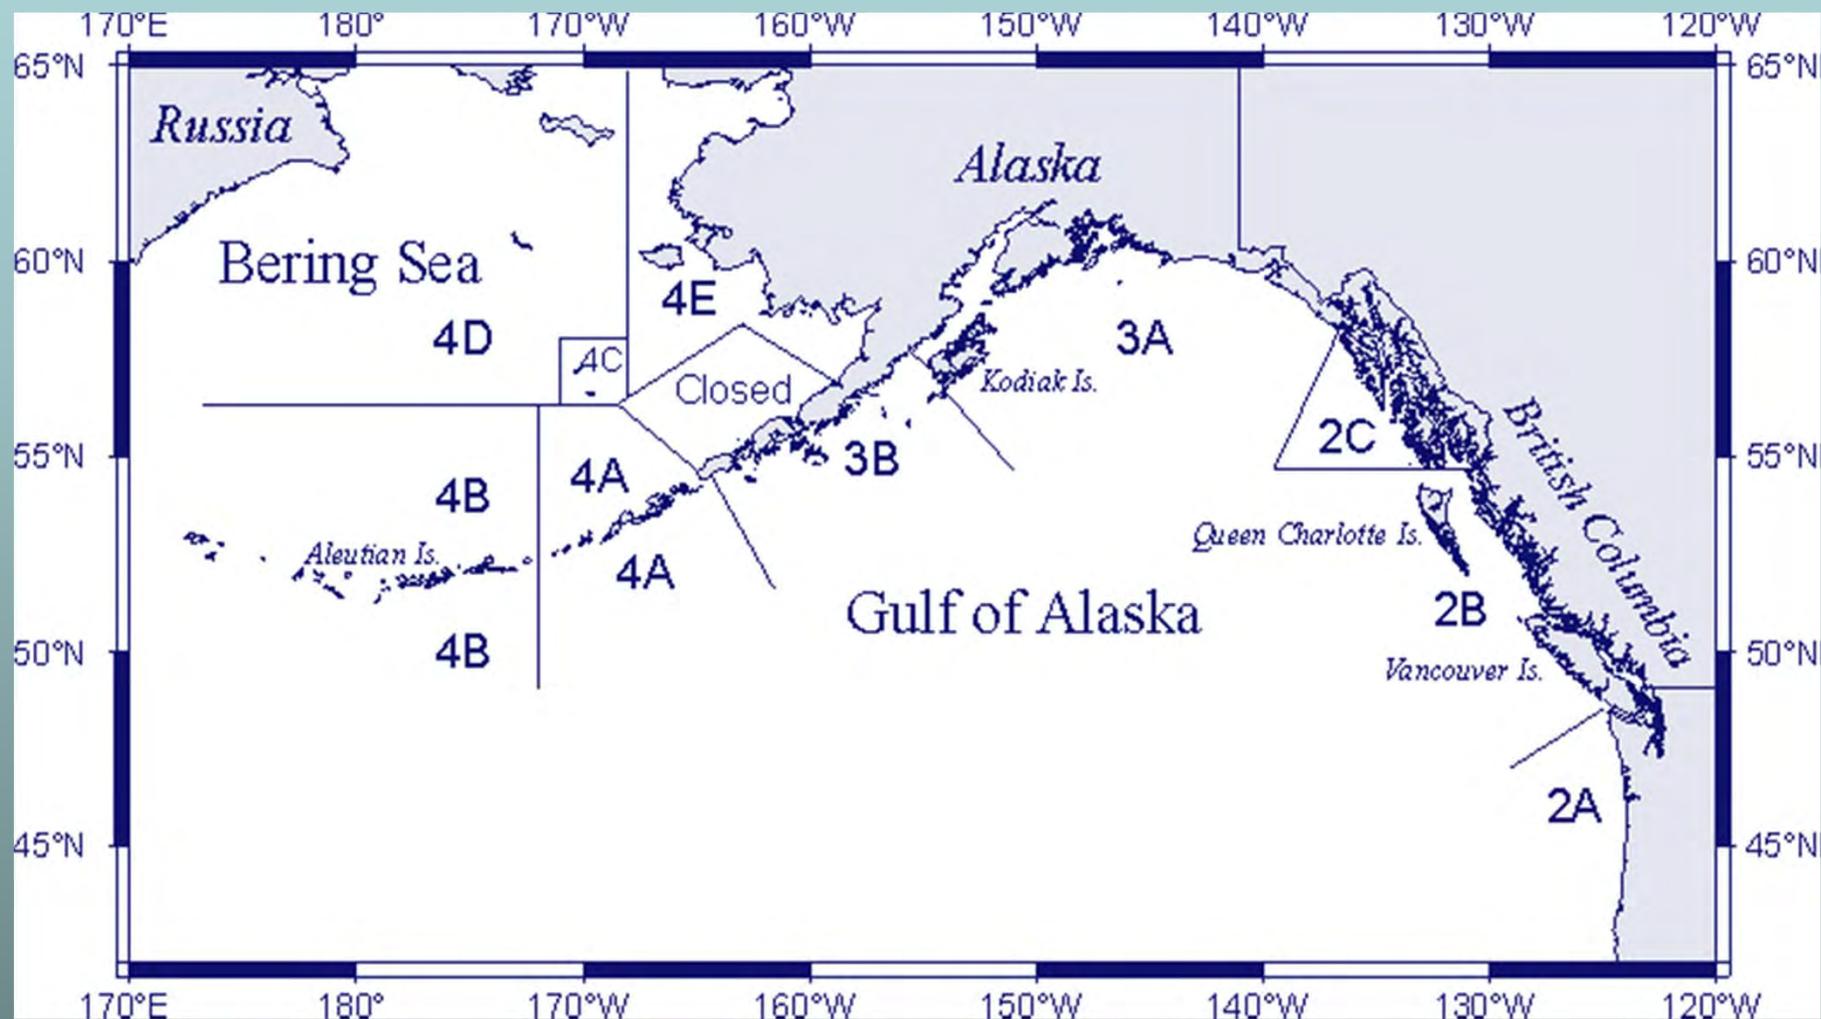

- Management of Pacific halibut
- 2015 season summary
- Proposed amendments to §28.20,
Title 14, CCR

Management Entities

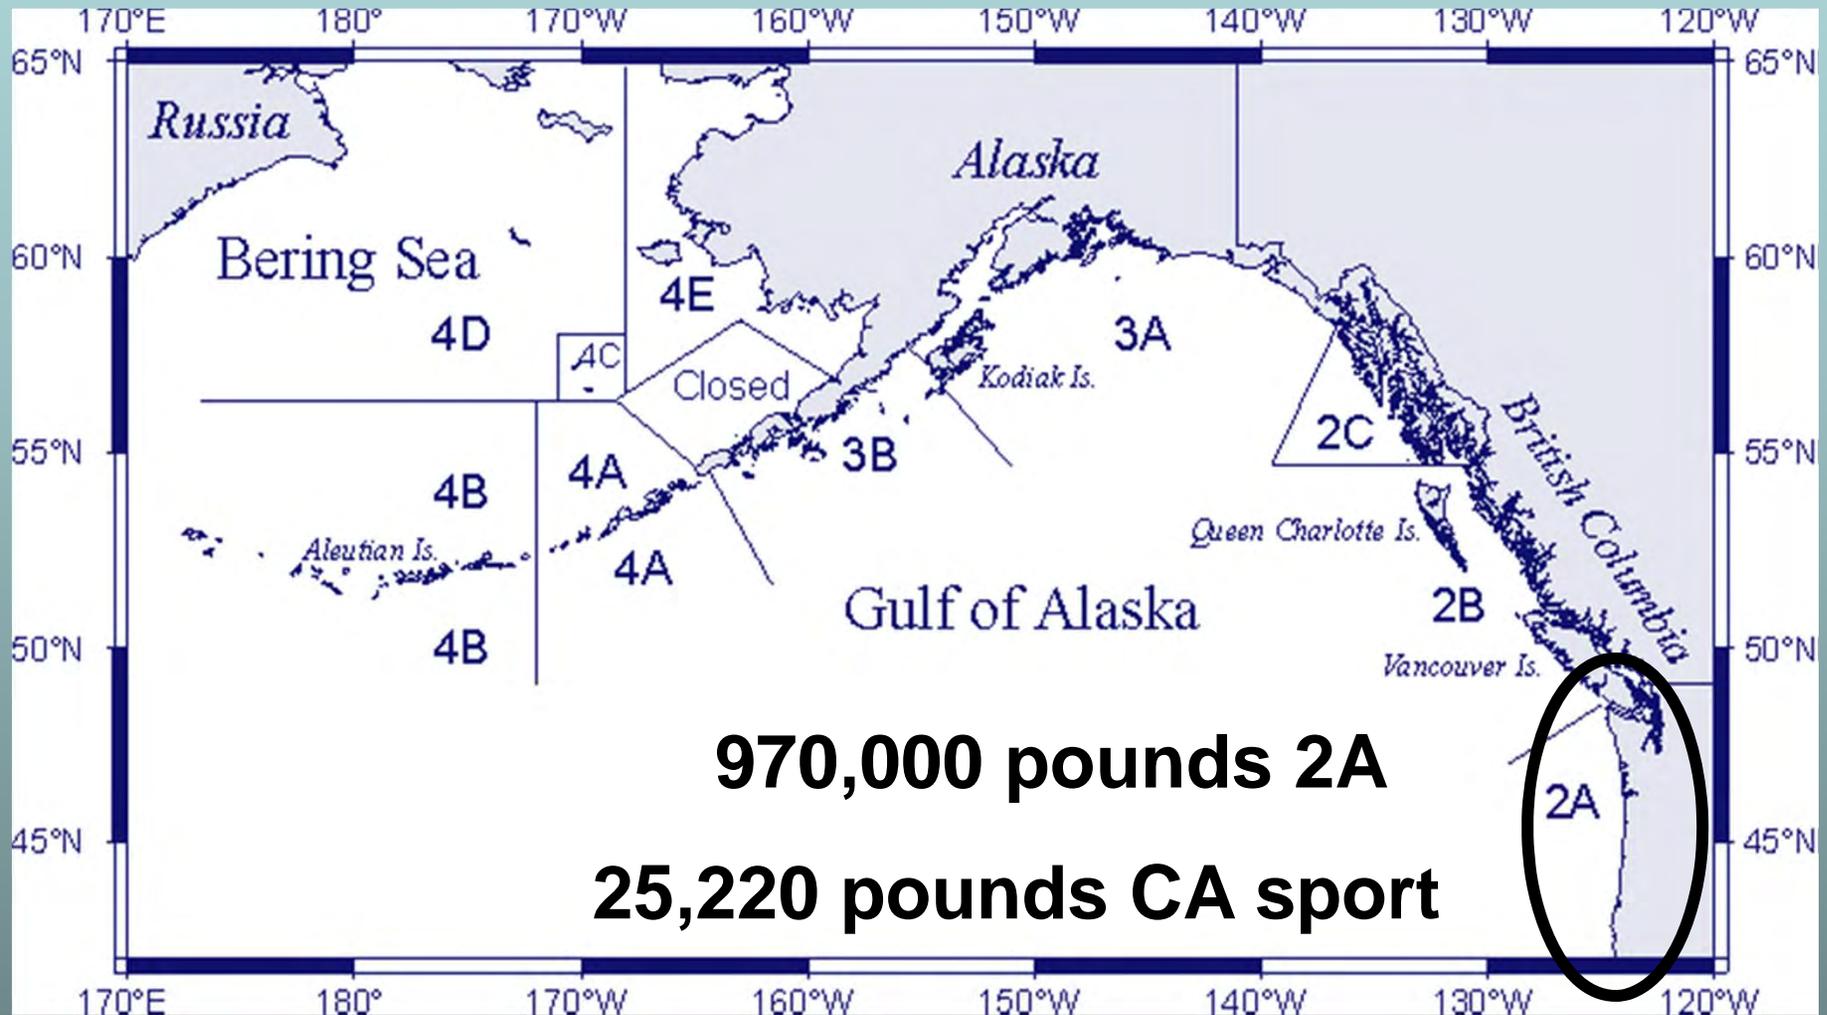

Management Areas

29.2 million pounds for 2015

Management Areas

29.2 million pounds for 2015

2015 Season Summary

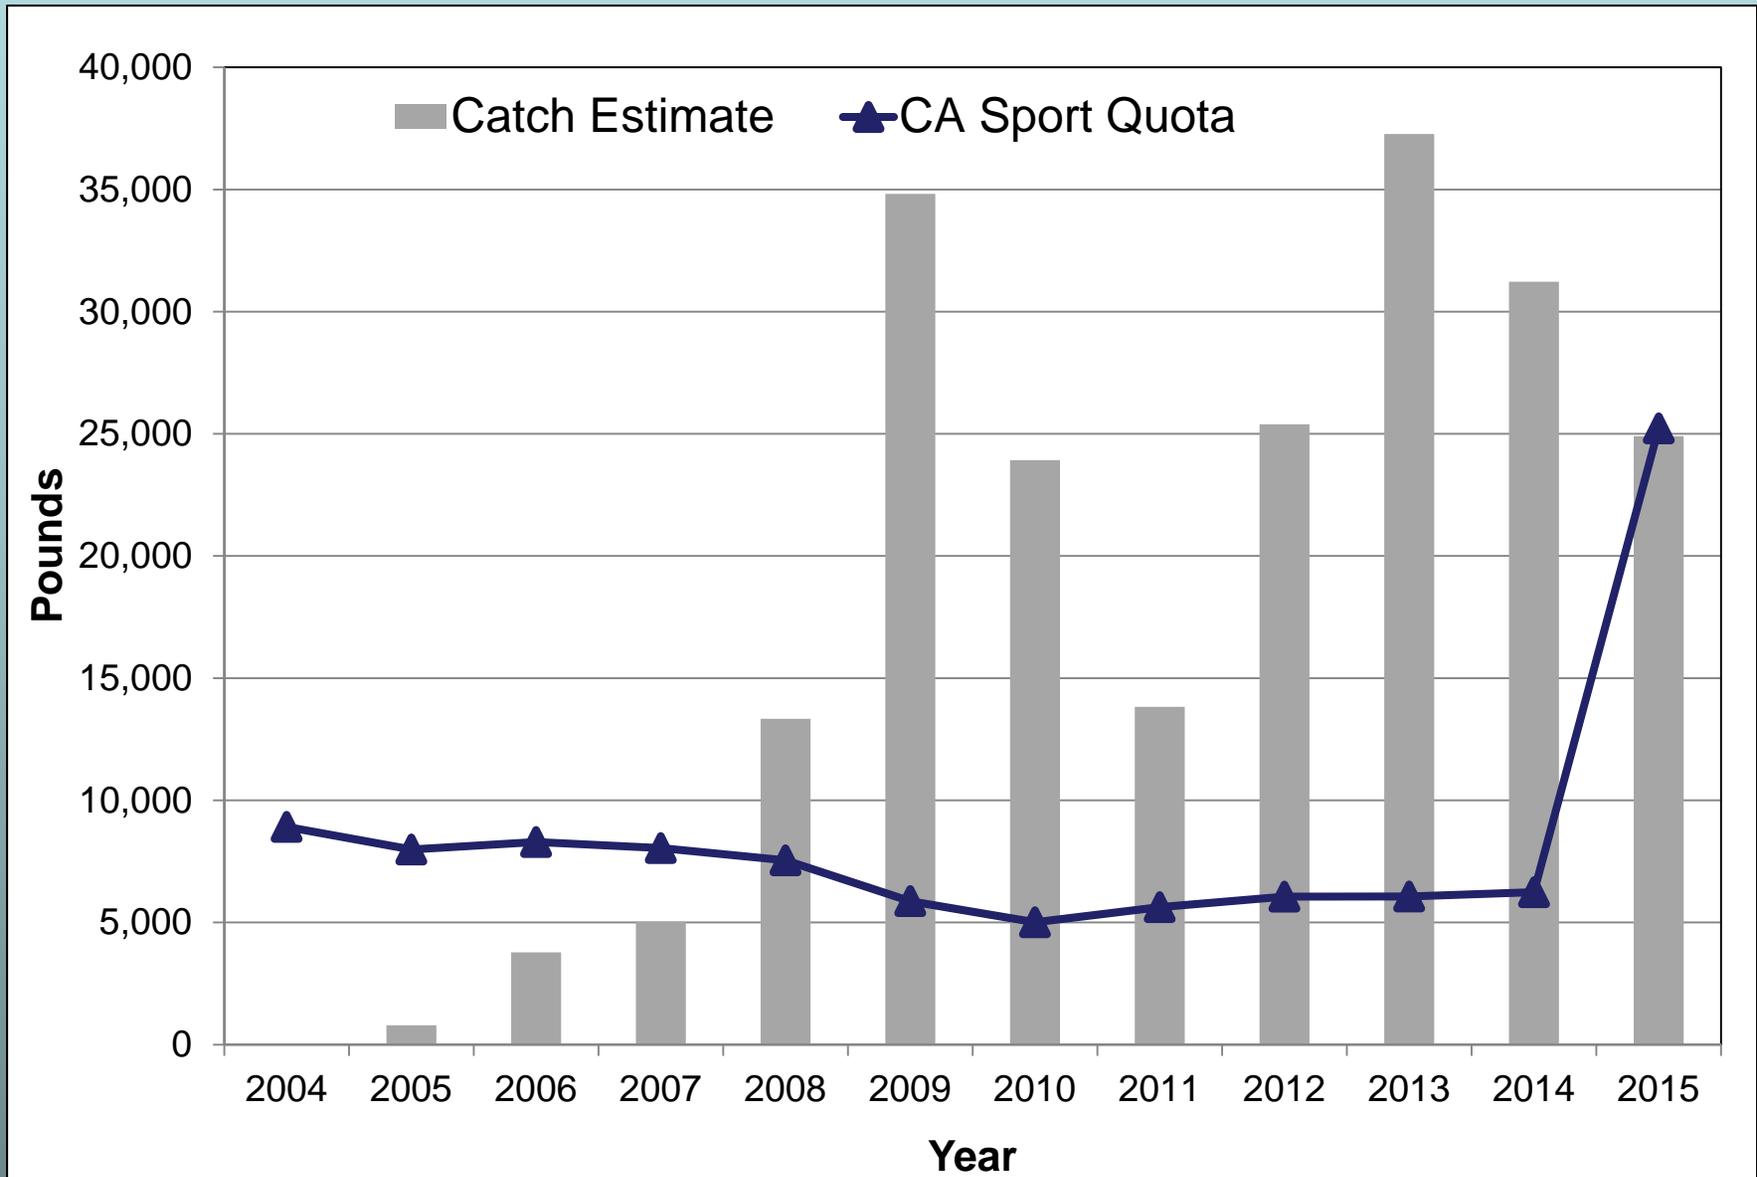

- Quota of 25,220 net pounds
- New weekly in-season tracking and coordination with NMFS and IPHC
- New season structure

2015 Season Summary

- IPHC/NMFS took action to close the season August 13 due to projected attainment of quota

- Final catch estimate is 24,906 net pounds (99 percent of quota)

Recreational Catch Estimates

Proposed Amendments to §28.20, Title 14, CCR

- Possible modifications to season dates, dependent upon final quota amount
 - Quota will be known last week of January 2016
 - If quota substantially different from that in 2015 then season dates may need to be adjusted
- Removal of year and quota amount in regulatory text
 - Replace with reference to Code of Federal Regulations and Federal Register

Timeline

- December 9, 2015 (today) – Notice meeting
- January 2016 – IPHC meeting - Area 2A quota determined (of which CA will receive 4 percent of the non-tribal share)
- February 2016 – FGC Discussion meeting
- April 2016 – FGC Adoption meeting
- May 1, 2016 – Start of fishing season (amended regulations need to be effective)

Thank You and Questions

California Allocation History Per PFMC's Catch Sharing Plan

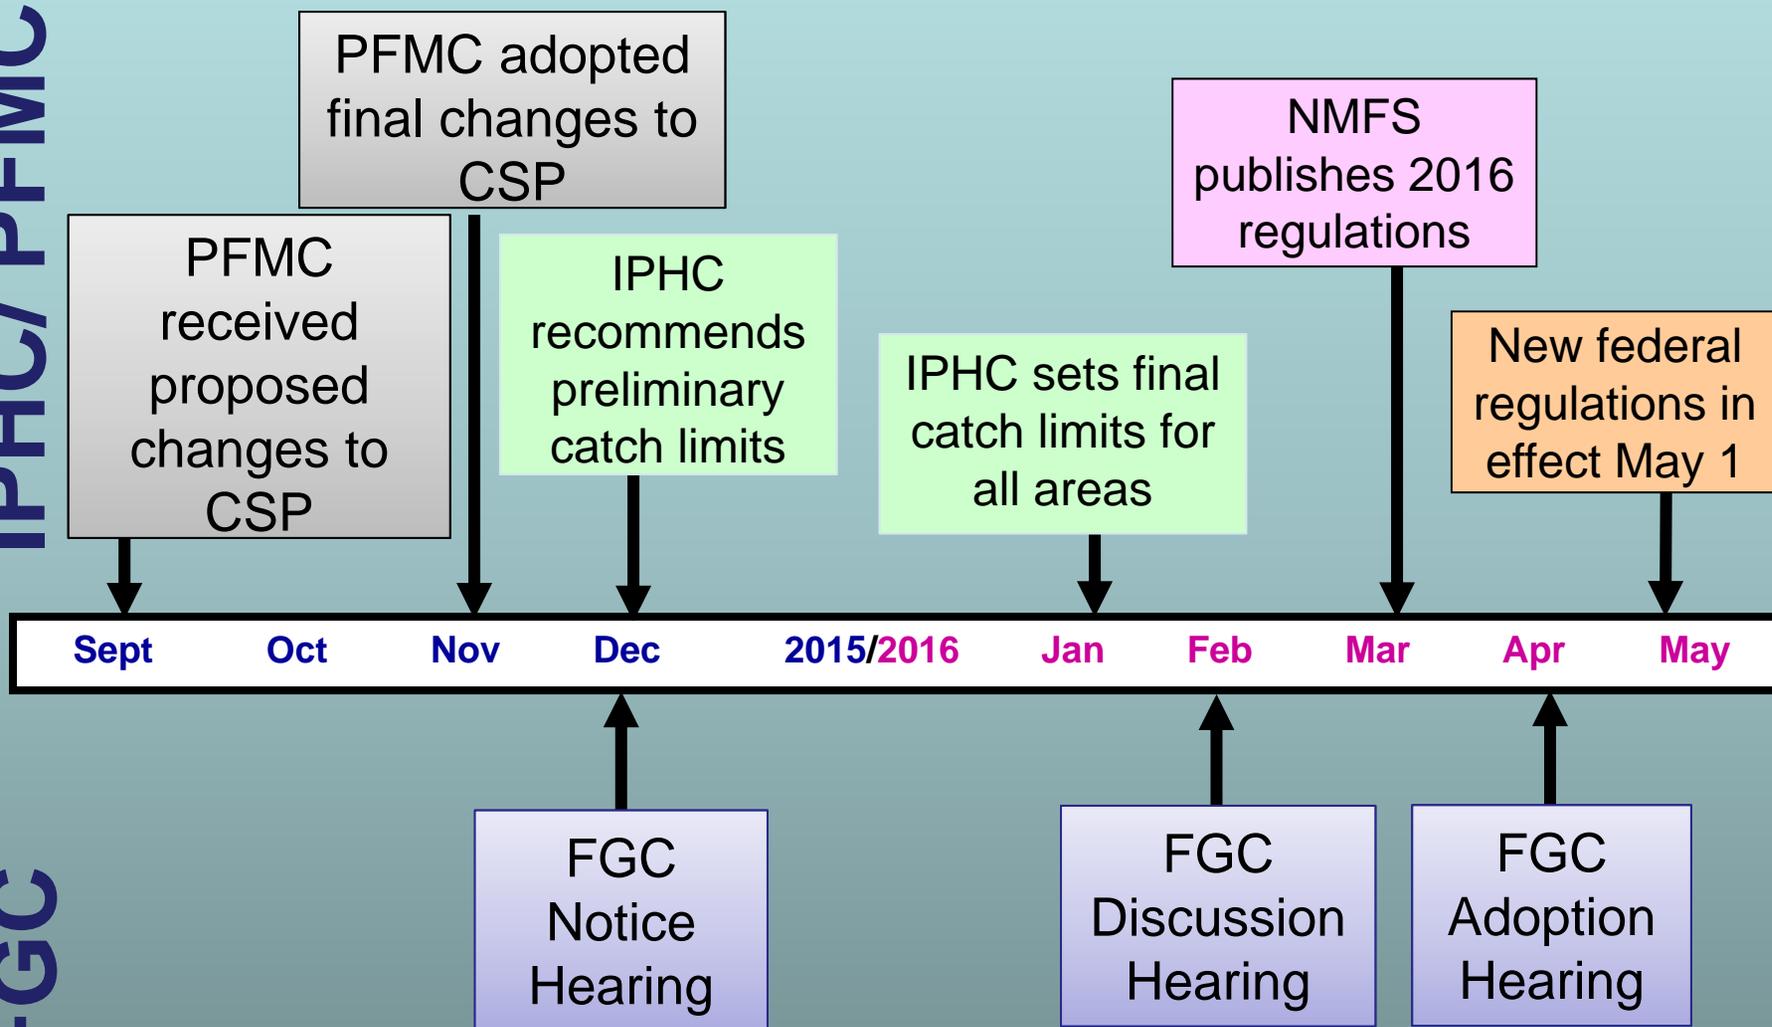

- **2001 through 2013** – California and Southern Oregon combined allocation of approximately 6,000 pounds per year
- **2014** – California given own subarea and is allocated 6,240 pounds
- **2015** – California allocation percentage to increase from one to four percent which resulted in quota of 25,220 pounds

Department Involvement

- Increased involvement at PFMC
- Heightened constituent and community involvement
- Engagement at IPHC
- Department collaboration with Humboldt Area Saltwater Anglers
- 2015 - New weekly catch reporting and inseason management coordination with NMFS
- Redirected staff resources

Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting
Re: Receipt of the Draft California Spiny Lobster Fishery Management Plan**

The Department of Fish and Wildlife (Department) is pleased to transmit the Draft California Spiny Lobster Fishery Management Plan (CA lobster FMP) to the Commission for receipt at its December meeting. It is anticipated the Commission will discuss this document at its February meeting and potentially consider its adoption in April 2016.

The Marine Life Management Act (MLMA) requires that FMPs form the primary basis for managing California's marine fisheries. Pursuant to the mandates of the MLMA, the draft CA lobster FMP is designed to guide future management of the fishery in a way that ensures sustainability of the CA spiny lobster resource.

The CA lobster FMP is the culmination of over three and a half years of work and represents the recommendations from the Lobster Advisory Committee (LAC), a constituent group made up of stakeholders from various sectors. The CA lobster FMP has undergone independent, external peer review and has benefitted from the input of the Commission, MRC, California Tribes and Tribal Communities, and stakeholders.

If you have any questions regarding this item, please contact Dr. Craig Shuman, Regional Manager, Marine Region at (805) 568-1246.

CALIFORNIA SPINY LOBSTER FISHERY MANAGEMENT PLAN

November 10, 2015

DRAFT

California Department of Fish and Wildlife

Marine Region

Executive Summary

The California Spiny Lobster (CA lobster) is an important natural resource managed by the state of California for over 100 years. The species supports a valuable commercial fishery and a significant recreational fishery. CA lobsters also act as important keystone predators within the southern California nearshore ecosystem. The commercial fishery in California extends from Point Conception south to the U.S.-Mexico border, and accounted for approximately 430.9 metric tons (mt) (950,000 pounds) in ex-vessel landings and \$18.2 million in ex-vessel value during the 2014-15 fishing season. The California recreational fishery ranges from Central San Luis Obispo County south to the U.S.-Mexico border, and is estimated to contribute between \$33-\$40 million in consumer spending to the California economy each year.

The 2011 California Department of Fish and Wildlife (CDFW) stock assessment indicates that the CA lobster stock is stable under the current management measures. The current minimum size limit allows many lobsters to reproduce for one to two years before reaching the legal size limit. The seasonal closure (March-October) protects individuals from harvest during the sensitive spawning period of the species. The limited-entry nature of the commercial fishery restricts the number of commercial participants.

A substantial increase in average landing price (\$/pound) has occurred within the commercial fishery during recent years. Around the same time, overall commercial trap effort as measured by the amount of trap pulls recorded on CDFW-issued daily lobster fishing logs has also increased. The increase in commercial fishing effort has raised questions about the long-term sustainability of the fishery, the negative consequences on the fishing grounds and associated ecosystems from increased gear usage, and the economic health of the commercial fishery.

The recent rise in commercial effort is also accompanied by changes in the dynamics of the recreational fishery. The recreational sector has traditionally been dominated by divers, but in the early 2000s, the popularity of boat-based hoop nets began to rise. Starting in 2008, recreational lobster fishermen were required by CDFW to record their daily fishing activity and catch on standardized report cards.

Report card sales have increased over the last seven years, suggesting that participation has increased. However, card sales do not necessarily reflect actual fishing effort or catch. Report card return rates have steadily increased since the program was first implemented due to proactive CDFW effort to educate the public and the establishment of a non-reporting fee in 2013. Based on the returned cards, CDFW estimates that recreational fishermen harvested 31% of the total catch (commercial + recreational) during 2014-15 fishing season. As return rate continues to improve from new public outreach and reporting requirements, CDFW will be better able to estimate recreational effort and catch.

In 2012, the state implemented a set of new marine protected areas (MPAs) under the **Marine Life Protection Act (MLPA)** in southern California. The 50 MPAs and two special closures in this region are designed to serve a myriad of objectives including conservation of valuable fishery resources. These MPAs create safe zones for species such as CA lobsters to reproduce without fishing pressure, but at the same time shift and compress fishing effort to the remaining non-MPA areas.

Marine Life Protection Act (MLPA) - The MLPA, enacted in 1999, required the California Department of Fish and Wildlife to develop a Marine Life Protection Program, including a Master Plan for a network of Marine Protected Areas (MPAs) within state waters. The network of MPAs includes an improved State Marine Reserve (complete no-take areas) component and other classifications of MPAs (State Marine Parks and State Marine Conservation Areas). The goals of the MLPA are varied and include protecting portions of ecosystems in a variety of habitats, preserving biodiversity, and helping to sustain and protect populations of fished species.

In light of the dynamic nature of the fisheries, it is important for CDFW to adopt a cohesive management strategy for CA lobster. Accordingly, a key provision of this Fishery Management Plan (FMP) is a harvest control rule (HCR) for CA lobster. The HCR serves as the foundation for managing the fishery in the future as well as the primary mechanism to prevent, detect, and recover from overfishing as required by the **Marine Life Management Act (MLMA)**. The HCR is a type of adaptive management framework that identifies potential conservation problems and prescribes appropriate management responses. It consists of three parts: 1) reference points, 2) a control rule toolbox, and 3) a control rule matrix. Reference points are the metrics used to gauge the status of the fishery. The three CA lobster reference points are: 1) Catch, 2) **Catch Per Unit Effort (CPUE)**, and 3) **Spawning Potential Ratio (SPR)**:

REFERENCE POINT	THRESHOLD	RATIONALE
Catch	$\frac{\text{average catch for 3 most recent seasons}}{\text{average catch for 10 most recent seasons}} \leq 0.9$	Identifies possible change in stock stability, particularly growth overfishing
CPUE	$\frac{\text{CPUE for 3 most recent seasons}}{\text{CPUE for 10 most recent seasons}} \leq 0.9$	Identifies potential adverse changes in the fishery, mainly economic overfishing
SPR	$SPR_{CURRENT} \leq SPR(\text{Average 2000-2008})$	Detects biological sustainability, particularly recruitment overfishing

The reference points incorporate important information regarding the fisheries such as the effects of fishing and MPAs. New information is interpreted in relation to prescribed reference point thresholds that signal when changes within the fishery may warrant management responses. Once these changes are detected within the fishery, resource managers have flexibility to choose the appropriate management response from a toolbox of eight management tools. These consist of: 1) Change commercial trap limit, 2) Change recreational bag limit, 3) Establish a Total Allowable Catch (TAC), 4) Implement district closures, 5) Change season length, 6) Change minimum size limit, 7) Implement a maximum size, and 8) Establish a sex selective fishery (Male-only fishery or female-specific size restrictions). The control rule matrix links specific reference point results to the appropriate management response.

Marine Life Management Act (MLMA)- The Marine Life Management Act (MLMA), which became California law January 1, 1999, established goals of conserving entire ecosystems, recognizing non-consumptive values, sustainability, habitat conservation, restoring depressed fisheries, limiting bycatch, and recognizing fishing communities.

Catch Per Unit Effort (CPUE) - The rate at which fish are caught; typically a number or weight of fish captured per unit of effort. Units of effort can be assigned many ways, including the time spent fishing (hours or days), the amount of fishing gear deployed (number of vessels, traps, nets, etc.), the number of times that fishing gear is deployed and retrieved (e.g., net hauls, trap pulls), or a combination of these estimates. Because it is difficult and expensive to scientifically measure the number of fish in an area (abundance), CPUE is often used as an index for the relative abundance of organisms across time or space. For CA lobster, CPUE is typically defined as the number of legal (or sublegal-sized) lobsters per trap pull for the commercial fishery, and number of legal lobsters retained per fishing trip for the recreational fishery. Effort is most often described in terms of trap pulls, total traps, and number of active permits for the commercial fishery, and number of fishing trips for the recreational fishery.

Spawning potential ratio (SPR) – A ratio of the number of eggs produced during the lifetime of an average female in a fished population to the number of eggs produced during the lifetime of an average female in an unfished population; used to characterize the amount of impact fishing has on a population’s ability to reproduce.

Lobster Advisory Committee – A committee composed of representatives from the recreational fishery, the commercial fishery, environmental interest groups, scientific experts, non-consumptive recreational interest groups, and federal resource managers. The committee was responsible for providing crucial constituent inputs during the drafting process of this FMP, in part through a consensus recommendation.

The scientific foundation for the HCR underwent an independent, external peer review (see Appendix VII and VII). In particular, reviewers focused on the choice of reference points, the model used to calculate SPR, and the decision to manage CA lobster as a single stock. The primary changes to the previous draft of this FMP in response to peer review include:

- A von Bertalanffy growth model was used to describe lobster age at a given size within the model used to calculate SPR.
- Catch and CPUE reference points were made more sensitive by setting the threshold levels at 0.9 rather than 0.8.
- Expanded discussion of possible reference points and associated models was added to the FMP along with increased explanation of the selected approach.
- Information on regional differences within the stock was added and better understanding of these differences was highlighted as an information need.

This FMP also describes various management tools considered during the stakeholder **Lobster Advisory Committee** (LAC) process. The LAC reached consensus on several regulatory recommendations that will assist future fishery management. These recommendations include, but are not limited to: 1) Commercial permit-based trap limit, 2) Tail clipping or hole punching of recreationally caught CA lobsters, 3) An additional grace period for commercial fishermen to deploy traps before the season and an additional period to retrieve traps after the season, 4) Changing the opening time for the recreational season, 5) Restrictions on mechanical pullers for the recreational fishery, 6) Allowance to carry SCUBA gear on commercial vessels, 7) Requirement to mark recreational hoop net floats, 8) Clarifying regulatory language on the take of lobster by hand, and 9) Increased soak time for commercial traps.

CDFW currently collects substantial fishery-dependent data on CA lobster through commercial logbooks, landing receipts, recreational lobster report cards, creel sampling, and at-sea sampling. However, better information on the species stock distribution, ecological role, and life history (e.g., movement, **recruitment**, reproduction, mortality) would allow CDFW to improve its future management activities. Pursuant to the MLMA mandates, CDFW will continue to work with its constituents to improve research and monitoring efforts in order to better maintain sustainable CA lobster populations and associated fisheries.

Recruitment - The process, event, or rate by which individuals enter new life stages or segments of a population. *Larval recruitment* refers to the process or event by which larvae of marine species exit the planktonic life stage. *Fishery recruitment* (or, recruitment to the fishery) refers to the moment that an animal becomes vulnerable to capture in a fishery – usually because it has attained some minimum size or age for harvest.

Acknowledgements

The California spiny lobster FMP is the result of collaboration among many individuals and organizations. We would first like to thank all the Lobster Advisory Committee (LAC) members and particularly the constituent representatives for their many contributions and cooperative attitude throughout the process. The LAC volunteered a great deal of time and provided input that helped the FMP to represent the varied knowledge, interests, and values of its members. We thank Dr. Richard Parrish, Dr. Matthew Kay, and Dr. Yong Chen for providing modeling expertise that was critical for the development of sound reference points for assessing the status of the stock. We thank the Sea Grant Collaborative at-Sea Sampling Program (CAPS) and in particular Dr. Carrie Culver for openly sharing their data which was valuable in many ways throughout the writing of the FMP. Retired Marine Region staff members who dedicated many years to the lobster resource and fishery participants include Kristine Barsky, Dr. Douglas Nielson, and Kai Lampson. Finally independent peer review greatly improved the FMP and we thank the organizers of that effort, Ocean Science Trust, and the scientific experts including Dr. John Field, Dr. Michelle Comeau, Dr. Robert Muller and Dr. Pete Raimondi.

Acronyms

 YPR – Yield per Recruit

1. Introduction

The Marine Life Management Act (MLMA) establishes a policy for the State to ensure the conservation and **sustainable** use of California’s living marine resources (FGC § 7050(b)). The MLMA states that Fishery Management Plans (FMP) “shall form the primary basis for managing California’s sport and commercial marine fisheries” (FGC § 7072). FMPs are documents that consolidate available information under the statutorily prescribed frameworks (FGC §§ 7072, 7075, 7080-7088); their contents and any subsequent amendments form the basis for all **fishery** management decisions. The California Department of Fish and Wildlife (CDFW) is responsible for drafting FMPs and presenting them to the California Fish and Game Commission (Commission). FMPs become effective upon adoption by the Commission through a public process. Implementation is done through a separate Commission rulemaking process, and the implementing regulations are codified in Title 14 of the California Code of Regulations. This FMP is developed for the California spiny lobster (*Panulirus interruptus*; CA lobster) in U.S. waters.

1.1 The Goal of the Spiny Lobster FMP

The goal of this FMP is to formalize a management strategy that can respond effectively to changes in the CA lobster fisheries pursuant to the tenets of the MLMA. CA lobsters have long supported major **commercial** and **recreational fisheries**, and the species plays a key role in maintaining the health of the southern California kelp forest **ecosystem**. This ecosystem is important to a number of non-consumptive users such as divers, eco-tourists, researchers, educators, and the conservation community.

To achieve responsive and effective management, this fishery must be adaptable and sustainable. This FMP uses an **adaptive management** framework (Holling et al., 1978; Walters and Hilborn, 1978) based on a harvest control rule (Section 4.3). Section 90.1 of the Fish and Game Code (FGC) defines adaptive management as “a policy that seeks to improve management of biological resources, particularly in areas of scientific uncertainty, by viewing program actions as tools for learning.”

1.2 Efforts Leading Up to the Spiny Lobster FMP – The Lobster Advisory Committee

This FMP incorporates input from the Lobster Advisory Committee (LAC). The LAC was formed in early 2012 following a call by CDFW for volunteers to represent various public stakeholder groups. The purpose of the LAC is to involve constituent representatives with the development of this FMP. The LAC provided guidance on FMP objectives and end-products as well as ideas for management options that addressed the key issues put forth by members of the public. The LAC consists of representatives from the marine science community, the recreational fishing sector, commercial fishing sector, the non-consumptive recreational sector, the environmental

Sustainable, Sustainable use, and

Sustainability - With regard to a marine fishery, means both of the following: 1) continuous replenishment of resources, taking into account fluctuations; and 2) securing the highest possible present and long-term social and economic benefits, maintaining biological diversity, and managing fisheries in a way that does not exceed **optimum yield**. See also FGC § 7050(b).

Fishery - Fishing for, harvesting, or catching one or more populations of marine fish or marine plants that may be treated as a unit for purposes of conservation and management that are identified on the basis of geographical, scientific, technical, recreational, and economic characteristics.

Commercial fishery - Describes a group of enterprises and individuals as well as their actions associated with fishing for certain species with the intent of selling the catch.

Recreational fishery - Describes a fishery associated with taking of any fish for any purpose other than profit.

Ecosystem - The physical and climatic features and all the living and dead organisms in an area that are interrelated in the transfer of matter and energy, which together produce and maintain a characteristic type of biological community. Ecosystems can range in size.

community, and the federal government.

A total of nine LAC meetings occurred between June 2012 and September 2013. All meetings were open to the public, and public input was encouraged. Meeting announcements were posted on the CDFW website, and the public was encouraged to sign up for the Lobster FMP news email service. Meeting summaries as well as various background documents are available on the CDFW website (www.wildlife.ca.gov/Conservation/Marine/Lobster-FMP). The LAC reached consensus on several management recommendations for CDFW and the Commission (Section 4.5, Appendix II, and Appendix IX).

2. Background of the California Spiny Lobster Fishery

CA lobsters have been fished since the 1800s. U.S. fishermen target CA lobsters primarily from Point Conception south to the U.S. – Mexico border, and off southern California islands and banks (Barsky, 2001; Figure 1-1). Some fishing takes place north of Point Conception, but as of 2013 effort has not been significant. The commercial and recreational fisheries run from early October to mid-March, with the recreational fishery starting 4 days earlier than the commercial fishery (FGC § 8251; 14 CCR § 29.90). This results in a 24 week commercial fishing season and a 24.5 week recreational fishing season.

A 2011 **stock assessment** suggested that the post-2000 CA lobster **population** is at a sustainable level where surplus production provides the majority of the harvestable CA lobster each season (Neilson, 2011). This conclusion was based mostly on consistency in the size of captured lobsters, **harvest rates**, catch totals, and level of fishing effort since 2000.

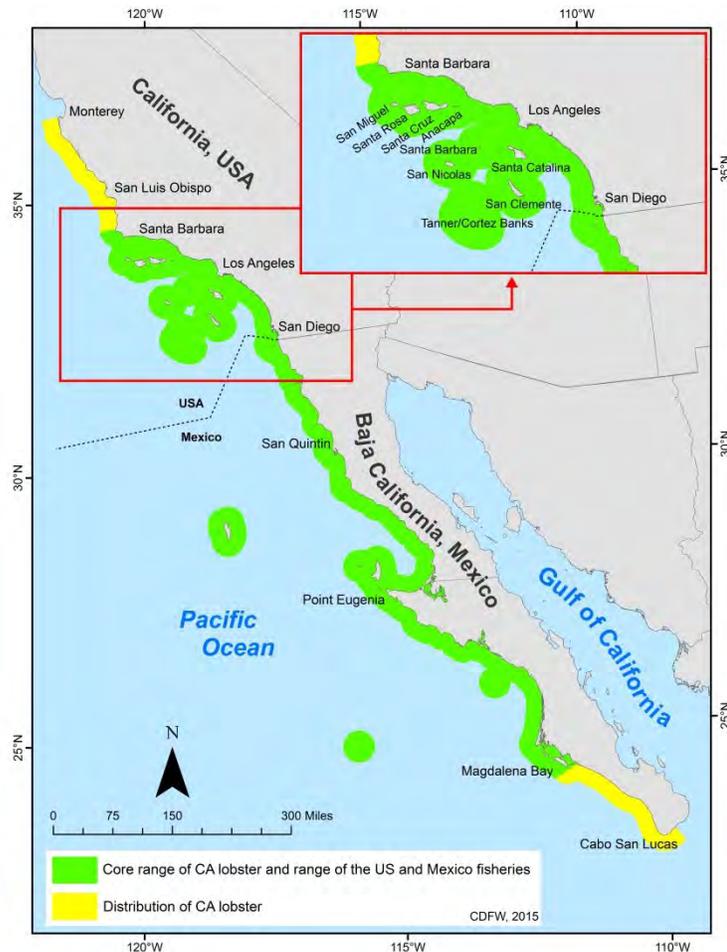

Figure 1-1: Geographic range of CA lobster (*P. interruptus*).
 *A 20mi buffer from the coast was used to indicate the approximate range of the species, and does not represent fine-scale distribution

Stock assessment - An evaluation of the status of a stock, including past and current stock levels and information to help guide future harvest. Assessments may integrate many different biological data, including growth rates of fish, mortality rates, age at first reproduction, fecundity, size classes present in the catch, and selectivity of fishing gear.

Population – All the individuals of a species that live in the same geographic area. A population may contain several discrete breeding groups or stocks.

Harvest rate (u) - The percentage of legally harvestable individuals in a population that are removed each year due to fishing.

Stock - A group of fish of the same species in a given management area. A single stock may be comprised of multiple populations or be a portion of a single larger population.

Biological sustainability of the **stock** is attributed to multiple factors. Chief among them is likely the minimum legal size for the CA lobster fisheries, which is larger than the size at which individuals reach sexual maturity (Section 3.3). The number of sublegal-size lobsters caught by commercial fishermen has increased in recent years, which suggests that the current size limit is effective, and that a sizable number of sublegal-size lobsters are present in the wild and contributing to reproduction (Neilson, 2011).

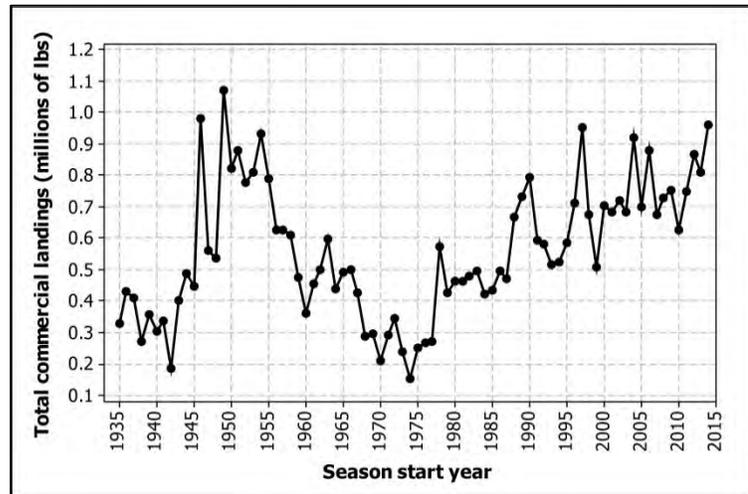

Figure 2-1: Commercial CA lobster (*P. interruptus*) landings from the 1936-37 to 2014-15 fishing seasons.

2.1 Commercial Fishery History and Description

The commercial CA lobster fishery can be characterized by several distinct periods. Commercial landings peaked at an all-time high of 485 mt (1.07 million pounds) during the 1949-50 fishing season, and declined to a record low of 69 mt (152,000 pounds) during the 1974-75 fishing season (Figure 2-1). The reason for this decline was thought to have been the illegal take of sublegal-size adults, and was corrected by the introduction of escape ports in 1976, which allowed sublegal-size individuals to exit

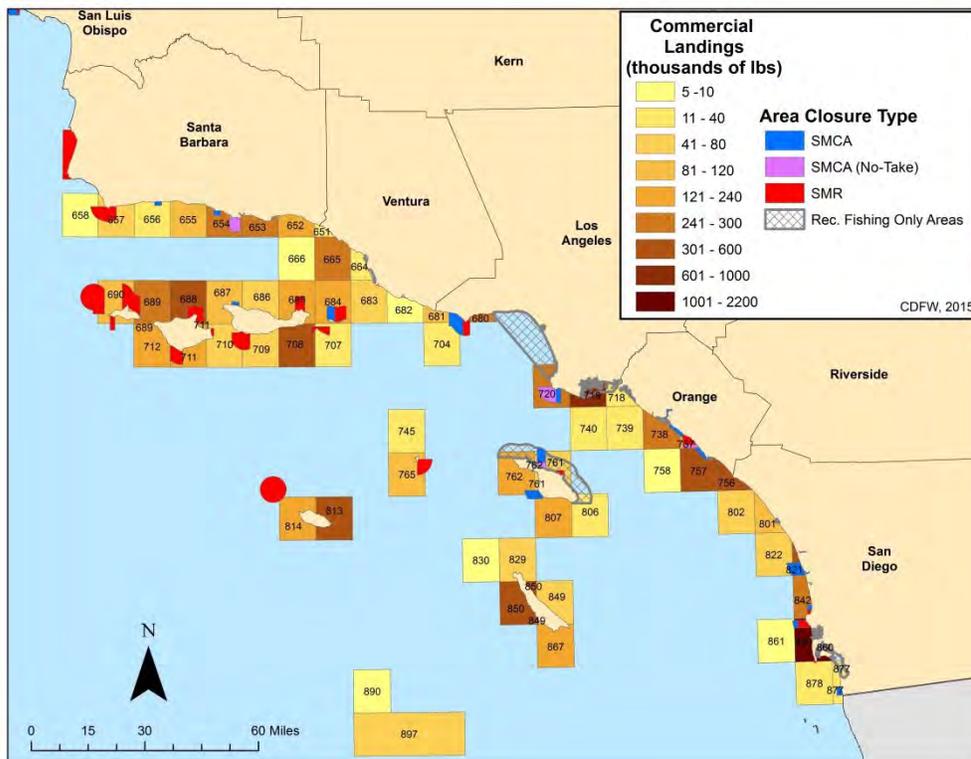

Figure 2-2: Commercial CA lobster (*P. interruptus*) landings by CDFW commercial fishing block between 2000-2014 fishing seasons overlaid with MPAs and recreational-only fishing areas.

*SMCA = State Marine Conservation Area

**SMR = State Marine Reserve

traps (Barsky, 2001). After 1976, the harvest increased and was stable for approximately a decade. Landings then showed further increases but volatility until the 2000-01 fishing season, when 319 mt (702,000 pounds) were landed. Since 2000, **landings** have fluctuated within a relatively narrow range, exceeding 300 mt (661,000 pounds) each season. Figure 2-2 provides a snap shot of CA lobster landings based on commercial fishing blocks between 2000 and 2013 along with marine protected areas (some of which prohibit the take of CA lobster). Since 2000, the number of active commercial participants has remained relatively consistent between 145 and 160.

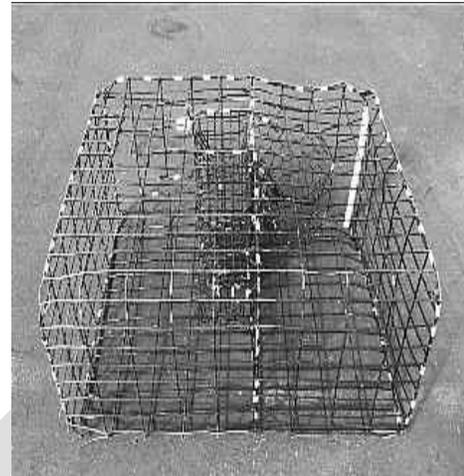

Figure 2-3: CA lobster (*P. interruptus*) commercial fishing trap.

Commercial fishermen use wire box-like traps deployed from boats to catch CA lobsters (Figure 2-3). Properly placed and serviced traps do not generally cause significant physical disturbance to the environment (Eno et al., 2001). Traps are usually deployed in less than 31 m (100 ft) of water, but some are deployed as deep as approximately 93 m (300 ft). According to a 2013 CDFW commercial fishery survey, fishermen generally operate 75 to 1,000 traps each season, with a median of 300 traps. California law requires fishermen to service (pull and clean) each deployed trap at least once every 96 hours, weather conditions permitting (FGC § 9004).

Traps - Generally, a wire basket or cage used for trapping certain types of organisms.
Landings - The number or poundage of fish unloaded at a dock by commercial fishermen or brought to shore by recreational fishermen for personal use. Landings are reported at the points where fish are brought to shore. Note that landings, catch, and harvest define different things.

Commercial landings tend to be distributed evenly between San Diego County, Los Angeles/Orange Counties, and Santa Barbara/Ventura Counties. However habitat area and fishing effort are not equally distributed. For example, in the last 10 years 20-30% of all trap pulls and a similar proportion of the total catch can be attributed to the single fishing block at Point Loma, San Diego. In general, 80% of a season’s catch is landed within the first half of the commercial season by mid-January. The majority of CA lobsters caught by the commercial fishery have reached legal size within the last year, although larger lobsters are still landed (Neilson, 2011).

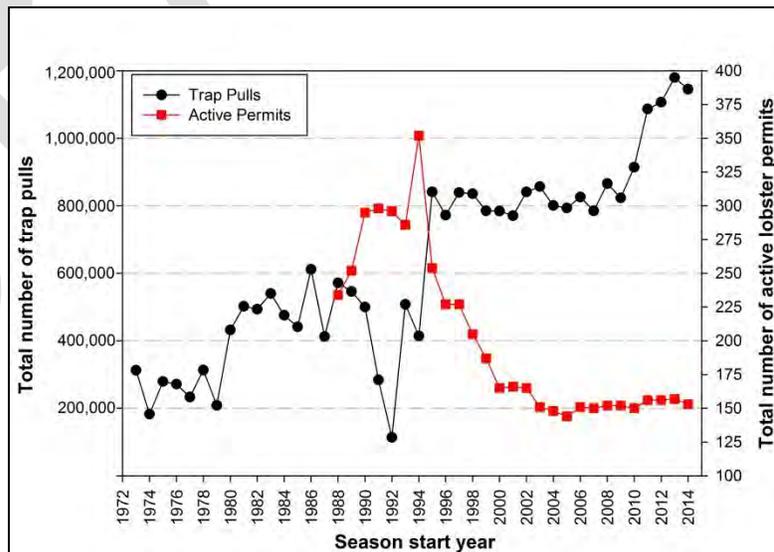

Figure 2-4: Total commercial trap pulls for CA lobster (*P. interruptus*) by year (black) compared to total number of active fishermen by year (red).

*Active Permits defined as individuals who made at least one landing during a particular fishing season

Commercial fishing effort (i.e., number of trap pulls) has been increasing in recent years despite an overall decrease in the number of active fishermen since the late

1990s (Figure 2-4). Between 1995 and 2009, the annual total trap pulls of the commercial fleet hovered near 800,000 pulls. In 2012, the number increased to just over 1.1 million pulls, despite the number of active fishermen remaining stable at about 150 individuals since 2003. This effort increase could be driven by several factors. Permit transferability adopted in 2005 can create considerable debt for new entrants into the fishery. Transferable lobster operator permits sold for approximately \$75-100K in the 2010s on the private market. This estimate is based on online permit exchange (e.g., <http://www.permitmaster.com>) and is consistent with testimonies from commercial fishermen during the Commission’s Marine Resources Committee meetings. It is reasonable to expect the owners of this debt would have incentive to fish harder than undebted permit holders.

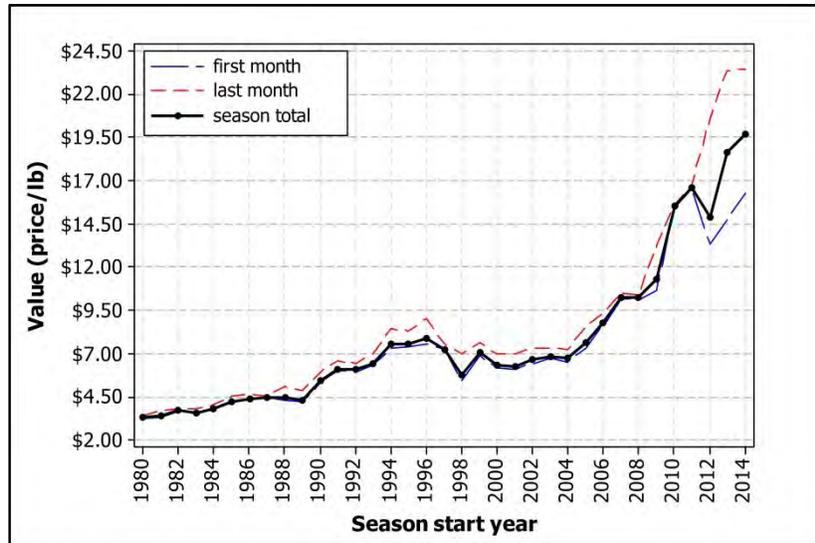

Figure 2-5: Mean commercial CA lobster (*P. interruptus*) landings value (price/pound (lb)) by fishing season. Lines indicate the total season, beginning (Sept+Oct) and ending (Feb+Mar) average value.

Ex-vessel price/Ex-vessel value - The value of fish at first sale by fishermen at the dock, distinguished from wholesale or retail value.
Yield per recruit (YPR) - A theoretical value that describes the yield to a fishery that is contributed by a given number of recruits (usually a single recruit).

Furthermore, some longtime permit holders who formerly contributed little effort to the fishery are becoming increasingly active because of the rapidly rising ex-vessel price of CA lobster in recent years. The average landing price of CA lobster has consistently increased over each season since the early 1990s (Figure 2-5). In the 2014-15 fishing season the fishery hit a record average seasonal landing price of \$19.67/pound. The average landing price (\$/pound) of CA lobster increased by approximately \$8/pound between the 1980-81 and 2009-10 fishing seasons as domestic demand slowly grew.

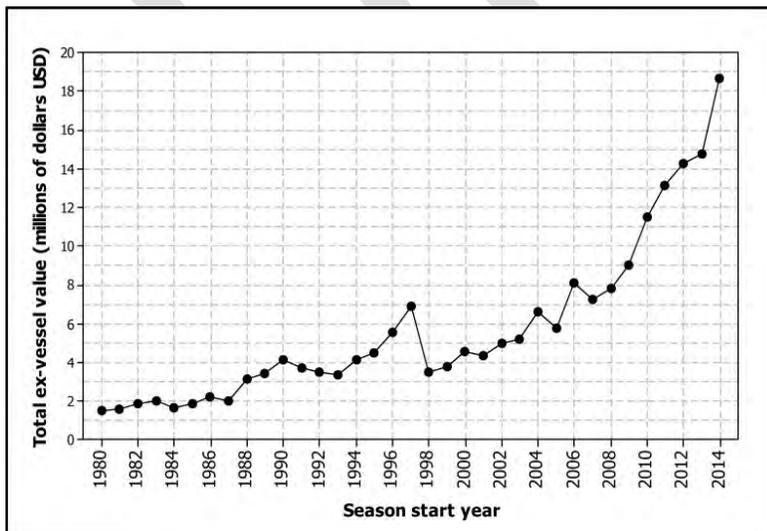

Figure 2-6: Total ex-vessel value of the CA lobster (*P. interruptus*) fishery from 1980 to 2014.

However, the average price increased by the same amount in just 5 years between the 2009-10 fishing season and the 2014-15 fishing season, as foreign markets expanded and export demand grew (Figure 2-5). Total **ex-vessel value** increased gradually between the late 1960s and 1990s, after which the value increased at a much faster rate and reached a record high of \$18.7 million in the 2014-15 fishing season (Figure 2-6).

Figure 2-7 shows the cumulative percentage contribution of fishermen, ranked from highest to lowest catch, to the total catch of the fishery in the 2013-14 fishing season. If all fishermen land similar levels of catch, the cumulative catch will be a straight line. Here the slope is curved, which means that differences exist with some fishermen landing more than others. Furthermore, the curve is very gradual with no significant break, suggesting there is high competition within the fishery, and a fisherman can easily trade place with those immediately before or after him/her from one season to the next. However, this graph does not show the difference in operational costs between fishermen; a more efficient fisherman (e.g., loses less traps or running a more efficient boat) may generate more profit than a more highly ranked competitor.

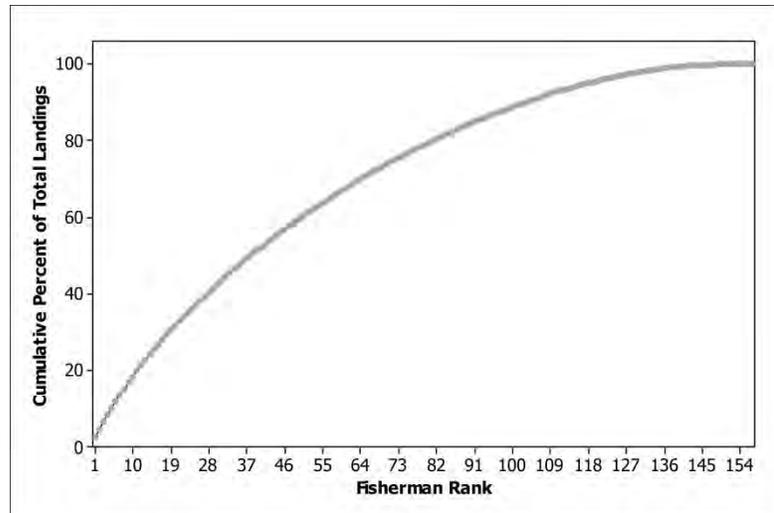

Figure 2-7: The cumulative percent contribution of fishermen to the 2013-14 CA lobster (*P. interruptus*) fishing season landings.

*The graph starts with the fisherman with the highest landings and incrementally adds the landings of the next highest-landing fisherman until all active fishermen are accounted for.

High effort in the commercial fishery may present challenges to sustainability when it results in a high harvest rate. Instantaneous harvest rate (Section 4.1) in the San Diego region is estimated to be higher than Santa Barbara. For CA lobster, however, **yield per recruit (YPR)** increases very little when harvest rates are increased beyond a certain point, leading to **economic overfishing** (Kay, 2011; Section 4.1). This scenario is nearly universal among the world's lobster fisheries (Gardner et al., 2013). The economic inefficiency of high harvest rates is accompanied by other challenges to California's MLMA objectives (Section 4.1). These include a lower spawning potential, diminished non-consumptive user experiences, and greater risk of undesired ecological interactions (e.g., bycatch, lost gear, ghost fishing).

2.2 Recreational Fishery History and Description

The recreational fishery targets CA lobster using **hoop nets** (Figure 2-8) or by hand when diving (**SCUBA** or skin diving). Historically, diving has been more prevalent than hoop netting. Eighty percent of the interviewees in a 1992 CDFW recreational **creel survey** were composed of divers, with hoop netters accounting for 20%. This pattern has since changed with 80% of the recreational interviewees hoop netting in the more recent 2007 CDFW recreational creel survey.

CDFW was not able to quantify recreational catch until recent years through the recreational lobster **report card** (Section 5.1.1; Table 2-1). Low report card return rates cause uncertainty in recreational catch estimates, because returned cards may not reflect unreturned cards, and sample size is reduced for stratification. However, return rates have been improving and a non-reporting

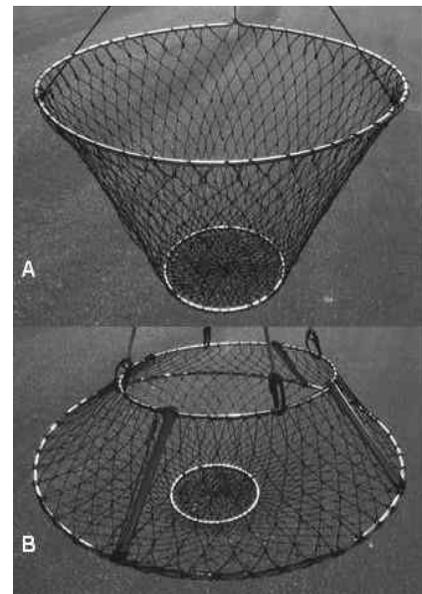

Figure 2-8: Traditional hoop net (A) and rigid conical hoop net (B).

fee of \$20 was implemented to cover costs of CA lobster management in 2014. An anticipated effect of that fee is an improvement in return rates. Estimates for recreational catch range from 292,442 pounds in 2013 to 527,357 pounds in 2009 representing 27 to 43% of the total recreational and commercial catch. While the estimated 95% confidence intervals for recreational catch are narrow, they do not incorporate uncertainty due to poaching or the potential that catch on returned report cards is not representative of catch on un-returned report cards.

CDFW allows two types of hoop nets: traditional hoop nets and rigid **conical hoop nets** (14 CCR § 29.80). The traditional hoop nets lie flat on the seafloor and only take their three-dimensional shape when pulled to the surface. A slow or jerky pull can allow lobster to escape out the top or sides. Conical hoop nets, introduced in 2006, have rigid sides and do not lie flat on the seafloor. The lobster must climb up and into the net to reach the bait. When disturbed, lobsters fleeing sideways are blocked by the net regardless of how the hoop net is pulled. A 2009 CDFW study found that conical nets catch about 57% more lobster than traditional style nets over time (Neilson et al., 2009). Additionally, Miller (2014) found that the size of lobsters entrapped within a power plant cooling system significantly decreased following the introduction of conical hoop nets and the increased use of hoop nets in the recreational fishery. The power plant is located within Santa Monica Bay where only recreational fishing is allowed. This suggests the recreational fishery may be having an impact on the local population and continued monitoring is warranted.

Statistical comparison between hoop net fishermen and divers has been particularly problematic. For example, in 2009, only 50.9% of all report cards returned were from hoop net fishermen, even though both the creel survey and the recreational industry representatives indicated that a large majority of the recreational fishermen at that point were hoop net fishermen. The most recent set of report card returns (2014-15 fishing season) was composed of 60% hoop net fishermen. However, this result may still be underrepresenting the overall fraction of hoop net fishermen. When the report card requirement was first implemented, report cards tracked the calendar years. Starting in 2013, CDFW adjusted report cards to track individual lobster fishing seasons which cross consecutive calendar years, following input from various constituent representatives. Data from the 2014-15 fishing season lobster report cards estimated the recreational catch to be 199.2 mt (439,151 pounds), or about 31% of the total (i.e., recreational plus commercial) catch. The report cards also indicate that most CA lobsters captured by the recreational fishery are caught in areas where the commercial fishery is prohibited (Figure 2-9; FGC § 8258). It is unclear whether this pattern is caused by ease of access from ports or better fishing conditions. Communication with hoop net retailer representatives suggests that public interest in hoop nets may have plateaued. (J. Salazar, pers. comm.), but future recreational effort increases may be inevitable due to human population growth in California. CDFW will continue to improve its data collection on the recreational sector and remain adaptive towards any change.

Economic overfishing - Fishing levels that exceed maximum economic yield.

Hoop net - A round net used to catch lobster by the recreational lobster fishing sector in California; it traditionally lies flat on the seafloor and assumes a basket shape upon retrieval to the surface.

SCUBA - "Self-Contained Underwater Breathing Apparatus" utilized to catch lobster by hand by the recreational lobster fishing sector in California; proposed here as a way for commercial fishermen to retrieve lost traps or cut out of entanglement.

Creel survey - Catch information gathered from recreational fishermen.

Conical hoop net - A modified style of hoop net used to catch lobster by the recreational lobster fishing sector in California; it is basket shaped, does not collapse, and does not lie flat on the seafloor.

Report card - A means of collecting fishery-dependent data on the recreational lobster fishery in California. Lobster report cards collect information on the number of people recreationally fishing for lobster each year, the gear they use, and their harvest and success rates. Required since 2008 to be filled out by all persons fishing recreationally for lobster in California.

Table 2-1: Estimate of Total Recreational CA Lobster (*P. interruptus*) Fishing Effort and Catch from 2008 to 2015 based on recreational report card data.

Estimates of Total Recreational Lobster Fishing Effort and Catch								
Calendar Year	Number of Cards Sold	Return Rate	Estimated Number of Active Lobster Cards (Cards that recorded at least one trip)	Estimated Number of Fishing Trips	Average CPUE (# of Lobsters Kept Per Trip)	Estimated Weight of Landings in Metric Tons (mt) (pounds (lb))	Percent of Total (Recreational + Commercial) Landings	± 95% Confidence Intervals
2008*	27,472	22%	24,038	104,085	2.1	160.93 mt (354,792 lb)	32%	6.73 mt (14,837 lb)
2009	32,343	14%	27,847	147,868	2.2	239.21 mt (527,357 lb)	43%	13.02 mt (28,715 lb)
2010	29,108	12%	25,033	127,168	2.1	197.24 mt (434,848 lb)	38%	12.96 mt (28,570 lb)
2011	33,376	16%	28,870	154,743	2.0	195.02 mt (429,953 lb)	36%	9.85 mt (21,722 lb)
2012	37,193	33%	28,527	127,801	2.0	185.97 mt (409,984 lb)	32%	6.14 mt (13,532 lb)

*SMCA = State Marine Conservation Area (may allow some commercial and/or recreational take)

**SMR = State Marine Reserve (no take areas)

***Northern-most dot denotes total catch between San Luis Obispo up to CA-OR border

2.3 Bycatch within the Fishery

Bycatch occurs in both the recreational and commercial CA lobster fisheries. There are generally two types of bycatch (FGC § 90.5) in the fisheries: 1) sublegal-size lobster; and 2) other non-targeted marine life. The MLMA calls for the minimization of bycatch when the amount or type is “unacceptable” (FGC § 7085(c)). Based on available data, CDFW concludes that there is no indication of unacceptable bycatch levels in either the commercial or recreational fisheries.

2.3.1 Commercial Fishing Bycatch

Trap fisheries generally have minimal bycatch of species other than invertebrates (Morgan and Chuenpagdee, 2003; Matthews et al., 2005). These traps are required to have destruct devices (destruct clips/rings) to avoid ghost fishing as well as escape ports to minimize the catch of sublegal-size lobster. Traps are set on the bottom in rocky areas between approximately 3.05 to 91 m (10 to 300 ft) and are baited with whole or cut fish (CDFG, 2001). However, unattended traps can impact the marine ecosystem (e.g., increased chance of gear loss), and fishermen are required to raise and service them at intervals not exceeding 96 hours, weather permitting (FGC § 9004).

A Collaborative At-Sea Sampling Program made possible by Collaborative Fisheries Research West, California Sea Grant, and California Ocean Protection Council was initiated during the 2012-13 CA lobster fishing season. This program did not specifically focus on bycatch, however bycatch information was collected. Sampling was performed by fishermen throughout the **Southern California Bight (SCB)** with a total of 2,520 traps sampled. These data are reported in Table 2-2.

Table 2-2: Bycatch found in 2,520 commercial CA lobster (*P. interruptus*) fishing traps (Source: CASP unpublished data, Culver, 2013).

Common species name	Scientific name	% of total animals caught (5,284)
sublegal-sized CA Lobster	<i>Panulirus interruptus</i>	83.29%
Kellet's Whelk*	<i>Kelletia kelletii</i>	5.98%
Rock Crab*	<i>Cancer</i> spp.	4.20%
Wavy Top Snail	<i>Megastrea undosa</i>	0.47%
Sheep Crab*	<i>Loxorhynchus grandis</i>	1.29%
Cabezon	<i>Scorpaenichthys marmoratus</i>	0.45%
Lingcod	<i>Ophiodon elongates</i>	0.28%
CA. Scorpionfish (Sculpin)	<i>Scorpaena guttata</i>	0.04%
Swell Shark	<i>Cephaloscyllium ventriosum</i>	0.11%
Rockfish (Unidentified)	<i>Sebastes</i> spp.	0.02%
Goby (Unidentified)	Gobiidae spp.	0.02%
CA Sheephead	<i>Semicossyphus pulcher</i>	0.02%
Ocean Whitefish	<i>Caulolatilus princeps</i>	0.02%
Horn Shark	<i>Heterodontus francisci</i>	0.04%
Perch (Unidentified)	Embiotocidae spp.	0.04%
Skate (Unidentified)	Rajidae spp.	0.04%
Crab (Unidentified)	Decapoda spp.	0.02%
Sea Hare (Unidentified)	<i>Aplysia</i> spp.	0.09%
Sea Star (Unidentified)	Asteroidea spp.	2.44%
Kelp Crab (Unidentified)*	<i>Taliepus nuttallii</i> / <i>Pugettia producta</i>	0.09%
Octopus (Unidentified)*	Octopodidae spp.	0.23%
Urchin (Unidentified)	Echinoidea spp.	0.74%
Barred Sand Bass	<i>Paralabrax nebulifer</i>	0.02%
Snail (Unidentified)	Gastropoda spp.	0.06%

*Species that are legal to sell

Available information shows that a majority of CA lobster commercial fishing bycatch consists of invertebrates, with sublegal-size lobsters making up a great majority of the total bycatch. The other most common bycatch in the CA lobster commercial fishery are Kellet's whelk, rock crabs, starfish, sheep crabs, urchins, and wavy top snails (Culver unpublished data, 2013). Data from CDFW commercial fishing logs suggest that the amount of sublegal-size lobster bycatch has increased in recent years.

Fishermen may unintentionally damage (break legs or antennae) sublegal-size lobsters when removing them from traps. One Australian study found that spiny

Southern California Bight (SCB) – The coastal and its immediate offshore areas between Point Conception to the north and the U.S. – Mexico border to the south. The curvature of the coastline and the relatively shallow depth of the area lead to oceanographic and biological characteristics that are clearly distinguishable from the central California coast.

Fecundity - The reproductive capacity of an individual female animal during a reproductive event or breeding season, generally expressed as the number of eggs or larvae per unit weight or per individual.

lobsters with broken appendages become less fecund due to extra energy being exerted for healing and repairing the broken appendages (Melville-Smith and de Lestang, 2007). Any similar impact on the **fecundity** of CA lobster and the survival rates of returned sublegal lobsters is currently unknown.

Commercial CA lobster fishermen can legally retain certain crabs, Kellet's whelks, and octopi (FGC § 8250.5). These bycatch are reported and included in the calculation of the total annual landings of each species. Since most bycatch that are not legally retained by fishermen can be returned to the ocean alive with proper handling, the ecosystem impact through bycatch for this fishery is limited (Hovel & Neilson, 2011; Miller, 1996). Data from Mexico reflect similar patterns in bycatch. While a 2004 study suggests that bycatch is practically non-existent in the Mexican lobster fishery (SCS, 2004), a more recent study found the weight of the bycatch in that fishery to be 15% of the total catch (Shester and Micheli, 2011). Most of the Mexican bycatch, excluding sublegal lobster, consists of crabs and other invertebrate species. Recent studies also observed sea bird (cormorant) bycatch in Mexico and Florida (Matthews et al., 2005; Shester and Micheli, 2011). However, there has not been any cormorant mortality attributed to lobster traps in California, which are all outfitted with escape ports.

2.3.2 Recreational Fishing Bycatch

Recreational fishing for CA lobster primarily occurs from Point Conception, CA to the U.S. – Mexico border, including **offshore** islands and reefs. Lobsters are caught by hand during dive trips, and divers are required to release sublegal-size individuals immediately after measuring. Certain other invertebrates may also be retained by divers targeting lobster. Hoop netters are primarily boat-based. They generally set the baited nets on the bottom in shallow waters < 30.5 m (100 ft), and raise them after a soak time of < 2 hours. Available information shows that most of the hoop net bycatch is invertebrates such as sublegal-size lobsters, rock crabs of the *Cancer* genus, and sheep crabs. Some **finfishes** are also caught, with round stingrays being the most common (Neilson et al., 2009). Live finfishes and invertebrates can usually be released from hoop nets safely (Hovel and Neilson, 2011). Survival is high when animals are quickly returned to the water (Miller, 1996).

Offshore - All oceanic waters outside state waters or deeper than 100 fathoms.
Finfish - Any species of bony fish or cartilaginous fish (sharks, skates and rays). Finfish do not include amphibians, invertebrates, plants or algae
Total allowable catch (TAC) - A specified numerical catch objective for each fishing season; the attainment (or expected attainment) of which may cause closure of the fishery.

Data on hoop net bycatch is limited, and no data on diving bycatch exists. An unknown number of crabs are retained by hoop netters every year. Available data come from a CDFW hoop net study at Zuniga Jetty near San Diego Bay, CDFW video observations of hoop netting at Indian Rock at Catalina Island, and recreational gear data from the California Lost Fishing Gear Recovery Project. CDFW also relies on information provided by its enforcement officers as well as anecdotal information provided through online fishing reports posted on recreational fishing websites.

2.3.3 Legality of Bycatch and Seabird and Marine Mammal Gear Interactions

Commercial and recreational fishermen are not allowed to retain sublegal-size lobsters under current California law (FGC § 8252; 14 CCR § 29.90). However, fishermen may retain legal-size crabs and octopi provided that they have the valid permits (14 CCR § 125; 14 CCR § 29.85; FGC § 8250). Commercial fishermen may also retain Kellet's whelk until the whelk's annual **total allowable catch (TAC)** is reached (14 CCR § 127; FGC § 8250).

Seabird and otter bycatch is not common within the CA lobster fisheries. Research conducted on sea otter entrapment and mortality in fish and shellfish traps suggests that the CA lobster fishery is not

expected to contribute to otter mortality if the current geographic extent of the fishery and the current otter range both remain unchanged (USGS, 2014). Of the 15 reported instances of trap-related sea otter mortalities during 1974-2007, 14 occurred in either Pacific cod or crab traps (Hatfield et al., 2011). One incidence of a sea otter mortality associated with lobster traps was recorded in 1987 (Carretta et al., 2014). The majority of California's southern sea otter mortalities on record were the result of shark attacks, boat strikes, mating trauma, diseases, parasites, infections, and biotoxins (CDFW-MWVCRC, 2013).

Marine mammal mortality as a result of entanglement in lobster fishing gear is rare in the CA lobster fishery. Lobster traps are generally deployed in less than 100 ft of water, a depth range where large marine mammals such as whales are not generally found. However, the number of whales observed entangled in trap gear on the California coast has been increasing in recent years (National Marine Fisheries Service stranding database). Since the year 2000, there have been four reported incidences of gray whales, one humpback whale, and one unidentified whale entangled in lobster gear (Carretta et al., 2014; National Marine Fisheries Service stranding database) and 1 recorded incidence of bottlenose dolphin entanglement in 2008 (Carretta et al., 2014). Mortality due to entanglement was confirmed for only the unidentified whale.

The National Marine Fisheries Service classifies fisheries based on their level of interaction with marine mammals and guides when incidental take permits under MMPA are required. Under MMPA, a fishery would require an incidental take permit if it is classified as "Category I" or "Category II" (50 CFR § 229.2). The CA lobster fishery was classified as "Category III" in 2014 (79 FR 77934). Such fisheries "have a remote likelihood of, or no known incidental mortality and serious injury of marine mammals" (50 CFR § 229.2). The fishery should continue to remain in Category III as long as its annual take of any marine mammals continues to remain less than 1% of a given stock's potential biological removal level or, in combination with other mortality sources, is responsible for less than 10% of the stock's potential biological removal level (50 CFR § 229.2).

2.4 History of Conservation and Management Measures Affecting the Fishery

California has regulated the CA lobster fishery for over a hundred years. Current management measures include commercial fishing permits, recreational harvest report cards, gear restrictions, **size limits**, time and area closures, and a recreational possession limit. The Commission has complete management authority over the recreational fishery (14 CCR § 29.90) and significant management authority over the commercial CA lobster fishery (Table 2-3) (14 CCR § 121-122; FGC §§ 8254, 8259).

California law controls the commercial fishery's overall **fishery effort** with a **limited entry program** (FGC § 8259; 14 CCR § 122). Since 2005, fishermen with transferable permits are allowed to sell their permits under strict conditions. Individuals wishing to enter the fishery have to purchase a permit from an existing permittee. The number of permittees actively fishing has been stable since 2008. During the 2013-14 fishing season, 141 transferable permits and 51 non-transferable permits were renewed; 157 of those permits were actually fished.

On the recreational side, all fishermen are required to purchase a CA lobster report card regardless of their age, and all fishermen 16 years or older must purchase a sport fishing license unless they are fishing during free fishing days or on public fishing piers. All recreational fishermen are restricted

Size limit - The minimum size a fish or other organism must be for it to be possessed.

Fishing Effort - A measure of some expenditure in pursuing a fishing activity.

The measure in lobster fishing effort is usually in terms of number trap pulls (in commercial fishery), number of fishing trips, or time spent fishing.

Limited entry program - Regulatory program that restricts the total number of permitted fishing licenses or vessels.

by a daily bag and possession limit of 7 lobsters and a 3.25 inch (82.6 mm) minimum carapace size. Hoop nets are restricted to 5 hoop nets per person (2 if fishing from a public pier) and 10 hoop nets per vessel. Fishermen are also required to pull and inspect the contents of their hoop nets every 2 hours.

In 1998, the MLMA was passed and required the state to manage all fisheries sustainably, in part through the use of FMPs. In 1999, the Marine Life Protection Act (MLPA) was passed in California, which led to the establishment of a statewide network of **marine protected areas** (MPAs) (Section 4.7).

2.5 Economic and Social Factors of the CA Lobster Fisheries

The economic status of the CA lobster fishery was evaluated by an independent panel of experts in April 2013. The report (Appendix VI) analyzes the expenditures of the commercial fishery and recreational fishery, as well as the economic significance of the commercial fishery based on the 2009-10 to the 2011-12 fishing seasons. The report provides a statewide perspective on the economic significance of the fishery and establishes a foundation for future economic analysis.

Ten commercial lobster fishermen were surveyed with questions relating to the cost of participating in the fishery based on methodologies established in a 2009 study (Hackett et al., 2009). The commercial lobster fishery's total 2011 operational cost was estimated at approximately \$10.5 million. Of this, over half (> \$6 million) comes from a combination of bait (~\$1.6 million), fuel (~\$1.3 million), crew wages

Table 2-3: Regulatory history of the CA lobster (*P. interruptus*) fishery.

Year	Regulatory Change Affecting the Commercial CA Lobster Fishery	Type of Change
1894	1 pound minimum size in Los Angeles, San Diego, and Ventura Counties	Size limit
1901	Berried Females Protected (repealed)	Management
1901	First minimum length implemented (9½" total length)	Size limit
1913	First slot limit introduced (9" – 13½")	Size limit
1917	Slot limit modified (10½" – 16")	Size limit
1955	3.25 inch carapace length minimum size implemented	Size limit
1957	2x4 inch wire mesh required or 2 inch high openings along two sides of traps to allow escape of undersized lobsters	Gear restriction
1961	Implementation of the modern day open season: The first Wednesday in October through the first Wednesday after March 15	Season
1961	Fish and Game Commission given authority to manage the fishery	Management
1961	Lobster permits required. New permits issued by lottery with a capacity goal of 225 fishermen	Management/ Permitting
1973	Logbooks required by law to record essential fishery information. Also, permit applications require estimate of number of traps to be fished	Reporting
1976	Escape ports are required for commercial traps	Gear restriction
1986	Fish and Game Commission given authority to limit the number of permits	Management/ Permitting
1992	The recreational season opener is moved to the Saturday preceding the first Wednesday in October to provide the sport fishery with four days of fishing prior to the commercial opener	Season
1994	Fish and Game Commission places a moratorium on new permits for 2 years in preparation for a switch to a limited entry permit fishery	Management/ Permitting
1996	Limited entry permit program begins	Management/ Permitting
2003	Lobster permit lottery repealed	Management/ Permitting
2011	CDFW initiates a spiny lobster Fishery Management Plan as mandated by the 1998 Marine Life Management Act	Management
2012	A network of new marine protected areas go into effect in Southern California as mandated by the 1999 Marine Life Protection Act	Fishing area restriction

(~\$1.8 million), and federal taxes (~\$1.1 million) (see Appendix VI).

The economic impacts (**total economic value added, total economic output**) of the commercial fishery were calculated based on factors such as expenditures (e.g., trap costs, fuel cost) and revenue (e.g., fishing income, export and domestic sales). The gross ex-vessel value of the fishery from the 2011-12 season was \$12.9 million, and the statewide total economic output was over \$22 million, contributing a total of 323 full-time equivalent jobs. The total economic value added to the economy during this same period was just under \$12 million, with \$695,893 contributing towards employee compensation (wages and salaries plus benefits for deckhands, crew members). Licensed CA lobster fishermen took in an estimated income of \$3.8 million (see Appendix VI, Table 3).

The amount of economic impact the commercial fishery has on coastal communities differs across the southern California region, but the amount of added value is on a similar order of magnitude for each region. The fishery adds roughly \$2.1 million dollars of net economic output to the economy of Santa Barbara County, \$1.4 million to Ventura County, \$2 million to Los Angeles County, \$1.6 million to Orange County, and \$3.5 million to San Diego County (see Appendix VI, Table 4).

Total economic value added – Total economic output less the goods and services used up to create that output; for lobster fishery, it means the net value of the lobsters after costs like trap purchases are accounted for. Also known as Net Economic Output.
Total economic output – The total amount of economic output that does not take into account the amount of intermediate goods consumed during the harvest/production process; for lobsters, this means the amount of money sales generate before costs such as trap cost are considered. Also known as Gross Economic Output.

The 2013 Economic Report represents the most recent attempt at quantifying the economic impact of the commercial lobster fishery. However, several areas of the report could be improved and revised. The total net income for the fishery was only estimated to be \$11,188,354 which is unexpectedly low given 151 active permit holders in 2011. Communication with active commercial lobster fishermen suggests that the cost of commercial lobster fishing may have been overestimated in the report, which likely led to the low estimate for net income. Estimating the true cost of the commercial fishery is complicated by fluctuations in fuel price and competition dynamic within the fishery over time. In addition, the ex-vessel price of CA lobsters has continued to increase significantly since the report was produced, which likely has changed the magnitude of the total economic impact from the commercial fishery.

State-wide expenditures on recreational lobster fishing were calculated based on a telephone survey conducted by CDFW in 2012. The survey targeted a random sample from all individuals who returned a calendar year 2011 lobster report card. The survey found that Californians spent between \$33 - \$40 million dollars on recreational lobster fishing in 2011 (see Appendix VI). Of this, roughly \$7 million is attributed to residents who live in zip codes that border the coastline, \$20 million is attributed to other residents living in zip codes that are at least partially within 50 miles of the coastline, while roughly \$10 million is attributed to residents living further inland. The largest sources of expenditures were non-coastal residents who live within 50 miles of the coast who fished CA lobster along the coast, and those who live more than 50 miles from the coast who dove for CA lobster offshore.

3. Natural History and Population Dynamics of the California Spiny Lobster

The California spiny lobster (*Panulirus interruptus*) is one of approximately 55 spiny lobster species found in tropical and temperate oceans worldwide, most of which are fished commercially and/or recreationally (Booth, 2011; Phillips and Kittaka, 2000). Spiny lobsters are named after the forward-pointing spiny projections that cover their bodies. The species lack the pincers found on clawed lobsters.

The body of *P. interruptus* has two readily identifiable parts: (1) a fused head and thorax (cephalothorax) enclosed in a carapace, and (2) the abdomen, or tail (Figure 3-1). The carapace protects most major organs and serves as the attachment point for the legs. In sexually mature males, the gonad pores (sperm ducts) are found at the base of the fifth pair of the legs.

Figure 3-1: External anatomy of CA lobster (*P. interruptus*). CL = carapace length.

Females have enlarged swimmerettes, or pleopods, along each side of the tail and a small claw on the fifth legs.

3.1 Critical Habitat and Known Threats to the Habitat

One of the primary objectives of the MLMA is to ensure that “the health of marine fishery habitat is maintained” (7056(b)). In order to accomplish this, an understanding of the spatial extent of habitats that support CA lobster throughout their **life history** is needed. The CA lobster is endemic to the North American west coast from Monterey, California southward to at least as far as Magdalena Bay, Baja California (Wilson, 1948; Schmitt, 1921). A small isolated population may have persisted in the northwestern corner of the Gulf of California (Kerstitch, 1989). Johnson and Snook (1927) reported its occurrence as far south as Manzanillo, Mexico. The core range, however, lies between Point Conception, CA and Magdalena Bay (Figure 1-1). The physical center of the range is within Mexico. Population density and fishery **productivity** within Mexico’s border is the highest near Cedros Island and Vizcaino Peninsula in Baja California (Vega, 2003a).

Sub-adult and adult CA lobsters are commonly found on the seafloor at depths ranging from **intertidal** to 64 m (210 ft) (Mitchell et al., 1969; Robles et al., 1987; Allen, 1916; Lindberg, 1955), while the **planktonic** larvae have been found offshore as far as 530 km (329 mi.) and at depths to 137 m (449 ft) (Johnson, 1960a; CDFG, 2001). Rocky structures/reefs are important **habitat** for CA

Life history - The history of changes an organism passes through in its development from egg, spore, or other primary stage until its natural death.

Productivity - Describes the birth, growth, and death rates of a stock. A highly productive stock is characterized by high birth, growth and mortality rates, and as a consequence has a high turnover. Such stocks can usually sustain higher exploitation rates and, if depleted, could recover more rapidly than comparatively less productive stocks.

Settlement - In marine ecology, it means the process by which organisms change from an open ocean life history phase to assume a new mode of life as a member of a sea-floor community. In lobster, it is the stage at which juveniles move into the adult habitat where they become resident.

Substrate - The surface or medium on or in which an organism lives (i.e., mud, sand, rocks)

lobster, and high quality rocky habitat is often characterized by the presence of brown algae such as giant kelp (*Macrocystis pyrifera*), feather boa kelp (*Egregia menziesii*), and stalked kelp (*Pterygophora californica*), as well as surfgrass (*Phyllospadix* spp.) (Lindberg, 1955; Engle, 1979). CA lobster habitats are generally described in relation to their juvenile (approx. < 3 years old) and adult (approx. > 3 years old) life stages.

Juveniles range from individuals that have recently settled from the planktonic stage (carapace length (CL) 7-8 mm) to individuals in the range of 44-56 mm CL (Mitchell et al., 1969; Parker, 1972; Serfling, 1972; Engle, 1979). CA lobster larvae prefer to settle on common surfgrass and red algae that are abundant in rubble habitats (Parker 1972, Engle 1979, Castañeda-Fernández de Lara et al., 2005). These shallow rubble habitats are crucial for the CA lobster (Winget, 1968; Blecha, 1972; Parker, 1972; Serfling, 1972; Engle, 1979, Castañeda-Fernández de Lara et al., 2005). These structurally complex habitats also protect and conceal juveniles from predators (Parker, 1972; Engle, 1979). CA lobsters typically remain in these habitats for 2-3 years post-**settlement** until they become sub-adults (Parker, 1972; Engle, 1979; Castañeda-Fernández de Lara et al., 2005).

Adult and sub-adult CA lobster commonly occupy natural hollow spaces within rocky **substrate**. They may also occupy hollowed-out holdfasts of giant kelp created by sea urchin grazing (Mai and Hovel, 2007) or burrows excavated (either by CA lobsters or sand scouring processes) near the base of colonies of the sandcastle tube worm (*Phragmatopoma californica*) (Zimmer-Faust and Spanier, 1987). Human structures such as pier pilings (Stull 1991), industrial debris (Lindberg, 1955), harbor jetties (Neilson et al., 2009), and artificial reefs (Barilotti et al., 2005; Reed et al., 2006) can also serve as habitats.

CDFW, working with outside researchers, has compiled all readily available data detailing the spatial coverage of surfgrass¹, eelgrass (*Zostera spp.*)², giant kelp³, hard rocky reef (natural)⁴, and artificial reefs¹. For areas where the bottom substrate habitats have not been previously mapped, aerial multispectral survey data were used to estimate the locations of hard substrate based on the presence of giant kelp coverage recorded in 1989, 1999, 2002-2006, and 2008-2009. Since kelp requires hard rocky substrate to settle and establish, the presence of kelp was determined to serve as an appropriate proxy to estimate reef areas that may act as lobster habitat. Figure 3-2 provides a snap-shot of known area that each of these habitats occupies within the historical range of the CA lobster fishery. For a detailed, known account of these habitats at a regional level, see Appendix III. It is important to note that any artificial or natural hard substrate associated with the sea floor can serve as CA lobster habitat, not all of which are depicted on the map.

Activities such as beach nourishment and urban runoff can adversely affect these habitats (Peterson and Bishop, 2005). Coastal development can also pose a threat to estuarine habitats (Kennish, 2002). Lastly, global climate change will lead to sea level rise and may intensify the impact of El Niño and its associated storm events (Shaughnessy et al., 2012; Section 3.11). Rising sea level coupled with more intense storms can further erode and destroy existing seagrass beds and kelp beds.

3.2 Growth

Like all crustaceans, CA lobsters have a rigid exoskeleton that covers the outer surface of their bodies. Once formed, this exoskeleton does not shrink or expand. In order to increase its body size, a CA lobster must shed its exoskeleton and replace it with a larger one (Mykles, 1980). The molt frequency and molt increment (size increase during each molt) of a CA lobster determines its growth rate. Rapidly growing young lobsters molt many times per year, but molt frequency decreases with age (Engle, 1979). Existing studies suggest that *P. interruptus* can usually reach a sexually mature size before reaching the minimum legal size of 82.5 mm CL (Table 3-1). However, how quickly or at what age individual CA lobsters can reach the **size at maturity (SAM)** is a complex scientific question. While a variety of modeling approaches allow estimation of growth rates and thus age at a given size, the von Bertalanffy growth equation may be most common (Chang et al., 2012). Currently CDFW uses the von Bertalanffy growth equation, which written as:

Size at maturity (SAM) - The size at which 50% of animals in a population have reached sexual maturity and are capable of reproduction.

$$l_t = L_{\infty}(1 - e^{-K(t-t_0)}). \quad (\text{Equation 3.1})$$

Where l_t is the size at time t , L_{∞} equals the average maximum achievable size, K is a growth constant that represents a rate, t is the time step, and t_0 is the size at age zero. Observations of maximum and minimum sizes of individuals can be used to estimate L_{∞} and t_0 and then K can be calculated. The K

parameter may also be borrowed from comparable species. Parameters can also be derived by fitting the equation to annual growth increment data acquired from tag and recapture studies. Estimates for a CA lobster's lifespan, which is crucial for the calculation of the growth constant K (Chavez and Gorosteita, 2010), range from 30-50 years (Neilson, 2011). A species' asymptotic (maximum) size, L_{∞} , can also vary based on the methodology adopted (Mathews and Samuel, 1990). Choosing the appropriate parameters is important for the management of the fisheries, since the resulting growth curve will directly inform CDFW of the ability of the stock to replenish itself (Section 4.3). CDFW currently uses parameters derived by Vega (2003a) but is continuing to explore other methods for estimation of von Bertalanffy parameters as well as other types of growth models (see Appendix X).

Table 3-1: Size at which 50% of female of CA lobsters (<i>P. interruptus</i>) in various population samples were sexually mature (size at maturity: SAM).			
♀ SAM (mm CL)	Location	Source	Method*
72.5	Baja (Sebastian Vizcaino bay)	Ayala 1983	Ovary
72.6	Baja (Vizcaino Peninsula)	Vega 2003a	Sperm/Egg
70.0	California (Palos Verdes)	Lindberg 1955 (in Engle 1979. Converted using $CL=0.31*TL$)	Ovary
66.6 (215 mm TL)**	California (Palos Verdes)	Lindberg 1955 (215 mm TL converted to CL using: $CL=0.31*TL$)	Ovary
78.2 (215 mm TL)**	California (Palos Verdes)	Lindberg 1955 (215 mm TL converted to CL using: $CL=0.3798*TL-0.342$)	Ovary
63.5 (205 mm TL)**	California (La Jolla)	Fry 1928 (in Wilson 1948) (205 mm TL converted to CL using: $CL=0.31*TL$)	Not specified
74.4 (205 mm TL)**	California (La Jolla)	Fry 1928 (in Wilson 1948) (205 mm TL converted to CL using: $CL=0.3798*TL-0.342$)	Not specified
77.2	California (Palos Verdes, La Jolla)	Kay 2011 (Kay converted TL data of Fry 1928 and Lindberg 1955 using: $CL=0.3798*TL-0.342$)	Egg
Legal Size in California: 82.5 mm CL *Methods used to measure SAM include analysis of dissected ovaries ("Ovary"), or the proportion of females with a spermatophore and/or eggs ("Sperm/Egg" or "Egg"). ** SAM reported as total length (TL) by original researchers; TL's were converted to CL in preparation of this document or in other reports, as indicated in the "Source" column. Estimates 3a vs 3b and 4a vs 4b are from same data and differ only in the conversion factor from TL to CL. Although the large range of values for California (63.6-78.3 mm CL) may reflect some degree of natural variation, it may also be caused by differences in how total lengths (TL) were measured in early studies (i.e., Wilson 1948, Lindberg 1955, Backus 1960) and different methods used to convert these total lengths to carapace length (CL) by Engle (1979) and Kay (2011). Due to these inconsistencies, and the time elapsed since initial SAM observations, renewed estimates of SAM in California may be prudent. (Note: 3 ¼ inch legal size = 82.5 mm).			

3.3 Reproduction

Mating in *P. interruptus* occurs when a male places a putty-like spermatophore on the sternum of a female (Figure 3-1). These females are termed "plastered." The spermatophore is durable and can remain in place for months, which allows females to store sperm until eggs in their gonads are fully developed and ready to be fertilized (Ayala, 1983). Plastered females are common from January-May, but are most abundant from February-April (Figure 3-3; Mitchell et al., 1969; Bodkin and Browne, 1992). Females use their hind walking legs to scratch open the spermatophore, which fertilizes eggs as they are extruded. These females then attach the eggs under the pleopods.

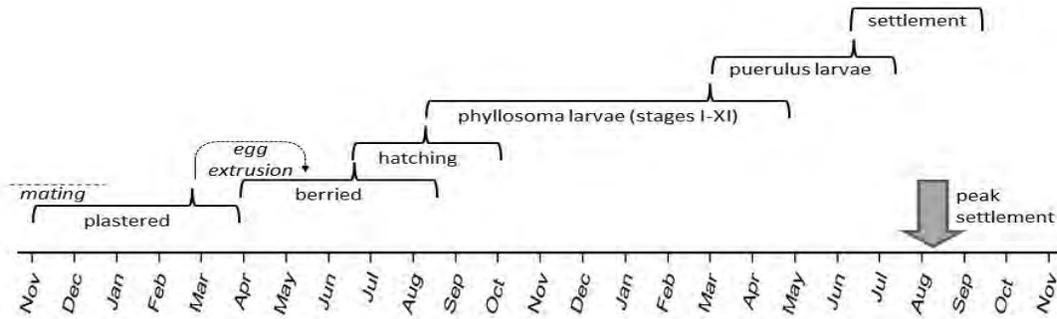

Figure 3-3: Timing of reproduction, larval development, and settlement for CA lobster (*P. interruptus*).

Females with eggs on their tails are referred to as “berried”, and are commonly found in California from late April-August and are most abundant June-July (Figure 3-3, Mitchell et al., 1969; Bodkin and Browne, 1992). The time of year at which CA lobster can be found berried depends on factors such as latitude (Pineda-Barrera et al., 1981) and temperature (Vega, 2003b). Females produce one brood of eggs per year (Mitchell et al., 1969; Ayala, 1983; George, 2005).

The total number of eggs carried by individual females (fecundity) increases with female carapace length (Figure 3-4). Lobsters in California carry fewer eggs than individuals in Baja, and this north-south increase in the number of eggs carried was also observed within Baja (Pineda-Barrera et al., 1981). The size at which 50% of female *P. interruptus* in a population are capable of reproduction has been estimated at a number of sites throughout Baja and California. In California, SAM estimates range from 63.5 – 78.2 mm CL, and Baja range from 72.5 mm - 72.6 mm (Figure 3-4; Table 3-1; Table 3-2). Egg-bearing females in the 55 – 60 mm CL size range have been encountered (although not common) during the current CDFW MPA Baseline study in southern California, with the smallest observed size being 53mm CL (Hovel et al., 2015).

Pelagic - Of or relating to aquatic organisms that live in the ocean without direct dependence on the shore or bottom.
Plankton - Very small organisms that passively drift with tide and current.
Nearshore - All oceanic state waters within 0-3 miles from shore or less than 100 fathoms deep, whichever is greater.

3.4 Larval Biology and Dispersal

After an incubation period of approximately 8-9 weeks, developing embryos hatch from the eggs on the female’s tail and enter the water column as free swimming (**pelagic**) larvae called phyllosoma (Johnson, 1956). Phyllosoma are flattened, transparent, and 1-2 mm long (4-5 mm including appendages) when they hatch. They then pass through 11 different stages of development and attain a body length of 26-32 mm (Johnson, 1956; Mitchell, 1971). Phyllosoma spend 7-8

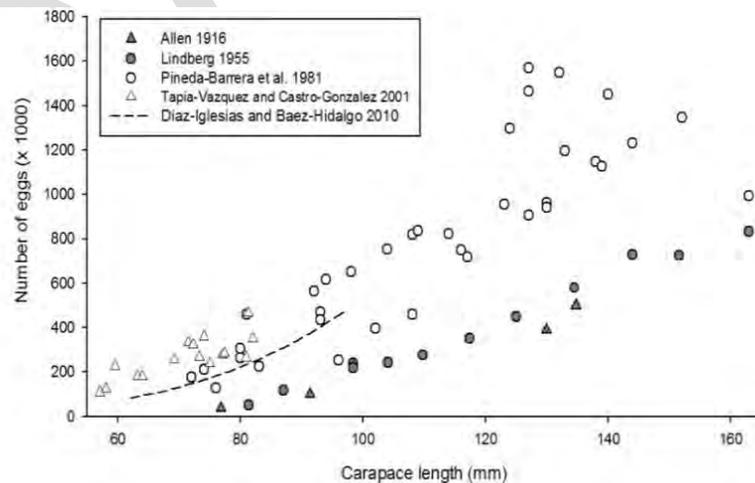

Figure 3-4: Fecundity of CA lobster (*P. interruptus*) from a number of studies throughout its range. Taken from Kay, 2011. *Observations of Lindberg (1955) and Allen (1916) are from California. Pineda-Barrera et al. (1981) and Tapia-Vazquez and Castro-Gonzalez (2001) sampled in Baja. Diaz-Iglesias and Baez-Hidalgo (2010) report an equation (but no raw data) of the relative fecundity, which is the number of eggs that produce healthy swimming larvae, for ovigerous females collected from multiple sites in Baja. (note: legal size = 82.5 mm CL)

months drifting with ocean currents and feeding on **plankton** (Mitchell, 1971; Dexter, 1972) then transform into a puerulus stage that closely resembles adults (Johnson, 1960a). The pueruli settle on **nearshore** reefs then molt into juvenile lobsters (Parker, 1972). The duration of the puerulus stage is estimated at 2-3 months, and settlement in California occurs from June-October with a strong peak in August (Figure 3-3; Parker, 1972; Serfling, 1972; Serfling and Ford, 1975a). The same general timing has been observed in Baja (Guzman del Proo et al., 1996). The arrival and “landing” of pueruli upon a potential habitat surface is referred to as settlement. Because peak hatching and settlement in California both occur in August, newly settled lobsters are assumed to be 1 year old upon settlement (Parker, 1972; Engle, 1979).

Table 3-2: Age at sexual maturity and legal size for CA lobster (*P. interruptus*).

Age at maturity*		Age at legal size		Source	Region	Method
M	F	M	F			
4-5	5-6	7-8		Lindberg 1955	California	lab, LF, molt
5	7	11	10	Mitchell et al. 1969	California	LF
3-4	5-6			Serfling 1972	California	lab, LF
5-6	8-9	11	13	Odemar et al. 1975	California	Tag
		8		Ford and Ferris 1977	California	lab, tag
		8-10		Bodkin and Browne 1992	California	Molt
3	5	4	7	Ayala 1976	Baja	unknown
4.5	6	6.5	8.5	Guzman del Proo and Pineda 1992	Baja	unknown

As reported from previous studies and adapted from Engle (1979). Methods used to determine ages include: laboratory study of captive individuals (lab), analysis of length-frequency data (LF), tag-recapture studies (tag), and molting frequency x molt increment (molt).

**sexual maturity for CA studies = 58 mm CL (M), and 70 mm CL (F); (Lindberg 1955, in Engel 1979); sexual maturity for Ayala (1976) = 65 mm CL*

While the center of the geographic distribution of the CA lobster is located around central Baja California, the SCB population is currently managed as an independent stock. The strong southward California Current usually prevents a large number of larvae from being transported north of Point Conception (Pringle, 1986). Other features within the SCB such as the Southern California Eddy and the deep Davidson current can help retain the larvae within the U.S. border (Johnson, 1960a; Mitarai et al., 2009; Figure 3-5). Features such as the Ensenada Front and the Baja California upwelling maximum tend to block the northward transport of larvae from the geographic center of CA lobster’s distribution (Parrish et al., 1981; Selkoe et al., 2007).

Studies of CA lobster genetic population structure generally find high gene flow suggesting well mixed larvae. Iacchei et al. (2009) sampled the mitochondrial DNA of CA lobsters in California and Baja Mexico and found high gene flow and some significant structure but with little relationship to spatial pattern. Their results suggest a well-mixed population with the potential for some areas to self-recruit and they propose that the California lobster population is less reliant on larvae from Mexico than previously thought. Later Iacchei et al. (2013) used microsatellite markers and again found high gene flow and significant population structure but no correlation with distance among sample locations. However, higher kinship rates within sample sites than among sample sites suggested that larvae are not always mixed and may either self-recruit or remain in cohesive groups during the pelagic phase, particularly where currents are driven by high upwelling intensity. While this study provides evidence of some potential for self-recruitment, the frequency with which cohorts of larvae remain in cohesive groups until settlement and whether source and sink sites are consistent through time is unclear. Sites with the highest levels of kinship were within Baja.

Another study examined recruitment dynamics and genetics of two fish species (kelp bass (*Paralabrax clathratus*) and California sheephead (*Semicossyphus pulcher*)) that also have core ranges located within Baja California. Recruitment did not improve significantly in the SCB even when northward current flowing from Baja was particularly strong (Selkoe et al., 2007). The same study concluded that the genetic makeups of the SCB subpopulations of the two species suggest that they are not a sink population of the core Baja population (Selkoe et al., 2007). This information, coupled with records of phyllosoma being found hundreds of kilometers offshore (Koslow et al., 2012), suggest that recruits are kept within the SCB and are well-mixed between different parts of the SCB. While mixing across the US-Mexico border certainly occurs, it likely does not dominate CA population dynamics.

3.5 Pathology

Spiny lobsters in the family Palinuridae do not harbor many naturally occurring diseases (Shields, 2011). However, a large diversity of disease-causing agents have been isolated from tissues of spiny lobsters held at artificially high densities (e.g., market pens) or from individuals subject to excessive handling or poor environmental conditions (Evans, 2000). Causative agents of these diseases include bacteria, viruses, fungi, and protozoans (Evans, 2000; Shields, 2011). The *Panulirus argus* virus 1 (PaV1) is one notable disease that is lethal to juvenile *P. argus* throughout the Caribbean (Behringer et al., 2010). Presently no disease epidemic, such as the withering foot syndrome found in abalones, is known to affect wild CA lobster.

Lobsters are known to accumulate the toxin domoic acid, which is produced by the diatom *Pseudo-nitzschia*. This microscopic alga is common and seasonally abundant in coastal waters. Domoic acid accumulates in the bodies of animals that filter diatoms and other food particles from seawater (e.g., mussels, scallops, etc.); these animals are preyed upon by CA lobster. Domoic acid can be concentrated in lobster and crab organs, but is typically less concentrated in the muscle tissue (e.g., meat of the tail, legs, and antennae). For this reason, it may at times be safe to eat lobster tails and not viscera when *Pseudo-nitzschia* blooms are present but consumers should check with authorities (<https://www.cdph.ca.gov/healthinfo/environhealth/water/Pages/Shellfish.aspx>).

3.6 Movement

CA lobsters exhibit two general types of movement: **nocturnal** foraging and seasonal inshore-offshore movements. Foraging involves nightly movements across spatial scales that range from 1-1,000 m (3.3 – 3,281 ft), with the average distances being closer to 10-250 m (33-820 ft) (Stull, 1991;

Nocturnal - Relating to, or occurring at night.
Physiological - Of or relating to the normal functioning of an organism.

Hovel and Lowe, 2007; Withy-Allen and Hovel, 2013). One study recorded an average nightly forage distance (± 1 SE) of 143 ± 10 m (469 ± 32 ft) for an individual, with a maximum distance of 475 m (1,558 ft) and a minimum distance of 48 m (157 ft) per night (Withy-Allen & Hovel, 2013). Many recreational divers, hoop netters, and commercial fishermen target CA lobster during these nightly forays because they are often easier to find and capture.

The cumulative distances moved by CA lobsters making relatively short distance foraging movements could result in longer displacements across MPA boundaries with important implications for MPA effectiveness for CA lobster conservation. Measurement of CA lobster home ranges helps to indicate whether nightly movements are additive, resulting in long distance dispersal, or if lobsters move in a more circular pattern returning to a place of origin on subsequent nights. In the La Jolla Ecological Reserve, individuals were found to maintain small home ranges of between 651 m^2 (0.16 ac) and $5,912 \text{ m}^2$ (1.46 ac) per week, based on the area in which an individual had 50% and 95% chance of being found, respectively (Hovel & Lowe, 2007). Furthermore, individuals tend to retain site-fidelity after each forage trip, often returning to the same general geographic feature (i.e., a particular rock formation or kelp bed) as opposed to the same exact shelter (Hovel & Lowe, 2007). These results indicate that MPAs may result in increased survival rates for CA lobsters within their boundaries.

Seasonal inshore-offshore movement is characterized by occupancy of shallow reefs in summer and fall months, when surface waters are relatively warm and storm activity is low, followed by movement into deeper water with the arrival of winter swells, storms, or colder surface waters (Mitchell et al, 1969). The **physiological** advantages of moving into warm shallow water include faster growth (Engle, 1979) and accelerated egg development (Mitchell, 1971). The timing and intensity of cues that initiate movement out of shallow water have not been rigorously studied. Studies suggest that female CA lobsters tend to exhibit more seasonal movements, potentially due to the need to seek optimal spawning locations (Withy-Allen and Hovel, 2013; Kelly, 2001).

3.7 Predation and Defense

Many predators prey on juvenile CA lobster (Table 3-3), the most common of which are California sheephead, cabezon (*Scorpaenichthys marmoratus*), rockfishes (*Sebastes* spp.), kelp bass, giant sea bass (*Stereolepis gigas*), and octopus (especially the two-spot octopus, *Octopus bimaculata*). Fish predators of adult lobsters tend to be the larger individuals such as male California sheephead and giant sea bass. Southern sea otter (*Enhydra lutris nereis*) may also become an important predator in the future, and continued range expansion of sea otters could have serious effects on the CA lobster fisheries (Odemar et al., 1975; USFW, 2005). As of 2014, the southern limit of the otter range has not expanded, and the most recent survey suggests that the southern boundary of the species' range may have retracted slightly (USGS, 2014).

Lobsters encountered in open areas (e.g., while feeding at night) often attempt to flee by repeatedly flapping their tails, which propels them backward and away from perceived threats (Nauen and Shadwick, 1999; Nauen and Shadwick, 2001). Spiny lobsters encountered in their shelters often withdraw to the interior of the shelter, or flee through exit holes at the rear of shelters. If escape is not possible, spiny lobsters may attempt to defend themselves by orienting their bodies and antennae directly towards the predator (Herrnkind et al., 1975; Zimmer-Faust and Spanier, 1987; Spanier and Zimmer-Faust, 1988, Loflen and Hovel, 2010; Figure 3-6). This is especially common at the entrance of shelters, where many individuals can block the entrance by forming a phalanx with this posture. Right after a molting event, a lobster's antennae and exoskeleton remain soft for about one week. During this time lobsters are especially susceptible to predation and tend to limit movements that increase the risk of being eaten (Mitchell et al., 1969).

Figure 3-6: CA lobsters (*P. interruptus*) inhabiting dens in the natural environment, displaying typical posture with antennae directed outwards and in gregarious groupings (left panel).

3.8 Prey

CA lobsters typically forage at night, when they exit the relative safety of their shelters and actively search for food (Allen, 1916; Lindberg, 1955; Roth, 1972; Engle, 1979; Zimmer-Faust et al., 1985; Stull, 1991). CA lobsters are often described as **scavengers**, but they also function as predators and grazers (Table 3-4). CA lobsters routinely attack live prey such as mussels (Robles 1987, 1997), snails (Engle, 1979; Schmitt, 1982; Schmitt, 1987), and sea urchins (Tegner and Dayton, 1981, Tegner and Levin, 1983, Eurich et al., 2014). Common food items routinely observed during field observations and laboratory experiments in gut and fecal contents include bivalves, echinoderms, small crustaceans, gastropods, and corraline algae (Table 3-4).

CA lobster diets vary with age and size. Juveniles spend their early years in surfgrass while adults frequent habitats associated with hard-bottom. Habitats and food types can vary by locations, even for

Predator	Predation event observed/studied	CA lobster in gut contents of predator	Anecdotal
CA Sheephead	1 ^T , 4	1, 4, 6*	3, 4, 5, 6
Moray eel	1 ^T	4*	1, 4, 3, 6
Giant (black) sea bass		1*	3, 4
Octopus	2, 6, 7 ^T		1, 3, 4, 6
CA lobster			3
Southern sea otter			8, 9
Horned shark			5
Leopard shark		4*	4
Cabezon	6 ^l , 7*	4, 7*	4, 6
Rock fish (Sebastes)		4, 6 ^{l,*}	4
CA scorpion fish (sculpin)	6 ^l	4	4
Kelp bass		4, 6*	6
Black surfperch		6 ^p	
Spotted kelpfish	6 ^l		
Smoothhound shark	7*		

Studies are divided into three categories: those in which predation was observed or studied in the field (“Predation event observed/studied”), those in which stomach contents of predators were examined (“*P. interruptus* in gut contents of predator”), and studies in which predation was mentioned from second-hand or anecdotal accounts (“Anecdotal”).

X* = observations reported but were not first-hand
 X^T = lobsters in traps mutilated when these predators co-occur in trap
 6^l = very small juvenile lobsters preyed upon
 6^p = newly settled pueruli preyed upon
 (1^{Allen 1916}; 2^{Maddox 1933}; 3^{Wilson 1948}; 4^{Lindberg 1955}; 5^{Mitchell et al. 1969}; 6^{Engle 1979}; 7^{Winget 1968}; 8^{Odemar 1975}; 9^{USFW 2005})

sites that are close to each other (Winget, 1968). Foraging distance increases as an individual grows (Tegner and Levin, 1983; Ling and Johnson, 2009) and therefore can also affect what prey items are available to a given lobster. A CA lobster's size is itself a limitation of what it can eat. For example, Eurich et al. (2014) found that smaller individuals had difficulty breaking through the test (external shell) of large urchins, whereas larger CA lobsters are more capable of consuming these prey. The interaction further depends on the population density (CA lobster and urchin) and the prey quality, as CA lobsters prefer healthy urchins from kelp-beds over urchins with limited gonad tissue found in urchin barrens (Tegner and Levin 1983, Ling and Johnson 2009, Eurich et al. 2014).

Table 3-4: Prey items of CA lobster (*P. interruptus*), categorized by three study types.

Prey Item	Gut/Fecal		Field		Lab	
Mollusca	C ^{4,5}					
Bivalves	C ^{7,8}					
mussels (<i>Mytilus</i>)	C ^{3,9}		C ^{2,9-12,14}	E ¹³		E ²⁰
Gastropods	C ^{3,7,8,9}		C ^{6,14}	E ¹³		E ^{17,18}
Echinoderms	C ⁴	R ^{5,7}				
Sea urchins	C ³		C ¹⁵	E ¹³	C ¹⁶	E ²¹
Sea cucumber						E ¹⁹
Crustaceans	C ^{4,5,7,8,9}					
<i>P. interruptus</i>	C ³		E ¹			
Crabs	C ^{3,9}					
Bryozoans		R ^{3,4,5,7,8}				
Polychaetes	C ³	R ^{5,7,8}		E ¹³		
Hydroids		R ³				
Sponges		R ^{3,4,5,7}	E ¹			
Eggs	C ^{4,5}					
Fish	C ^{4,8}	R ^{3,4}	E ¹			
Squid						E ²⁰
Foraminiferans		R ^{5,8}				
Coralline algae	C ^{3,4,5,7}	R ⁸				
Surf grass	C ^{4,7,8}	R ^{4,5}				
Other algae	C ^{4,9}	R ^{3,4,7,8}	E ¹			

("Gut/Fecal" = gut and/or fecal content analysis; "Field" = field observations; "Lab" = lab observations). For Gut/Fecal studies, prey are reported as common (C) or rare (R) in samples. For field observations, prey were indicated as commonly attacked (C) or rarely attacked (R). For lab experiments, prey that were preferred in choice experiments are noted as commonly (C) preferred or rarely eaten (R). Also reported are prey that were observed to be eaten (E) in situations for which there was no measure of preference or frequency.

3.9 Ecosystem Role of CA Lobster

The interactions between CA lobsters and their prey are considered direct effects because the action of one species (i.e., predator) directly affects another species (i.e., prey). Through direct predation, CA lobsters have been found to limit the **abundance** of the top snails (*Tegula aureotincta* and *T. eisinia*) in cobble and rocky reef habitats (Schmitt, 1982; Schmitt, 1987). CA lobsters have also been found to limit the density and size of mussels (*Mytilus californianus*, *M. galloprovincialis*, *Septifer bifurcatus*) and gastropods (snails) in rocky intertidal habitats at Catalina Island (Robles, 1987; Robles et al., 1990;

Robles, 1997; Robles et al., 2001). In addition, CA lobsters are thought to limit the local abundance of red and purple sea urchins (*Strongylocentrotus franciscanus* and *S. purpuratus*) on reefs in southern California (Lafferty, 2004; Tegner and Levin, 1983).

CA lobster predation can also trigger indirect effects in marine ecosystems. The most clearly demonstrated indirect effect of lobster predation in marine ecosystems involved predation upon intertidal mussels. Robles and Robb (1993) observed that as CA lobsters preyed upon intertidal mussels, red algae were able to colonize and grow in the empty spaces previously occupied by the mussels. In this case, CA lobster predation upon mussels indirectly influenced the abundance of algae.

As previously stated, CA lobsters are thought to limit the local abundance of red and purple sea urchins on reefs in southern California. Urchins are herbivores that consume algae and kelp. In southern California, the **biomass** of giant kelp (*M. pyrifera*) can be inversely related to urchin abundance (Ebeling et al., 1985; Arkema et al., 2009) or the intensity of urchin grazing (Harrold and Reed, 1985). Therefore, CA lobster can impact giant kelp indirectly by releasing it from urchin grazing and thus enhancing the persistence and extent of kelp forests (Dayton and Tegner 1998; Jackson et al., 2001; Dayton, 2003; Graham, 2004; Lafferty, 2004; Halpern et al., 2006; Eurich et al., 2014).

<p>Abundance - The total number of animals in a population. This is rarely known, but usually estimated from relative abundance although other methods may be used.</p> <p>Biomass (B) - The total weight of organisms at a given point in time in a defined stock, area, population, or catch.</p>

3.10 Regional differences in lobster biology and ecology

Both commercial log data and the collaborative at-sea sampling program (CASP) (Yaeger et al., in prep.) demonstrate that the average size of CA lobsters increases along a south to north gradient within the SCB. There are likely multiple reasons for this relating to both fishery dynamics and biology. As noted in Section 2.1, fishing effort is not equally distributed. The particularly high fishing effort and catch off Point Loma in San Diego likely contributes to reduced average lobster size. Mean CPUE for legal-sized CA lobster across whole fishing seasons has generally not been significantly different among regions of the SCB during the last three fishing seasons (Yaeger et al., in prep.). This suggests that fishing effort may be well matched to abundance. However, CPUE for legal-size lobsters declines more sharply across the season in the southern region of the SCB. Additionally, the northern Channel Islands are relatively difficult to access and local MPAs had been in place for almost 10 years at the time of CASP sampling, possibly contributing to lower fishing pressure and greater average size in the region.

Biological explanations for differences in average size include temperature, habitat quality, and recruitment patterns. Higher temperatures are known to increase lobster growth rates elsewhere (Pech et al., 2009). This does not explain larger lobster sizes in the northern region of the SCB where temperatures are typically colder. However higher temperatures are known to increase lobster activity and catchability (Ziegler et al., 2003, 2004). Therefore larger sizes in the north may relate to decreased vulnerability to harvest, giving lobsters more time to grow before eventually being captured. Hovel et al. (2011) also observed generally increasing CA lobster sizes at southern sites within the SCB and measured a significantly higher growth rate at Laguna, CA where average size was highest. These findings suggest complex interactions between fishing effort and several environmental factors influencing growth and vulnerability. Abundance of sub-legal CA lobsters is greater in the southern regions (Yaeger et al., in prep.) indicating higher recruitment, as might be expected due to proximity to the center of the species geographic range.

There are potentially regional differences in reproductive dynamics across the SCB although differences are not well understood. Several aspects of CA lobster reproductive biology were found to correlate

with environmental factors in Baja California, Mexico (Vega 2003b). Rates of spermatophore deposition on females were found to be correlated with low SST and strong upwelling while egg laying and hatching were accelerated in response to increasing summer temperatures. Variation in these environmental characteristics is likely to similarly influence reproduction in the SCB. SAM may also vary with latitudinal temperature gradients. Differences in sex ratio and/or trap vulnerability among regions may also affect regional reproductive output. CASP data did not find consistent differences among regions in the sex ratio of legal-size individuals in traps. However, significantly more female sub-legal CA lobsters were captured in all regions and all sampling years (Yaeger et al., in prep.). This greater vulnerability of females to traps has important implications for the effects of fishing on reproduction. Areas with high fishing effort and thus repeated capture and release of sub-legal females will induce relatively more stress on those females. Melville-Smith and de Lestang (2007) demonstrated a reduction in Australian western rock lobster fecundity due to handling stress.

3.11 Climate Change Impacts on CA Lobsters

Climate Change (CC) is a shift in global climate pattern characterized by increasing global air and ocean temperatures in most regions, widespread melting of snow and ice, and rising global average sea level (IPCC, 2013). These widespread environmental changes have been attributed to the emission of greenhouse gases (GHG), such as carbon dioxide (CO₂), methane, and nitrous oxide brought on by industrialization. While atmospheric methane and nitrous oxide are significant contributors to climate change, CO₂ is currently considered to be the primary contributor. A more detailed discussion on CC background mechanisms are presented in Appendix V.

Various CC effects will likely impact the CA lobster fishery. Sea surface temperature (SST) in the SCB is predicted to rise (NOAA, 2012). Warmer atmospheric temperature may also change the **upwelling** and circulation pattern of the region (Bakun, 1990; Bakun et al., 2010; Rykaczewski and Dunne, 2010; Pisas et al., 2001; Snyder et al., 2003). CC can also lead to more intense storms and increased runoff along the southern California coast (IPCC, 2013). Lastly, it is widely believed that increasing atmospheric CO₂ concentration will continue to acidify the ocean (Caldeira and Wickett, 2003; Royal Society, 2005; Pecl et al, 2009). Figure 3-7 illustrates the various factors (A-F) and pathways that CC can impact the CA lobster fishery. It is important to note that CC is an incredibly complex phenomenon. While scientists can make reasonably accurate predictions on big picture changes, predicting on a smaller geographic scale (e.g., SCB) is still challenging (IPCC, 2013) (See also Appendix V).

Warmer SST in the pelagic environment may lead to better survivorship, and growth in the SCB. As for fishery effects of CC, warmer coastal environments may make adult CA lobsters more active and easier to capture (Pringle, 1986; Koslow et al., 2012). Furthermore, since California is at the northern edge of the lobster's current domain range, higher SST could extend the population northward. Conditions such as **El Niño** (see Appendix V), which leads to warmer water along the California coast, could provide episodic transport of larvae north from Mexico which could also increase harvest (Pringle, 1986).

Upwelling - On the California coast, upwelling is the upward movement of deep waters into the nearshore ecosystem due to springtime winds moving the topmost layers of water away from land.

El Niño - A periodic warming of the ocean surface waters in the eastern Pacific Ocean. It is characterized by a lack of upwelling of cold, nutrient-rich waters nearshore.

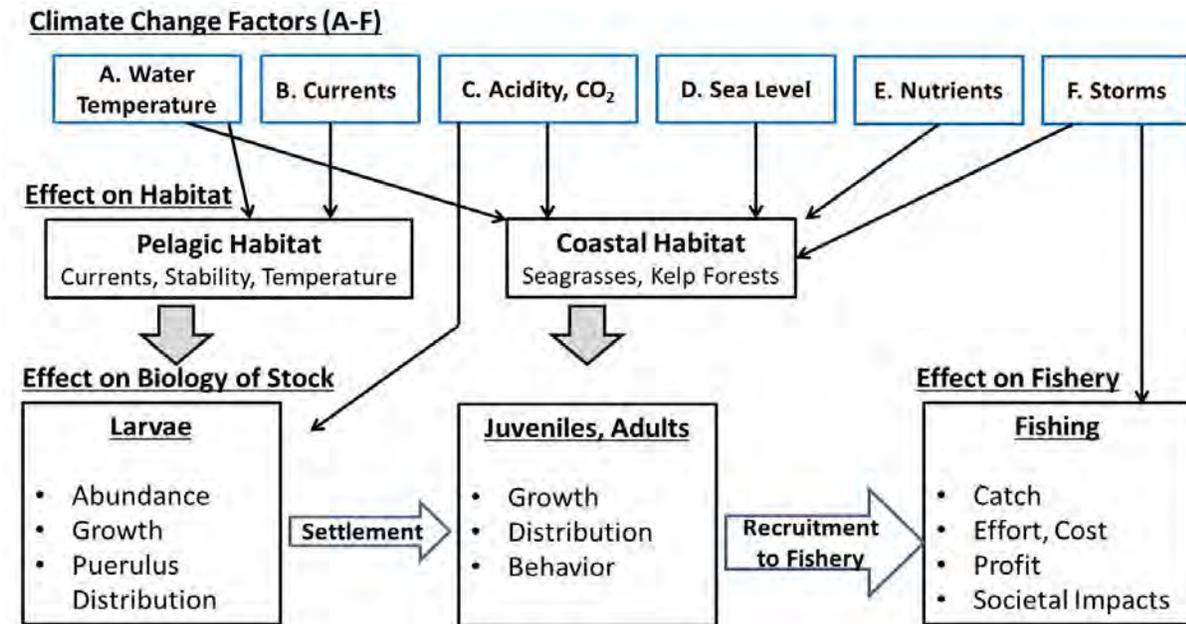

Figure 3-7: Schematic showing relationships between Climate Change variables (labeled A-F), habitat, lobster biology, and the fishery. Further topics listed within the individual boxes are specific variables that are expected to change under CC. Credit: Dr. K. Hovel, San Diego State University

As SST increases, species typically found off Baja California could begin to occur with greater frequency within the southern California kelp forests. Such changes have already been observed in some kelp forests (Field et al., 1999). Kelp itself may be impacted by increasing SST and reduced nutrients. It is unclear at this point exactly how kelp forests will respond to warming SST, but the effect is likely negative (Steneck et al., 2002). Likewise, CA lobster, being more subtropical, may or may not be directly (i.e., physiologically) affected by increasing SST. However, there may be an increased likelihood of disease with higher water temperatures. For example, the bacterial epizootic shell disease found in east coast lobster stocks has been linked to higher water temperature (Glenn and Pugh, 2006).

Whether CC would intensify upwelling in southern California or suppress it is still subject to ongoing scientific debate (B and E, Figure 3-7) (Bakun et al., 2010; Rykaczewski and Dunne, 2010). Weaker upwelling leads to declines in **zooplankton** abundance (Roemmich and McGowan, 1995) and a decrease in CA lobster larvae food sources. Stronger upwelling can increase the CA lobster larvae food sources, but it can also change the dispersal and recruitment pattern of the stock in the open ocean (Gaylord and Gaines, 2000; Connolly et al., 2001) (B, Figure 3-7). Harley et al. (2006) suggested that increased upwelling may decrease the populations of some **benthic** species such as lobsters by moving potential recruits offshore and away from suitable habitats. This is probably more applicable to regions north of Point Conception and would thus act to inhibit northward settlement of the lobster. Sea level rise will lead to coastal inundation and increased coastal erosion, especially during more intense storms and high tidal periods (D, Figure 3-7). Coastal erosion can lead to silting of coastal habitats, in particular seagrass beds used for settlement and adult foraging. Even in areas that will not experience intense silting, seagrass beds would still be sensitive to changing light wavelengths brought about by increased turbidity and changing water depth (Moore et al., 1997).

Zooplankton - Small animals passively carried along with water currents and other water movement.
Benthic - On or relating to the region at the bottom of a sea or ocean.

More intense storms combined with increased nutrient runoff (E and F, Figure 3-7) can also damage or completely destroy seagrass beds. This would reduce the amount of suitable habitat for lobster puerulus settlement, resulting in fewer successful recruits. Similarly, kelp beds could be damaged or destroyed at more frequent intervals, thereby disrupting adult lobster habitat and its immediate ecosystems (Pecl et al., 2009). In addition, more intense storms could also hinder fishing activities and damage deployed lobster traps.

Lastly, CC may also lead to a more acidic ocean (C, Figure 3-7). Water corrosive enough to dissolve seashells has been observed off California and is expected to become more frequent (Feely, 2008). The types of organisms potentially affected include snails and mussels, corals, and many phytoplankton species. It is unclear if there will be any direct adverse effects on lobster (Pecl et al., 2009). Many crustaceans, including the American Lobsters on the east coast, are able to resist acidifying ocean water (Ries et al., 2009). However, even if CA lobsters can maintain their protective shells in a more acidic environment, there would still be adverse impacts. Compensating for the corrosive effect of carbonates requires significant energy that would otherwise be used for reproduction and growth (Long, 2013). Additionally, calcified CA lobster prey such as urchins and bivalves could be impacted leading to cascading effects on CA lobster growth and survival.

4. Measures for Conservation and Management of the CA Lobster Fishery

The primary goal of fishery management under the MLMA is sustainability (FGC § 7050(b), § 7056). The MLMA and the Master Plan define sustainability as:

- a) Continuous replacement of resources, taking into account fluctuations in abundance and environmental variability.
- b) Securing the fullest possible range of present and long-term economic, social, and ecological benefits, maintaining biological diversity, and, in the case of fishery management based on maximum sustainable yield, taking in a fishery that does not exceed optimum yield (FGC § 99.5).

CDFW aims to sustainably manage the CA lobster fishery through a **harvest control rule** (HCR) that consists of 3 reference points, an HCR matrix, and a toolbox of 8 regulatory options.

4.1 Overfishing, Sustainable Yield, and Overfished

The MLMA's mandates for sustainability are closely tied to the concept of **overfishing** as defined by the Fish and Game Code. Fish and Game Code section 98 defines overfishing as "a rate or level of taking that the best available scientific information, and other relevant information that the commission or department possess or receives, indicates is not *sustainable* or that jeopardize the capacity of a marine fishery to produce the maximum sustainable yield on a continuing basis [emphasis added]." Other types of overfishing refer to economic and ecosystem effects of harvest in addition to more specific effects on a stock. These include:

Harvest control rules (HCR) - Harvest control rules are plans of action that prescribe adjustments in harvest regulations (e.g. fishing effort, total allowable catch, minimum legal size) and are activated ("triggered") when the calculated amount of a resource that can be taken (the defined upper limit, also known as "threshold reference point") is reached or surpassed.

Yield per recruit (YPR) - A theoretical value that describes the yield to a fishery that is contributed by a given number of recruits (usually a single recruit).

Recruitment overfishing: Fishing that depletes the mature adult population (spawning stock) to a level at which reproduction is inadequate to replenish the population (Sissenwine et al., 1987).

Growth overfishing: Fishing in which **yield per recruit** is lower than theoretical maximum values due to the harvesting of small and rapidly growing fish (Diekert, 2012).

Economic overfishing: Level of fishing effort that exceeds **maximum economic yield (MEY)** (Flaaten, 2010).

Ecosystem overfishing: Level of fishing that creates significant adverse impact to the species diversity, trophic composition, and productivity of an ecosystem (Murawski, 2000).

These different types of overfishing each present their own threats to sustainability. **Recruitment overfishing** is a threat to the biological sustainability of a fishery; this type of fishing activity is most commonly linked to collapse of fish stocks. In contrast, economic and **growth overfishing** can be biologically sustainable, but reduce the economic and social sustainability of a fishery. Finally, ecosystem overfishing threatens the integrity of the larger ecosystem, which is ultimately essential for the conservation of the stock as well.

Each type of overfishing is associated with a particular harvest rate. Fishery scientists usually describe the rates at which fish are removed from a stock with two types of measurements. The first and more intuitive measurement is the *harvest rate* (u), which is the proportion of all legally harvestable fish that are taken in a fishing season. Values for harvest rates can range from 0-1. For example, harvest rates of 0, 0.5, and 1 indicate that none, half, and all of the harvestable fish are taken every season, respectively. The second measurement is the **instantaneous fishing mortality rate** (F), which can be calculated directly from the harvest rates (and vice-versa). Unlike u , F is described in the less intuitive log space and comports better with complex scientific calculations used in fisheries models.

The total harvest from each season is considered the fishery yield, and together with harvest rates and sustainability objectives form interrelated metrics for evaluating the fishery (Figure 4-1). An extremely low harvest rate will result in a low

Maximum economic yield (MEY) - The maximum possible revenue after accounting for the costs of fishing that may be achieved in a fishery. MEY typically is reached at smaller catches than MSY.

Instantaneous Fishing mortality (F) - The rate at which organisms are harvested or killed due to fishing; F is an instantaneous rate that reflects the rate at which a proportion of a population is being lost, whereas the harvest rate (u) is an annual rate that reflects the rate at which a number of fish from a population is being lost.

Maximum sustainable yield (MSY) - In a marine fishery, means the largest catch that can be taken from a stock continuously over time that does not result in a continuing reduction in stock abundance, assuming constant environmental conditions. MSY is generally presented as a maximum annual catch that can be maintained indefinitely; however, MSY can change with fluctuations in abundance and environmental variability (e.g. shifts in ocean regimes), requiring adjustments in allowable harvest.

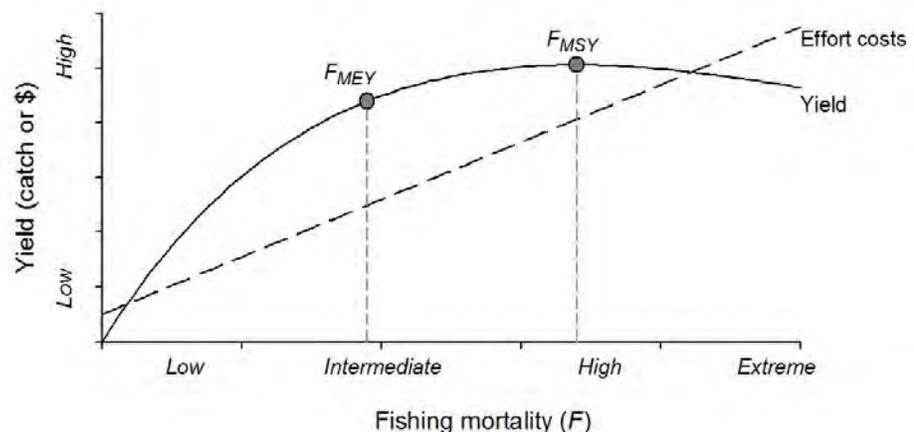

Figure 4-1: The general relationship between fishing mortality (or harvest rate) and fishery yield (solid curved line). Also shown is hypothetical effort cost (diagonal dashed line). The fishing mortality that produces maximum economic yield (F_{MEY}) can be visualized as the fishing mortality at which the distance between the yield curve and the effort cost line is greatest.

fishery yield which may not satisfy the economic and social sustainability objectives of the fishery. As harvest rates increase, fishery yield also increases. But once the harvest rates increase beyond a stock's ability to regenerate itself, growth and recruitment overfishing may occur which would drive down the yield of the fishery. For a fishery under equilibrium conditions, the total harvest that equals the stock's ability to regenerate is called the **maximum sustainable yield (MSY)**, and the fishing mortality rate associated with this yield is referred to as F_{MSY} .

Any fishery would also have an MEY. Any amount of fishing effort (e.g., # of traps fished, days at sea) has costs associated with a number of factors (e.g., additional fishing gear, bait, fuel, crew days). Consequently, the cost of fishing increases as effort and harvest rate increase (diagonal dashed line in Figure 4-1). Due to this increase and the dome-shaped relationship between harvest rate and fishery yield, there is usually a mortality rate (F) at which a fishery achieves MEY, or F_{MEY} . A fishing mortality rate that exceeds F_{MEY} represents economic overfishing. F_{MEY} is almost always lower than F_{MSY} (Flaaten, 2010). Thus, a harvest rate that is biologically sustainable may still lead to economic overfishing and undermine the economic objectives of a fishery.

A high harvest rate can also undermine the environmental objectives set forth by MLMA if fishing leads to habitat damage, unacceptable bycatch levels, and/or trophic disturbance. For example, if CA lobsters are fished to an extent that they are no longer able to control the urchin population, overgrazing of kelp forests by the urchins may occur. The loss of kelp may then negatively impact the resilience of the CA lobster stock (Section 3.9). Academic researchers have begun to tackle the task of quantifying ecosystem overfishing over the past several years (Murawski, 2000; Methot et al., 2013).

In addition to overfishing, the MLMA also requires CDFW to define the criteria for when a fishery is considered "**overfished**" (FGC § 7086). Under the MLMA, "[if] a fish population is depressed, and the principle means for rebuilding the population is reduction of take, then the fishery is to be classified as overfished" (FGC §97.5). A fishery is "**depressed**" when "a declining population trend has occurred over a period of time appropriate to that fishery" (FGC § 90.7).

It is important to note that the term overfished refers to the status of a fish stock, while overfishing refers to the activity of fishing and describes fishing practices in which too many fish are removed. When only a relatively small proportion of an available stock is being harvested (low harvest rates), overfishing is unlikely and **stock size** typically remains high (not overfished). When a relatively high proportion of an available stock is being harvested (high harvest rates), the risk of overfishing increases, and the stock is more likely to drop below a level that would classify it as being overfished.

Overfished - A stock that is at unacceptably low levels because it has experienced overfishing and has not been rebuilt.

Depressed fisheries - The condition of a fishery for which the best available scientific information and other relevant information that the Commission or Department possesses or receives, indicates that a declining population trend has occurred over a period of time appropriate to that fishery. With regard to fisheries for which management is based on maximum sustainable yield, or in which a natural mortality rate is available, "depressed" means the condition of a fishery that exhibits declining fish population abundance levels below those consistent with maximum sustainable yield.

Stock Size – Total estimated number or biomass of fish within a stock.

Furthermore, an overfished stock is not always being subjected to overfishing, and vice-versa. Consider, for example, a **depleted** stock that is closed to fishing. After fishing stops, the harvest rate falls to zero, but until stock biomass rebuilds, the stock remains overfished. This condition would be represented by the lower left-hand region of Figure 4-2 (low harvest rate and low biomass). Paradoxically, during the period when a newly emerging fishery is fished down to levels associated with the MSY the fishing rate appears to be unsustainable, because there is no surplus production in an unfished stock. However, surplus production increases as biomass approaches MSY, and sustainability is achieved if the harvest rate matches surplus production, despite that same harvest rate being responsible for fishing the stock down from unfished biomass. A stock would not be considered “overfished” until the stock size suffers a dramatic decline (upper right-hand portion of Figure 4-2), to levels significantly below the biomass associated with MSY. The designations of overfishing and overfished ultimately depend on the sustainability objectives of the society.

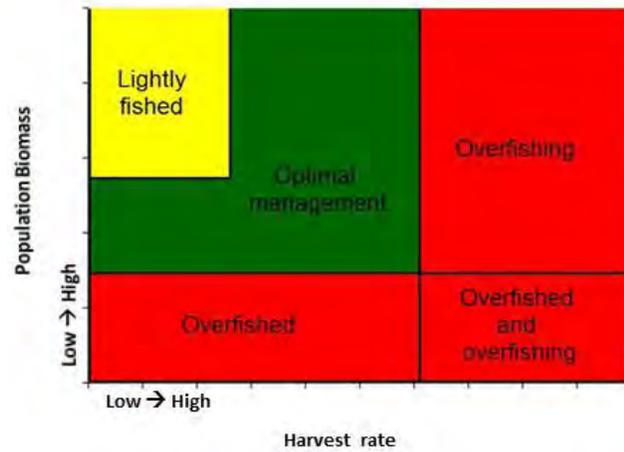

Figure 4-2: The general relationship between harvest rate and stock size.

4.2 Introduction to Harvest Control Rules

Many fishery managers around the world are moving towards adopting dynamic HCRs as their means of achieving MEY and MSY as well as avoiding overfishing and facing overfished stocks. HCRs are a type of management framework that “formulate[s] a procedure for making harvest policy decision[s].” It does so by “identify[ing] a pre-agreed course of management action as a function of identified stock status and other economic environmental conditions” (WCPFC, 2012). The HCR framework here is comprised of five fundamental components (Figure 4-3):

- 1) Harvest regulations
- 2) Data collection
- 3) Data Analysis
- 4) Reference point(s)
- 5) HCR matrix

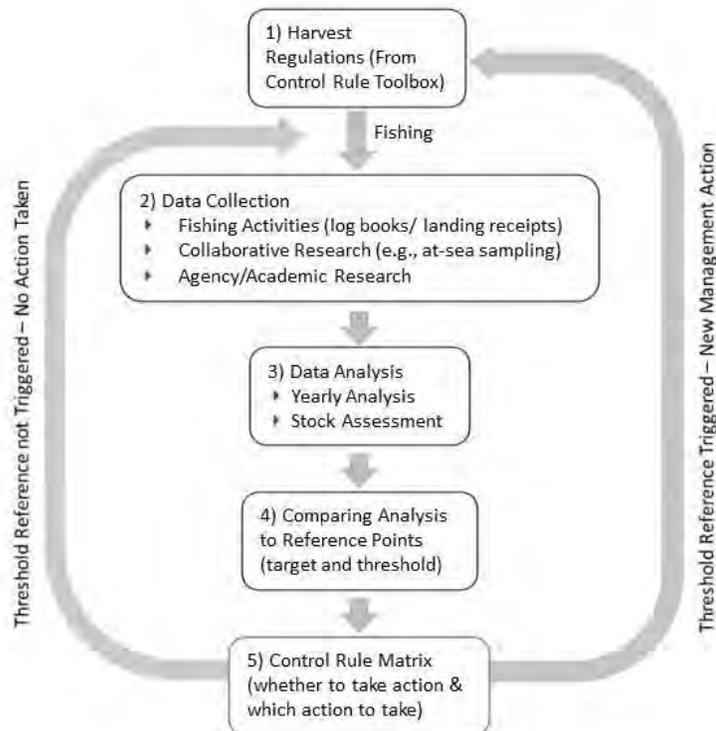

Figure 4-3: The relationship among the five elements of a general fishery management framework.

4.2.1 Harvest regulations

Harvest regulations are the rules that define how fishermen are allowed to harvest fish. These regulations typically take one of three specific approaches for ensuring sustainability: (I) managed escapement (used exclusively in salmon fisheries); (II) use of a dynamic time scenario (e.g., common when a stock is tied to extremely variable environmental conditions or when high bycatch is a problem), and; (III) manage for a sustainable harvest rate (Figure 4-4, modified from NRC 1998). The goals of these approaches are the same: to ensure fishery sustainability by avoiding overfishing and to achieve recovery when a stock is overfished.

For most fisheries, management with escapement goals or a dynamic time scenario is inappropriate or logistically impossible (NRC, 1998). The more practical alternative is to manage for a harvest rate that maintains relatively high fishery yield without causing overfishing. Broadly speaking, there are three types of harvest regulations: biological regulations, effort-based harvest regulations, and catch-based harvest regulations (items IIIa-c in Figure 4-4).

Harvest regulations - The rules that define how fishermen are allowed to harvest fish. Harvest regulations are diverse and include restrictions on size of animals harvested, effort, total catch, gear types, season, or location where fishing is permitted.

4.2.1.1 Biological harvest regulations

Biological harvest regulations directly protect some portion of a stock and buffer it against recruitment overfishing and growth overfishing. Common biological regulations include legal size limits (minimum and maximum), sex-based regulations, seasonal closures, and spatial restrictions (e.g., MPAs) (Figure 4-4, item IIIa).

Minimum legal size (Min LS) protects rapidly growing young fish, some of which may be reproductive. A Min LS can prevent recruitment overfishing only if it is larger than the size at which fish first start reproducing. A Min LS can prevent growth overfishing only if it protects rapidly growing young animals.

Maximum legal size (Max LS) is intended to protect large animals that have high fecundity and buffers against recruitment overfishing. Max LS may also have ecological and/or market benefits. A management framework that employs both a Min LS and Max LS is often referred to as having a “slot” or “over/under” size limit.

Sex-based regulations are designed to safeguard the reproductive output of females with the assumption that remaining males present in a fished population can successfully fertilize all the available eggs. Fishermen may only be allowed to harvest male animals (male only fishery) larger than the size at sexual maturity, as is the case for the US west coast Dungeness crab fishery.

Figure 4-4: Methods for achieving fishery sustainability, including the three types of harvest regulations for harvest rates.

Alternatively, a fishery can prohibit the landing of berried females (females that are carrying eggs), as in the Atlantic USA/Canada fishery for American lobster *Homarus americanus*. These two examples serve to mitigate the impact of fishing on the **spawning potential** of the stock.

Area closures prohibit all or some fishing activities in prescribed areas. Heavily fished lobster populations around the world tend to show rapid increases in biomass, average size of individuals, and abundance inside closed areas (Diaz et al., 2011; Moland et al., 2013).

Spawning Potential – The reproductive output (# of eggs) that may be produced during the lifetime of an average female.

Seasonal closures act as biological regulations when they protect animals during the reproductive phase of their life cycle – such as the closure of the CA lobster fishery during summer in California. Seasonal closures also reduce total annual effort (see *Effort-based regulations*).

4.2.1.2 Effort-based harvest regulations

Whereas biological regulations serve to lessen the impact of fishing on the population dynamics of a stock, effort-based regulations protect the portion of the stock that is vulnerable to harvest (legally harvestable). This can help prevent recruitment overfishing and growth overfishing, but can also prevent economic overfishing when increases in effort (and harvest rate) begin to provide diminishing return in terms of yield (i.e., the flattened part of a yield curve, Figure 4-1).

Limited Entry programs limit the total number of participants in a fishery.

Capping permit transfers (e.g., an annual limit) can limit the activation of latent **capacity** in a fishery, thereby avoiding abrupt increases in effort.

Seasonal closure does not have to correspond to a targeted species' life cycle; instead, it can serve to only control fishing effort by defining a maximum number of days per year that an individual can fish.

Gear limits define a maximum amount of gear (i.e., traps or hoop nets) a fisherman can use.

Gear type regulations generally restrict the use of gears that destroy habitat or catch portions of the stock protected with biological harvest regulations. They may also protect immature individuals (i.e., escape ports) or reduce bycatch mortality (i.e., excluder devices in trawls, or barbless hooks for salmon). These regulations can also control the harvest rate by prohibiting new gear types that increase harvest efficiency. However, it is important to note that gear type restriction can impose economic inefficiency on fishermen.

4.2.1.3 Catch-based regulations

As with effort-based regulations, catch-based harvest regulations serve to protect the portion of the stock that is vulnerable to harvest (legally harvestable).

Daily bag limit is a daily limit on the number or weight of fish that a recreational fisherman may legally retain.

Annual bag limit is an annual limit on the number or weight of fish that a recreational fisherman may legally retain.

Total allowable catch (TAC) is the total catch that can be taken during each fishing season. A TAC works by protecting a fraction of the stock

Capacity - The potential ability of a vessel or a fleet of vessels to capture organisms. This ability is based on the number of fishing vessels in the fleet, the size and technical efficiency of each vessel, time spent fishing, and management regulations.

Bag limits - The total amount of fish or other species that may be captured per person per day by law.

Individual transferable quota (ITQ) - A program which limits the catch allowed per license or individual as well as the number of individuals who participate.

that is large enough to ensure sustainable reproduction, which stabilizes catches and associated economic output of the fishery from year to year. In TAC fisheries, catch is often monitored during the season, and managers usually close the fishery once the TAC is reached, although in-season catch projections may allow the use of less disruptive regulatory measures if taken before reaching the TAC. In some fisheries, the TAC for an upcoming season is adjusted in response to recent trends in some reference indicator such as catch per unit effort (CPUE) or recruitment. Adjustment can also occur in response to going over or under the TAC in the previous season. Federal fishery management plans are required to establish a mechanism for specifying an annual catch limit, which is a form of a TAC (16 USC § 1853(a)(15)). Federal managers are required to take actions whenever an annual catch limit is exceeded (50 CFR §§ 600.310(f)(2)(iv), (g)(3)).

One limitation of TAC is that it does not prevent the “race to fish”, a dynamic in which fishermen competitively attempt to catch fish before other fishermen catch them. In fact, a TAC can accelerate the race to fish because it shrinks the portion of fish available for harvest. In response, fishermen often invest in tools that provide a competitive advantage such as faster boats, more traps, and better technology – an effect known as “capital stuffing” (Copes, 1986).

Individual transferrable quota (ITQ) is a dedicated portion of a TAC. In TAC fisheries, the race to fish and capital stuffing can be addressed with a quota system like ITQ (Costello et al., 2008). Quotas grant fishermen exclusive access to some fraction of a TAC. A quota system can also lead to additional economic benefits by allowing fishermen to focus fishing during periods of peak market price or spread fishing activities out over a longer period of time to avoid market gluts. The key incentive with quota management is that fishermen can wait to harvest their “share” of the catch. Individual transferable quotas (ITQs) are a common form of quota that may be transferred among fishermen. Transferable quota systems are designed to balance fleet dynamics by allowing for more flexible fishing operations. ITQs require focused monitoring and enforcement, which can add to management costs.

4.2.2 Data collection

Data collection gathers information that directly informs the stock assessments and management decisions (Figure 4-3). The MLMA stipulates that FMPs employ the best available scientific information (FGC § 7050(b)(5)). This is referred to as **essential fishery information (EFI)**, which includes information about species life history, habitat requirements, status and trend of the population, fishing effort, catch level, fishery’s effect on the fish population, and “any other information related to the biology of a fish species [...] in the fishery that is necessary to permit fisheries to be managed [sustainably]” (FGC § 93; Section 5.2, 5.3).

EFI is gathered by CDFW from a number of fishery-dependent (e.g., commercial logbooks and recreational report cards) and fishery independent sources (e.g., research programs conducted by agency staff, academic staff, or NGOs). Information from logbooks, landing receipts, and report cards are confidential (FGC §§ 1050.6, 8022(a)). CDFW is increasingly interested in developing collaborative programs bringing fishermen together with scientists associated with academic institutions or NGOs to increase the quality and quantity of data collected (NRC, 2004; Section 5.3).

Essential fishery information (EFI) - With regard to a marine fishery, means information about fish life history and habitat requirements; the status and trends of fish populations, fishing effort, and catch levels; fishery effects on fish age structure and on other marine living resources and users; and any other information related to the biology of a fish species or fishery that is necessary to inform management.

Thresholds (threshold reference points) – For the purpose of this FMP, the levels of stock size or reproductive potential, or fishing mortality rates that are not sustainable.

4.2.3 Data Analysis

Raw data have limited management value until they are analyzed, which may be a formal stock assessment or a less formal analysis. A stock assessment integrates a diverse range of EFI to evaluate the status of a fish stock, including past and current stock levels, and includes information to help guide future harvest rate. A stock assessment can provide a clear picture of the present condition of a stock (i.e., is it *overfished*?) and the impacts of current harvest practices (i.e., is *overfishing* occurring?). CDFW will determine how often, or when, to perform stock assessments for the CA lobster based on availability of new data or updates, and response time of the stock to changes in the environment or the fishery.

4.2.4 Fishery Management Reference Points

Analyzed data must be placed into the context of policy/value judgment. For example, a drop in catch level should trigger management actions only if a relevant statutory/regulatory mandate or a manager deems it important. This is where a **threshold reference point** comes in. Threshold reference points signal when a stock would require management attention. Many HCRs used for other fisheries use a single reference point (e.g. biomass) but distinguish three levels or threshold types termed target, trigger and limit reference points. These divide the range in stock status into healthy, overfishing, and overfished zones. This “precautionary approach” was outlined by the United Nations Fish Stock Agreement of 1999 and was adopted by the Canadian government (DFO, 2006) among others.

Frequently reference points are based on the concept of MSY. They are specified relative to the fishing mortality level that produces MSY (F_{MSY}) or the stock biomass level at MSY (B_{MSY}). MSY may be calculated using dynamic models with detailed stock-recruitment information when it is known. Examples include the non-parametric production model developed by Sissenwine and Shepherd (1987) and dynamic pool models used by Shepherd (1982) and Mace (1994). Many fisheries do not have the data resources required for these models and therefore MSY proxies are used. For example, the Canadian precautionary approach suggests that B_{MSY} may be replaced with the average biomass (or index of biomass such as catch or CPUE) over a productive period. This may be considered a B_{MSY} proxy or simply an alternative fishery indicator as suggested by Sainsbury (2008).

Alternatively, “empirical reference points” are not model based and are based on directly observable properties of a stock (Sainsbury 2008). Unconventional empirical reference points that need not be based on MSY include a desirable recruitment level (Shepherd et al. 2001), particular size or weight distributions (Punt et al. 2001), or presence/absence within portions of the stock’s range (Hobday et al. 2004). While these measures do not require a model for their derivation, it may be advisable to use complex modeling for identification of appropriate targets and limits (Sainsbury et al. 2000). This will be an ideal use for the CA lobster Management Strategy Evaluation (MSE) model once fully developed (see Section 4.6).

Whenever a stock reaches a reference point threshold, resource managers must investigate the cause and potentially provide a response. A number of specific reference points are used in spiny lobster fisheries around the world and are described below: i) stock size; ii) total catch each season; iii) CPUE; iv) harvest rate (fishing mortality); v) YPR/SPR; and vi) recruitment indices.

i) Stock size

Estimates of stock size measure how a stock has been impacted through fishing and whether or not the stock is overfished or is at risk of becoming overfished. A common metric for stock size is B/B_0 , which is the current biomass (B) divided by the virgin stock biomass (B_0). Other measures of stock

size may refer to the number of fish present, the total spawning biomass, or the biomass that is available to the fishery.

ii) Catch (total catch per season)

Since stock assessments are costly to conduct, catch trend over time can instead serve as a tentative proxy for relative stock size. A significant change in catch can always be susceptible to multiple interpretations. However, the fact that a significant change in catch appears is itself a clear indicator that, at a minimum, an impact at a biological, ecological, or anthropogenic level is occurring.

Using total catch as a proxy for stock size can be misleading when factors other than stock size influence the number of fish captured. For example, changes in water temperature in southern California may influence the activity level of lobsters on the seafloor, and in turn alter their catchability (the probability that an individual will be captured in fishing gear). Such behavioral changes are not necessarily accompanied by changes in stock size, but they may influence total catch and therefore the perception of stock size. Regulatory changes that alter the access or efficiency of fishermen (and therefore catch rates) can similarly impact total catch.

iii) Catch per unit effort (CPUE)

CPUE is used by fishery managers in two important ways. First, it serves as a proxy for the relative abundance of fish in an area. This proxy assumes that there is a relationship, though not necessarily a linear one, between the condition of a stock and the rate at which they are captured under any given unit of effort (e.g., time spent fishing, amount of gear deployed). As with total catch, long-term trends in CPUE can provide insight into changes in the stock, which will influence management decisions.

In addition, CPUE is also very useful for tracking the optimal effort level and detecting economic overfishing. An example of this is found in management zone “CRA8” of the New Zealand fishery for *J. edwardsii* (Bentley et al., 2005). The lobster stock in this zone was classified as overfished, and a CPUE-based rebuilding plan was proposed. The objectives of this CPUE-based plan were (among others) the restoration of spawning biomass as well as the maintenance of high catch rates that ensure economic viability (Bentley et al., 2005).

CPUE data are relatively inexpensive and easy to collect, but they can be influenced by factors other than fish abundance (e.g., new regulations, environmental variability, catchability, and selectivity). CPUE-based reference points can also be misleading when advances in technology (e.g., gear construction, vessel electronics) make the fishermen more efficient and the gain in efficiency is not reflected by adjusting the reported unit of effort (e.g., trap pulls, number of traps fished). In such a scenario, fishermen may be perceived to have maintained the same level of effort while in reality their effective effort may have increased substantially. This phenomenon is known as **effort creep**, and is thought to have been an important contributor to the catch/stock declines in fisheries for *Panulirus cygnus* in Western Australia and *J. edwardsii* in South Australia (Bentley et al. 2005; Section 4.4).

<p>Effort Creep - A phenomenon where technology advancements in a fishery are able to mask the declining efficiency of a fishery caused by stock declines</p>
--

iv) Harvest rate/ fishing mortality

Estimates of current harvest rates (or, fishing mortality) provide information that helps managers maintain fishery yield while avoiding recruitment overfishing and economic overfishing (Figure 4-1).

v) Yield per recruit (YPR)

The yield that a fishery can achieve (i.e., pounds of fish caught; monetary value of fish sold) changes as a function of the harvest rate, and is often expressed in terms of YPR. YPR is the theoretical yield that is produced from a single recruit (or some fixed number of recruits) that is subjected to different harvest rates.

vi) Spawning potential ratio (SPR)

In addition to yield, harvest rate also affects the ability of a stock to replace itself. Because fishing tends to reduce the number and the size of individuals, it has the potential to negatively impact the reproductive output of a population, or spawning potential. The SPR is usually a ratio of the number of eggs produced by a fished population divided by the number of eggs produced by an unfished population. SPR values range from 1-0. For example, SPR values of 1, 0.5, and 0 correspond to harvest rates at which a population can produce all, half, or none of the eggs produced when the stock is unfished, respectively (Figure 4-5). At low harvest rates, SPR values are high because many large animals remain in the population (Figure 4-5). At higher harvest rates, SPR declines and may ultimately reach zero if no size limit is in place to protect at least some portion of the breeding stock. It is important to note that SPR assumes that an unfished population would produce a relatively constant amount of eggs or maintain a relatively constant spawning stock biomass (Rochet, 2000).

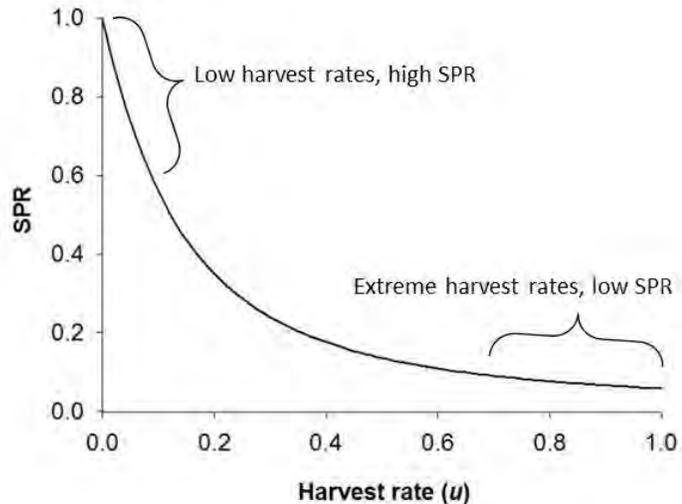

Figure 4-5: The general relationship between fishing mortality (or, harvest rate) and spawning potential ratio (SPR).

Depending on the amount of scientific information available to resource managers, various methods can be used to calculate a stock's current spawning potential, the unfished spawning potential, and an SPR level that is sustainable (Table 4-1). A model is required for calculation of spawning potential, but complexity can range from the simplest methods that scale up from an average weight (as the Cable-CDFW model does), to more complex models utilizing size frequency data, stochasticity and stock-recruitment data. Methods for calculating the egg production or yield of an unfished population in particular vary greatly. For example, the SPR of a hypothetically unfished stock for the Cuban spiny lobster fishery was calculated based on egg production of a theoretical unfished population with the assumption that growth rate and fecundity would be the same whether the individual is in a fished or unfished population (Puga et al., 2005). On the other hand, the SPR of a theoretical unfished Western Australia lobster stock was calculated based on spawning stock biomass with density dependent variables (Hall and Chubb, 2001). Others have empirically measured the egg production of current unfished stocks existing within marine reserves. Although the methods for calculating SPR can vary among different fisheries, the underlying purpose is generally the same: to gauge a fished stock's ability to replenish itself.

vii) Abundance of larvae or recruits

When measured over many years, trends in the abundance of larvae (or very young recruits) returning to a fishing ground can provide indirect evidence of a stock's relative spawning biomass. The abundance of larvae/recruits often varies year-to-year due to environmental conditions, and

therefore may not be related to fishing mortality. However, long term trends (e.g., increasing, decreasing, or stable abundance) can inform managers about the reproductive potential of a stock. In some cases, levels of recruitment can be used to forecast future catches (Phillips, 1986) or estimate spawning stock biomass (Lasker, 1985).

Table 4-1: Spawning potential ratio (SPR) used around the world.

Species	Location	SPR _{THRESHOLD}	Source	Rationale / derivation
<i>Panulirus argus</i>	Cuba	0.143	Puga et al. 2005	Replacement line analysis
	USA: Atlantic and Gulf of Mexico	0.20	FMP	Theoretical (Goodyear 1993); empirical (Mace and Sissenwine 1993)
	USA: Atlantic and Gulf of Mexico	0.05	Addison 1997	Not specified; proposed for use in conjunction with recruitment (to the fishery) observations
	USA: Florida	0.05	Bohnsack et al. 1990	Historical levels associated with catch; proposed in FMP
	USA: Caribbean	0.20	Bohnsack et al. 1990	Theoretical (Goodyear 1993)
	USA: Caribbean	0.20	FMP	Not specified, "committee recommendation"
<i>Panulirus cygnus</i>	Western Australia	0.20	Hall and Chubb 2001	Historical performance of fishery
<i>Jasus edwardsii</i>	Victoria, Australia	0.20	FMP	Not specified
	New Zealand	0.20	NRLMG Report 2010	Not specified
<i>Homarus americanus</i>	USA – NE Atlantic	0.10	Addison 1997 Rosenberg et al. 1994	Historical performance of fishery

4.2.5 Harvest Control Rule Matrix

An HCR prescribes management actions (e.g., continue monitoring or implement regulatory changes to the fishery) when a certain reference point is triggered. Responses are required when reference points thresholds are reached or surpassed (Section 4.3). An HCR can consist of a simple relationship between one reference point threshold and one response (e.g., fishery closes when catch drops below a certain level). The precautionary approach prescribes three types of response to three different threshold levels of a reference point. Drastic measures would be taken when the reference point drops below the limit level, more measured responses would be implemented when below the upper stock reference point, and management might be reduced when above the target level. A single regulatory response option might be used such as changes to a TAC. Another HCR approach uses multiple reference points (e.g., Catch, CPUE, SPR, YPR, Fishing Mortality). One form of this approach, termed "traffic light", monitors multiple reference points and the number above or below thresholds leads to different levels of management response (Caddy 2002). The benefits of approaches using multiple reference points and/or a blend of model-based and empirical reference points have been noted by several researchers (Fogarty 2004, Hilborn 2002, Halliday 2001 Caddy 2004). Additionally, multiple harvest regulatory options (e.g., Seasonal Closure, Size Limit, Gear Restriction, TAC) can provide the necessary management flexibility to address specific fishery issues. In these types of HCRs, the relationship between triggers and responses (i.e., Harvest Regulations) is complex and interconnected.

A clearly detailed decision matrix is a formal mechanism that guides the appropriate management responses based on the triggering of different reference points. This mechanism provides managers

with a pre-determined and transparent decision-making process that preserves scientific and policy decision-making prerogatives.

4.3 HCR for the California Spiny Lobster Fishery

An HCR was developed by CDFW with substantial input from the LAC and independent scientific experts. The associated reference points were also peer reviewed by an external committee of scientific experts (Appendix VII). The CA lobster HCR applies adaptive management by gauging the status of the fishery with specific reference points and tailoring responses when management actions are needed to ensure sustainability and prevent overfishing. It also fulfills the MLMA mandate that requires “each fishery management plan or plan amendment prepared by CDFW shall specify criteria for identifying when the fishery is overfished” (e.g. FGC § 7086(a)).

The HCR is composed of three components. Three specific reference points serve as the metrics to assess the state of the fishery and the CA lobster stock. A Control Rule Matrix details how the reference points will work together to identify an emerging issue within the fishery and its underlying causes. Lastly, a tool box of eight regulatory options gives CDFW and the Commission flexibility to address emerging and ongoing issues. The HCR is not guaranteed to capture every possible issue the fishery will face, and like any other management tool, resource managers will need to exercise independent judgment when using the HCR. In the future, CDFW will explore ways to improve the HCR, such as modifying reference points, or methods for their calculation, to more accurately reflect the status of the fishery and meet the MLMA management objectives. Future improvements may or may not (depending on the type of change) be subject to an amendment process (Section 6.2.2).

4.3.1 Reference Points for CA Lobster Fishery

The three reference points chosen for the CA lobster HCR are based upon:

- 1) Catch (the total catch in a single season)
- 2) CPUE (the number of legal lobsters caught per trap pull)
- 3) SPR (# eggs produced by current fished population / # eggs produced by unfished population)

Landing receipt - A document provided by the Department to commercial fish markets for recording landing information. Information required includes date, port of landing, species or market category of fish, pounds landed, and price paid.

These make use of both model-based and empirical data streams. Total catch ($CATCH_{CURRENT}$) and CPUE ($CPUE_{CURRENT}$) can be calculated directly from landing receipts and commercial logbooks without any change to current CDFW data collection. SPR can be calculated by inputting data from landing receipts and logbooks through computer models such as the Cable-CDFW Model. A single limit threshold separates desirable and undesirable states for each reference point. Designation of the threshold levels for each of the reference points uses an empirical (not model-based) approach by referencing a stable and productive period for the stock. Different combinations of position relative to these reference points can develop a nuanced picture of stock status. For example, decline in catch alone can be caused by decline in stock size, but can also be caused by unrelated factors (e.g., policy change, lower catchability of animals). However, an increase in catch accompanied by a decrease in CPUE may suggest that economic overfishing is occurring. This multiple reference point approach is similar in function to the traffic light fisheries management approach and can result in multiple divisions of stock state (overfished, overfishing, healthy) akin to the precautionary approach. Moreover, the varied information content of the three reference points allows for more tailored management responses than could be justified by a single reference point with multiple levels.

4.3.1.1 Catch-based reference point

The catch-based reference point for a particular season is calculated as follows:

$$CATCH_{CURRENT} = \frac{\text{average catch for 3 most recent seasons}}{\text{average catch for 10 most recent seasons}} \quad (\text{Equation 4.1})$$

The catch-based threshold reference point is any value for $CATCH_{CURRENT}$ that is equal to or less than **0.9**: $CATCH_{THRESHOLD} = CATCH_{CURRENT} \leq 0.9$, (Equation 4.2)

It is important to note that this reference point is primarily designed to detect trend. Catch can fluctuate drastically from year to year due to socioeconomic, environmental, and biological factors. These annual fluctuations often do not reflect problems that warrant management responses (Figure 4-6). Averaging the catch from the three most recent seasons for the reference point numerator serves to smooth those fluctuations. The 10-year running average in the denominator of the reference point was chosen because long-term environmental changes might alter our expectations for sustainable catch levels (upwards or downwards). The CA lobster stock status is influenced by warm and cold water regimes driven by the Pacific Decadal Oscillation and this has been observed using fisheries-dependent (Neilson, 2011) and fisheries-independent (Miller, 2014) data sources.

In addition to detecting noteworthy trends, initiation of the moving average in the present implicitly values the healthy stock status within the last 10 years. A $CATCH_{CURRENT}$ value of 1.0 would indicate that catches are stable, i.e. catches over the last three years are similar to the last 10 years. Setting the reference point threshold at 1.0 would indicate that the fishery does not want to tolerate any reduction in catch from the current state. However, ideal catch rates will fluctuate from year to year with recruitment variation and catches within 80% of an apparently high stable point (i.e., MSY) are a reasonable expectation for sound management (Hilborn 2010). Based on the independent science review committee recommendations to make the catch threshold more sensitive and responsive and

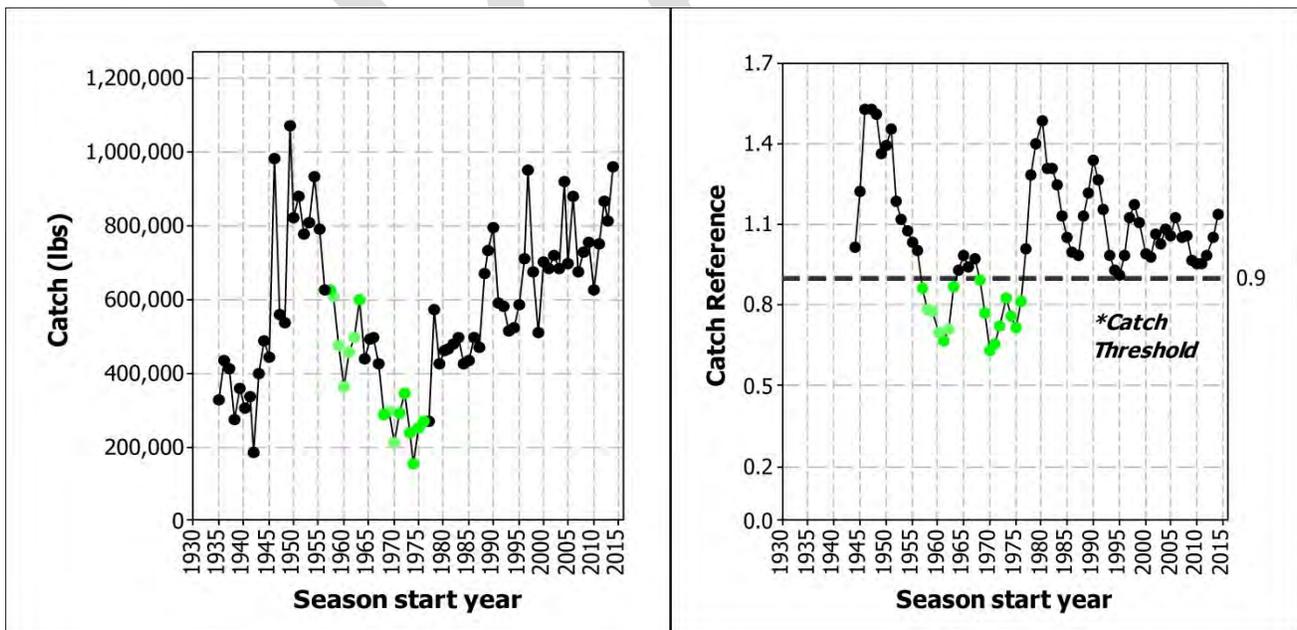

Figure 4-6: Annual catch (left panel) and catch reference values based upon Equation 4.1. With a threshold reference point ($CATCH_{THRESHOLD}$) of $CATCH_{CURRENT} = 0.9$, $CATCH_{THRESHOLD}$ is exceeded (i.e., catch is considered to be low and triggers management consideration) in years where values the right-hand panel fall below the 0.9 value line (represented by green dots). Values at or near 1.0 in the right-hand panel indicate stable catches. Individual years listed (x-axis) are the year in which an individual lobster season began (e.g., 1935 = 1935-36 season).

CDFW analyses, the $CATCH_{CURRENT}$ value was modified from 0.8 to 0.9 resulting in a more sensitive threshold. Reaching this threshold would indicate that catches for the three most recent seasons are less than 90% of the average catch from the 10 most recent seasons, suggesting both a declining trend that warrants consideration and a separation from the high, stable catches of the last 10 years. However, because a reference point based on a moving average may not detect small gradual changes, CDFW will initiate further analysis whenever $CATCH_{CURRENT}$ drops for 6 seasons in a row. $CATCH_{CURRENT}$ declined for 10 seasons in a row during the steep decline of the 1950s and 60s. While the $CATCH_{THRESHOLD}$ of 0.9 would have already been triggered after 6 seasons of that period, future stock dynamics may show slower declines that warrant management action but would not otherwise be detected. CDFW developed the moving average approach through consultation with several lobster fishery experts during the LAC process (Dr. Ray Hilborn, Dr. Matthew Kay, Dr. Hunter Lenihan, Dr. Richard Parrish, and Dr. Jeremy Prince). An examination of California's catch history also indicates that a $CATCH_{THRESHOLD}$ of 0.9 would have provided warning of major declines in catch performance in the modern era of this fishery and appropriately, would not trigger management during rebuilding phases or catch levels likely reduced by environmental regime (Figure 4-6). The most recent $CATCH_{CURRENT}$ value for the 2014/15 season is above the 0.9 threshold.

4.3.1.2 CPUE-based reference point

The CPUE-based reference point for any season ($CPUE_{CURRENT}$) is calculated in the same manner as $CATCH_{CURRENT}$:

$$CPUE_{CURRENT} = \frac{\text{average CPUE for 3 most recent seasons}}{\text{average CPUE for 10 most recent seasons}} = 0.9 \quad (\text{Equation 4.3})$$

The CPUE-based threshold reference point is any value for $CPUE_{CURRENT}$ that is equal to or less than 0.9:

$$CPUE_{THRESHOLD} = CPUE_{CURRENT} \leq 0.9 \quad (\text{Equation 4.4})$$

The rationale for using the value of 0.9 (originally proposed at 0.8) is based on recommendations from the independent science review committee to make the CPUE threshold more sensitive. Using a moving average is based on input from experts and stakeholders through the collaborative LAC process, which determined that a moving average of CPUE would signal important adverse change (e.g., economic overfishing) within the fishery that may warrant management consideration. CPUE data has only been available since 1973 (Figure 4-7), but retrospective analysis of $CPUE_{CURRENT}$ (Figure 4-7) since that time indicates that this threshold is able to detect important changes in the fishery. $CPUE_{THRESHOLD}$ would have been crossed seven times; three sequential seasons in the mid-1990s and the last four fishing seasons on record. Both catch and the number of trap pulls dipped sharply in 1991 and remained depressed for a series of years leading to the $CPUE_{THRESHOLD}$ being crossed. Alternatively, low CPUE and $CPUE_{CURRENT}$ values since 2010 have been the result of a sharp increase in the number of trap pulls while catch has maintained consistently high levels. Effort increase in the 2010/11 season was likely driven by an increase in the price/pound for CA lobster and both have remained high. These instances below $CPUE_{THRESHOLD}$ point to verifiable changes in the dynamics of this fishery relating to fisherman behavior and economics. Different years are below the $CPUE_{THRESHOLD}$ than those that are below the $CATCH_{THRESHOLD}$, suggesting that these two reference points are complementary and not redundant. As is the case with the catch reference point, CDFW will initiate an investigation if the $CPUE_{CURRENT}$ drops for 6 years in a row even if the $CPUE_{THRESHOLD}$ is not crossed.

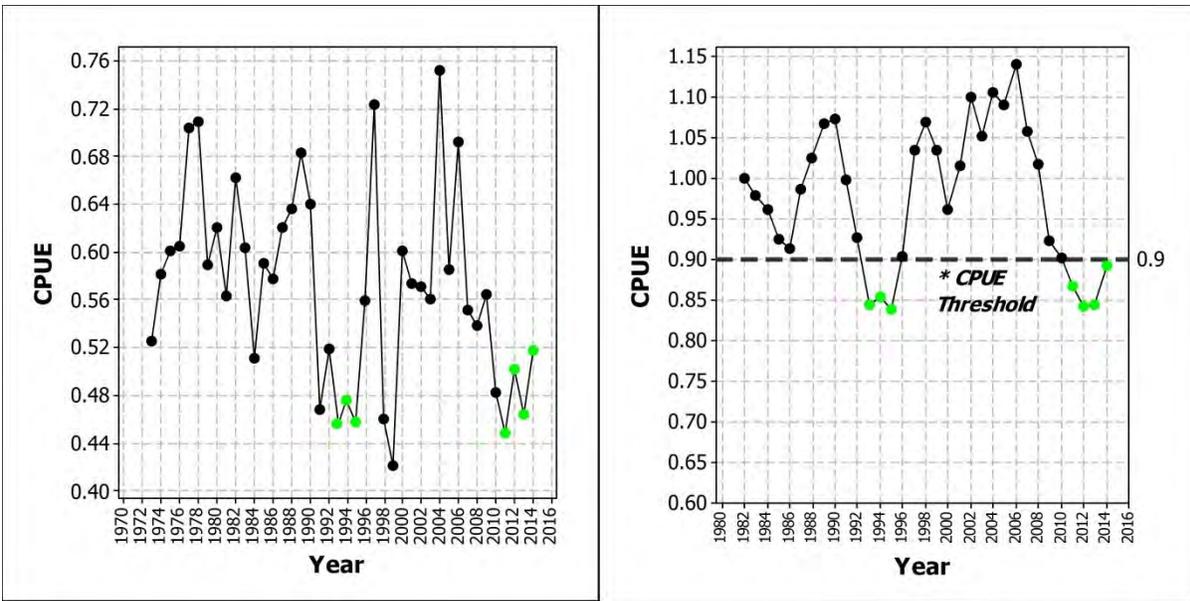

Figure 4-7: Annual CPUE (left panel) and CPUE reference values based upon Equation 4.3. With a threshold reference point ($CPUE_{THRESHOLD}$) of $CPUE_{CURRENT} = 0.9$, $CPUE_{THRESHOLD}$ is exceeded (i.e., catch is considered to be low and triggers management consideration) in years where values the right-hand panel fall below the 0.9 value line. Values at or near 1.0 in the right-hand panel indicate stable catches. Individual years listed (x-axis) are the year in which an individual season began (e.g., 1970 = 1970-71 season).

4.3.1.3 SPR Reference Point

The SPR reference point has the most biological information content of the three reference points and thus is the best indicator of the potential for recruitment overfishing. SPR can be calculated in several ways. The method currently employed by CDFW utilizes data from commercial logbooks and commercial landing receipts to calculate the average weight of lobsters caught in a given year. CDFW then relates average weight to a corresponding fishing mortality (F) which allows estimation of SPR. This calculation is currently accomplished using the Cable-CDFW Model (Appendix X). SPR is a model **output** based on 46 user-specified inputs, each responsible for the calculation of various biological, economical, and operational characteristics of the fishery. The age-length relationship, for example, incorporates three inputs: L_{∞} , K , and t_0 (the maximum length a CA lobster can biologically attain, the growth rate, and a number that adjusts the initial size of a lobster for the calculation, respectively; Section 3.2). Average weight can be used to estimate the reproductive potential of a stock because it 1) expresses the age of lobsters when removed from the population and thus their number of reproductive seasons before death, and 2) the female size at reproduction dictates fecundity. Methods for calculating the spawning potential of an unfished stock (the denominator of the SPR ratio) vary, as described in Section 4.2.4. The Cable-CDFW uses a theoretical unfished stock without density dependence.

The threshold for the SPR reference point is any current value of SPR that is less than the average SPR calculated for the fishing seasons from 2000/01 to 2007/08. These years were deemed stable and productive by the 2011 CDFW stock assessment and are considered here as “reference” years for calculation of the threshold.

$$SPR_{THRESHOLD} = SPR_{CURRENT} < SPR_{REFERENCE}, \text{ (Equation 4.5)}$$

A distinction should be made between the calculation of $SPR_{CURRENT}$ and $SPR_{THRESHOLD}$ values in this and other management contexts. Several types of models that allow calculation of $SPR_{CURRENT}$, like the Cable-CDFW model, do not require stock-recruitment data or model-based estimates of MSY. However,

analysis of sustainable SPR levels and thus appropriate placement of an $SPR_{THRESHOLD}$ does require stock-recruitment relationship information. In the absence of this data, frequently fisheries managers set $SPR_{THRESHOLD}$ levels by looking to comparable taxa (Mace & Sissenwine 1993). For example, SPR thresholds used for many other lobster fisheries are based on the calculated value of 0.20 (i.e., 20% of unfished spawning biomass or egg production) commonly used for finfish fisheries (Table 4-1; Mace and Sissenwine, 1993; DiNardo, 1999; SAFMC, 1998; CFMC, 1990). Crustaceans such as lobster are thought to be able to persist at lower levels than many finfish and the calculations of $SPR_{THRESHOLD}$ for some lobster fisheries with the necessary stock-recruitment data are lower than for most finfish. For example, the $SPR_{THRESHOLD}$ values have been estimated to be 10% for the American lobster fishery off the northeast coast of the United States (Zhang et al., 2012), 14% for Caribbean spiny lobster in Cuba (Puga et al., 2005), and 2.5% for a Newfoundland stock of American lobster (Ennis and Fogarty, 1997).

The approach taken by this FMP is that the $SPR_{THRESHOLD}$ should not be based on calculations for other species or value judgements of other jurisdictions. In the absence of stock-recruitment information and associated production modeling, the reference years for the CA lobster fishery serve to set a threshold that is conservative, empirically based, and specific to a period when the stock and fishery were stable and productive (Neilson, 2011). While the $SPR_{CURRENT}$ and $SPR_{REFERENCE}$ values are model-based, the Cable-CDFW model is a non-dynamic equilibrium model, meaning it does not incorporate environmental variability or a stock-recruitment relationship. It assumes constant recruitment under any exploitation scenario and therefore that any level of exploitation is sustainable and will not lead to recruitment overfishing. Steneck and Wahle (2013) describe why equilibrium modeling was inappropriate for the American lobster fishery and may be inappropriate for other lobster fisheries as well. This draw-back is related to the fact that while the Cable-CDFW model does estimate F , it cannot incorporate stock-recruitment replacement information to estimate F_{MSY} . Therefore the $SPR_{THRESHOLD}$ in this FMP is $SPR_{REFERENCE}$ rather than SPR_{MSY} .

Other methods for calculation of F (and thus SPR) exist and some are capable of incorporating environmental stochasticity and/or variable recruitment including catch curve analysis (Kay and Wilson 2012, Groeneveld 2000, Sparre and Venema 1998), Leslie-Delury depletion models (Leslie and Davis 1939, Delury 1947, Restrepo 2001, Gonzalez-Yanez 2006) and length-based mortality estimators (Beverton and Holt 1956, Ault et al. 2005). Those that incorporate the distribution of individual lobster sizes, rather than an overall average size, add additional value and ability to distinguish processes effecting lobster life stages differentially (Puga 2013, Muller 1997). However annual length frequency data are not available for CA lobster. It should be noted that current genetic evidence (reviewed in Section 3.3) suggests that CA lobster are well mixed during the larval phase. This suggests that stock-recruitment relationships at sub-regions of the SCB are likely to be weak due to mixing among regions. If mixing between the California and Baja Mexico stocks also weakens the California stock-recruitment relationship, the SPR reference point described here will only serve to describe the effect of fishing on the adult stock and not its potential replenishment. Because of these larval dynamics and their consequences, the Cable-CDFW model equilibrium assumption of constant recruitment may be more reasonable for this stock than for many other invertebrate fisheries.

SPR is also the component in the HCR where the effects of MPAs are factored into the management of CA lobster fisheries. Through the Cable-CDFW Model, CDFW accounts for MPA effects on SPR through six different inputs. These are: 1) the total fraction of the species' habitat covered by the MPA, 2) migration rate into the MPAs, 3) migration rate out of the MPAs, 4) a reduced fishing mortality rate experienced by individuals that cross the MPA boundaries, 5) average length of MPAs, and 6) average distance between MPAs. The model treats all MPAs as if they have reached full maturity and therefore increased survival within simulated MPAs has allowed for the number and size of lobsters inside to

reach equilibrium. Only areas that prohibit both recreational and commercial take are considered MPAs. Although recreational-only areas do protect lobster from commercial traps, they receive disproportionately higher fishing effort from the recreational sector (Figure 2-9). Lobster report card data indicates that the majority of recreational fishing effort for lobster is taking place in recreational only areas.

CDFW currently estimates the percentage of lobster habitat protected by MPAs to be 14.6% based on mapped areas and proxies for hard bottom habitats and MPA area. Other habitats used by CA lobster were not included because 1) hard bottom is the CA lobster primary habitat, and 2) other habitat types were not mapped with equal reliability across the SCB. For example, surfgrass habitat mapping only delineates linear segments of coastline with and without surfgrass. The width in the offshore direction is unknown and will vary according to shoreline slope and patterns of water turbidity. Even the relatively well mapped hard bottom habitat is not equally available in all regions of the SCB, so proxy information must be used. Kelp canopy was used as an indication of hard bottom in unmapped areas. However, coverage of the canopy can be different from the extent of the reefs on which kelps are attached. Furthermore, the lack of kelp canopy in an area does not necessarily indicate the absence of reefs. Table 4-2 provides the habitat area known to be hard or soft substrate, the proportion of rocky habitat estimated using kelp as a proxy, and the area that is unknown. During the early 2000s there were only a small number of no-take MPAs (e.g., northern Channel Islands, La Jolla) and using the best available information, CDFW estimates approximately 4.5% of CA lobster habitat at that time was closed to both commercial and recreational fishing. CDFW will continue to incorporate better habitat information as they become available.

Table 4-2: Percentage of bottom area by region from shore to 300 m depth covered by hard, soft, or unknown habitat types and their data sources. North and south mainland regions are delineated by Dana Point.

Region	Substrate	Source	Percent Area
Mainland North	Hard	Coarse	0.2
	Hard	High Resolution	1.3
	Hard	Kelp	1.5
	Soft	Coarse	2.7
	Soft	High Resolution	54.2
	Unknown	N/A	40.2
Mainland South	Hard	High Resolution	9.0
	Hard	Kelp	0.2
	Soft	High Resolution	60.1
	Unknown	N/A	30.7
Northern Channel Islands	Hard	High Resolution	3.9
	Hard	Kelp	3.6
	Soft	High Resolution	43.9
	Unknown	N/A	48.9
Southern Channel Islands	Hard	Coarse	12.7
	Hard	High Resolution	2.6
	Hard	Kelp	4.5
	Soft	Coarse	25.1
	Soft	High Resolution	22.0
	Unknown	N/A	33.0

Because $SPR_{THRESHOLD}$ is calculated as the average of the reference years, annual SPR values fluctuated above and below that average during those years and to the present. The highest SPR value was associated with the highest average weight observed during the 2001-02 season. Average weight was at

a minimum during the 2005-06 season but has since been rising and reached a value higher than 2001-02 during the most recent 2014-15 season. SPR has been rising, in part because of rising average weight, but also because of model simulated MPA benefits applied to the 2012-13 season and those that follow. Under current conditions with 14.6% MPA coverage the model provides an SPR enhancement of four to five percentage points over the SPR calculation at the same average weight with 4.5% MPA coverage (Figure 4-8). This improvement reflects the importance of the MPAs to the reproductive potential of the species as well as the insurance they provide against recruitment overfishing. The metric used to measure a stock’s reproductive potential should reflect the effects of a management tool designed in part to protect that very stock’s reproductive potential. However, it is unlikely that the MPAs, implemented in 2012 as a result of the south coast MLPA process, have actually achieved equilibrium and their full potential. Given that the average weight during the 2014-15 fishing season was above the average of the reference years, $SPR_{CURRENT}$ for 2014-15 was also above $SPR_{THRESHOLD}$ with or without the model benefit from MPAs. CDFW will monitor average weight and SPR closely until further research illustrates substantial benefit of MPAs to CA lobster and that the model-simulated enhancement to reproductive potential is warranted.

A current limitation of the Cable-CDFW model is its decreasing sensitivity in estimation of F and SPR as average weight decreases (see Appendix X). Figure 4-9 illustrates an aspect of this issue with the flattening of the curves with increasing F. As average weight declines and F increases, SPR changes little and cannot extend to zero. With MPAs in place, SPR asymptotes at a higher level. The current average weight corresponds to an F estimate where the SPR curve bends and accuracy of SPR estimation is good. The average weight where model accuracy declines depends on input parameters, particularly growth. Collection of age and growth information is a high priority and CDFW will seek to augment and validate existing information and improve the growth parameters and/or update the equations describing growth within the Cable-CDFW model. These refinements will not require amendments to the FMP as they represent improvements in accuracy and not a shift in the Cable-CDFW Model approach (see Section 6.2.2). Additionally, model refinements apply to calculation of both $SPR_{CURRENT}$ and $SPR_{THRESHOLD}$ and therefore represent concurrent improvements to both estimates (see Appendix X).

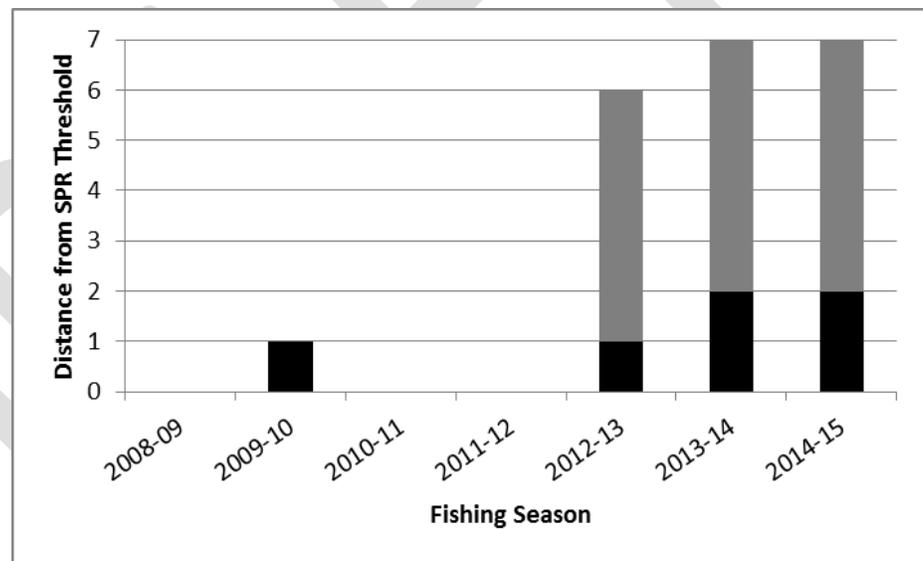

Figure 4-8: Percentage points above SPR threshold with 4.5% (black) and 14.6% (gray) CA lobster habitat within MPAs. Seasons with no bars are equal to SPR threshold.

existing information and improve the growth parameters and/or update the equations describing growth within the Cable-CDFW model. These refinements will not require amendments to the FMP as they represent improvements in accuracy and not a shift in the Cable-CDFW Model approach (see Section 6.2.2). Additionally, model refinements apply to calculation of both $SPR_{CURRENT}$ and $SPR_{THRESHOLD}$ and therefore represent concurrent improvements to both estimates (see Appendix X).

Available CDFW data from logs and landing receipts show that individuals in the northern Channel Islands are notably larger than the minimum legal size, while lobsters in the south are generally caught very close to the legal size. Given equal fecundity and growth and recruitment rates the Cable-CDFW model indicates higher F in the south and lower SPR because southern CA lobsters would participate in fewer spawning seasons before capture. However higher abundance of small CA lobsters in the south may be due in part to higher recruitment and not only a product of higher F. Additionally, CA lobsters in the

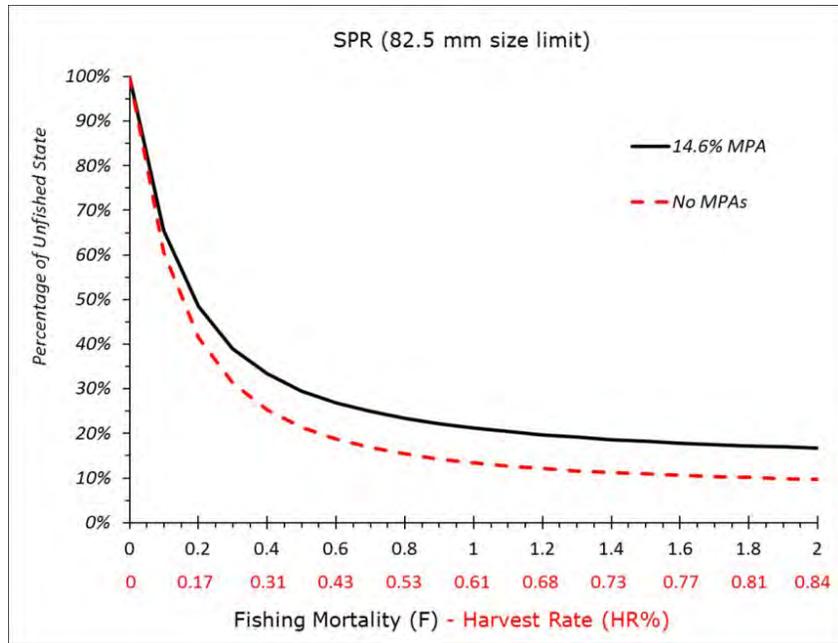

Figure 4-9: Relationship between spawning potential ratio (SPR) and fishing mortality (F) CDFW-Cable Model outputs under conditions with no MPA coverage and 14.6% MPA coverage.

south may be sexually mature at a younger age and smaller size. Larger numbers of sub-legal CA lobster reproducing at a smaller size may increase SPR in the south and these dynamics would not be reflected in the Cable-CDFW model. Analysis of CAPS data indicates higher reproductive capacity in the south despite smaller average size due to the far greater abundance of sub-legal individuals (Yaeger et al., in prep.). This highlights that the Cable-CDFW model should not be used to compare regionally specific model outputs based on regionally specific average weight without also incorporating regionally specific growth, recruitment rates and reproductive characteristics. Considering that model parameters cannot currently be estimated at local scales and information on population mixing due to the species' protracted larval phase, treating the entire CA lobster stock within the U.S. border with one SPR value is appropriate. Information related to regional differences in the species' biological parameters and in fishery dynamics will need to be improved to better assess the adequacy of using a single SCB-wide SPR value (Section 5.2).

4.3.2 Implementation: HCR Matrix

The three reference points selected to monitor and manage the CA lobster fishery (Catch, CPUE, and SPR) are incorporated into an HCR Matrix. This matrix provides a “dashboard” approach to assist managers in interpreting the status of Catch, CPUE, and SPR reference points in relation to their respective thresholds (Table 4-3). Based on these interpretations, the matrix would prescribe particular courses of action to address the current condition of the fishery. Depending on the respective trend and status of each measurement (i.e., have any of the threshold reference points been exceeded?), the matrix identifies various management strategies ranging from easing harvest regulations, to no regulatory action, to further restricting the fishery.

The HCR is discretionary and not every triggering event will necessarily lead to an immediate regulatory response. Additional evaluation is needed before taking action to determine if external factors (i.e. new regulations, market dynamics, or environmental changes) have caused or contributed to the reference point(s) being exceeded. This process will include consultations with the fishing communities and other

Table 4-3: Harvest Control Rule (HCR) Matrix. Interpretation of different scenarios in which threshold reference points are exceeded, and recommended management responses. Symbols for each reference point are: ↑ (“safe”, does not exceed threshold), and ↓ (exceeds threshold). Note that once $CATCH_{THRESHOLD}$ or $CPUE_{THRESHOLD}$ are exceeded, monitoring CPUE and Catch trends provides valuable information that managers can use to “fine tune” the fishery or to detect overfishing early (i.e., before the stock becomes overfished).

Scenario	Reference Point			Interpretation/possible causes	Suggested management response sequence
	CATCH	CPUE	SPR		
1	↑	↑	↑	<ul style="list-style-type: none"> ○ Stock productivity and fishery performance stable and/or increasing 	<ul style="list-style-type: none"> a) Monitor reference point trends b) Make no change (if reference points are stable or just above thresholds) c) Ease effort regulations (if reference point trends are increasing)
2	↓	↑	↑	<ul style="list-style-type: none"> ○ Fishery under-harvested (i.e., fishing effort and harvest rates are low, could be caused by drop in price or other economic factors) 	<ul style="list-style-type: none"> a) Monitor reference point trends b) Make no change (if CPUE/SPR trends stable/just above threshold) c) Ease effort regulations (if explanations for decreasing catch are not biological and CPUE/SPR trends increasing)
3	↑	↓	↑	<ul style="list-style-type: none"> ○ Catchability down ○ Potential economic overfishing ○ Potential early warning of recruitment overfishing 	<ul style="list-style-type: none"> a) Monitor reference point trends b) No change (if SPR trends are stable/above threshold) c) Effort reduction (if SPR trends declining) d) No change, or ease catch restriction (if catchability is proven to be lower than usual and is causing CPUE decline)
4	↓	↓	↑	<ul style="list-style-type: none"> ○ Catchability down ○ Potential economic overfishing ○ Potential early warning of recruitment overfishing (fewer recruits surviving to adulthood) 	<ul style="list-style-type: none"> a) Monitor reference point trends b) Investigate underlying causes c) Confirm SPR trends and model inputs d) If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate e) Effort reduction (if SPR trends declining)

Table 4-3 Continued: Harvest Control Rule (HCR) Matrix.

Scenario	Reference Point			Interpretation/possible causes	Suggested management response sequence
	CATCH	CPUE	SPR		
5	↑	↑	↓	<ul style="list-style-type: none"> ○ Stock overfished ○ Recruitment largely provided from Mexican stock 	<ul style="list-style-type: none"> a) Investigate underlying causes b) Confirm SPR trends and model inputs c) If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate
6	↓	↑	↓	<ul style="list-style-type: none"> ○ Stock overfished, and ○ Possible catchability increase (effort creep due to technology, etc.) 	<ul style="list-style-type: none"> a) Investigate underlying causes b) Confirm/monitor CPUE (misreporting?) c) Confirm SPR trends and model inputs d) If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate
7	↑	↓	↓	<ul style="list-style-type: none"> ○ Stock overfished ○ Overfishing indicated 	<ul style="list-style-type: none"> a) Investigate underlying causes b) Confirm SPR trends and model inputs c) If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate
8	↓	↓	↓	<ul style="list-style-type: none"> ○ Stock overfished ○ Overfishing indicated ○ Disease 	<ul style="list-style-type: none"> a) Investigate underlying causes b) Confirm SPR trends and model inputs c) If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate

stakeholders. For example, if the triggering of the catch-based reference point coincides with a new effort-based regulation, the first task would be to determine if the triggering event is caused by the new regulation. If it is determined that the triggering event is caused by the new regulation and not biological processes, no further management action may be necessary. In the event that management actions are warranted, the HCR calls for the implementation of one or more of the eight regulatory options provided in the control rule toolbox (Section 4.3.3).

4.3.3 Regulatory options linked to the control rule

This FMP prescribes a control rule toolbox of eight regulatory options (not in order of rank) that are available to decision makers (Table 4-4) when threshold reference points are triggered, and there is reason to either restrict or ease fishing opportunity. The specific actions in the toolbox are:

- 1) Change in commercial **trap limit**
- 2) Change in recreational bag limit
- 3) TAC
- 4) District Closures
- 5) Change in season length
- 6) Change minimum size limit
- 7) Impose a maximum size limit
- 8) Sex selective fishery (Male-only fishery or female-specific size restriction)

Trap limit – A type of regulatory measure that restricts the number of traps a fisherman may fish at any one time within a given season.
Allocation - In the LFMP allocation means a certain amount of lobster set aside for recreational, commercial, and ecosystem needs.

Each of the eight regulatory options in the control rule toolbox carries specific benefits and limitations (Table 4-4) that managers will need to carefully evaluate, including impacts to constituents, level of regulatory change, and duration of regulatory change (i.e., how long it will remain in place). CDFW will consult with the fishing communities and other stakeholders in order to better inform any management recommendation to the Commission on the proper regulatory response.

1) Implementation and subsequent adjustments to commercial trap limit

Relative to fisheries for finfish and other invertebrates, crustacean (crab and lobster) fisheries can sustain more intense harvest rates without rapidly collapsing (Zhang et al., 2012; Ennis and Fogarty, 1997). This resilience against fishing pressure often allows commercial lobster fisheries to remain at high effort levels that can be economically inefficient and unnecessary for maintaining high yield. Over time, such effort level can lead to economic overfishing, and if left unregulated, can lead to recruitment overfishing. Therefore, reducing effort when fishery performance (e.g., CPUE) or stock status (e.g., SPR) is in decline would likely address the root cause of such declines. As specified in Table 4-4, effort adjustment also allows for increases when reference indicators (e.g., Catch, CPUE, SPR) indicate that the fishery is underutilized. A trap limit would directly reduce the number of traps fishermen put in the water.

The CA lobster fishery is not currently regulated by a trap limit. However, recent rise in fishing effort has contributed to recent $CPUE_{CURRENT}$ values below the $CPUE_{THRESHOLD}$ (Section 4.3.1.2) and has led to possible economic inefficiency within the fishing sector (Sections 2.1). Furthermore, an excess of lost traps may create further environmental and social concerns. CDFW has worked closely with its constituents to resolve these issues, and as part of the implementing regulations for this FMP, the CDFW will propose a formal trap limit program that allows the Commission to adjust commercial sector fishing effort (Section 4.5). Once the limit is in place the Commission will be able to adjust it as needed based on the HCR.

2) Change in recreational bag limit

An adjustment to the recreational bag limit would serve to control effort in the recreational sector. Adjustment options may consist of daily, weekly, monthly, or annual limits. A bag limit would change the amount of lobsters a recreational fisherman can keep. The MLMA requires any type of **allocation** within an FMP to be equitably shared between the recreational and commercial sectors (FGC § 7072(c)). Any proposed change to the recreational bag limit is allocative by nature, and should be considered in conjunction with possible adjustments for the commercial sector.

3) TAC

A TAC or a TAC/ITQ management framework can prevent a stock from being overfished. However, management challenges in quota fisheries include, but are not limited to, allocation of catch among fishermen, consolidation of capacity when quota is transferable, accounting for natural fluctuations in stock size that may render the TAC too restrictive or aggressive from year to year (e.g., Johnston and Butterworth, 2005), access to the fishery if/when quota shares increase in price, and increased administrative and enforcement costs to regulatory agencies. Advocates of quota systems argue that the high cost of transferring quota shares should lead to increased stewardship among current fishermen because they have an incentive to protect their asset. This and other aspects of TAC/quota management are complex (e.g., Branch, 2009) and often contentious. While some studies emphasize the successes of TAC and quota approaches to management (Costello et al., 2008; Bonzon et al., 2010), others suggest that they should be considered cautiously on a per-case basis (del Valle and Astorkiza, 2007; Bromley, 2009; Ecotrust, 2009; Gardner et al., 2013).

If the SPR-based threshold reference point is exceeded, a TAC could be established for California. Approaches for determining a TAC for California include, but are not limited to: (a) accurately estimate the biomass of the stock, and then determine what fraction of the stock the fishery is allowed to harvest; (b) determine a conservative catch level (i.e., one that is historically low/modest) that is clearly sustainable and set that as the TAC, or; (c) identify a target CPUE and adjust the TAC through time until CPUE falls to within some range of the target value (e.g., New Zealand zone CRA8, see Bentley et al. 2005). Equitable distribution of the TAC between the commercial and recreational sectors will be necessary (FGC § 7072(c)). If a quota system is adopted, allocation between and within sectors (commercial and recreational) will need to be considered. Quota allocation is likely to be highly contentious.

4) District Closures

Some areas may be closed only to certain types of fishing, and areas closed to fishing tend to experience very low fishing mortality (although some fishing mortality can occur due to spillover and poaching). Population increase inside closed areas can increase the spawning output of the entire stock. However, closing areas off to fishing can also displace fishing effort to other areas, placing more pressure on the unprotected portion of the stock (Section 4.2.1.1). Furthermore, existing CDFW records show that most of the recreational take in the state occurs in locations where commercial fishing is prohibited (Santa Monica Bay, Long Beach Harbor, San Diego Bay, and the front side of Catalina; Figure 2-9).

A number of areas (Districts) are presently closed to commercial harvest. Prominent examples include the north side of Catalina Island, Santa Monica Bay, and harbor jetties. If the SPR-based reference point threshold is exceeded, these areas could be additionally closed to recreational harvest. Doing so would enhance the spawning output of populations in these areas. The FMP only accounts for the effect of

areas closed to both commercial and recreational fishing on SPR using the Cable-CDFW Model (Section 4.3.1.3).

5) Change in season length

Seasonal closures reduce fishing mortality by reducing the number of days that fishing is allowed each year. Closed seasons can protect stocks during important life events, such as spawning. A longer closed season could also improve survival of individuals that would have succumbed to fishing, which in turn increases SPR. The current closed season in California protects reproduction, and any extension of current seasonal closures is unlikely to provide substantial protection for reproductive behaviors or activities. However, it is possible that climate change may lead to a shift in the timing of reproduction or a change in the length of the reproductive season. Such changes could prompt a change in season length. If the SPR-based threshold reference point is exceeded, fishing season length could be shortened, either by delaying the opening date or by closing the season early. That said, most catch occurs during the first part of each season, therefore reducing the duration of the season would have a disproportionately small effect on fishing mortality.

6) Change minimum legal size

Increasing the Min LS would ensure that animals will, on average, reproduce more times before they are caught. Furthermore, females will be slightly larger and produce more eggs. Increasing the Min LS is a simple, effective, and direct way to increase SPR. However, it will lead to extra cost for the fishermen as they make adjustments to their gears (e.g., enlarge escape ports). If the SPR-based threshold reference point is exceeded, the Min LS could be increased to a size that ensures a target SPR within a specified time frame. A reduction in Min LS would have the opposite effect, if future conditions suggest that SPR could be reduced.

7) Establish maximum legal size

If the SPR-based threshold reference point is exceeded, a Max LS could be implemented to protect larger spawning females. As the communities inside MPAs mature, they will likely comprise more of these adults with higher fecundity, and a Max LS would be expected to protect these important spawners as they move outside of the boundaries of the MPAs. Trophy animals would not be available to the recreational community.

8) Sex selective fishery

A sex selective restriction allowing the harvesting of male lobsters (and consequently not allowing the harvesting of female lobsters) could be implemented for the CA lobster fishery. If the SPR-based threshold reference point is exceeded, changing sex regulation for females could be an efficient mean to increase SPR. As stated in Table 4-4, there are advantages and disadvantages to this system that should be carefully considered. Prohibition on the take of berried females is another sex selective provision that could be considered.

Table 4-4: Control rule toolbox: The eight regulatory options available to decision makers if threshold reference points are triggered and their relative benefits vs. limitations

Regulatory options	Benefits	Challenges/Limitations
1) Change commercial trap limit	<ul style="list-style-type: none"> Restores economic performance (CPUE) and stock status (SPR) Directly addresses most common management problem in lobster fisheries (high harvest rates due to high effort) Applicable when performance/stock increases (i.e., harvest rates can be scaled upwards in absence of crisis, or after recovery) Accentuates the multiple benefits of trap limit for other MLMA objectives (i.e., Table 5.1) 	<ul style="list-style-type: none"> Mechanisms only applicable to commercial Requires implementing a trap limit program May disrupt established business/fishing practices
2) Change recreational bag limit	<ul style="list-style-type: none"> Restores stock status (SPR) Directly addresses most common management problem in lobster fisheries (high harvest rates due to high effort) Applicable when performance/stock increases (i.e., harvest rates can be scaled upwards in absence of crisis, or after recovery) 	<ul style="list-style-type: none"> Mechanism only applicable to recreational
3) TAC	<p><u>Without individual quota system (e.g., ITQ)</u></p> <ul style="list-style-type: none"> Can provide long term stability to catch and prevent overfishing Adjustments and rebuilding measures are simple and efficient <p><u>With individual quota system (e.g., ITQ)</u></p> <ul style="list-style-type: none"> Can provide long term stability to catch and prevent overfishing Can ease “race to fish” Can encourage fishing during high market value periods (unless cost of fishing is higher then), this is often later in the season for CA lobster – can have economic benefits Can lead to effort reduction (but not guaranteed) TAC/ITQ can be tuned to other fishery performance measures (e.g., CPUE); maximize efficiency 	<p><u>Without individual quota system (e.g., ITQ)</u></p> <ul style="list-style-type: none"> Encourages “derby” fishery, exacerbates high effort level, and compromise safety (“race to fish”) Allocation across sectors difficult (commercial vs. recreational) Difficult to monitor recreational catch against a TAC (current system is not sufficient) Recruitment/stock size variability problematic for setting optimal/appropriate TAC Data-intensive; usually based upon stock assessment Increased administrative and enforcement costs <p><u>With individual quota system (e.g., ITQ)</u></p> <ul style="list-style-type: none"> Difficult to monitor recreational catch against a TAC (current system is not sufficient) Allocation both across and within sectors difficult Recruitment/stock size variability problematic for setting optimal/appropriate TAC/quota Data-intensive; usually based upon stock assessment Increased administrative and enforcement costs

Table 4-4 Continued: Control rule toolbox.

Regulatory options	Benefits	Challenges/Limitations
4) District closures (e.g., Santa Monica Bay, jetties, Catalina)	<ul style="list-style-type: none"> • Directly protects stock and increases SPR • Protected areas can be directly incorporated into stock assessment • Streamlining management by prohibiting all lobster fishing in certain CDFW fishing districts • Can directly target localized issues 	<ul style="list-style-type: none"> • If implemented alone, does not reduce high effort in fished areas (potential root of problem), thus does not improve economic performance • Increased congestion in open areas • Likely to reduce yield, reduce public access • May disrupt established business/fishing practices
5) Change season length	<ul style="list-style-type: none"> • Ease and immediacy of implementation and enforcement (applies both sectors in same manner) • Can estimate benefits from historical catch records 	<ul style="list-style-type: none"> • If implemented alone, does not reduce high effort (potential root of problem) unless large change is made, thus does not improve economic performance • The timing of catches made within season varies regionally (high early season in south, more prolonged in north), thus impact will bear regional disadvantages. Not likely to be uniformly effective throughout range of fishery • Shortens and temporally eliminates access to market
6) Change minimum size limit	<ul style="list-style-type: none"> • Ease and immediacy of implementation and enforcement (applies to both sectors in same manner) • Directly protects stock and increases SPR • Easily incorporated into stock assessment 	<ul style="list-style-type: none"> • Disproportional economic impacts in southern portions of range where most animals in catch are close to legal size • High cost to commercial fishermen needing to adjust trap openings • If implemented alone, does not reduce high effort, thus does not improve economic performance • Initial season could have major catch reduction
7) Impose a Maximum Size Limit	<ul style="list-style-type: none"> • Ease and immediacy of implementation and enforcement (applies to both sectors in same manner) • Directly protects stock and increases SPR • Impact easily incorporated into stock assessment • Enhances other MLMA objectives: (1) Ecological benefits of large animals in food chain, (2) non consumptive users 	<ul style="list-style-type: none"> • Benefits (increases in SPR) are minimal at high harvest rates because few animals survive to large size • If implemented alone, does not reduce high effort (potential root of problem), thus does not improve economic performance • May disproportionately impact recreational sector
8) Sex Selective Fishery (male only or female-specific size restriction or condition)	<ul style="list-style-type: none"> • Ease and immediacy of implementation and enforcement (applies to both sectors in same manner) • Directly protects stock and increases SPR; similar method works in <i>H. americanus</i> fishery (V-notch program) and crab fisheries (i.e., Dungeness) • Enhances other MLMA objectives: (1) Ecological benefits of large animals in food chain, (2) non consumptive users 	<ul style="list-style-type: none"> • If implemented alone, does not reduce high effort (potential root of problem), thus does not improve economic performance • Reduced yield to fishery, likely large effect • Mating dynamics unknown, small males might not fertilize eggs of larger protected females due to (1) sperm limitation and (2) antagonistic interaction between large females and small males during mating

4.4 Management of Other Lobster Fisheries

Commercial lobster fisheries exist in many parts of the world. The lessons learned from these global lobster fisheries have played an important role in shaping this FMP. The following review of four select lobster fisheries from other parts of the world highlights the various tools used in lobster fishery management. A comprehensive list of fisheries is listed at the end of this section (Table 4-5).

4.4.1 Baja Mexico *Panulirus interruptus* Fishery

The Mexican lobster fishery operates through fishing cooperatives which are regional groups of fishermen with rights that were first allocated by the government in 1936 (SCS, 2011). Concessions granted to each cooperative define the allowable species, fishing zone boundaries, and effort levels for each cooperative. Adherence to these concessions and prevention of poaching is largely ensured by the cooperatives themselves. Lobster is harvested by 26 cooperatives from the border with the US to Margarita Island but only 10 of those cooperatives, located in the region from Punta Abreojos to Isla Cedros, catch approximately 80% of the catch. Nine of those cooperatives are jointly certified by the Marine Stewardship Council. Federal government control over stock assessment and management is held by the National Institute of Fisheries (Instituto Nacional de Pesca (INAPESCA)) and instituted through the Regional Center of Fisheries Research (CRIP) in La Paz and Ensenada. Co-management and collaboration (e.g. data collection) is required by law as a part of concessions and cooperatives are included in discussions of research results and management recommendations through workshops. Landings data on logs is collected by CRIP and compared to landings data recorded on receipts of sale submitted to the national aquaculture and fishing commission (CONAPESCA).

The fishery is managed using a combination of a minimum legal size (82.5 mm CL), a closed season, a prohibition on taking berried females, trap design requirements, and particular fishing areas and trap limits for each cooperative (SCS, 2011). Commercial landings in Mexico during 2000-10 were approximately 4 times those in CA. Very little lobster is taken recreationally. During the 2010-11 fishing season, approximately 1,250 fishermen operated 564 boats and 28,296 traps (Vega, pers. comm.). The stock has been assessed using a variety of models (Chavez and Gorostieta, 2010; SCS, 2011). INAPESCA used the results of a biomass dynamic model (Hilborn and Walters, 1992) applied by Vega et al. (2000) to set the biomass at maximum sustainable yield (BMSY) as a reference point. The stock is considered below optimum when $B/BMSY < 1$ and above optimum when the ratio is > 1 . Specific management responses to a ratio < 1 are not prescribed. Investigations in 2014 found that $B/BMSY$ is approximately 1.58 and therefore above optimum, but increased effort was not recommended due to a desire to avoid economic overfishing (SCS, 2014).

4.4.2 South Australia *Jasus edwardsii* Fishery

The South Australian lobster fishery has been regulated with limited entry, seasonal closure, minimum harvestable size, trap limit, trap design restrictions, and a prohibition against keeping berried females (SAFMR, 2006; SAFMR, 2007). A trap limitation was implemented in the 1980s when fishing capacity began to expand due to technological advances (Sloan and Crosthwaite, 2007). Each fishing license is restricted to fishing between 20-100 traps (SAFMR, 2006), but a fisherman or a holding company may own more than 1 fishing license (FAO, 2001). The recreational part of the fishery accounts for less than 5% of the fishery's annual harvest, and is further managed through daily limits and gear restrictions. In addition, recreational fishermen are required to clip the tails of each lobster they catch; the clipping helps identify recreationally caught lobsters and prevent them from entering the commercial markets.

In the early 2000s, landing and CPUE for the fishery dropped due to unfavorable environmental conditions (Linnane et al., 2013a). State managers then implemented a TAC of 625 mt (1.38 million

pounds) for the fishery in 2003 and a system of limited permit entry in 2007 (Sloan and Crosthwaite, 2007; Linnane et al., 2013a). The stock has since improved but has not fully recovered (Linnane et al., 2013a). The improvement may have been due to a more stringent TAC of 470 mt (1 million pounds) that was implemented in 2008 (Linnane et al., 2013a; Linnane et al., 2013b). The lower TAC may have prevented growth overfishing, but it could take years before recruitment improves (Phillips and McWilliam, 2009; McGarvey et al., 1999).

The fishery currently uses a formal HCR based on CPUE, measured as the weight of legal-sized lobster per trap lift, and recruitment abundance, measured as the number of sublegal-sized lobster per trap lift (Sloan and Crosthwaite, 2007). When both CPUE and recruitment decrease below specific reference points, managers must either decrease the TAC by 10%, introduce spatial management measures, or both. When CPUE and recruitment increase beyond specific reference points, managers are required to increase the TAC by 10%.

4.4.3 Florida *Panulirus argus* Fishery

The Florida lobster fishery contains a large recreational component (Sharp et al., 2005). The recreational fishery was estimated to account for 24% of the total lobster landings in the state during the 2009-10 fishing season (SAFMC, 2012). The fishery is managed in part through seasonal closure, minimum size restriction, trap/bag limit, trap design restrictions, TAC, and prohibition against keeping berried females for both recreational and commercial fishermen (Florida Administrative Code (FAC) § 68B-24.001 *et seq.*).

The fishery first experienced decline in the early 1990s in part from overfishing (Milon, 1999; Matthews, 2004). The state then implemented a tag-based trap limitation during the 1993-94 season, which would decrease the number of traps within the state through attrition until a target goal of 400,000 traps is reached (FAC § 68B-24.009). Fishermen may transfer their trap limits to immediate family or other lobster permitted fishermen, but transfer outside family would incur a fee of \$2 per transferred trap as well as a 10% reduction on the number of tags transferred (FAC § 68B-24.009; Florida Statutes Annotated (FSA) § 379.3671(2)(a)1.). The trap limitation and other conservation measures have likely improved both the health of the stock and the efficiency of the fishery (Milon et al., 1999).

4.4.4 Western Australia *Panulirus cygnus* Fishery

The Western Australia lobster fishery has maintained a high sustainable yield for decades. Management measures for the commercial fishery include management by zones, seasonal closure, minimum size, limited entry, trap limit, trap design restrictions, TAC, a maximum size for females, and prohibition on keeping berried females (GWADF, 2014). Recreational fishermen are allowed to use traps or to dive for lobsters, but they are subject to daily bag limit, and may take lobsters only during the day (GWADF, 2013). The recreational fishery is small, accounting for only 2.6% of the total fishery landing in the 2010/2011 season (GWADF, 2012).

Harvest from this fishery increased substantially in the 1980s and 1990s due to technological advances which resulted in depressed recruitment, but was relieved through the implementation of biological (e.g., maximum female size limit) and effort-based measures (e.g., trap limit) (Hall, 2001). Recruitment dropped again in the mid-2000s. This recent decline was most likely caused by unfavorable oceanographic conditions (Brown, 2009). In response to the drop in recruitment, the fishery managers decided to implement a fishery-wide TAC (GWADF, 2014). The managers are currently implementing an ITQ system to divide the TAC into transferable components (Fletcher and Santoro, 2012).

Table 4-5: Global Lobster Fishery Overview.

Lobster Species (Jurisdiction)	Biology-based Management Tools							Catch-based Tools			Effort-based Management Tools						Co-Management by Regions	Main Source of Reference
	Minimum Size	Maximum size	Taking of Berried Females Restricted	Taking of Molting Lobsters Restricted	MPAs and Other Area Closures	Seasonal /Temporary Closure	Minimum Trap Service Interval	Bag/ Daily Limit	TAC	ITQ	Limited Entry	TAE (Total Allowable Effort)	Trap Limit	Gear Design Restrictions	Gear Type Restrictions	Tail Clipping for Recreational Fishery

1 Recreational fishery introduced in 1996, but no creational sector exists (Regulaciones Pesqueras de Cuba 164/1996d; but see Phillips et al., 2000)
 2 Total catch quota shared between 10 management regions
 3 Fishermen may dive or trap for lobsters, but not both
 4 Fishery uses nets instead of traps; number of nets limited per boat
 5 Days at sea limited

6 A V-shaped notch is fixed on a female before release
 7 A V-shaped notch is fixed on a female before release
 8 Not all management areas are limited entry, but Maine residency always required for license
 9 Maine residency always required for license
 C = Commercial and R = Recreational

4.4.5 Maine *Homarus americanus* Fishery

In Maine, a combination of good management practice and favorable environmental conditions has resulted in historically high landings (Steneck, 2006). Both commercial and recreational fishermen are regulated with minimum and maximum size, trap limit, trap design restriction, and prohibition against taking of berried females (13-188 CMR §§ 25.01 *et seq.*). The commercial sector is further restricted with an area-based limited entry program (12 MRS §§ 6446-6447). Each management area may also further reduce the 800-per-fisherman trap limit required by the state through a voting process within the fishing community (12 MRS §§ 6446, 6447(5)(A); 13-188 CMR 25.10(2)). The stock is not considered to be overexploited, but concerns related to suboptimal economic performance, increases in territorial conflicts, trap entanglements (i.e. excess gear in the water), and harbor congestion have surfaced (Acheson and Acheson, 2010).

4.5 The LAC Process and the Resulting Regulatory proposals

CDFW convened the LAC to facilitate communication and build consensus between various constituent groups and CDFW. The LAC is composed of representatives for the recreational fishermen, commercial fishermen, non-consumptive recreational users, conservation interests, and the various levels of government. The process included nine regular meetings between June 2012 and September 2013. The process also involved specific communications such as the 2013 Commercial Trap Survey, which allowed members of the commercial fishing community to provide input detailing the fishing practices and perspectives on the fishery.

During the LAC process, constituent representatives were able to reach consensus on a number of items pertaining to the CA lobster fisheries, such as recognizing the current distribution of catch between the commercial and recreational fisheries to be acceptable. The LAC also reached consensus on five objectives to guide future allocation considerations for the lobster fishery:

1. Identify current effort levels for each sector and establish controls to prevent unrestricted growth.
2. Identify the proportion of overall catch and/or effort from each sector, and if necessary, take corrective action to maintain those proportions if the percent of total catch and/or effort by sector deviates significantly from a pre-determined base period.
3. Recognize the current differences between sectors in traditional fishing grounds and time-of-day fished, and seek to maintain those differences.
4. If increases or decreases to the fishery are required due to application of the control rule, those changes should seek to maintain equitability and not give an advantage to either sector unless biological triggers require a change to allocation.
5. End illegal commercialization.

Most importantly, the LAC also formed consensus on several regulatory recommendations that would benefit the fisheries and/or the natural resources. These proposals were compiled into a finalized consensus recommendation on September 11, 2013. The LAC recommendations (described below) were submitted to the Commission for its consideration at the June 2015 Commission meeting along with Department recommendations.

Commercial trap limit recommendation

In 2013 CDFW mailed a focused commercial lobster trap survey to all lobster operator permit holders (141 transferable and 53 non-transferable permit holders). The survey asked specific questions regarding individual trap fishing effort and sought to assess the level of support for a commercial trap limit. A total of 111 permit holders responded; the majority of survey responses (62%) were submitted by fishermen who target lobster south of Santa Monica Bay (including Santa Barbara Island, Santa Catalina Island, San Clemente Island, and Cortez Bank). Over 76% of all respondents replied “yes” to the question “do you think

there needs to be a trap limit?” Of the respondents who favored a trap limit, 48% wanted a trap limit of 300 traps or less, and 34% wanted a trap limit of 350-400 traps. Other notable responses include a 78% “no” for regional trap limits (northern vs. southern parts of the fishery), 52% responding “yes” to being able to stack two permits to increase their trap numbers under a trap limit, and 67% responded “no” to stacking more than two permits.

The result of this survey was presented to the LAC during the development of the LAC Commercial Trap Limit Proposal. Through consensus, the LAC recommended a trap limit of 300 attached to each fishing permit. The LAC formalized this proposal in part to cap and potentially reduce current effort level. However, the proposal also aims to eventually cap the long-term effort capacity of the commercial fishing fleet at 42,300 traps (141 permits x 300 traps each). Furthermore, each fisherman may stack a maximum of 2 permits. The proposed mechanism will give fishermen the flexibility to fish up to 600 traps each. Fishermen may receive more tags during a season to replace tags lost during rare and unforeseen catastrophes. The LAC also proposed a phase-in trap limit approach to allow each fisherman to purchase a one-year temporary permit for 300 more traps when for the first three years after the trap limit goes into effect. The phase-in permits were proposed to give fishermen time to adjust their fishing practices during the initial implementation of the trap limit.

The LAC process acknowledged that even with the ability to hold two permits, some existing fishermen, especially those fishing between 600-1,200 traps, may need to extensively modify their fishing practices. However, the interest of these fishermen must be balanced with: the risk of pollution due to lost gears if trap intensity continues to escalate; the externalized economic inefficiency impacting the rest of the commercial fleet; and the desire of other fishermen and other stakeholders wishing to see fewer traps in the water. The CDFW considers the LAC trap limit proposal as an appropriate balance and will recommend it as part of the implementing regulations for this FMP. CDFW also considers the trap limit as an important substantive regulatory proposal from the FMP/LAC process. Unlike the other regulatory proposals listed in this section, the commercial trap limit is an integral part of the HCR. It is a pro-active initiative aimed to improve the biological, social, and economic sustainability of the CA lobster fisheries.

Permission to carry SCUBA gear on commercial vessels

Existing regulations do not explicitly prohibit SCUBA equipment on commercial lobster vessels. However, regulations do prohibit commercial fishermen from using SCUBA equipment “to assist in the take of lobsters” (14 CCR 122(g)). SCUBA gear is an important tool for recovery of lost traps that otherwise might remain in the marine environment. It can also be used for disentanglement in instances when trap lines are caught on a vessel’s propeller. This proposal will clarify that commercial fishermen may use SCUBA for the purpose of securing traps, retrieving lost gear, or to unfoul a line from a vessel; it will remain illegal to use it for the take of lobster.

More than one permittee may operate from the same vessel

Neither the FGC nor the CCR prohibits two or more holders of lobster operator permits from operating from the same vessel. However, how liabilities are shared between these fishermen in the event of a violation is unclear. As such, the LAC proposes joint liability for operator permit holders operating from the same vessel in the event of a violation.

Extend the trap service interval

Federal regulations require fixed gear (includes traps) in federal waters to be serviced at least every seven days (50 CFR § 660.230(b)(3)). The desire to conform to federal regulation and to provide lobster fishermen with more flexibility in servicing their gear led the LAC to propose a longer soak time for lobster traps, extending it from four to seven days. This extended service requirement would only apply to lobster traps.

Formalize the use of notes in the commercial fishery

Lobster fishermen are allowed to authorize another lobster operator permit holder to pull his or her trap by assigning that permit holder a note. This system was designed to allow one permit holder to pull the traps of another in the event of an emergency, such as sudden illness or vessel breakdown. The LAC proposes to formalize the note system with more CDFW oversight through the submission of a waiver for CDFW approval in order to minimize potential abuse.

Additional grace period for deploying and retrieving traps

The LAC also proposes to extend the grace period for trap deployment before the commercial season opens and the grace period for trap retrieval after the commercial season closes. Commercial fishermen are currently allowed to deploy traps in the water 6 days before the season opens. They are also given 6 days to remove their traps from the water after the season closes. However, all traps left in the water during the grace periods must be unbaited with doors wired open. Fishermen may not bait the traps until 24 hours prior to the season opening, and traps must still be emptied of baits and wired open when season closes.

The LAC considers the current grace period length to be too short. Commercial fishermen tend to over-stack their decks with traps and create hazardous conditions. To decrease the chance of accidents and navigational hazards, the LAC proposes to extend the grace period for deploying and retrieving traps to 9 days. Fishermen are still prohibited from baiting the traps until 24 hours before the season opens, and traps must still be emptied and wired open when the season closes.

Branding of commercial buoys

Existing regulation requires lobster fishermen to have their respective fishing license numbers on their buoys in contrasting colors (14 CCR § 122(k)). Feedback from commercial representatives suggests that numbers that are branded onto the buoys are just as legible as the ones that are painted. Furthermore, branding does not erode as quickly as paint, which translates to less effort on the part of the fishermen to maintain legibility. For these reasons, LAC is proposing to explicitly allow fishermen to paint their license numbers in contrasting colors or to brand the numbers in a clearly legible form.

Tail clipping/hole-punching of retained recreational lobster

Tail-clipping/hole-punching is practiced in other recreational lobster fisheries. For example, Australia requires marking retained recreationally-caught lobsters, where enforcement officers can use clipping or hole-punching to distinguish recreationally-caught lobsters from commercially-caught lobsters. The same can be accomplished in California. This tool is relatively simple to implement and enforce and can help prevent recreationally-caught lobsters from entering the black market.

Prohibition on mechanical hoop net pullers

A prohibition on mechanical hoop net pullers has been proposed to deter poachers from using the pullers to poach commercial traps. The LAC has also proposed to incorporate an exemption for fishermen with disabilities.

Changing the opening time for recreational season

The midnight opening time for the recreational season has led to confusion amongst the recreational fishing community. Concerns over safety were also discussed by the LAC, due to fatalities routinely occurring on opening nights. Furthermore, a midnight opening is more difficult for CDFW to enforce than a day time opening. Due to the safety and enforcement issues associated with a midnight opener, the LAC proposes to move the recreational season opener to an alternate time. However, the LAC has expressed concerns over potential economic impacts to the Commercial Passenger Fishing Vessels and dive charter boats if the

opener is moved to after midnight compared to before midnight, as this could result in one less night of fishing.

Marking recreational hoop net floats

The LAC has also reached a consensus on supporting a rule requiring the marking of all hoop net floats with the operator's unique identifications (e.g., individual license numbers, GO ID numbers). This is intended to allow enforcement officers to better identify hoop net operators and lost gear.

Clarifying regulatory language on diving for lobsters

Current regulation prohibits the possession of "hooked devices" when diving for lobsters. This has led to different interpretations of the language as well as citation for spear fishermen who were in possession of spear guns while attempting to take lobsters by hand. The LAC proposes to clarify the language, remove the reference to "hooked device," and focus the regulatory language on how lobsters may only be taken by hand when diving. Merely carrying spearfishing gear while taking lobsters should be legal, while the use of such gear to aid in lobster fishing should remain illegal.

4.6 Management Strategy Evaluation Model (MSE)

An important step that CDFW is taking to further improve CA lobster fisheries management is the refinement of the **management strategy evaluation model (MSE)**. MSE is a sophisticated model that integrates traditional fishery stock models with management measures to predict the effects of those measures. It is an individual-based simulation model. This means that each individual lobster is simulated as a unique agent and the fate of each lobster is dependent on its state-based probability of moving, reproducing, living, or dying in each time step. A lobster's state is described by features such as sex, reproductive stage, and size. The model incorporates the effects of both the recreational sector and the commercial sector and provides an estimate of future performance of the CA lobster stock under different sets of management activities.

Management strategy evaluation (MSE) – For the purposes of the spiny lobster FMP, the MSE is a computer model that simulates lobster population dynamics, designed by a team led by Dr. Yong Chen, University of Maine. The MSE was designed to allow CDFW to monitor and evaluate the effects of management measures and the lobster fisheries on the lobster population.

4.6.1 Capability of the MSE

The MSE includes: 1) an operating model for simulating the dynamics of the spiny lobster stock and fishery; 2) historical and simulated fishery-dependent, fishery-independent, and biological data; 3) a stock assessment model yielding estimates of the current stock biomass/abundance and fishing mortality; 4) a set of alternative management actions that are practical, enforceable, and can be simulated; 5) a set of performance measures for evaluating the performance of these management actions with respect to management objectives; and 6) a set of harvest control rules determining how the management regulations should be adjusted based on a set of defined biological reference points and stock assessment results. The model is very sophisticated, and it requires tremendous resources to run effectively. As in most fishery stock models, the MSE incorporates known characteristics of a fish population and its associated fisheries to simulate a virtual population. MSE can be used in that capacity to determine important population-level characteristics, such as abundance (i.e., perform a stock assessment). The MSE, for example uses total MPA coverage to calculate a probability of encounters between individual lobsters and lobster fishermen. The encounter rate is then used to determine the fishing mortality of the stock.

However, MSE's capability extends beyond the ability to conduct stock assessments. Once an MSE run produces a simulated CA lobster stock that is comparable in its key attributes to the actual stock, it could then apply different hypothetical HCRs to the virtual population and predict the performance of each HCR (e.g., comparing the 10-year yield of an HCR using a $CATCH_{THRESHOLD}$ of 0.9 with an HCR using a $CATCH_{THRESHOLD}$ of 0.8). The model would determine whether any threshold reference point has been reached during each

virtual fishing season and apply changes to the stock's fishing mortality accordingly to simulate management actions. The model then records the status of the stock, such as total yield, over multiple fishing seasons. CDFW would then be able to assess the merit of different management options using these results. The MSE currently does not take changing environmental trends into its calculation, though CDFW scientists are attempting to incorporate such considerations into the MSE model.

4.6.2 Incorporating the MSE

The core components of the model were completed in the fall of 2013. However, the model is not yet ready for deployment. Current model outputs exhibit unresolved patterns in residuals and questionable population trends for MPAs, suggesting that it requires further development. While the current version of MSE is able to incorporate all the management measures within the control rule toolbox (Section 4.3.3), it cannot incorporate CPUE and SPR as reference points. As in the refinement of $CATCH_{THRESHOLD}$, MSE can potentially use and refine $SPR_{THRESHOLD}$, after the program code is modified to provide SPR estimates. In the meantime, CDFW will continue to improve these inputs with various monitoring efforts, including the effects of new management actions (e.g., at-sea sampling, lobster report cards, landing receipts; Section 5.1.1). If the MSE model is adapted to calculate SPR, CDFW would use the model as an alternate means of calculating $SPR_{THRESHOLD}$. Alternatively, if one of the reference points used by MSE is found to be a better indicator of the CA lobster stock's ability to replenish itself, the FMP will be amended appropriately to incorporate the new metric.

Eventually, the MSE has the potential to streamline future management actions for the CA lobster fisheries and reduce administrative uncertainties. More importantly, the model offers CDFW the potential to assimilate and analyze biological and regulatory information much more quickly, which would ultimately serve to enhance the fisheries. Once the model is fully developed, CDFW will make the appropriate recommendations to the Commission.

4.7 CA lobster and ecosystem management

This FMP adopts an ecosystem approach to management. In this context, consideration for factors such as population structure, habitat, trophic interactions, cumulative impacts of the fisheries, and climate change is crucial (COS, 2012). The first part of this FMP is dedicated to the incorporation of information on both the environmental impact of the fisheries (Chapter 2) as well as the ecosystem role of the CA lobster (Sections 3.7, 3.8, 3.9) into the FMP, in addition to the information related to the CA lobster's own natural history (Chapter 3). Next, management measures were considered in the context of other existing state regulatory structure. One of the most notable existing measures is the system of interconnected MPAs that have been established in the SCB since 2012.

On January 1, 2012, the south coast regional network of 50 MPAs, covering 355 square miles or about 15% of state waters, went into effect (including 13 previously established MPAs in 2003 at the northern Channel Islands that were retained without change)

(<https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Statistics>). These MPAs were established to achieve a set of six ecosystem-based conservation goals, most of which are not strictly related to fisheries (FGC §§ 2851, 2853). However, properly managed MPAs have been shown to enhance fisheries under the right circumstances by protecting critical habitats (Grafton et al., 2006). The MPAs, especially the state marine reserves, make it unlawful to "injure, damage, take, or possess any living, geological, or cultural resource" unless the activities are part of a permitted research, restoration, or monitoring process (PRC § 36710(a)). Protection of critical habitat can, for the case of CA lobster, translate to increased spawning potential (Kay, 2011).

It is currently estimated that 14.6% of all known SCB CA lobster habitats are protected by MPAs (Section 4.3.1.3) assuming that CA lobster fisheries occur out to 100 m (~300 ft) depth). Refinement of the data, such as analyzing the difference between habitats inside MPAs and habitats outside MPAs, is an ongoing information need (MPA Monitoring Enterprise, 2014). CDFW incorporates this number as well as other MPA specific data (e.g., MPA size, adult spillover, fishing effort adjustment due to MPA) into the calculations of the SPR reference point through the Cable-CDFW Model.

A significant number of studies have been dedicated to the effects of MPAs over the past several decades (e.g., Grafton et al., 2006; Roberts et al., 2003). However, information detailing their effects on the CA lobster fishery has been sparse. It is known that MPAs can eliminate fishing mortality inside their boundaries, but displace fishing effort and intensify fishing in the non-MPA areas (Beverton and Holt 1957; Guenette et al., 1998; Goñi et al., 2010; Alcalá et al., 2005; Shester, 2008). Existing research shows that under the right conditions, MPAs can allow lobsters to reach a larger reproductive size before being caught (Díaz et al., 2011). Past research on a related species of spiny lobster, *J. edwardsii*, further shows that larger females carry more eggs and produce stronger larvae (Smith and Ritar, 2007). If CA lobsters exhibit the same type of improvement in fecundity as they age, and if the southern California MPAs are allowing individuals to grow to a larger size before being caught, then the MPAs will contribute to the fisheries through enhanced recruitment.

MPAs have also been shown to contribute to lobster fishery yield in outside unprotected areas through movement (adult “**spillover**”). Whether MPAs will contribute to spillover of a fishery depends on a variety of factors, such as the location and size of the MPAs in relationship to the mobility of individual lobsters (Bevacqua et al., 2010; Moland et al., 2013). Furthermore, in an era of global climate change, MPAs are areas where CA lobsters would not be impacted simultaneously from climate change (Section 3.11) and fishing.

<p>Spillover - The emigration of adults from a protected area to the fishing grounds, and/or larval export from the protected area to surrounding areas.</p>

MPAs can also almost completely eliminate other ecosystem impacts from commercial and recreational fishing within their boundaries. These include bycatch and trap-habitat interactions. Moreover, the elimination of fishing pressure in certain areas can ensure that a portion of the CA lobster stock will grow to a size large enough to enable them to assist with controlling the local urchin population (Section 3.9).

In addition to the MPAs and the new HCR, measures that have been proven to be effective at keeping the CA lobster stocks at a biologically sustainable level (Section 2.4) will remain in place. Existing regulations for the recreational industry include the mandatory reporting requirement, minimum size limit, area closures, bag limit, gear restriction, and season restriction. Existing regulations for the commercial industry include the mandatory reporting requirement, minimum size limit, area closures, limited entry, gear restriction, trap specification, and season restriction. The CA lobster fisheries also adhere to the Marine Protected Areas (MPAs) regulations.

The management measures and strategies this FMP adopts are thus not designed to independently solve every ecosystem-related issue attributed to the CA lobster fisheries. Instead, the FMP management strategies, the MPAs, and existing management measures all have their respective strengths and weaknesses, and they are meant to complement each other. For instance, while the MPAs can eliminate fishing, and thus all bycatch, within their borders, they are not designed to curtail bycatch elsewhere. This is where existing rules such as trap design specifications and new rules like the proposed trap limit would complement the MPAs and reduce the overall ecosystem impact of the CA lobster fisheries. Additionally, the HCR, in conjunction with the proposed trap limit, will help control fishing effort and further buffer against unsustainable harvest of CA lobsters. The HCR will help maintain the role of CA lobster as an

important trophic link within the nearshore ecosystem as well as the integrity of the associated benthic habitat, and will also minimize impacts to non-targeted species.

While this FMP and existing management measures will go a long way towards protecting the CA lobster resource and its associated ecosystem, activities of other agencies with jurisdictions over coastal and nearshore areas may affect the lobster fishery. For example, the authority to manage coastal development of the state is vested in the California Coastal Commission (PRC §§ 30000 *et seq.*). The Coastal Commission can use the information within this FMP (Section 3.1) to inform its permitting and other regulatory functions to minimize impact to important lobster habitats. The information will also serve as a starting point for intergovernmental collaborations in important future developments.

5. Fishery Research Protocol – Essential Fishery Information

The MLMA requires CDFW to formulate FMPs with the best available science or other relevant information without delaying plan preparation (FGC § 7072(b)). Certain categories of EFI relate to the socio-economic aspect of a fishery while others relate to the natural history and biology of the fished species. CDFW must outline how it would obtain missing or outdated EFI within an FMP (FGC § 7081).

5.1 Research and Monitoring Needs for Essential Fishery Information

CDFW has primarily relied on its own **fishery-dependent data** to determine the status of the spiny lobster stock and associated fisheries. The need to improve existing data has shaped CDFW CA lobster-related research since 2007. Table 5-1 describes the future data needs for managing the CA lobster fishery, including the biological EFI category, their importance, current state of knowledge, and methods for improving them.

5.1.1 Existing CDFW Research Methods

The following methods are currently employed by CDFW and its partners:

Logbooks

Commercial fishermen have been required to record specific information for each fishing trip in commercial logbooks since 1973. A logbook entry must contain the date, fisherman and crew ID, vessel ID, CDFW fishing block, a landmark (typically a shoreline feature or reef) corresponding to the area fished, the number of legal-size CA lobster retained, and the number of sublegal-size lobsters released. Effort is compiled based on the number of trap pulls or the length of the soak time. Associated landing receipt ID numbers can also be recorded. Each log has room to record 3 days of fishing with up to 5 sets of trap pulls per day. CDFW is working towards a transition from paper to electronic commercial fishing logs and plans for the CA lobster fishery to be the first to implement a voluntary electronic log by the 2019-20 fishing season.

Commercial landing receipts

Commercial landings have been recorded since the early 1900s via commercial landing receipts. Landing receipts record the date of sale, species(s) landed, port of landing, fisherman ID, vessel ID, CDFW fishing block from which the catch was taken, the price paid, and weight landed. Landing receipts are filled out by fish dealers or by fishermen permitted to sell their own catch.

Fishery-dependent data - Information collected directly from or during the process of fishing, or from fishery landing data. May be collected from commercial and/or recreational sources, and may include catch/effort reported by fishermen, size and age composition of the catch, and biological samples collected at port.

Correlating commercial logbooks and landing receipts

Information such as the weight and number of lobsters landed by a fisherman on a given day is important for both the management and the enforcement of the CA lobster fisheries. CDFW uses this type of information to obtain the annual average size of a landed CA lobster, which is crucial for determining the SPR of the stock. To obtain such information, correlation between commercial logbooks and landing receipts is necessary.

In the mid-1990s, CDFW transitioned from daily logs to new logs that record up to three days of fishing. Unlike the daily logs, which recorded the weights landed on a daily basis, the new logs provide space for the number of legal-size lobsters retained, but not weight. Landing receipts between fishermen and buyers, on the other hand, only record weight and not number of lobsters sold (Appendix IV). In order to determine the weight of the lobsters caught on an individual fishing date, CDFW must first identify the landing receipt ID numbers recorded on the log of that particular date. CDFW must then retrieve the specific landing receipt with the corresponding ID.

This current system of correlating logs with receipts is a complex process. For fishermen that sell all of their catch from a single day to one buyer, correlation is straight-forward. However, CDFW will not be able to determine the precise weight of the lobster caught on a single day for fishermen that sell multiple days' worth of catches to a buyer. CDFW can locate the landing receipt in question, but there is no way of attributing different portions of the landed weight to different days of fishing.

CDFW currently bases its SPR calculation on data taken from only log entries that are tied to one landing receipt. More sophisticated computer programs can also analyze the correlation between catch totals and landed weights from logs with multiple landing receipts per fishing day, but the process is much more complicated. As part of the implementing regulations for this FMP, CDFW is proposing to amend the landing receipts to record the total number of lobster purchased as well as the ID number of the corresponding logs to address this issue.

Recreational lobster report cards

Report cards were introduced during the 2008-09 recreational season and must be purchased by every person fishing for lobster in California, including individuals who are not required to possess a valid sportfishing license (e.g., youths under 16, pier fisherman). Initially, the report cards were valid for a single calendar year and captured data for the last half of a given season and the first half of the subsequent season. Because of the mismatched timing, CDFW could not obtain results from a full season until approximately 15-17 months after the season ended. A new seasonal card introduced for the 2013-14 season can shorten the wait time to 3-5 months following season closure.

Report cards record the date, location, gear type, and number of lobster retained. The report cards provide 92 fishing location codes for fishermen to choose from as of the 2013-14 fishing season. The spatial resolution for coastal areas south of Point Conception is relatively high. However, the Channel Islands are each represented by a single location code, and CDFW's ability to analyze fine scale recreational catch patterns is limited. Furthermore, all take north of Surf Beach in Santa Barbara County (up to the California-Oregon border) is represented by a single code (Figure 2-9). CDFW may modify the spatial resolution of the report cards in the future based on management needs.

Recorded gear categories include conical hoop net, flat hoop net, skin diving, and SCUBA diving. However, the cards do not include the number of nets used nor the amount of time spent fishing. In addition, CDFW cannot practically compare the time recreational fishermen spent hoop net fishing directly with the time the

community spent diving. Consequently, CDFW uses ‘trips’, or a single line from the report cards, as the unit of effort. Due to this, as well as uneven report card return rates, only limited effort comparisons are possible between hoop netting and diving using the report card. Refined data collection of effort could be achieved with two additional columns on the card: the number of nets used (zero if diving) and the total time spent fishing.

At- sea fishery sampling

At-sea sampling refers to instances when fishermen gather data during normal fishing operation. Such a program was integrated with other data collection efforts (e.g., observers, **fishery-independent** surveys, tagging studies) to manage the New Zealand rock lobster fishery (Starr and Bentley, 2002; Starr, 2010).

California Sea Grant in collaboration with CDFW conducted a three-year project for CA lobster based on a framework developed for the southern California rock crab fishery (Culver et al., 2010) and an earlier effort by CDFW. The project collected the same general information as the lobster logs but included animal size, sex ratio, reproductive condition, shell condition, and trap density. This has provided important corroboration for CDFW’s logbook data (and vice versa) and was used to help refine our estimates of average weight and subsequent calculations of SPR. At-sea sampling programs can also provide more accurate estimates of CPUE. The program required willing and capable fishery participants and employed financial incentives to offset reduced productivity for those participants. Because there is not continued, dedicated funding for the project, the program’s successful adoption in the future will depend on fishermen who recognize the value of additional data and voluntarily continue the work or additional mandatory reporting requirements.

Creel sampling

Two creel surveys were undertaken by CDFW targeting the recreational lobster fishery. The data collected included fishing mode (type of fishing platform), gear, number of hours fished, fishing location, number of CA lobster released, number kept, carapace length, weight, and sex. The surveys involved intercepting fishermen leaving a site after fishing. Survey sites include launch ramps, piers, jetties, and beach access points.

Fishery-independent data – Scientific research to collect information that is independent of commercial or recreational fishing operations. Surveys utilizing commercial fishing gear may provide unbiased estimates of abundance. Surveys may also use other methods (e.g., acoustics, SCUBA, video) to collect other biological or ecological information (e.g., movement, migration, growth rates, natural mortality) relevant to a fishery.

California Recreational Fisheries Survey (CRFS) - The California Recreational Fisheries Survey (CRFS) is the method for estimating total marine recreational finfish catch and effort in California. The CRFS is a coordinated sampling survey designed to gather catch and effort data from anglers in all modes of marine recreational finfish fishing.

The first survey occurred in 1992 and targeted lobster fishing during the first two weekends of the CA lobster season at four sites. The 2007 survey encompassed the entire SCB and was done in preparation for the launch of the recreational lobster report card and sampled three of the four sites sampled in 1992. The 2007 survey also operated at night over the first 12 weeks. The 2007 sites were based on CDFW’s long running finfish-oriented **California Recreational Fisheries Survey (CRFS)**, which has since incorporated lobsters into its survey program. It is important to note that while most recreational lobster fishermen fish at night, CRFS sampling only occurs during daytime. CDFW has used the results from these creel surveys to compliment data from the recreational report cards as well as other assessment efforts.

Research trapping

Research trapping programs use lobster traps to sample populations. Research trapping is typically collaborative and takes place onboard commercial fishing vessels. In some instances, scientists trained to

use commercial fishing gear can work from research vessels, which can reduce scheduling conflicts among partners, especially when commercial vessels are unavailable (Kay et al., 2010).

Research trapping is a powerful tool because data are collected in a manner that matches fishery-dependent methods, which makes data directly comparable in statistical analyses and stock assessment. Furthermore, traps allow researchers to sample a relatively large number of lobsters not typically possible with traditional research approaches (e.g., SCUBA). These programs have been employed in California to support MPA monitoring efforts as well as lobster tag recovering efforts in the northern Channel Islands (Kay et al., 2011) and in San Diego (Hovel and Neilson, 2011).

Dive surveys

SCUBA diving is an essential method for directly observing CA lobster in their natural habitat. A large number of research groups use SCUBA to monitor reefs in southern California. CDFW scientists collaborated with other academic researchers on a baseline study for CA lobster within southern California MPAs. The study included a research trapping and tag/recapture component, SCUBA surveys, and a habitat mapping/lobster movement component. The SCUBA survey was used to determine abundance, density, den occupancy, habitat type, and other ecological information at key locations inside and outside select MPAs. While this method is uniquely able to estimate animal densities and their association with particular habitat features, it suffers from several drawbacks. SCUBA surveys are typically conducted during the day when lobsters are in dens and may be difficult to observe. Additionally, the patchy spatial distribution of lobsters necessitates that large areas be surveyed in order to count a sufficient number for statistical analysis.

5.1.2 Additional Research Methods

The following methods are not currently in use by CDFW to provide lobster EFI. However, CDFW is a research partner in a number of collaborative projects that include some of these methods led by other institutions.

Port sampling

Port sampling is a method by which samplers meet commercial vessels when they return from fishing and measure some fraction or all of the catch. This is a very efficient and cost-effective method for obtaining large sample sizes. During the 2008-09 fishing season, for example, a single researcher working with commercial lobstermen was able to sample 14 fishing trips from Santa Cruz Island and 17 trips from Santa Rosa Island. The catch sampled during these sampling sessions represented approximately 8.5% and 12.5% of the total 2008-09 catch from the CDFW fishing blocks encompassing Santa Cruz and Santa Rosa Islands, respectively (Kay et al., 2011). Port sampling is ideal for monitoring length frequencies, sex ratios, mean weight of animals in the catch, and condition of animals.

Larval collectors

Larval collectors are man-made devices upon which pueruli settle. They are typically constructed to resemble preferred settlement surface, and are usually deployed in nearshore waters. The effectiveness of two puerulus collector designs were tested by Miller (2014) in California and Arteaga-Rios et al. (2007) noted significant positive correlation between pueruli in collectors and commercial catch in Baja, Mexico five years subsequent. While these studies are encouraging, the utility of puerulus larval collection for CA lobster is still uncertain, and further research on sampling methodology is needed. The California Cooperative Oceanic Fisheries Investigations' (CalCOFI) zooplankton sampling time series has the potential to reveal more information regarding the abundance and distribution of earlier stage phyllosoma larvae across

several decades. Koslow et al. (2012) used this time series to identify a relationship between environmental conditions and phyllosoma abundance. The project is ongoing and may contribute to the management of the CA lobster fishery in the future. Abundance of earlier stage larvae may serve as an indicator of adult spawning potential while late stage larvae may help forecast changes in stock abundance, identify preferred settlement habitats, and differentiate source and sink areas. CDFW will seek to develop collaborations to model larval transport in the SCB and California Current, which can help determine the sources and the destinations of the lobster larvae across southern California.

Laboratory studies

Laboratory studies are useful for investigating aspects of lobster biology that cannot be studied in the field. Results of behavioral laboratory studies must be interpreted with caution because conditions in a controlled lab are inherently different from field conditions, though they are often designed to complement field studies.

Oceanography

Oceanography is a broad field within marine science that focuses on the physical properties and processes of the ocean (e.g., water temperature, salinity, depth, nutrient levels, storm activity, currents, and bottom types). This field of study can directly assess the effects of climate change, ocean acidification, and climate-driven hypoxia on future CA lobster population. Oceanography can also relate the physical characteristics of the ocean to biological processes such as productivity, trophic structure, population connectivity, distribution of larvae, growth rate and distribution of fish stocks, disease outbreak, and other management-relevant issues. Oceanographic data are typically collected with instruments deployed from boats and ships or with satellites; complex modeling is often the mainstay of data analysis.

Genetics

Genetics uses the hereditary material in an organism (e.g., genes coded for by DNA) to help understand a large number of biological processes. Because genes in DNA are passed from parents to offspring, and because certain genes are unique to individuals, populations, or species, they are a powerful tool for studying the relatedness of two or more organisms. This information can provide insight into topics like population connectivity, evolution, and disease susceptibility and resistance.

5.2 Biological EFI: Status, Application to Management, and Methods for Obtaining Data

Chapter 4 of the MLMA Master Plan designated this fishery as data rich for several EFI categories (e.g., growth rates and reproduction) and poor in others (e.g., stock distribution, recruitment). Even in areas where the population-wide characteristics are well understood, important details can still be missing or, regional differences have not been thoroughly explored (Table 5-1).

Age and growth

Accurate age and growth data are essential for CA lobster management. Growth rate can be used to determine the age of maturity or SAM and estimate of the number of spawning seasons a lobster would experience before reaching legal size when coupled with observations of SAM. Published growth rates for *P. interruptus* are highly variable (Section 3.2), and it is unknown whether, or by how much, growth rates might vary through time or from region-to-region in California. Furthermore, decades of fishing have resulted in a scarcity of older lobster that complicates determination of the species' maximum size.

CDFW currently estimates CA lobster growth rates, and subsequently age, using the commonly applied von Bertalanffy growth model with parameters derived by Vega (2003a) for the Mexican stock. Tag-recapture data exists for the CA stock from three studies representing different regions of the SCB and different lobster size classes (see Appendix X). The first of these studies provides information on the growth of juveniles from Santa Catalina Island (Engle, 1979). The second study conducted in the northern Channel Islands provides information on the growth of adults ranging up to relatively large sizes. Third, CDFW collaborated with academic researchers and fishermen to tag CA lobsters in San Diego Bay (Hovel and Nielson 2011) and South Coast Region MPAs (Hovel et al., 2015). These studies rely not only on research trapping to recover tags but also on recovery by recreational and commercial fishermen. Investigations by CDFW into the fit of the von Bertalanffy and other possible models to these data suggest that the von Bertalanffy model may not be the best choice for the CA lobster data. However, less conventional growth modeling options were ultimately rejected during peer review of this FMP, in part because these data contain a gap in information for lobsters in the 30 to 50 mm CL size range. Until that gap is addressed CDFW will continue to use parameters from Vega (2003a) but place a high priority on participating in tagging studies that address these critical knowledge gaps.

Estimating the age of crustaceans has historically been more difficult than aging finfish because crustaceans shed most of their hard structures that might be used for aging each time they molt. Tag-recapture studies only provide an indirect estimate of the age of individual lobsters. New advancements in crustacean aging have recently been made by counting rings in hard parts of the eye stalk and gastric mill that are not shed during molting (Kilada, 2012). Another method measures the concentration of a pigment called lipofuscin, and was found to be a suitable method for aging Caribbean spiny lobster *Panulirus argus* (Matthews et al., 2009). These methods provide a direct measurement of age and the potential for more accurate understanding of growth. CDFW will seek opportunities to investigate the application of these techniques to CA spiny lobster.

MPAs also provide researchers with an opportunity to correct for the maximum-size/age-related biases associated with fished populations. Due to the recent establishment of MPAs in southern California (established in 2012) it is unlikely that CA lobster populations inside the MPAs will show a dramatically different size structure than outside MPAs for many years (possibly 2-3 decades). CDFW is currently participating in the south coast region MPA Baseline Study in an effort to track the effects of MPAs on CA lobster populations. The current status of knowledge related to age and growth EFI ranges from poor to moderate. Obtaining better information related to age and growth is a high management priority (Table 5-1).

Stock distribution

The MLMA Master Plan defines a stock as “a population unit that is selected for management purposes” and its distribution as “where a stock is found.” It is necessary to define the stock distribution because of management implications related to potential biological differences between sub-populations and jurisdictional issues (CDFG, 2001). CDFW currently manages the entire population within the SCB as one population and one stock. The status of knowledge related to where CA lobster are found is currently well-known and genetic evidence generally points to CA lobster within US borders being well-mixed during the larval phase (Section 3). However there has been some recent genetic evidence of either self-recruitment and/or spatially cohesive larval cohorts. CDFW will continue to monitor advancements in genetic work and larval tracking as we seek to confirm CA lobster’s place in the spectrum between a single mixed population, a meta-population, or a group of separate sub-populations. The research priority for genetic structure is medium (Table 5-1). Regional differences in other aspects of CA lobster biology (e.g. fecundity, growth, reproductive timing) may also be indicators of sub-structure within the stock that may warrant

consideration of regional management in the future (Section 6.2.2). Collection of this information is of medium to high importance as noted throughout this section and Table 5-1.

Ecological interactions

The ecology of CA lobster is discussed in detail in Section 2.1. The species serves as an important scavenger and predator of the southern California kelp forest ecosystem. Predation on intertidal mussels by CA lobsters can relieve red algae from competition for space (Robles and Robb, 1993), and predation on urchins can relieve giant kelp from urchin grazing (Guenther et al., 2012 and references therein). CA lobster plays an important role in the ecology of rocky reefs, and it is associated with critical habitats such as surfgrass beds. Management should remain aware of information on the ecology and habitat preference of *P. interruptus*, and encourage related ecological research and monitoring.

A number of research programs both independently and in collaboration with CDFW are currently conducting long term monitoring of southern California reefs. These programs provide a valuable service monitoring the condition of CA lobster habitats, prey abundance, predators, water quality, and oceanography. The long list of research groups collecting such data include: the National Park Service Kelp Forest Monitoring Program, the Partnership for the Interdisciplinary Study of Coastal Oceans, Santa Barbara Coastal Long Term Ecological Research Program, the California Current – LTER, individual research laboratories, and Reef Check California. Research protocols and data collected for many of these organizations are available online. This FMP does not link ecological metrics directly to the reference points or the HCR, and future research and monitoring of ecological interactions are a medium level priority for CDFW at this time (Table 5-1).

Indices of Abundance - Measurements of the abundance of an organism made over time; used to make inferences about the abundance of an entire population.

Indices of abundance

Indices of abundance (catch and CPUE) are used as reference points that link directly to the HCR in this FMP. Indices of abundance are perhaps the most common reference points used in fisheries management, and they are described in detail in Section 4.2.4 and 4.3. CPUE and catch are currently tracked by CDFW data and will be available after each fishing season for the foreseeable future. CDFW is also interested in developing new types of data, making new control rules possible in the future. One example of this is CDFW collaboration on direct visual estimations of CA lobster density and abundance with various academic groups. The knowledge regarding catch and CPUE is rich. Their status as reference points means that the priority for continued monitoring of these parameters is high. CDFW has moderate information on visual surveys on the sea floor; this priority is low (Table 5-1). Larval abundance from CalCOFI as well as settlement studies offers prospective abundance indices that may be linked to spawning biomass and/or recruitment. Ongoing research in these areas is a medium priority.

Movement patterns

Lobster movements can be divided into two general categories: 1) seasonal movements related to biological or environmental cues, and 2) more frequent foraging excursions (Section 3.6). Both are important to this FMP because they are mechanisms by which lobsters exit MPAs or district closures and become vulnerable to fishing. The spatial scale and frequency of these two movement types require different research approaches.

Lobster movement over longer time periods (i.e., seasonal) can be studied using traditional tag-recapture studies that use individually identifiable tags. CDFW has been involved in such a movement study in San Diego Bay in collaboration with San Diego State University. CDFW was also involved in a study examining

spillover rates as part of the South Coast MPA Baseline Study in collaboration with fishermen, San Diego Oceans Foundation, and Scripps Institution of Oceanography.

Unlike seasonal movements, foraging excursions are best studied using “active” (signal-transmitting) tags that are applied to animals and tracked by researchers. CDFW undertook a multi-year tracking study with San Diego State University to look at CA lobster movement around San Diego Bay and the Point Loma kelp bed (Hovel & Neilson, 2011). The level of knowledge on movement patterns is moderate, and their priority is medium (Table 5-1). CDFW will continue to engage in independent and collaborative tagging studies.

Recruitment

Larval recruitment and fishery recruitment are two measures that can be useful in projecting the future trend of the fishery. Data that track larval abundance and recruitment can provide powerful information for fisheries management such as: 1) long term trends that provide direct evidence of a stock’s ability to replenish itself, 2) the state of the spawning biomass that produces the observed larval abundance (Jacobson and MacCall, 1995), and 3) annual levels of recruitment to predict future catches (e.g., Phillips, 1986; Caputi et al., 1995; Shanks et al., 2010). Spatial pattern of larval abundance also helps define reef areas that are sources or sinks for reproduction of the stock, which can be invaluable for understanding the role of MPAs as conservation tools. For these reasons, many lobster fisheries have data collection programs that track the abundance of larvae using artificial collectors. California has no collector program for CA lobster larvae, but phyllosoma larvae are collected on annual CalCOFI cruises and have been used to explore patterns and processes related to CA lobster larval abundance and environmental conditions or stock abundance (e.g., Johnson, 1960a, b; Pringle, 1986; Koslow et al., 2012).

Implementation of a formal CA lobster larval monitoring program could provide valuable information regarding the current and future conditions of the CA lobster stock. Abundance of earlier stage larvae may serve as an indicator of adult spawning potential while late stage larvae may help forecast changes in stock abundance. However, puerulus settlement data did not predict stock fluctuations of Australian lobster (Linnane et al., 2013a). The workload associated with a later stage puerulus larval collection program would be significant because collectors must be sampled frequently (every 1-2 weeks) over the peak settlement period of 4+ months. This sampling includes recovery of the collecting devices and laboratory sorting of the contents to count larvae. Such programs are only valuable if they are run nearly every year and over long time spans. A recent study by Miller (2014) examined the relative effectiveness of two collector designs, but testing would need to continue to identify the most appropriate type(s) of collectors for CA lobster. Thus, a larval recruitment monitoring program represents a significant long-term investment, and CDFW would need to identify the resources necessary to conduct this monitoring. A larval monitoring program that has the resolution to define larval sources and sinks could aid management, but would require a large number of larval collectors throughout the SCB and the associated cost would be significant. Such an approach would ideally be coupled with genetic studies that help identify the origins of settling larvae. An alternative to larval collection is to use oceanographic models of currents to estimate the locations of the population sources and sinks. Such a model was used to evaluate MPA network designs during the MLPA process in southern California. Development, refinement, and application of such models have not occurred within the context of CA lobster fishery, but CDFW will continue to explore this tool.

Monitoring fishery recruitment (growth of sublegal-size lobsters to legal size) allows for predictions of fishery yield for upcoming seasons, and provides assurance that reproduction has been successful in previous years (i.e., during the year(s) that current fishery recruits hatched and settled). Trends in sublegal-size abundance are used as reference points in some lobster fisheries (e.g., ASFMC, 2009). Obtainment of these data is inexpensive when collected in logbooks, but often do not reveal how many times individual

lobsters are caught, released, and recaptured. Fisheries that use sublegal-size abundance to estimate fishery recruitment usually have dedicated survey programs for collecting these data. Current knowledge regarding recruitment ranges from poor to moderate. Obtaining better information on the stock's sublegal-size abundance is one of the highest priorities for management, while information regarding larvae has medium priority (Table 5-1).

Reproduction

Size and age at maturity are important parameters for both the Cable-CDFW model and the MSE model. Determining this parameter has primarily been based on observing berried females found in fishery harvests and research trapping. Recent CDFW measurements during tagging studies suggest that SAM is smaller than previously thought. How this parameter and the timing of reproduction vary regionally is unknown. Fecundity of large female lobsters such as those inside MPAs has also not been thoroughly sampled. For these reasons, determining variability across regions is a future goal. State of knowledge on CA lobster reproduction is moderate, and the priority for obtaining better information is high (Table 5-1).

Total Mortality

Total mortality is the rate at which fish die, and it can be separated into two components: 1) **natural mortality** (causes include predation, disease, and old age), and 2) **fishing mortality**.

Total mortality - Natural mortality and fishing mortality combined.
Natural mortality (M) - The rate at which organisms in a population die due to natural causes.
Fishing mortality (F) - The rate at which organisms in a population die due to fishing.

Natural mortality is a critical parameter in biological models used in stock assessment. Several studies have estimated similar natural mortality rates for CA lobster (Chavez and Gorostieta, 2010; Kay, 2011; Nielson, 2011) and they are consistent with estimates for other temperate spiny lobster species (Kay and Wilson, 2012). Little is known about juvenile natural mortality. Factors that affect natural mortality include ocean temperature, oceanographic regimes (e.g., PDO, El Niño), reef-specific ecology, habitat characteristics, and existence of MPAs (Kay and Wilson, 2012). Approaches for estimating natural mortality include tag-recapture and examination of populations in MPAs.

Fishing mortality (F) is an estimate of the rate at which fish are caught. A harvest rate (u) can be calculated directly from F , and it is the percentage of the legally harvestable fish stock that is caught in a fishing season (Section 4.1). Fishing mortality (and harvest rates) lie at the core of this FMP. F directly links to the MLMA objectives (Table 5-1), to reference points determined or used by the FMP models, and to any control rule described by the FMP. A major emphasis of this FMP is focused upon the identification and management of harvest rates that avoid/minimize recruitment overfishing, economic overfishing, and ecological impacts. Available estimates for mortality range from poor to moderate and are adequate for modeling purposes. However, accurate and region-specific estimations of fishing mortality rates are central to accurate model runs, and are thus the highest research priorities identified in this FMP (Table 5-1).

Other EFI –Stock Composition

The models proposed by the CA lobster FMP to produce reference point data would benefit from additional EFI not explicitly listed in the MLMA Master Plan. CDFW may include any biological information that is

Stock Composition - Any description of the population attributes of a stock (age, size, sex), usually within a spatial context. This commonly refers to the spatial distribution of breeding groups or genetically-related organisms.
Length frequency distribution - A graphical representation of the number of organisms by length.

“necessary to permit fisheries to be managed [sustainably]” as part of a fishery’s EFI (FGC § 93). Additional EFI to improve modeling includes **stock composition**. Stock composition generally refers to the size composition (**length frequency distribution**), abundance, and sex ratio of a stock. Better information on the

spiny lobsters' stock composition can provide a useful and independent corroboration to CDFW's other assessment efforts.

Length frequency distribution gives CDFW a way to corroborate calculations of growth rate, fecundity, and mortality. However, the assumption that length frequency data derived from commercial landings would accurately represent the length frequencies of natural populations holds true only if lobsters of all sizes have an equal chance of entering and remaining in traps or other fishing/sampling gear. Otherwise, the true population size composition will be misrepresented in any data based on traps. To compensate for potential bias within the landings database, CDFW currently supplements its length-frequency data with samples from research traps, gill nets, and SCUBA surveys that are part of the collaborative South Coast MPA baseline study. California Sea Grant's at-sea sampling pilot project and creel sampling also provide more accurate length frequency distributions. At-sea sampling currently has several advantages over port-sampling: 1) higher spatial resolution; 2) sublegal-size lobsters are measured; and 3) bycatch can be recorded. Currently CDFW does not have a program for collection of individual length frequency data with guaranteed consistency through time. Such a program would expand CDFW's options for calculation of fishing mortality with potentially greater accuracy, distinguishing processes effecting lobster life stages differentially, and tracking cohorts through time.

Abundance of the legal-sized individuals can help assess present harvest rate and future catches. CDFW has calculated legal-size lobster abundance based on CDFW-collected commercial catch data in the past, but these estimations have relatively coarse spatial resolution. Finer geographical-scale estimations have also been made (e.g., Hovel and Neilson 2011; Kay et al. 2011; Iacchei et al 2005). CDFW has participated in new local studies to help fill the gaps between the previous studies, especially those pertaining to the southern portion of the bight.

The number of sublegal-size lobsters captured by the commercial fishery is being recorded in logbooks, and with improved tagging studies, comparisons of sublegal-size abundance across space and time can be adjusted to more accurately reflect the abundance of sublegal-size lobsters. Information on the sex ratio of the stock was recently collected by California Sea Grant's at-sea sampling program and CDFW is not planning any new monitoring effort to directly obtain information on stock sex ratios. Continued sex ratio information could be used to improve population model output and would be important if a sex-selective fishery were considered in the future.

In addition, research that describes invertebrate population changes in California MPAs is also an ongoing priority within CDFW to inform adaptive management of the State MPA network. MPAs affect lobster stock composition by producing large and localized increases in lobster average size and abundance inside reserve borders (Diaz et al., 2011). New information on the cumulative biomass and reproductive potential of the lobsters inside reserves can then be incorporated into the estimates for F , SPR , or other measures of stock size used in this FMP. CDFW's information on these parameters ranges from poor to rich, and obtaining better information is of the highest priority. This effort will potentially span decades as various components of the coastal ecosystem rebuild to pre-exploitation level.

Other EFI – Habitat Coverage by Type

An accurate estimation for the total percentage of CA lobster habitat that is contained within MPAs is an important input for the calculation of SPR (Section 4.3.1.3). CDFW obtained the current estimate by calculating the percentage of shallow hard-bottom habitats (0-100 m depth, 0-328 ft) that are protected by MPAs prohibiting both commercial and recreational take. This estimate utilizes the maximum extent of kelp

Table 5-1: Categories of EFI identified by the MLMA Master Plan and specific data types and their priorities for research identified by this FMP.

Biological EFI Category (MLMA)	Specific data types used in fisheries management	Current status of knowledge (poor, moderate, rich)	Priority for management and FMP (low, medium, high, highest)	Data collection methods												
				Logbooks	Landing Receipts	Rec. report cards	At-Sea Sampling	Port sampling	Creel sampling	Research traps	Research SCUBA	MPA monitoring	Larval collectors	Lab studies	Oceanography	Genetics
Age and growth	Individual growth rates	moderate	high				S	S	S	P		P		S		
	Longevity (max age and size)	poor	high									P				
Stock distribution	Catch relative to fishing blocks	rich	low	P	P						P		S		S	
	Genetic population structure/larval mixing	moderate	medium													P
Ecological interactions	Role as predators (e.g., to control grazers)	moderate	low									P			S	
	Essential habitat (e.g., surfgrass / shelters)	rich	medium									P			S	
Indices of abundance	Catch (per season)	rich	highest		P	P				P						
	CPUE	rich	highest	P		P	P				P					
	Visual surveys on seafloor	moderate	low									P				
Movement patterns	Seasonal/annual movement distances	moderate	medium					P				P				
	Nightly foraging distances	moderate	medium									P	P			
Recruitment	Source and sinks for larvae	poor	medium											P		P
	Larval abundance and recruitment	moderate	medium										P		P	
	Sublegal-size lobster abundance	poor	highest	P				P			P	S		S		
Reproduction	Size at maturity (SAM)	moderate	high					P				P		S		P
	Fecundity	moderate	high									P		S		P
Total mortality	Natural mortality	moderate	high									P		P		
	Fishing mortality (harvest rates)	moderate	highest	S	S			P				P		P		
	Handling mortality and sublethal impacts	poor	medium									P	P			
Stock composition	Size structure of stock (length frequency)	moderate	highest					P	P			P		P		
	Selectivity of length frequency sampling gear	poor	highest									P		P		
	Mean size of lobsters in catch	rich	highest	P	P			P	P			S				
	Effects of MPAs on size and abundance	moderate	highest					S				P	S	P		
Habitat coverage	% of a habitat type covered by MPAs	moderate	highest					P				P	P			S

For each data type, descriptions are provided for the current status of knowledge and the priority of improving data collection for management under this FMP (i.e., importance for assessing, monitoring, and maintaining sustainability of the fishery). Finally, data collection methods that are best suited to obtaining each data type are indicated. (P = primary data source; S = secondary data source).

canopy as a proxy for hard-bottom habitat in areas where seafloor mapping data are not available. Incorporation of other habitat types such as tidal flats and eelgrass beds is currently not appropriate either because the extent to which CA lobsters utilize these habitats is unclear, or because there is limited spatial data detailing the extent of these areas. Overall, CDFW possesses a moderate amount of information related to habitat coverage; better assessment of these areas is of the highest priority (Table 5-1). CDFW will continue to incorporate new information to better calculate the current state of the population's spawning potential, as well as to better estimate the baseline condition during the period of stability in the early 2000s, which is necessary to improve the $SPR_{THRESHOLD}$.

5.3 Socioeconomic EFI: Update on the 2013 Economic Report

The purpose of socioeconomic EFI is to help inform CDFW of the social and economic impacts of potential regulatory actions (CDFG, 2001). The MLMA Master Plan characterized the CA lobster fishery as data poor back in 2001. Various socioeconomic aspects of the fishery have since been analyzed first in a 2009 report and again in 2013 (Hackett et al., 2009; Appendix VI; Section 2.5). CDFW will continue to pursue similar studies in the future to update established knowledge and fill any knowledge gaps. In particular, future survey efforts should track the popularity of hoop nets as well as improve estimates on groups that have been sparsely sampled in previous socioeconomic surveys (Section 2.2).

Employment

The commercial CA lobster fishery was responsible for an estimated 323 full-time equivalent jobs during the 2011-12 fishing season. The commercial fishery was also responsible for a total estimated economic effect of over \$22 million in southern California over the same fishing season (Appendix VI). Analysis of the economic effects of the recreational fishery has not been done.

Expenditure

Analysis of the expenditures for both the recreational and the commercial fisheries during the 2011-2012 fishing season indicate that the Commercial fishery expended ~\$10.5 million and the recreational fishery expended ~\$40.8 million.

Resource Demand

The MLMA master plan defines resource demand as "the relationship between the quantity and quality of a good or service, and demand by the user at various market price or cost" (CDFG, 2001). Neither the 2009 nor the 2013 reports on the CA lobster fishery focused on this particular issue. However, recent increase in foreign demand and the associated rise in ex-vessel value for CA lobster show that better analyses on market demand may become increasingly important for effective fishery management.

Revenue

Revenue includes revenue from both sales conducted within the coastal community and sales through exports (CDFG, 2001). The ex-vessel value of lobsters landed in the 2011-12 fishing season was estimated at ~\$12.9 million. The revenue earned by supporting industries (e.g., boatyards, trap makers, etc.) is also part of the economic impact of the commercial fishery, and it has been estimated to be just under \$5 million per year between the 2009-10 and the 2011-12 fishing seasons (Appendix VI). However, as with the employment EFI, revenue for the supporting industry of the recreational fishery has not been calculated, and at this point can only be inferred from the sector's expenditure.

User/Industry Demographics

The demographics of the current commercial fishermen have not been analyzed. However, 86% of the recreational fishermen come from zip codes that are within 50 miles of the coastline (Appendix VI). Sport fishermen from further inland spend a disproportionately higher amount of money on their recreational trips (Appendix VI).

5.4 Cooperation and Collaboration in Fisheries Research

Globally, involvement of multiple stakeholders in fisheries research (e.g., the collection of fishery-dependent EFI) is increasing as researchers, managers, and fishermen expand communications and partnerships. The level and type of this involvement by stakeholders can differ widely. Research that involves stakeholders in some specific aspect of the project is considered cooperative research. In cooperative research, each stakeholder may focus their resources on one aspect of the research or may work jointly on one or several parts of the project (e.g. collecting data aboard a vessel provided by another stakeholder). Collaborative research, like cooperative research, brings stakeholders together to work towards a common goal. However, true collaborative research also involves stakeholders during all phases of research including hypothesis generation, data collection, and interpretation of results (NRC, 2004; Wendt and Starr, 2009).

Wendt and Starr (2009) add the caveat that true collaborative research also includes a joint intellectual effort during all phases of the research. While the distinctions between these two types of research are conceptually distinct, in most cases multi-stakeholder research is neither purely cooperative nor purely collaborative, but a continuum between the two as determined by the specific stakeholder involvement (NRC, 2004).

Cooperative and collaborative fisheries research (CFR) hold significant potential to improve fishery management by increasing the quantity of data collected (Karp et al., 2001; NRC, 2004) as well as improving communication, understanding, and trust between managers and stakeholders (McCay and Jentoft, 1996; Conway and Pomeroy, 2006; Wendt and Starr, 2009). In cases where the knowledge and skill of the stakeholders is successfully incorporated, CFR can also result in increasing the quality of data collected (NRC, 2004; Wendt and Starr, 2009).

While these benefits can be significant, they must also be weighed against the cost of conducting CFR. Elements for evaluating and prioritizing CFR include the expected benefits, the expected research costs, and the expectations for success (NRC, 2004).

Fishery participation in data collection and management is an integral part of some lobster fisheries (Phillips and Kittaka, 2000). In certain fisheries, industry participation focuses mostly upon CFR, in large part because it is cost-effective. However, because of its tight links to co-management, CFR can provide a bridge to locally-based co-management systems that may increase fishery sustainability (Wilson et al., 2003; Gutiérrez et al., 2011). Consequently, industry participation in other fisheries includes co-management arrangements in which industry directly participates in structuring harvest regulations. Important examples of lobster fisheries with CFR and co-management agreements include *P. interruptus* in Baja, Mexico (Scientific Certification Systems, 2011; Phillips et al., 2013), *H. americanus* in Maine (ASMFC, 2009; Acheson and Gardner, 2010), and *J. edwardsii* in some fishing communities in New Zealand (Miller and Breen, 2010).

Collaborative research and/or co-management can also be furthered when members of the commercial fishery and the recreational fishery form organizations to exchange information and perspectives as well

as to represent them during government processes. This FMP does not preclude future improvement to the HCR or better management alternatives, and the stakeholder community should encourage initiatives that further sustainability and fisheries performance as long as they adhere to the MLMA objectives. Fishermen are encouraged to collaborate on their own initiatives and to form community organizations to help inform management. An example of this type of arrangement is the California Sea Urchin Commission. Furthermore, interested parties may wish to work with CDFW and the Commission to develop innovations not explicitly mentioned in this FMP. These can include, but are not limited to, gear innovations, monitoring tools, regional management, and other technological advances.

6. Implementation and Amendment Process of the FMP

6.1 Implementation

The implementation of this FMP can be divided into 3 categories: 1) enforcement, 2) research and monitoring, and 3) management.

6.1.1 Enforcement

CDFW Law Enforcement Division (LED) officers patrol the coast and offshore islands off southern California on a daily basis. They also conduct inspections of landings, wholesale and retail facilities, restaurants, and vehicles used to transport fish. These officers serve to ensure compliance with CDFW regulations, including the ones that will result from this FMP, through both education and enforcement actions. They also collaborate with CDFW scientists to conduct research activities, participate in management activities, and provide on-the-ground information to management. Active enforcement is important to help ensure the estimated benefits to the stock from harvest regulations (e.g., MPAs, size limit, etc.) are realized.

6.1.2 Research and Monitoring

Chapter 4.7 outlines and discusses how CDFW will continue to monitor the CA lobster fisheries and to improve upon the existing state of knowledge regarding the fisheries and the species. These efforts include both primary research aimed at obtaining and refining the EFI as well as periodic monitoring of fishery-dependent data, such as information generated from the recreational lobster report cards and commercial landing receipts and logbooks.

6.1.3 Management

The Marine Life Management Act requires that “[f]ishery management decisions are adaptive and are based on the best available scientific information and other relevant information” (FGC § 7056(g)). Furthermore, management systems should be periodically reviewed for their effectiveness and fairness (FGC § 7056(m)). The CDFW will analyze and act on the results of research and monitoring efforts as appropriate to better inform the management framework outlined in the FMP. The ongoing and potential research efforts described in the previous chapter are expected to yield new useful information regarding the CA lobster stock and fisheries.

By design, the HCR is adaptive in nature. The ocean is a dynamic environment; requiring very specific action could lead to improper management responses. The HCR directs CDFW to investigate the underlying causes of any significant change relative to the threshold reference points. Refinement with the most up-to-date information will always be part of this process, as will active solicitation of input from stakeholders in interpreting the data. Once the underlying cause of a change is identified, CDFW will undertake analysis (e.g., using the MSE model, constituent input, etc.) to determine the most appropriate course of action.

CDFW will continue to seek input from the various constituents as appropriate. CDFW will also bear the primary responsibility of conducting other future amendment processes. To facilitate active oversight and proactive management, CDFW projects that CA lobster management will require a minimum of two full-time dedicated scientific staff positions and one scientific aid position in the future. The scientific staff will be responsible for overseeing the commercial data collected from the trap logs and the landing receipts and the recreational data collected from the lobster report cards. The staff will also be conducting and coordinating future research and public outreach efforts. The dedicated scientists will also be responsible for monitoring the threshold reference points and advising CDFW management of the status of the fisheries and the stock.

6.1.4 Cost

Costs associated with lobster management as outlined in this FMP can be divided into two categories: 1) regular and ongoing research and management and 2) investigations that may be prompted by the HCR on an unknown and irregular basis. Ongoing management will include all of the biological and enforcement tasks associated with existing regulations and statutes as well as proposed regulatory changes associated with this FMP. The annual cost estimates outlined in Table 6-1 are a minimum. Estimated personnel costs are based on current rates which will rise in the future.

Monitoring the reference points outlined by this FMP and managing the current data streams will require a minimum of three CDFW Marine Region biological personnel dedicated exclusively to CA lobster. These include one environmental scientist already on staff plus one new environmental scientist and one new scientific aid to be hired. Staff benefits and overhead rates of 47.66% and 35.00% were applied, respectively.

The enforcement costs for the CA lobster fisheries totaled \$ 493,463 for the 2013-14 fishing season. Officer hours accounted for \$206,792 and \$286,671 was attributed to patrol crafts' fuel and maintenance. It is not known how new regulations associated with this FMP will impact costs and therefore past costs should be considered the minimum of what may be required in the future. Aspects of recreational hole-punching of CA lobster tails and the commercial trap limit are likely to both require additional effort from enforcement staff and also improve enforcement efficiency. In total, CDFW expended 3,142 regular officer hours at an average of \$47.09 per hour and 833 overtime hours at an average of \$70.63 to regulate the commercial and recreational fisheries. Of this, 1,758 regular officer hours and 454 overtime hours were expended to enforce recreational statutes and regulations on shore. Enforcement of statutes and regulations from patrol crafts required 804 regular hours and 279

Table 6-1: Estimated Annual Implementation Costs.

Biological Personnel	New Environmental Scientist	Existing Environmental Scientist	Scientific Aid	Subtotal
Salaries & wages	72,702	72,702	23,000	
Staff benefits	34,650	34,650	10,962	
General expenses	6,000	6,000	1,500	
Other Expenses	20,000			
Overhead	46,673	39,673	12,412	
Biological personnel total	180,025	153,025	47,874	380,924
Enforcement (personnel & equipment combined)				493,463
ONGOING MANAGEMENT TOTAL				874,387

overtime hours. An additional 581 regular hours and 102 overtime hours were expended to enforce commercial laws and regulations that were not otherwise covered by vessel-based enforcement actions.

When HCR reference points are crossed, investigation of the underlying causes will be required. The scope of those investigations will depend on the number and identity of the reference points below threshold and their position. Scenarios of lesser concern may be investigated by examining existing data streams and require only some additional staff time from Marine Region staff not dedicated to lobster. Scenarios of greater concern may require dedicated field research efforts. This would involve equipment and travel costs, additional staff time, and possibly contracts with outside entities.

6.2 Adjustment and Amendment to Administration, Regulations, and the FMP

Under the FGC, each FMP “shall include a procedure for review and amendment of the plan, as necessary” (FGC § 7078). In particular, an FMP shall specify the type(s) of regulations that CDFW can adopt without amendment(s) to the FMP (FGC § 7087(b)). In addition to the type of regulations that can be adopted without an FMP amendment, this section will also prescribe the conditions of changing the FMP. This section does not apply to routine day-to-day CDFW operations.

6.2.1 Regulatory Amendments that Do Not Warrant FMP Amendments

The Commission can adopt new regulation concerning the CA lobster fishery without amendment to the FMP. These may include regulations designed to improve the orderly operation of the fisheries or more efficient conservation of the relevant resources. The LAC recommendations are examples of these regulations. This section does not modify CDFW’s and the Commission’s authority to promulgate regulations during emergencies (e.g., FGC § 240, GC § 11349.6).

6.2.2 When and How the FMP Will Be Amended

If new, relevant information becomes available, an FMP amendment based on that information may be appropriate. Not all changes to management procedures outlined in this FMP would prompt an amendment. For example, addition of a new or removal of an existing reference point would require amendment but refining parameters or calculations within the Cable-CDFW model using new EFI data would not require amendment. Any amendment that would affect an existing regulation or requires new regulations would be accompanied by a regulatory amendment proposal for the Commission.

CDFW may propose an FMP amendment out of its own initiative and discretion. In this case, CDFW will solicit input from Tribes, stakeholders, and the Commission. CDFW will provide Tribes and stakeholders with the relevant schedule and agenda. They will have at least 30 days to review the proposal prior to the hearing. CDFW may submit the proposal to the Commission after 30 days, or it may hold further public meetings before submission (see also FGC § 7077). Interested parties may also propose plan provisions or amendments to either CDFW or the Commission. Existing CDFW and Commission workload and priorities may affect the timeliness of the Commission’s response to petitions.

An FMP amendment can be focused on a particular part of the document; an amendment process should not automatically trigger the amendment of the entire FMP. However, an amendment on one part of the FMP should not contradict another part. Adopting a new type of reference point not contemplated in Section 4.3 HCR is one example. Changing or replacing a threshold reference point should not automatically trigger a review of the entire natural history of the CA lobster, but such a change must not contradict other parts of the HCR that are not being amended.

6.3 List of Inoperative Statutes

The implementing regulations of this FMP will render the following sections of the Fish and Game code inoperative once they are adopted:

1. FGC § 8251: This section dictates the season length for the commercial CA lobster fishery. The HCR prescribed by this FMP incorporates changes to season lengths as a possible management adjustment.
2. FGC § 8252: This section prescribes the size limit for the commercial sector, which is identical to the recreational sector limit found in the CCR. The commercial limit will be moved into Title 14, CCR reflecting the Commission's authority to make adjustment.
3. FGC § 8254(c): This section states an annual lobster permit fee of \$265. The permit fee will change due to implementation of the trap tag program.
4. FGC § 8258: This section lists the Districts where commercial lobster traps may be used to take CA lobster. The use of commercial traps to take CA lobster in certain Districts may change if the District closure option within the harvest control rule toolbox is used.

This FMP will render the following sections of the Fish and Game code inoperative as applied to only the CA lobster fisheries once the implementing regulations are in place:

1. FGC § 9004: This section requires commercial fishermen to service any deployed trap every 96 hours. However, 14 CCR § 122(n) specifically allows lobster fishermen to deploy unbaited traps more than 4 days before the season opens. Requiring fishermen to service unbaited traps is counterproductive. As such, this section will be rendered inoperative as applied to CA lobster fisheries.
2. FGC § 7857(e): This section prohibits CDFW from issuing more than one of a single type of permit, including a lobster permit, to a single fisherman. The trap limit program envisioned by the FMP may allow fishermen to stack multiple permits, and thus this section will be rendered inactive for lobster operator permits.

Glossary

Abundance - The total number of animals in a population. This is rarely known, but usually estimated from relative abundance (see **Relative abundance**), although other methods may be used.

Adaptive management - In regard to a marine fishery, means a scientific policy that seeks to improve management of biological resources, particularly in areas of scientific uncertainty, by viewing program actions as tools for learning. Actions shall be designed so that even if they fail, they will provide useful information for future actions. Monitoring and evaluation shall be emphasized so that the interaction of different elements within the system can be better understood.

Advisory Committee - The Advisory Committee is a body composed of public constituent representatives that provide important advice to the spiny lobster fishery.

Allocation - In the LFMP, allocation means a certain amount of lobster set aside for recreational, commercial, and ecosystem needs.

Bag limits - The total amount of fish or other species that may be captured per person per day by law.

Benthic - On or relating to the region at the bottom of a sea or ocean.

Biomass (B) - The total weight of organisms at a given point in time in a defined stock, area, population, or catch.

Bycatch - Fish or other marine life that are taken in a fishery but are not the target of the fishery. Includes non-target organisms whether or not they are discarded, and includes organisms discarded because they are of an undesirable species, size, sex, or quality, or because they are required by law not to be retained.

Cable-CDFW Model - A simplified and efficient fishery stock model developed for the California spiny lobster by Dr. Richard Parrish. CDFW currently uses this model to calculate the SPR of the stock.

Capacity - The potential ability of a vessel or a fleet of vessels to capture organisms. This ability is based on the number of fishing vessels in the fleet, the size and technical efficiency of each vessel, time spent fishing, and management regulations.

Catch Per Unit Effort (CPUE) - The rate at which fish are caught; typically expressed as a number or weight of fish captured per unit of effort. Units of effort can be assigned many ways, including the time spent fishing (hours or days), the amount of fishing gear deployed (number of vessels, traps, nets, etc.), the number of times that fishing gear is deployed and retrieved (e.g., net hauls, trap pulls), or a combination of these estimates. Because it is difficult and expensive to scientifically measure the number of fish in an area (abundance), CPUE is often used as an index for the relative abundance of organisms across time or space. For CA lobster, CPUE is typically defined as the number of legal (or sublegal-sized) lobsters per trap pull for the commercial fishery, and number of legal lobsters retained per fishing trip for the recreational fishery. Effort is most often described in terms of trap pulls, total traps, and number of active permits for the commercial fishery, and number of fishing trips for the recreational fishery.

Commercial fishery - Describes a group of enterprises and individuals as well as their actions associated with fishing for certain species with the intent of selling the catch.

Commission – California Fish and Game Commission

Conical hoop net - A modified style of hoop net used to catch lobster by the recreational lobster fishing sector in California; it is basket shaped, does not collapse, and does not lie flat on the seafloor.

Creel survey - Catch information gathered from recreational sources.

California Recreational Fisheries Survey (CRFS) - The California Recreational Fisheries Survey (CRFS) is the method for estimating total marine recreational finfish catch and effort in California. The CRFS is a coordinated sampling survey designed to gather catch and effort data from anglers in all modes of marine recreational finfish fishing.

Department - In the context of the LFMP, refers to the California Department of Fish and Wildlife (CDFW).

Depleted/Depletion - Exploitation of a resource down to unsustainable levels.

Depressed fisheries - The condition of a fishery for which the best available scientific information and other relevant information that the Commission or Department possesses or receives, indicates that a declining population trend has occurred over a period of time appropriate to that fishery. With regard to fisheries for which management is based on maximum sustainable yield, or in which a natural mortality rate is available, "depressed" means the condition of a fishery that exhibits declining fish population abundance levels below those consistent with maximum sustainable yield.

Economic output - Represents deliveries of final goods and services by the sector to domestic households, investment, government and non-profit institutions, and net exports outside the local economy.

Economic overfishing - Fishing levels that exceed maximum economic yield.

Ecosystem - The physical and climatic features and all the living and dead organisms in an area that are interrelated in the transfer of matter and energy, which together produce and maintain a characteristic type of biological community. Ecosystems can range in size.

Effort - A measure of some expenditure in pursuing an activity. The measure in CA lobster fishing effort is usually in terms of number of trap pulls, traps fished (in commercial fishery), number of fishing trips, or time spent fishing.

Effort Creep - A phenomenon where technological advancements in a fishery are able to mask the declining efficiency of a fishery caused by stock declines.

El Niño - A periodic warming of the ocean surface waters in the eastern Pacific Ocean. It is characterized by a lack of upwelling of cold, nutrient-rich waters nearshore.

Essential fishery information (EFI) - With regard to a marine fishery, means information about fish life history and habitat requirements; the status and trends of fish populations, fishing effort, and catch levels; fishery effects on fish age structure and on other marine living resources and users; and any other information related to the biology of a fish species or fishery that is necessary to inform management.

Ex-vessel price/Ex-vessel value - The value of fish at first sale by fishermen at the dock, distinguished from wholesale or retail value.

Fecundity - The reproductive capacity of an individual female animal during a reproductive event or breeding season, generally expressed as the number of eggs or larvae per unit weight or per individual.

Finfish – Any species of bony fish or cartilaginous fish (sharks, skates and rays). Finfish do not include amphibians, invertebrates, plants or algae.

Fishery - Fishing for, harvesting, or catching one or more populations of marine fish or marine plants that may be treated as a unit for purposes of conservation and management and that are identified on the basis of geographical, scientific, technical, recreational, and economic characteristics.

Fishery-dependent data - Information collected directly from or during the process of fishing, or from fishery landing data. May be collected from commercial and/or recreational sources, and may include catch/effort reported by fishermen, size and age composition of the catch, and biological samples collected at port.

Fishery-independent data – Scientific research to collect information that is independent of commercial or recreational fishing operations. Surveys utilizing commercial fishing gear may provide unbiased estimates of abundance. Surveys may also use other methods (e.g., acoustics, SCUBA, video) to collect other biological or ecological information (e.g., movement, migration, growth rates, natural mortality) relevant to a fishery.

Fishing mortality (F) - The rate at which organisms in a population die due to fishing.

Growth overfishing - Fishing in which yield per recruit is lower than theoretical maximum values due to the removal of small and rapidly growing fish.

Habitat - The physical, chemical, and biological features of the environment where an organism lives.

Harvest control rules (HCR) - Harvest control rules are plans of action that prescribe adjustments in harvest regulations (e.g., fishing effort, total allowable catch, minimum legal size) and are activated (“triggered”) when the calculated amount of a resource that can sustainably be taken (the defined upper limit, also known as “threshold reference point”) is reached or surpassed. Harvest control rules must be based on objective, measurable criteria such as population size, productivity, density, or other inputs.

Harvest rate (u) - The percentage of legally harvestable individuals in a population that are removed each year due to fishing.

Harvest regulations - The rules that define how fishermen are allowed to harvest fish. Harvest regulations are diverse and include restrictions on size of animals harvested, effort, total catch, gear types, season, or location where fishing is permitted.

Hoop net - A round net used to catch lobster by the recreational lobster fishing sector in California; it traditionally lies flat on the seafloor and assumes a basket shape upon retrieval to the surface.

Indices of Abundance - Measurements of the abundance of an organism made over time; used to make inferences about the abundance of an entire population.

Individual transferable quota (ITQ) - A program which limits the catch allowed per license or individual as well as the number of individuals who participate.

Input (from stock assessment models) - The numerical parameters provided to a stock assessment model; these can be a biological parameter such as the growth rate of the species, or it can be a management parameter, such as the legal size limit.

Intertidal - The part of the shore that lies between the low and high water lines.

Instantaneous Fishing mortality (F) - The rate at which organisms are harvested or killed due to fishing; F is an instantaneous rate that reflects the rate at which a proportion of a population is being lost, whereas the harvest rate (u) is an annual rate that reflects the rate at which a number of fish from a population is being lost.

Landing receipt - A document provided by the Department to commercial fish markets for recording landing information. Information required includes date, port of landing, species or market category of fish, pounds landed, and price paid.

Landings - The number or poundage of fish unloaded at a dock by commercial fishermen or brought to shore by recreational fishermen for personal use. Landings are reported at the points where fish are brought to shore. Note that landings, catch, and harvest define different things.

Length frequency distribution - A graphical representation of the number of organisms by length.

Life history - The history of changes an organism passes through in its development from egg, spore, or other primary stage until its natural death.

Limited entry program - Regulatory program that restricts the total number of permitted fishing licenses or vessels.

Lobster Advisory Committee - A committee composed of representatives for the recreational fishery, the commercial fishery, environmental interest groups, scientific experts, non-consumptive recreational interest groups, and federal resource managers; the committee was responsible for providing crucial constituent inputs during the drafting process of this FMP in the form of a consensus recommendation.

Logbooks - Records of fishing activity and catch maintained by commercial fishermen. Typically used to estimate CPUE in assessment models.

Management strategy evaluation (MSE) - For the purposes of the CA lobster FMP, the MSE is a computer model that simulates lobster population dynamics, designed by a team led by Dr. Yong Chen, University of Maine. The MSE was designed to allow CDFW to monitor and evaluate the effects of management measures and the lobster fisheries on the lobster population. The model will not be ready for use until CDFW adapts its scripts to the state's fishery management framework.

Marine Life Management Act (MLMA) - The Marine Life Management Act (MLMA), which became California law January 1, 1999, calls for using several tools to meet its goals of conserving entire ecosystems, placing value on non-consumptive benefits, sustainability, habitat conservation, restoring depressed fisheries, limiting bycatch, and recognizing the interests of people dependent on fishing. FMPs are one of those tools.

Marine Life Protection Act (MLPA) - The MLPA, enacted in 1999, required the California Department of Fish and Wildlife to develop a Marine Life Protection Program, including a Master Plan for a network of Marine Protected Areas (MPAs) within state waters. The network of MPAs includes an improved State Marine Reserve (complete no-take areas) component and other classifications of MPAs (State Marine Parks and State Marine Conservation Areas). The goals of the MLPA are varied and include protecting portions of ecosystems in a variety of habitats, preserving biodiversity, and helping to sustain and protect populations of fished species.

Marine protected areas (MPAs) - Areas closed to all fishing, or to specific user groups, or to the take of certain species; they are used to geographically limit effort and to protect portions of stocks as well as various ecosystem services and non-consumptive uses.

Maximum economic yield (MEY) - The maximum possible revenue after accounting for the costs of fishing that may be achieved in a fishery. MEY typically is reached at smaller catches than MSY.

Maximum sustainable yield (MSY) - In a marine fishery, means the largest catch that can be taken from a stock continuously over time that does not result in a continuing reduction in stock abundance, assuming constant environmental conditions. MSY is generally presented as a maximum annual catch that can be maintained indefinitely; however, MSY can change with fluctuations in abundance and environmental variability (e.g. shifts in ocean regimes), requiring adjustments in allowable harvest.

Natural mortality (M) - The rate at which organisms in a population die due to natural causes.

Nearshore - All oceanic state waters within 0-3 miles from shore or less than 100 fathoms deep, whichever is greater.

Nocturnal - Relating to, or occurring at night.

Non-consumptive uses - Activities which involve the specified resource but no harvest is involved.

Offshore - All oceanic waters outside state waters or deeper than 100 fathoms (for comparison see **Nearshore**).

Optimum Yield (OY) - With regard to a marine fishery, means the amount of catch taken in a fishery that: 1) provides the greatest overall benefit to the people of California, particularly with respect to food production and recreational opportunities, and takes into account the protection of marine ecosystems; 2) is the maximum sustainable yield of the fishery, as reduced by relevant economic, social, or ecological factors; and 3) in the case of an overfished fishery, provides for rebuilding to a level consistent with producing maximum sustainable yield in the fishery. Optimum yield should be no greater than maximum sustainable yield.

Output (of stock assessment models) - The substantive predictions of a model; for this FMP, it usually corresponds to the reference points.

Overfished - A stock that is at unacceptably low levels because it has experienced overfishing and has not been rebuilt.

Overfishing - Means a rate or level of take that the best available scientific information indicates is not sustainable or that jeopardizes the capacity of a marine fishery to produce the maximum sustainable yield on a continuing basis. The depletion of fish stocks to unacceptably low levels. See **Growth overfishing, Recruitment overfishing, and Economic overfishing**.

Pelagic - Of or relating to aquatic organisms that live in the ocean without direct dependence on the shore or bottom.

Physiological - Of or relating to the normal functioning of an organism.

Plankton - Very small organisms that passively drift with tide and current.

Planktonic - Of or related to **plankton**.

Population - All the individuals of a species that live in the same geographic area. A population may contain several discrete breeding groups or stocks.

Productivity - Describes the birth, growth, and death rates of a stock. A highly productive stock is characterized by high birth, growth and mortality rates, and as a consequence has a high turnover. Such stocks can usually sustain higher exploitation rates and, if depleted, could recover more rapidly than comparatively less productive stocks.

Proxy - A number that is used as a substitute for another number. In fisheries management, landing information is often used as a proxy for other types of information not yet available.

Recreational fishery - Describes a fishery associated with taking of any fish for any purpose other than profit.

Recruit - An organism entering the exploitable stage of its life cycle; or a larval or juvenile organism as it settles or appears in the adult ecological niche. See **Recruitment**.

Recruitment - The process, event, or rate by which individuals enter new life stages or segments of a population. *Larval recruitment* refers to the process or event by which larvae of marine species exit the planktonic life stage. *Fishery recruitment* (or, recruitment to the fishery) refers to the moment that an animal becomes vulnerable to capture in a fishery – usually because it has attained some minimum size or age for harvest.

Recruitment overfishing - Fishing that depletes the mature adult population (spawning stock) to low levels at which reproduction (and subsequent recruitment) is inadequate to replenish the population.

Reference points (biological reference points) - Reference points are quantitative (numerical) values that inform managers about the current status of a stock. Two important types must be considered, target and threshold (or limit) reference points. *Target reference point* is a numerical value that indicates that the status of a stock is at a desirable level; often management is geared towards achieving or maintaining this target. *Threshold (limit) reference point* is a numerical value that indicates that the status of a stock is unacceptable (e.g. overfished or too small), and that management action should be taken to improve stock status.

Relative abundance - Usually measured with indices that track trends of a population biomass (e.g., CPUE) over time. It is not a direct or (usually) precise estimate of biomass.

Report card - A mean of collecting fishery-dependent data on the recreational lobster fishery in California. Lobster report cards collect information on the number of people recreationally fishing for lobster each year, the gear they use, and their harvest and success rates. Required since 2008 for all persons fishing recreationally for lobster in California.

Scavengers - Animals that feed on dead or decaying organisms.

SCUBA - “Self-Contained Underwater Breathing Apparatus” utilized by the recreational lobster fishing sector in California to catch lobster by hand. **Settlement** - In marine ecology, it means the process by which organisms change from a pelagic larval life history phase to assume a new mode of life as a member of a sea-floor community. For CA lobster, it is the stage at which pueruli (late-stage larvae) settle to nearshore, surfgrass habitat.

Size at maturity (SAM) - The size at which 50% of animals in a population have reached sexual maturity and are capable of reproduction.

Size limit - The minimum size a fish or other organism must be for it to be possessed.

Skin diving - Breath hold diving (freediving) utilized to catch lobster by hand by the recreational CA lobster fishing sector in California.

Southern California Bight (SCB) - The coast and its immediate offshore areas between Point Conception to the north and the U.S. – Mexico border to the south. The curvature of the coastline and the relatively shallow depth of the area lead to oceanographic and biological characteristics that are clearly distinguishable from the central California coast.

Spawning potential ratio (SPR) - A ratio of the number of eggs produced during the lifetime of an average female in a fished population to the number of eggs produced during the lifetime of an average female in an unfished population; used to characterize the amount of impact fishing has on a population’s ability to reproduce.

Spillover - The emigration of adults from a protected area to the fishing grounds, and/or larval export from the protected area to surrounding areas.

Stock - A group of fish of the same species in a given management area. A single stock may be comprised of multiple populations or be a portion of a single larger population.

Stock assessment - An evaluation of the status of a stock, including past and current stock levels and information to help guide future harvest. Assessments may integrate many different biological data, including growth rates of fish, mortality rates, age at first reproduction, fecundity, size classes present in the catch, and selectivity of fishing gear.

Stock Composition - Any description of the population attributes of a stock (age, size, sex), usually within a spatial context. This commonly refers to the spatial distribution of breeding groups or genetically-related organisms.

Stock Size - Total estimated number or biomass of fish within a stock.

Substrate - The surface or medium on or in which an organism lives (i.e., mud, sand, rocks).

Sustainable, Sustainable use, and Sustainability - With regard to a marine fishery, means both of the following: 1) continuous replenishment of resources, taking into account fluctuations; and 2) securing the highest possible present and long-term social and economic benefits, maintaining biological diversity, and managing fisheries in a way that does not exceed **optimum yield**.

Thresholds (threshold reference points) - For the purpose of this FMP, the levels of stock size or reproductive potential that are not sustainable.

Total allowable catch (TAC) - A specified numerical catch objective for each fishing season, the attainment (or expected attainment) of which may cause closure of the fishery.

Total allowable effort (TAE) - A specified numerical effort objective for each fishing season. This can be expressed in number of boats, amount of gear used, etc.

Total economic output - The total amount of economic output that does not take into account the amount of intermediate goods consumed during the harvest/production process. For CA lobsters, this means the amount of money generated before costs such as trap cost are considered. Also known as Gross Economic Output.

Total economic value added – Total economic output less the goods and services used up to create that output. For the CA lobster fishery, it means the net value after costs like trap purchases are accounted for. Also known as Net Economic Output.

Total mortality - Natural mortality and Fishing mortality combined.

Traps - Generally, a wire basket or cage used for trapping certain types of organisms.

Trap limit - A type of regulatory measure that restricts the number of traps a fisherman may simultaneously utilize within a given season.

Unfished biomass - The unfished or pristine biomass.

Upwelling - On the California coast, upwelling is the upward movement of deep waters into the nearshore ecosystem due to springtime winds moving the topmost layers of water away from land.

Yield - The total number or biomass of fish captured.

Yield per recruit (YPR) - A theoretical value that describes the yield to a fishery that is contributed by a given number of recruits (usually a single recruit).

Zooplankton - Small animals passively carried along with water currents and other water movement.

Appendix: Letter to Tribal Representatives

[This page is left intentionally blank]

DRAFT

October 10, 2013

Name

Title

Business

Street Address

City, STATE Zip

Dear Honorable [FILL IN FULL NAME], Chairperson:

The California Department of Fish and Wildlife (Department) would like to inform you as a tribal representative that its Marine staff will be writing and compiling a Spiny Lobster Fishery Management Plan (FMP) over the next several months. The Department would like to know if spiny lobster is a culturally significant species to your Tribe, and, if so, if you would like to provide input into the development of the FMP or to seek government-to-government consultation with the Department about the FMP and the management of the spiny lobster fishery.

The Marine Life Management Act requires that the fishery management plan shall form the primary basis for managing California's commercial and sport marine fisheries. The spiny lobster supports important commercial and sport fisheries in southern California, and this FMP will ensure the continued health of the lobster fisheries in California.

The FMP will summarize all the readily available information on spiny lobster and its fisheries including: lobster natural history and population dynamics; fishery landings, regulations, and participants; current management and conservation measures; monitoring of the fisheries; essential fisheries information that is still needed; and a harvest control rule(s) should the lobster resource show signs of being overfished.

The Department has received suggestions and recommendations from various stakeholder groups, and has worked with a Lobster Advisory Committee that was created last year to develop recommendations. The lobster FMP website is: <http://www.dfg.ca.gov/marine/lobsterfmp/>.

The Department understands that the spiny lobster fishery may be of interest to some tribes in California, and the Department is soliciting input from tribes. The Department is also committed to understanding tribal interests, if any, relating to the spiny lobster fisheries in southern California before the draft FMP is completed. Next year, the draft lobster FMP will be peer reviewed both scientifically and by the general public. While tribes can provide comments on the spiny lobster FMP at that time, the Department would like to understand tribal interests early in the process.

The Department would welcome your preliminary input on southern California's spiny lobster resource and fisheries by November 15, 2013, so that it might be considered when writing the draft FMP. Please send your comments to Ms. Kristine Barsky, Senior Marine Biologist and Lobster FMP Coordinator, via email at Kristine.Barsky@wildlife.ca.gov or to the address above. If you would like more information on

the lobster FMP, or would like to set up either an informal informational meeting or a formal government-to-government consultation, please contact Ms. Barsky at (805) 985-3114.

We look forward to receiving your comments.

Sincerely,

Craig Shuman
Manager of the Marine Region

Address

Dear Honorable Tribal Representative:

The California Department of Fish and Wildlife (Department) would like to inform you as a tribal representative that several items are under development regarding the management of California's spiny lobster fisheries, and we are inviting your Tribe to provide input before these items are submitted to the Fish and Game Commission (Commission) for their possible consideration. In particular, the Department will be delivering two principle items to the Commission during 2015 and 2016: 1) a California Spiny Lobster Fishery Management Plan (FMP), and 2) new spiny lobster commercial and recreational fishery regulations. We anticipate proposing the first item at the Commission's December 2015 meeting and the second item at the Commission's February 2016 meeting. The Department would like to know whether your Tribe is interested in providing input on one or both of these proposed management items. At your discretion, your Tribe's input could be provided during the established provisions under the Commission process for public input beginning in December 2015, or through discussions or formal government-to-government consultation prior to December.

The California Spiny Lobster FMP

The Marine Life Management Act requires that fishery management plans (FMPs) shall form the primary basis for managing California's commercial and sport marine fisheries. The California spiny lobster resource supports important commercial and recreational fisheries in southern California, and this FMP sets a management framework for the fishery to ensure the continued health of the fisheries in California.

The FMP summarizes all the readily available information on spiny lobster and its fisheries including: lobster natural history and population dynamics; fishery landings, regulations, and participants; current management and conservation measures; monitoring of the fisheries; essential fisheries information that is still needed; and a harvest control rule to provide for a sustainable harvest.

The Department has received suggestions and recommendations from various stakeholder groups, and has worked with a Lobster Advisory Committee that was created to develop recommendations. The draft California Spiny Lobster FMP is currently available on the Departments spiny lobster FMP website at <http://www.dfg.ca.gov/marine/lobsterfmp/>.

Amending Spiny Lobster Commercial and Recreational Regulations

The Department is scheduled to request authorization to publish notice of intent to amend regulations associated with the FMP at the Commission's February 2016 meeting. Proposed commercial spiny lobster regulation amendments that will be considered by the Commission include: a commercial trap

limit; increasing the trap service requirement from 4 to 7 days; extending the period (from 6 to 9 days) for deploying and retrieving traps before and after the season; and reporting of commercial trap loss. Proposed recreational amendments include: requiring the hole-punching or fin-clipping of all retained lobsters; changing the timing of the recreational season opener from 12:01 am to 6 a.m. on the first Saturday of the season; require hoop net operators to mark hoop net floats with GO-ID numbers; and clarifying methods of take for crustaceans.

If you would like more information on the California Spiny Lobster FMP or the proposed regulatory amendments, or to request a printed copy of the draft FMP, please contact Mr. Tom Mason, Senior Environmental Scientist, by email, tom.mason@wildlife.ca.gov, or by phone, (562) 342-7107. If you would like to request formal government-to-government consultation, please contact Steven Ingram, Tribal Liaison, by email, tribal.liaison@wildlife.ca.gov, or by phone, (916) 651-7401.

We look forward to receiving your input.

Sincerely,

Craig Shuman, D. Env.

Appendix II: Executive Summary of the Constituent Involvement Plan

This Constituent Involvement Plan details the activities that will be conducted to involve constituents and participants in the development of the Spiny Lobster Fishery Management Plan (FMP). The FMP is being developed for the spiny lobster fishery by the California Department of Fish and Game as required under the Marine Life Management Act of 1998. An important part of the act is the good faith effort to involve all interested parties in resource management decisions through the dissemination of accurate information and collaboration.

I. Points of Input for Constituents

The Department uses a number of avenues to engage the public in development of the Spiny Lobster Fishery Management Plan (FMP).

Lobster Advisory Committee

- The Advisory Committee is a collaborative body of representatives from major constituencies that provides the Department with advice, recommendations, and feedback regarding actions that need to be taken during the development of the FMP. The Advisory Committee will give guidance on FMP objectives and end products, as well as provide ideas on content and management options that address the key issues put forth by constituents, members of the public, and our contractors. The Committee will review draft documents generated during the FMP process, and will provide feedback on content.
- CDFW ensured that the composition of the Lobster Advisory Committee reflects the diversity of interests and complexity of the California spiny lobster fishery. The Committee is made up of twelve members and five alternates, as follows:
 - Rodger Healy (Commercial Fishing Member)
 - Jim Colomy (Commercial Fishing Member)
 - Shad Catarius (Commercial Fishing Member)
 - Josh Fisher (Commercial Fishing Alternate Member)
 - Jim Salazar (Recreational Fishing Member)
 - Michael Gould (Recreational Fishing Member)
 - Al Stasukevich (Recreational Fishing Member)
 - Paul Romanowski (Recreational Fishing Alternate Member)
 - Lia Protopapadakis (Marine Science Member)
 - Kevin Hovel (Marine Science Member)
 - Jono Wilson (Marine Science Alternate Member)
 - Sarah Sikich (Environmental Organization Member)
 - Huff McGonigal (Environmental Organization Alternate Member)
 - Sean Hastings (Federal Agency Member)
 - David Kushner (Federal Agency Alternate Member)
 - Claudette Dorsey (Non-Consumptive Recreational Member)
 - Chris Grossman (Non-Consumptive Recreational Member)

Lobster Advisory Committee Schedule

Meeting Dates:

- **June 20, 2012, Los Alamitos (9:00 AM to 4:00 PM)** – LAC Charter and Ground Rules development, Timeline for FMP, List of Lobster FMP Issues, FMP Conceptual Framework, Comments from Public Meetings, and Review of Draft Fishery Overview Chapter
- **August 1, 2012** – Review Summary of Management Options.
- **December 5, 2012** – Discuss findings of Economic Profile Report, and Comments on Draft Fishery Management and Conservation Chapter.
- **April 10, 2013** – Discuss poaching issues and recreational fishery management
- **June 12, 2013** – Review Comments from Public Management Options Meetings.
- **July 10, 2013** – Discuss and evaluate fishing management options
- **August 15, 2013** – Review Management Strategy Evaluation Results.
- **September 11, 2013** – Finalize consensus for recreational fishing management measures, discuss and evaluate the harvest control rule, and identify monitoring and research priorities and funding mechanisms

Schedule for Public Meetings

Public Information Meetings

Description (both dates and locations): The purpose is to introduce the Lobster Fishery Management Plan (FMP) process, and explain what an FMP is and what it is not. CDFW will also discuss the general timeline for FMP completion. The majority of this meeting will focus on gathering information from members of the public regarding the issues or management concerns that need to be addressed during the FMP process.

Dates and Locations:

Wednesday, April 18, 2012
 Oxnard Performing Arts and Convention Center
 800 Hobson Way
 Oxnard, CA 93030
<http://www.oxnardpacc.com/directions.html>

Thursday, April 19, 2012
 Grand Pacific Palisades Hotel
 Auditorium
 5805 Armada Dr.
 Carlsbad, CA 92008
<http://www.grandpacificpalisades.com/map-directions>

Agenda (both dates and locations):

6:00 p.m.	Open House Workshop (no pre-registration required)
6:30 p.m.	Public meeting begins
6:45 p.m.	Highlights of the FMP Process and how to contribute
7:00 p.m.	Public Questions and Comments
8:00 p.m.	Open House Workshop
9:00 p.m.	Meeting concludes

Management Options Meetings

The purpose is to receive comments on potential management options, the impact of each option, and preferred options or suites of options.

- Dates: **April 23-24, 2013**
- Locations: **Ventura and Orange counties**

Fish and Game Commission Regulator Process

The formal regulatory process will begin in February 2015.

Written Comments

- The Spiny Lobster Fishery Management Plan Web Site has the ability to receive written comments. Web Site address: <http://www.dfg.ca.gov/marine/lobsterfmp/>
- Written comments can also be mailed to:
Department of Fish and Game
Attn: Spiny Lobster FMP
1933 Cliff Drive, Suite 9
Santa Barbara, CA 93109

II. Methods for Providing Constituents with Information

Since communication and participation are crucial to a successful FMP process, the Department will provide information through a range of options.

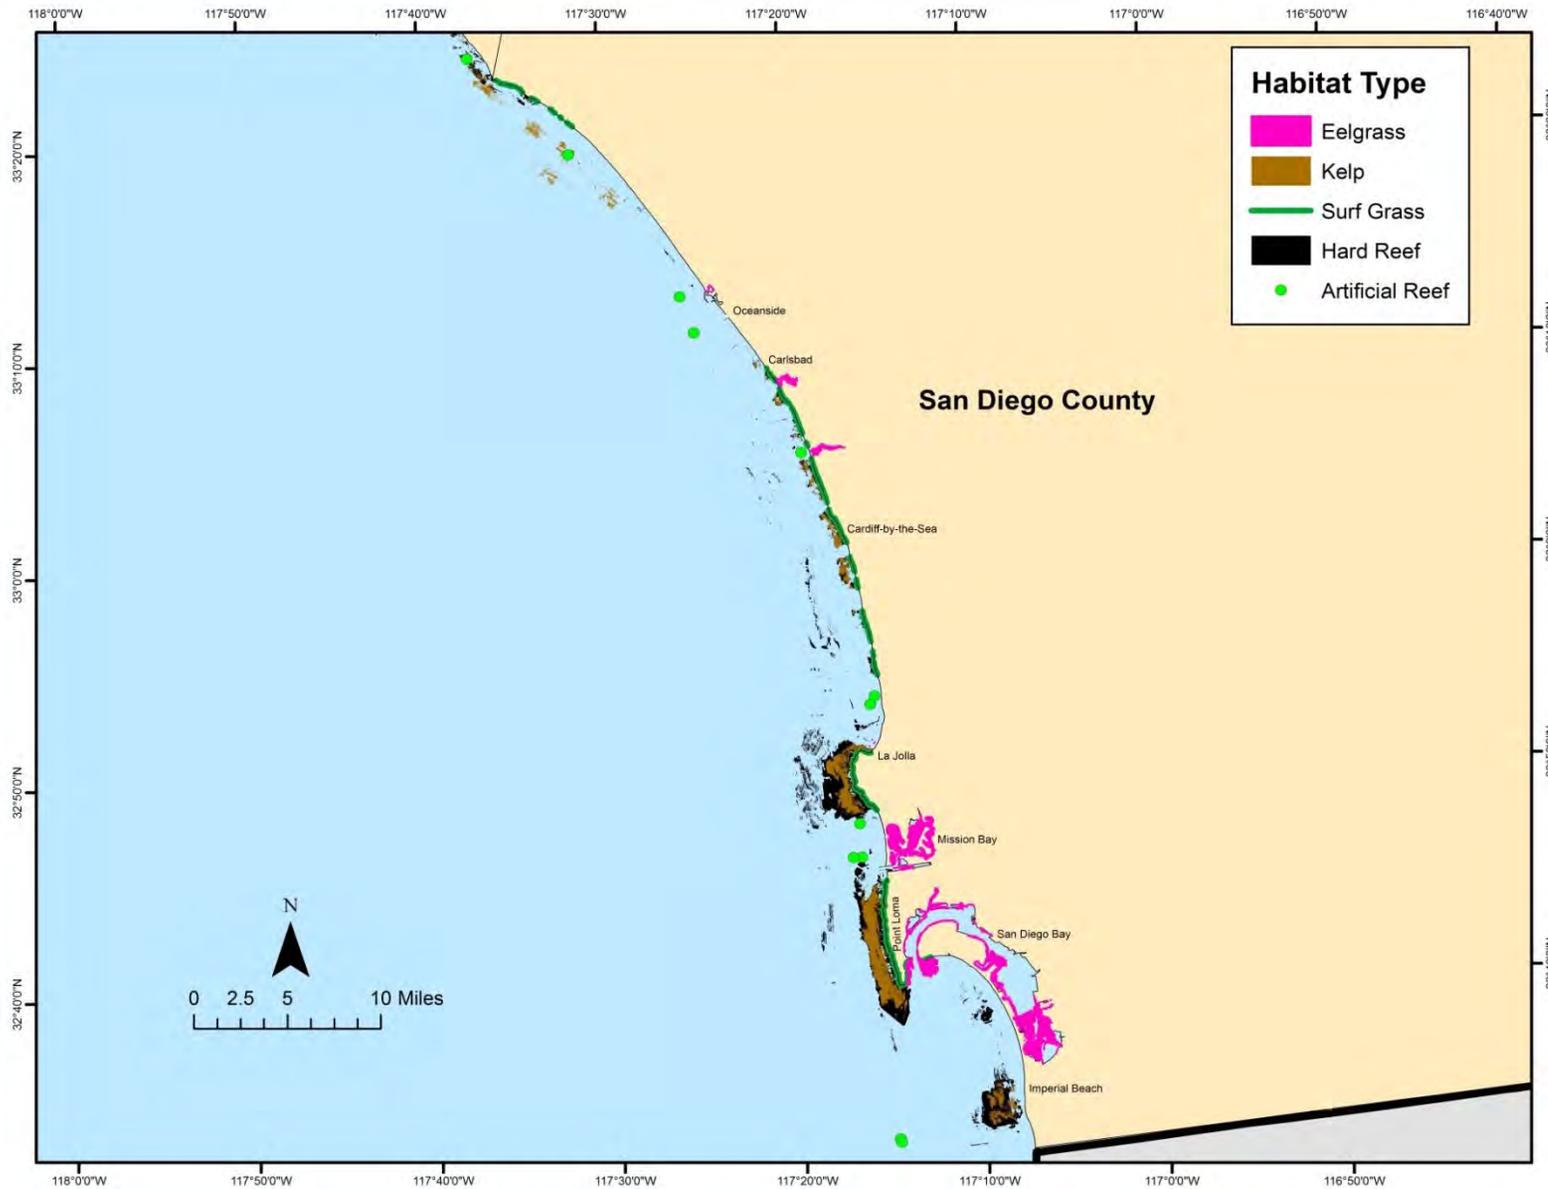

Available Resources

- The Spiny Lobster Fishery Management Plan Web Site:
<http://www.dfg.ca.gov/marine/lobsterfmp/>
- Electronic notices. Constituents can sign up for the [Lobster FMP News Service](#) through the Spiny Lobster Fishery Management Plan Web Site. The News Service will distribute electronic notices about future events. Once you are signed up, you can expect to receive emails that:
 - Announce the debut of a fully populated Lobster FMP website that includes informative background documents on lobster.
 - Keep constituents informed of news and public meeting information during the Lobster FMP process.
 - Announce the availability of Lobster FMP draft documents
- For those who cannot receive email, the Lobster FMP team will send the identical announcements via the U.S. Postal Service. To sign up to receive the Lobster FMP News Notices via mail, please contact Ms. Rosalyn McFarland at (805) 568-1231 to provide your mailing address.
- Flyers available at Fish and Game offices, and posted at strategic locations.
- Marine Management Newsletter

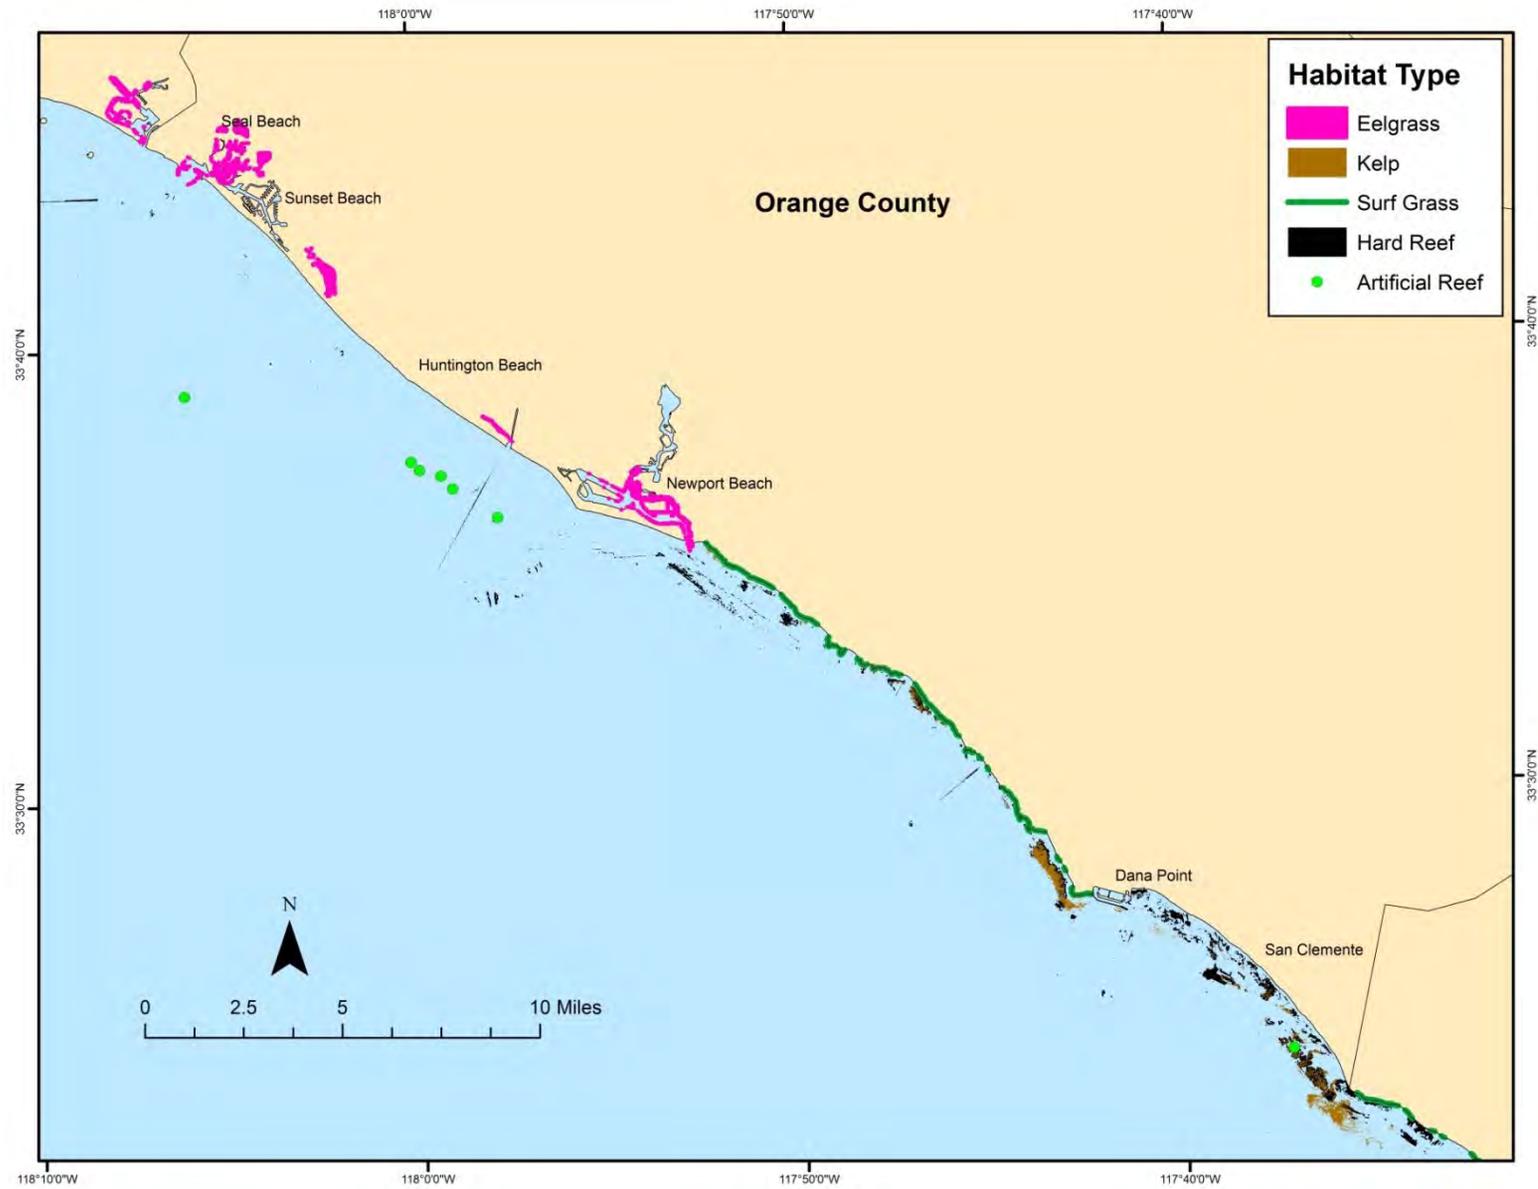

Special Publications

- Spiny Lobster Stock Assessment
- Technical Panel Review Publication of Stock Assessment

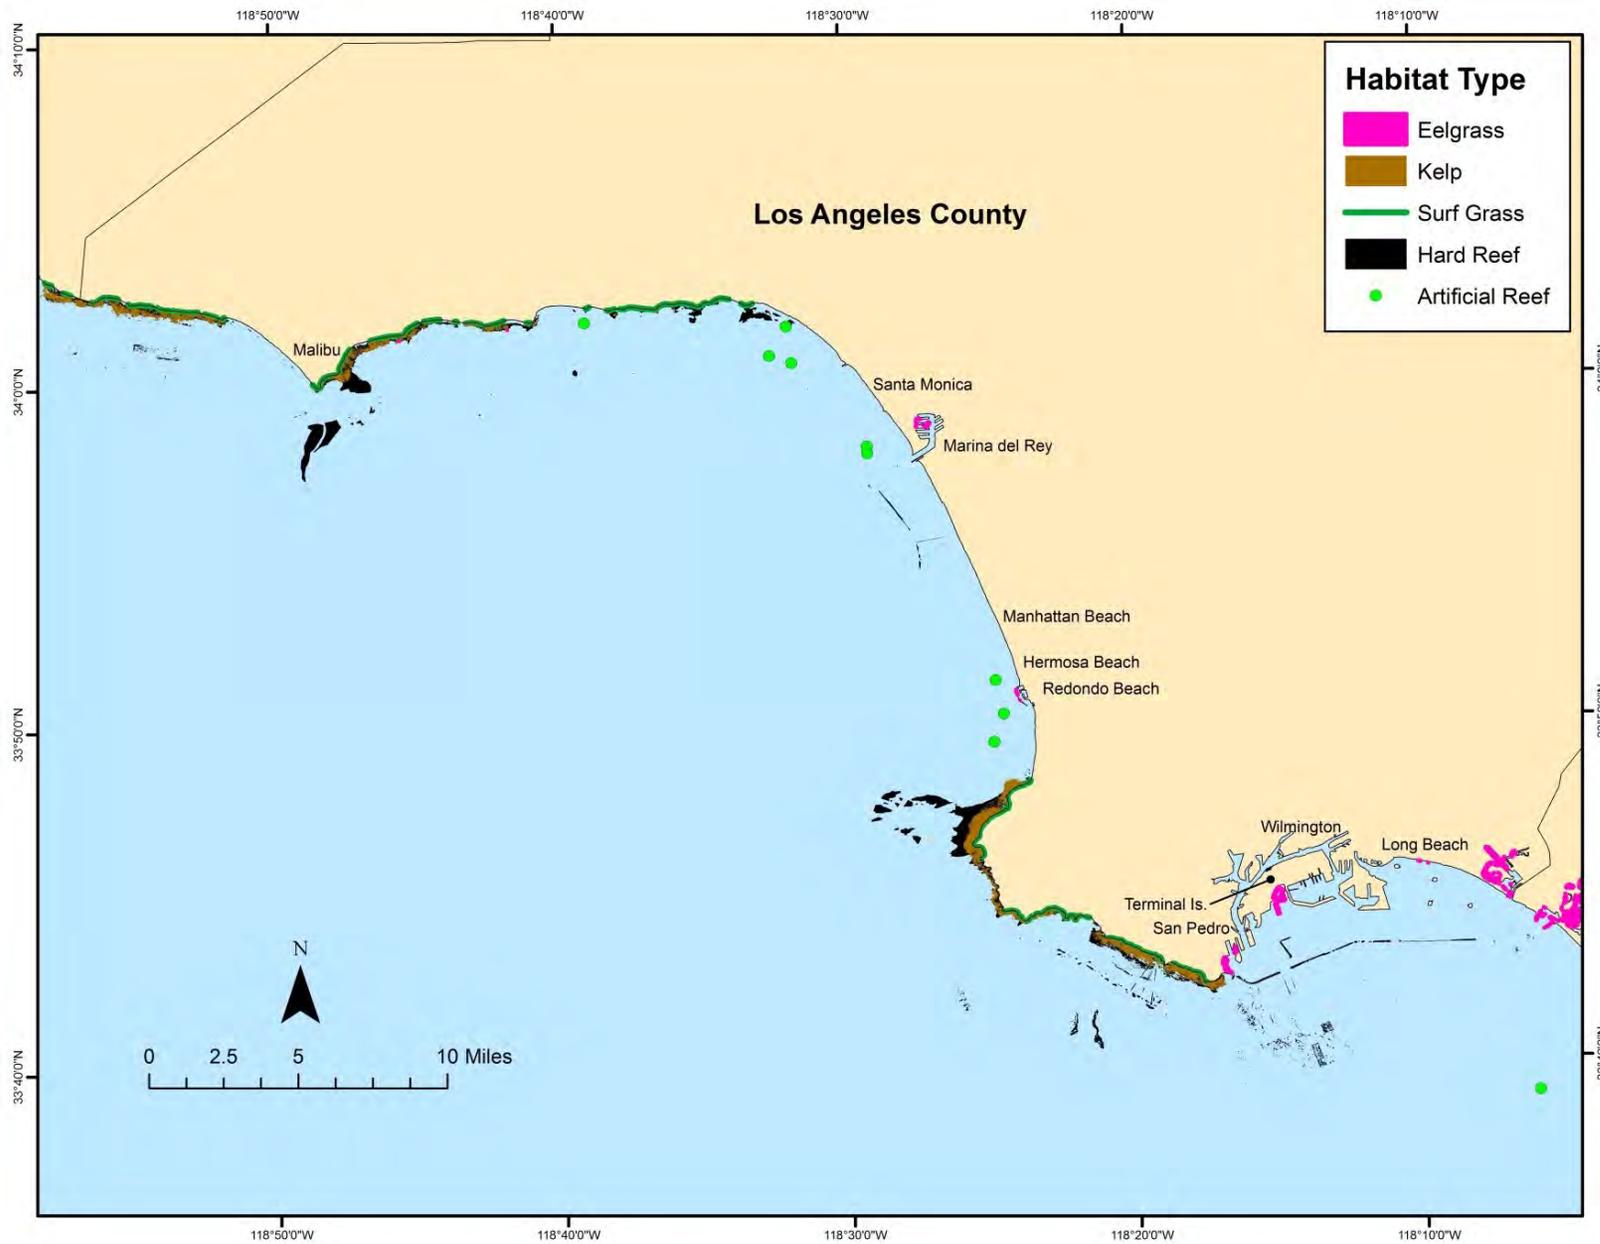

Appendix III: Habitat Maps by Areas

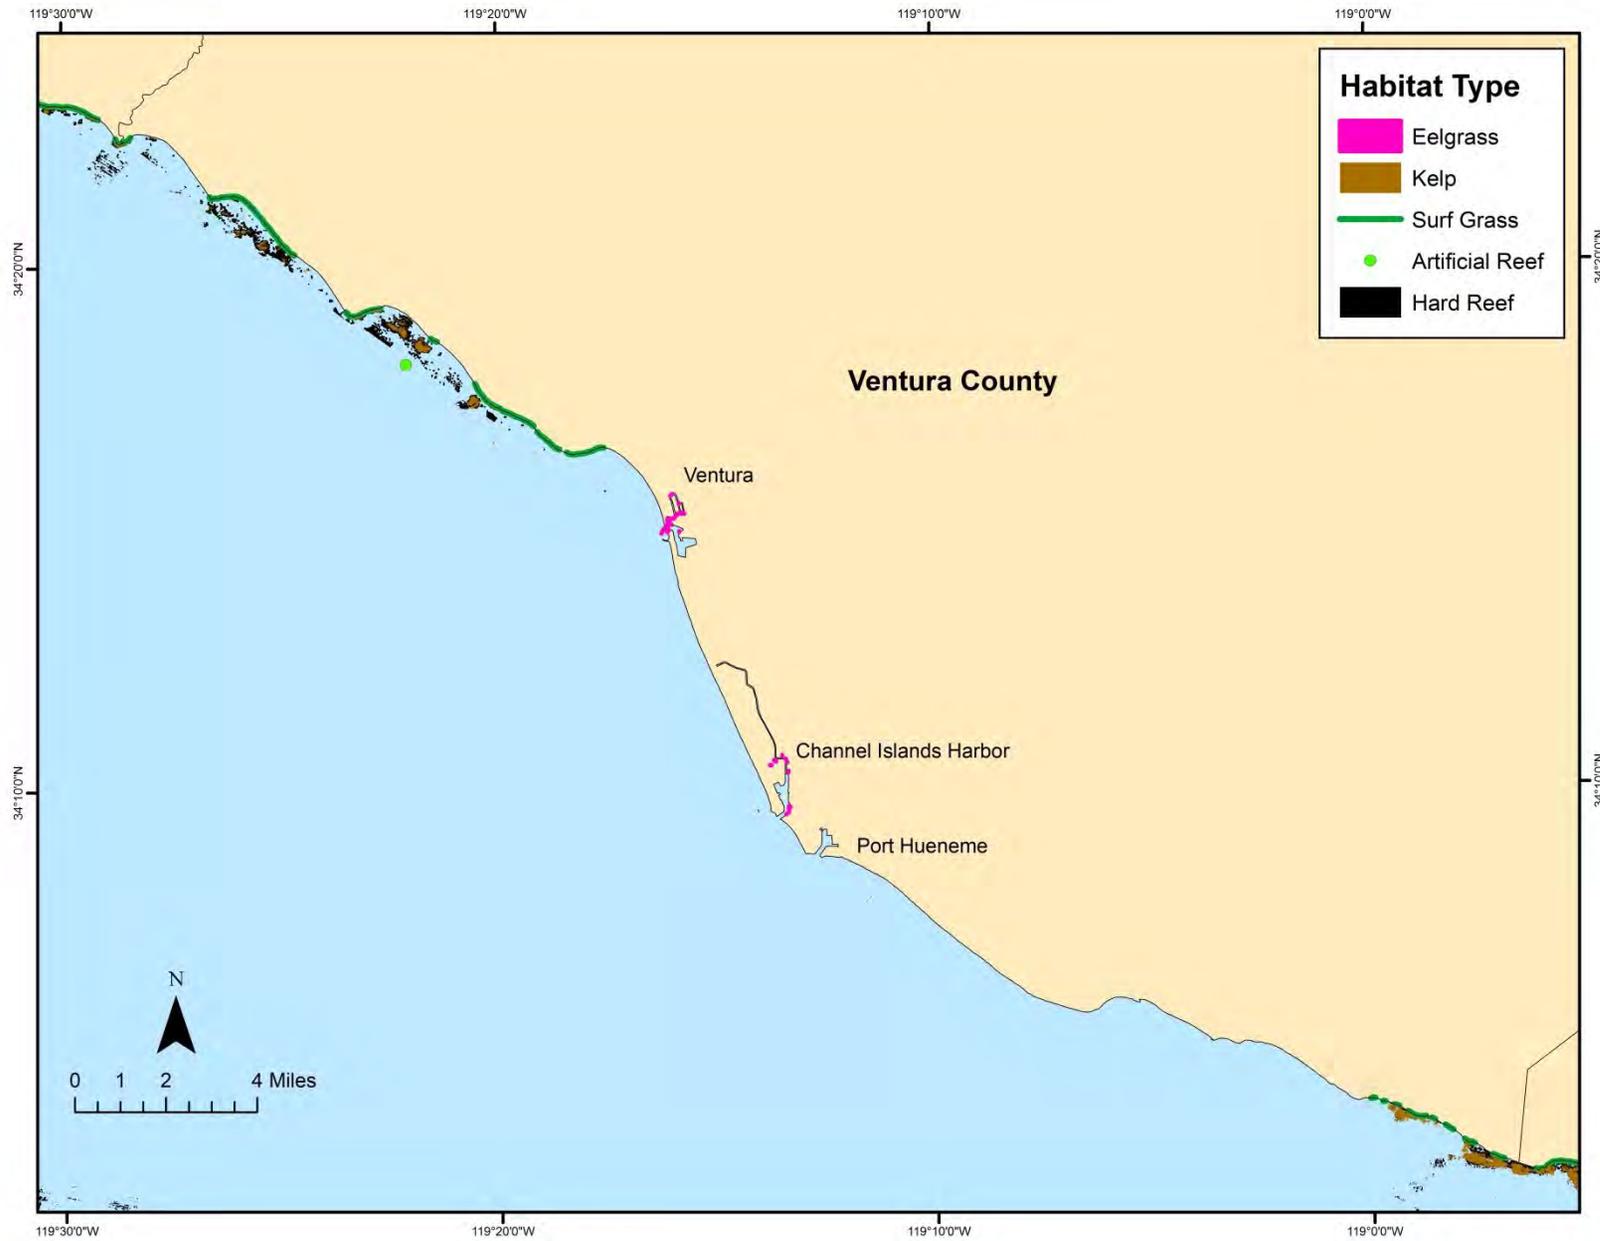

Critical CA lobster habitats along San Diego County

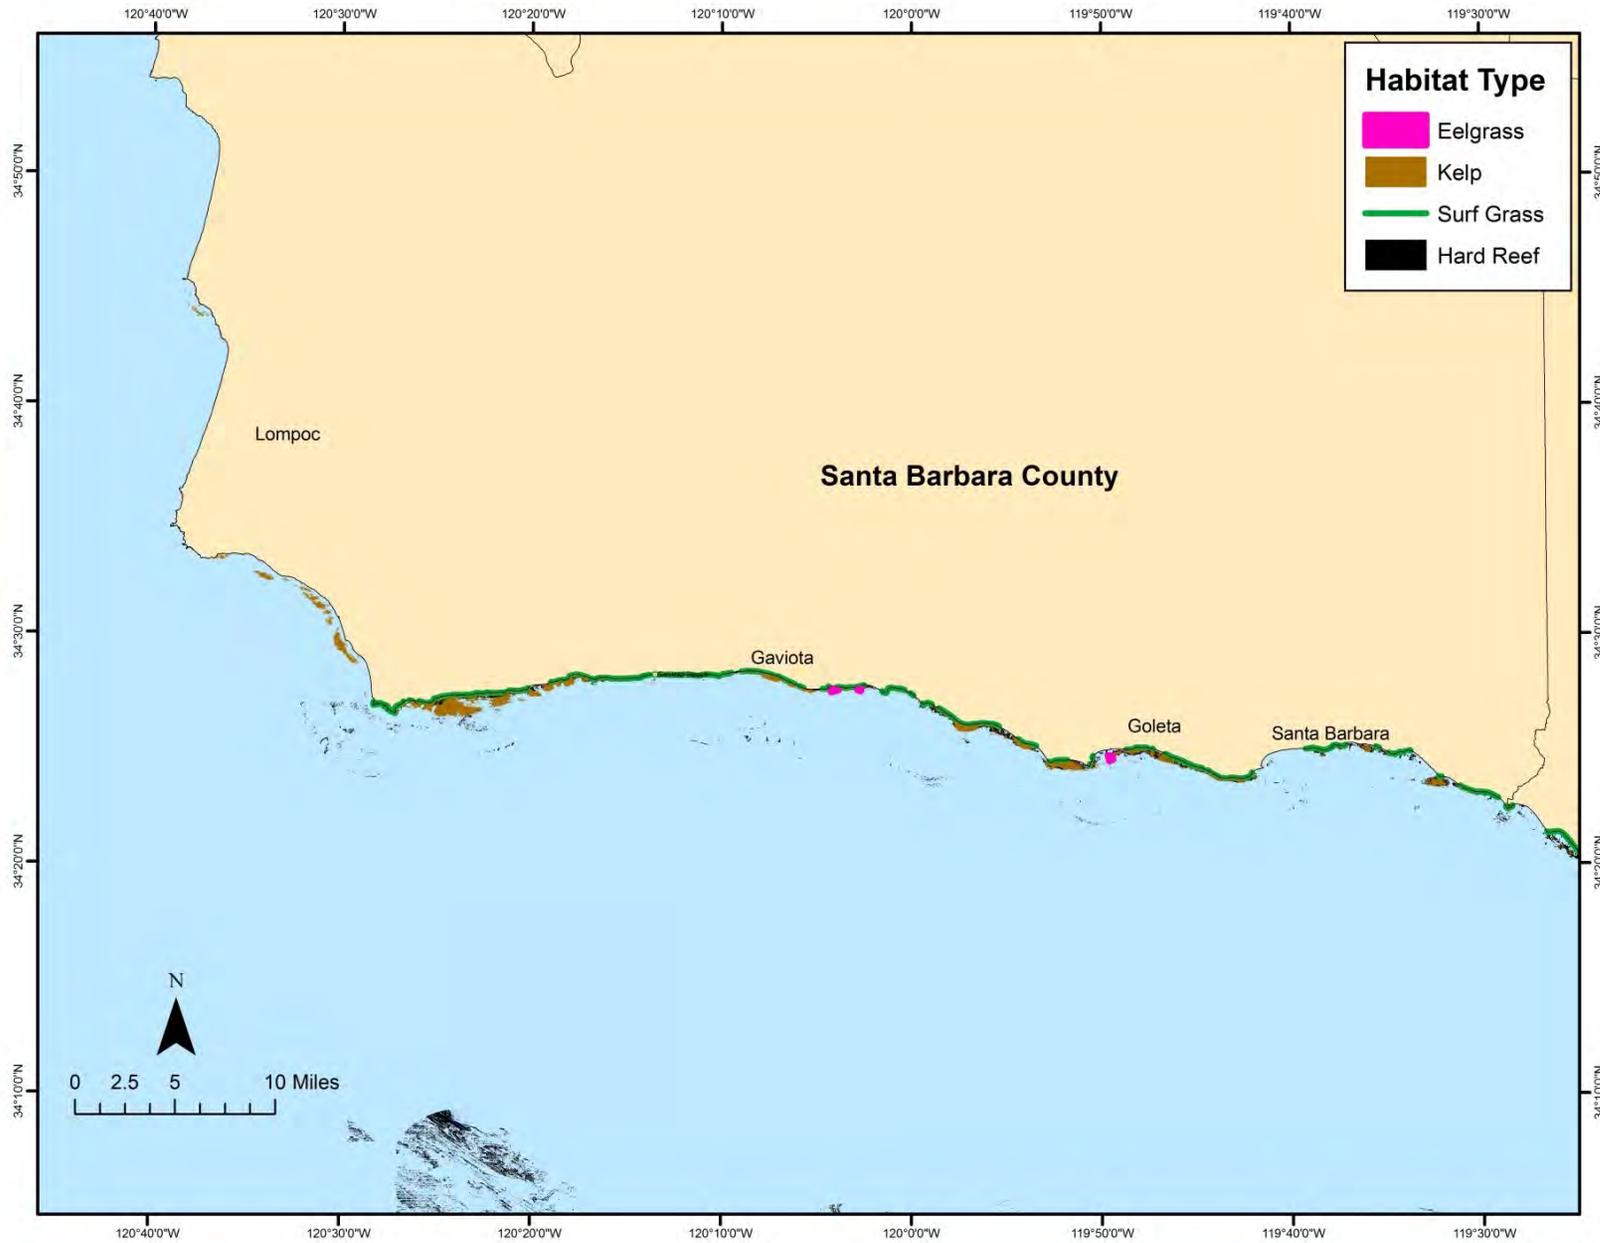

Critical CA lobster habitats along Orange County

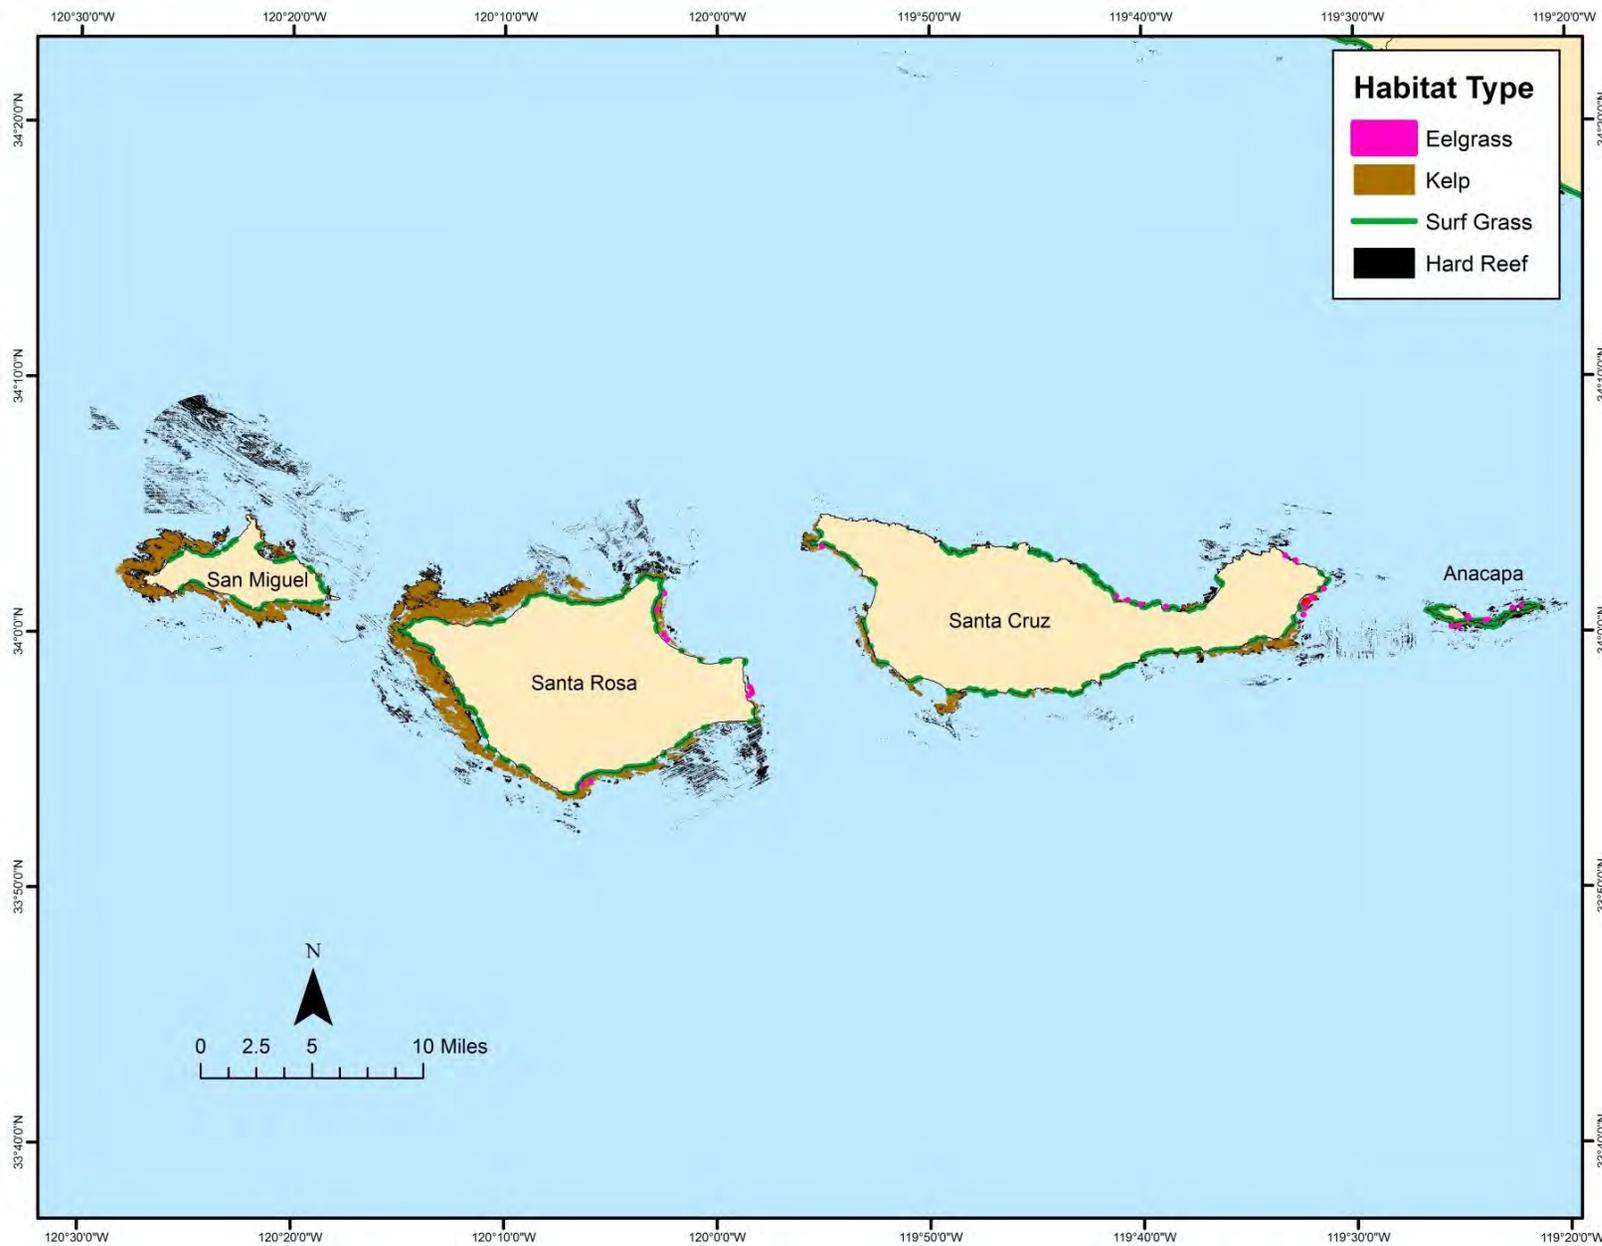

Critical CA lobster habitats along Los Angeles County

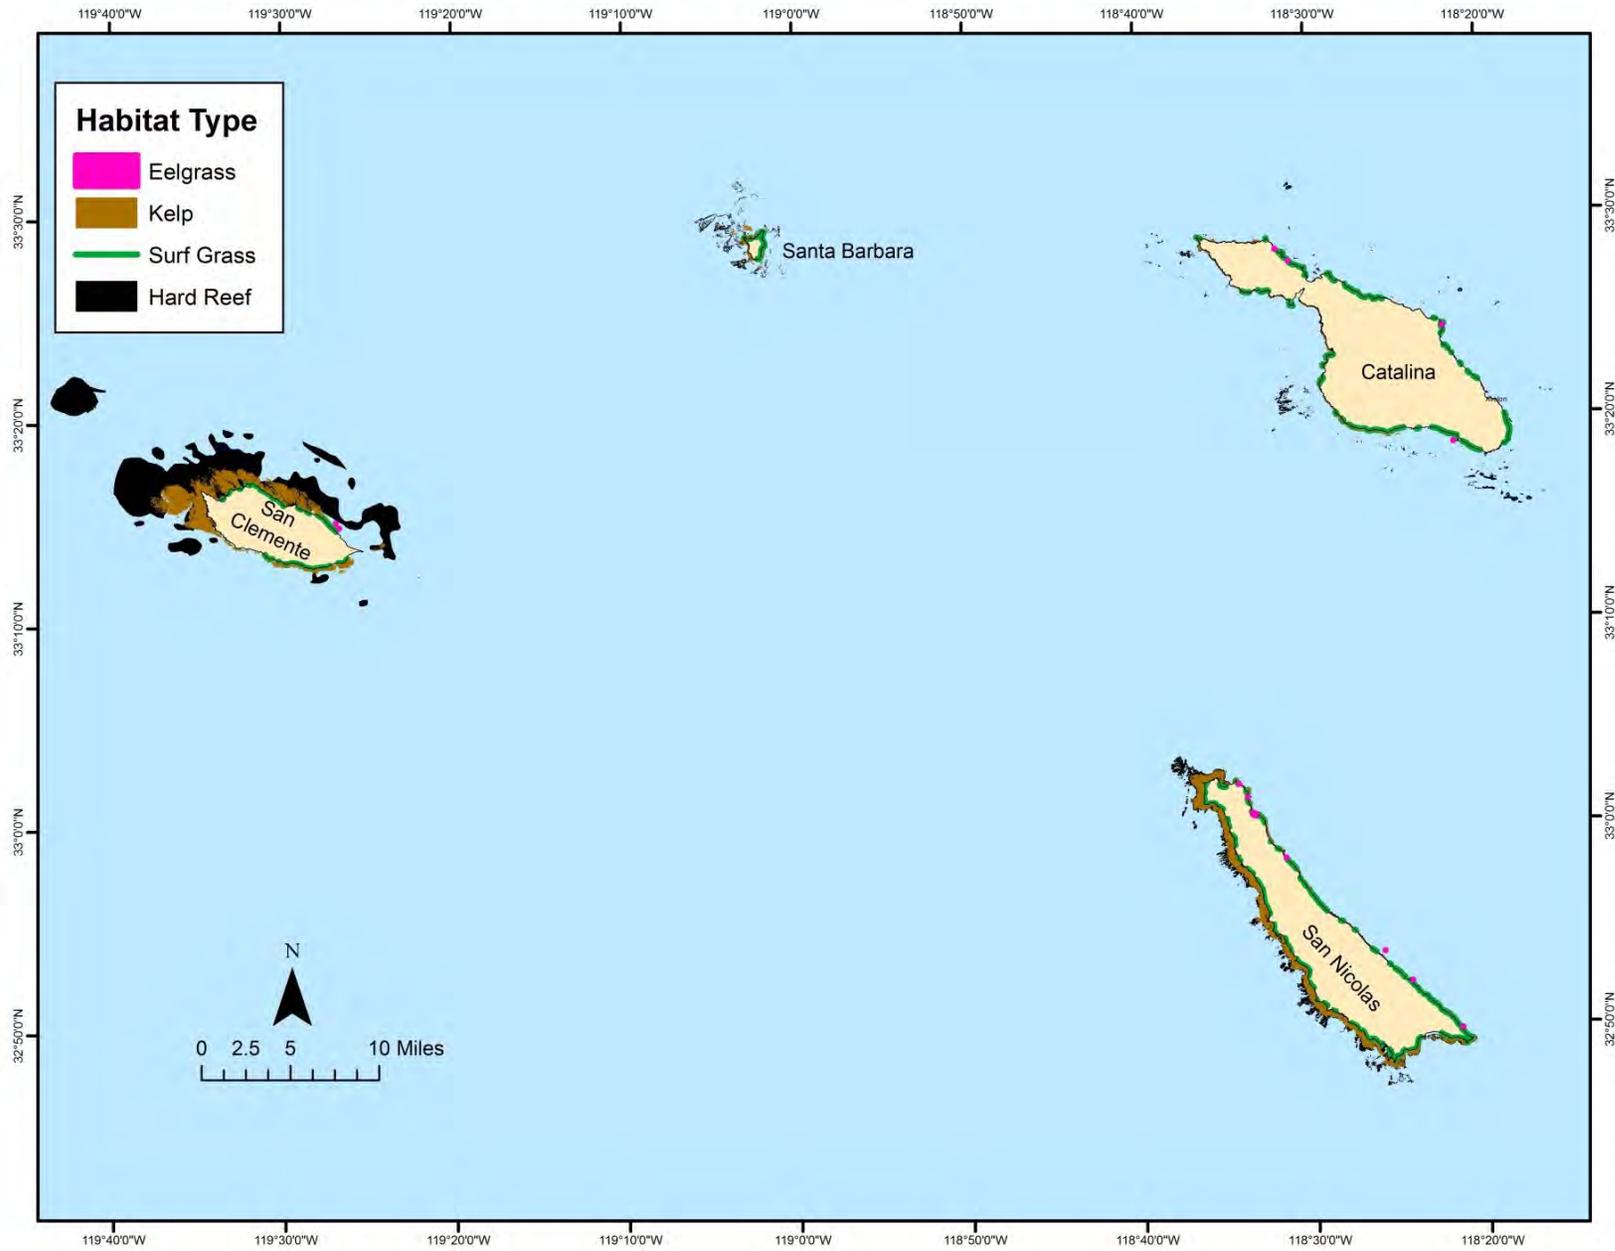

Critical CA lobster habitats along Ventura County

Critical CA lobster habitats along Santa Barbara County

Appendix V: Climate Change Vulnerability of the CA Spiny Lobster

By Dr. Douglas J. Neilson

The science of climate change (CC) involves the study of climatic stressors (e.g., atmospheric air temperature) affected by increasing man-made atmospheric greenhouse gas (GHG) concentrations, and their associated environmental responses. An exhaustive discussion of all the potential stressors is beyond the scope of this chapter and only a small portion, deemed to have obvious potential impacts when applied to the California spiny lobster fishery, will be covered. For the most part, these impacts are restricted to those acting directly on the lobster or fishery. There are understood to be indirect impacts as well, where CC affects some aspect of the environment that cascades down to the lobster. While changes to lobster habitat included in ecosystems that also include lobster will be briefly discussed, the larger topic of how ecosystem interactions are affected by CC is beyond the scope of this chapter. As our understanding of CC evolves, and direct or cascading responses in the environment are newly recognized or better resolved, this chapter should be revisited. As such, this chapter should be considered an initial step in an ongoing effort to addressing lobster-related CC issues.

This chapter will briefly discuss the life history and associated habitats for the California spiny lobster which will be important to understand as we discuss CC vulnerabilities. What CC is, and the underlying cause – GHG, and specifically changes in CO₂ - will then be discussed. Since CC is understood to be a global phenomenon and is being driven at this scale, this chapter will first lay out how the selected climate variables are expected to change over time. The relatively local response to CC in California will then be discussed, followed by how the spiny lobster population, habitat, and fishery, are potentially affected. Finally, ocean acidification will be briefly addressed. Ocean acidification is not a result of CC but rather is caused by the same rise in atmospheric CO₂ that contributes to CC.

Spiny Lobster Life History and Habitats

The California spiny lobster is endemic to the west coast of North America from Monterey, California southward at least as far as Magdalena Bay, Baja California (Wilson, 1948; Schmitt, 1921), with a small isolated population in the northwestern corner of the Gulf of California (Kerstitch, 1989). The main portion of the population resides in Mexico, and relatively few lobsters are found north of Point Conception. In U.S. waters, spiny lobsters are commercially fished from Point Conception south to the Mexican Border. Lobsters spend their larval phase, which can last up to ten months, as part of the plankton (Mai & Hovel, 2007; Mitchell 1971). Carried by currents, lobster larvae have been found as far as 530 km offshore and at depths as deep as 137 m (California Department of Fish and Game, 2001). The final, puerulus, stage is a strong swimmer and moves inshore in search of shallow, vegetated habitats such as eelgrass or surfgrass beds (Mai & Hovel, 2007) in which to settle. Survival of the individual is therefore dependent on both the starting distance offshore of the pueruli and its ability to locate suitable habitat. Sub-adult and adult lobster are bottom dwellers and found at depths ranging from the intertidal to 64 m (California Department of Fish and Game, 2001)

Spiny lobster are found in rocky areas often with plant communities dominated by giant kelp (*Macrocystis* sp.), feather boa kelp (*Egregia* sp.), coralline algae (*Corallina* sp.), and surf grass (*Phyllospadix* sp.) (Lindberg, 1955). They are also associated with eel grass (*Zostera* sp.) which flourishes in sandy areas (California Department of Fish and Game, 2001). Spiny lobsters are a major predator of benthic invertebrates and act as a keystone species preying on mussels along rocky shores (Robles et al., 1990) and on sea urchins in kelp forests (Tegner and Levin, 1983; Lafferty, 2004).

Climate Change

Climate Change is occurring as evidenced by observations of increasing global air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level (IPCC, 2007). The scientific consensus is that the driving force behind this change is man-made sources of greenhouse gases (GHG) – carbon dioxide (CO₂), methane, and nitrous oxide - and globally the average net effect of human activities since pre-industrial times has been one of warming. While methane and nitrous oxide concentrations are significant contributors to climate change, CO₂ is the currently the primary contributor and will be the focus of this discussion. The primary source of CO₂ is fossil fuel consumption.

In 2005, global atmospheric CO₂ levels were measured at 379 ppm, far exceeding the range observed over the last 650,000 years, and emissions grew by approximately 80% between 1970 and 2004 (IPCC 2007). In 2012, average atmospheric CO₂ levels had grown to 392.6 ppm globally, and exceeded 400 ppm for the first time at several arctic sites (Blunden and Arndt, 2013).

Responses to Climate Change

Local responses to climate change may not follow the global trend in either magnitude or direction of response. Because of this, global trends will be discussed briefly to introduce each climate stressor and lay the foundation on which to compare and contrast the local, California responses.

Global Responses

The IPCC (2007) reported that eleven of the twelve years from 1995 to 2006 ranked among the twelve warmest years since 1850. All of the ten warmest years on record have occurred since 1998 including 2012 (Blunden and Arndt, 2013), and 1998 was the only year in the 20th century hotter than 2012 (NOAA 2012). The trend appears to be continuing; July 2013 was the 37th consecutive July and 341st consecutive month with a global temperature above the 20th century average (Osborne and Lindsey, 2013). The rate of warming has also increased. Since 1880, the decadal rate of increase has been 0.11°F increasing to 0.28°F per decade since 1970 (NOAA, 2012).

Global average sea level rise (SLR) has occurred at an average rate of 1.8 mm yr⁻¹ since 1961, increasing to 3.1 ± 0.7 mm yr⁻¹ since 1991 (IPCC, 2007). Estimations of future global sea rise are on the order of 8-23 cm (3.15-9.06 in) by 2030, 18-48 cm by 2050, and up to 140 cm by 2100, all relative to sea level in 2000 (NRC 2012). These estimates vary however based upon which models are used and which variables are included; the NRC values, for instance, are higher than the IPCC (2007) estimation (18-59 cm) for the year 2100.

California Responses

Air temperatures are expected to increase more over continental land masses than over the oceans (Bakun, 1990). Along the California coastline, this will result in atmospheric pressure gradients leading to intensification of winds (Field et al., 1999). Stronger winds, in turn, are expected to intensify upwelling along the west coast of the US. Under normal conditions, intensification of upwelling would lead to cooler water temperature. However, higher air temperature can also lead to stronger thermal stratification and a deepening of the thermocline (Roemmich and McGowan, 1995), reducing the cooling effect of, and nutrient delivery by, the upwelling. On millennial timescales, upwelling has been positively correlated to air temperatures (Pisias et al., 2001), and upwelling along the California coast has increased over the last 30 years (Snyder et al., 2003). Previous warm periods were associated with reduced current flow in the California Current system (Pisias et al., 2001).

SLR will vary depending on a number of factors both long-term and short term. These include storm events, melting ice and glaciers, circulation patterns, climate variations, and tectonics. (NRC, 2012). Modeled SLR at west coast tide gage locations predicted relative sea level rises of around 0.35 ± 0.25 mm yr⁻¹. Total SLR off Los Angeles, relative to 2000, is projected at 14.7 ± 5.0 cm (5.79 ± 1.97 in) by 2030, 28.4 ± 9.0 cm by 2050, and 93.1 ± 24.9 cm by 2100.

The primary force behind year-to-year variability along the California coast is the El Niño Southern Oscillation (ENSO) (Field et al., 1999). The name refers to coupled ocean-atmospheric processes where the Southern Oscillation is a flip-flop of atmospheric pressure over the south Pacific, and where El Niño refers to the in-water response. El Niños result in rapid warming events in California, increased storminess, and drops in phytoplankton and kelp productivity. Strong El Niño events can increase sea levels 10 to 30 cm (3.94 – 11.81 in), raise sea surface temperature (SST) an average of 2.7 °F, increase stratification, and decrease nutrient delivery into surface waters, all over a few winter months. El Niño events persist for a few months to a year with some extreme El Niños lasting for two years. La Niña displays an equally abrupt and short-lived effect on California coastal ecosystems. However, in the case of La Niña, SST is suppressed (-1.8 °F on average). Currently it is unknown whether ENSO activity will be enhanced, or damped, or whether the frequency of ENSO events will change (Collins et al., 2010)

Lobster

Increased SST conditions will likely favor the spiny lobster fishery since behavioral changes related to warm temperatures, increase harvest (Pringle, 1986; Koslow et al., 2012). Also, California is situated at the northern edge of the lobster's current domain range; lower numbers of lobster north of Point Conception are generally attributed to the cooler water found there. Increasing SST could therefore result in a general extension northward of lobster, particularly during El Niño years or times of enhanced Davidson Current northward flow. These latter two conditions are also thought to provide episodic transport of larvae north from Mexico which would also increase the spiny lobster abundance over time. (Pringle, 1986).

As SST increases, assemblages within southern California kelp forests will shift to more dominance of southern species – such a shift has already been observed in some kelp forests (Field et al. 1999). Kelp itself may be impacted by increasing SST and reduced nutrients, although it is unclear at this point exactly what response, positive or negative, kelp forests will have relative to climate change. Likewise, it is unclear if the California spiny lobster, being more tropical, would be directly (i.e. physiologically) affected negatively by increasing SST.

There is an increased likelihood of disease with higher water temperatures. As an example, the bacterial infection, epizootic shell disease, is present in American lobster stocks on the east coast of the US and is possibly linked to higher water temperatures. Catchability increases with increasing temperature. Considered alone, this could lead to higher harvests in the future. Even if countered by other climate change factors, variations in catchability would still need to be understood and addressed in stock assessment and modeling efforts for accurate results.

It is still unclear whether increased stratification or upwelling, countering stratification, will be the dominant response to climate change. Increased stratification, however, is projected to lead to declines in zooplankton abundance (Roemmich and McGowan, 1995) which could adversely affect the zooplankton larval phase of the spiny lobster directly or indirectly by reducing food sources. Conversely, upwelling and alongshore transport are strong determinants of dispersal and recruitment (Gaylord and Gaines, 2000; Connolly et al., 2001). Harley et al. (2006) cited modeling work that suggested increased

offshore movement (e.g., upwelling) can be negatively correlated with population size in benthic species. Very strong upwelling, therefore, could reduce the ability of lobster to maintain adult populations in some areas. This is probably more applicable to regions north of Point Conception and, as such, would act to reduce northward movement of the lobster range rather than impact the southern California population.

Increasing SLR will lead to coastal inundation and increased coastal erosion, in particular when accompanied by expected higher intensity storm events coinciding with high tidal periods. Coastal erosion can lead to silting of coastal habitat necessary for the lobster, in particular seagrass beds used for settlement and adult foraging. Even in areas spared from excessive silting, seagrass beds would still be sensitive to changing wavelengths of light brought about by increased turbidity and water depth. The fishing industry could also experience flooding at dock and harbor facilities. This would potentially affect both the fishermen and dealers.

Seagrass beds could be impacted by more frequent, higher intensity storm events damaging part of a bed, or completely destroying it. These events could also become relatively common occurrences. Damage or destruction of seagrass beds would impact lobster through reduction in suitable habitat for puerulus settlement. This could result in adult mortality exceeding recruitment leading to local loss of populations. Similarly, kelp beds could be damaged or destroyed at more frequent intervals. Lobsters are considered, along with urchins and kelp, to be necessary for the health of the kelp forest ecosystem. If kelp is lost at higher frequencies the result could be an imbalance in the kelp/lobster/urchin relationship leading ultimately to loss of the ecosystem (and by extension, the lobster located there). In terms of the fishery, these storm events could also affect the fishermen economically by hindering their ability to fish, and by the destruction of gear.

Changes to the lobster stock may also occur via altered larval distribution and settlement, loss or gain of coastal nursery habitats, and altered abundances of strongly interacting species (e.g. predators and prey) (Pecl et al. 2009). Though first-stage larval abundance generally is correlated with SST (Fig. 5), changes in wind patterns and storm frequency may alter larval dispersion and settlement (Caputi et al. 2010). Because spiny lobster larvae spend up to 10 months in the plankton stage, and the final larval stage actively swims from offshore to coastal nursery habitats, settlement success is dependent on the planktonic larvae's distance offshore at the time of final molt. Any change in currents and storms that result in farther offshore dispersion will have an adverse effect on harvest in the future.

Ocean Acidification

Although not specifically caused by climate change, ocean acidification is a separate phenomenon also related to increasing amounts of atmospheric CO₂. The ocean absorbs CO₂ from the atmosphere naturally and acts as a buffer for atmospheric CO₂. The pH of the oceans, however, is affected by the level of absorbed CO₂. With increasing levels of atmospheric CO₂, the ocean's CO₂ level also rises and the water becomes more acidic. It has been estimated that the oceans have absorbed half of the anthropogenic-induced CO₂ from the atmosphere (Pecl et al., 2009), and this has resulted in a more acidic ocean. (Caldeira and Wickett, 2003; Royal Society, 2005; Pecl et al, 2009). As acidity continues to increase, there will be increasingly adverse effects on many organisms that use calcium carbonate for their shells and skeletons since calcium carbonate will dissolve as acidity increases. Water corrosive enough to dissolve seashells has been observed off California and similar occurrences are expected to become more frequent (Feely, 2008). The types of organisms potentially affected include snails and mussels, corals, and many phytoplankton species. It is unclear if there will be any adverse effects of

acidification directly on lobster (Pecl et al., 2009). Also, distribution, extent, and composition of coastal vegetated habitats that house lobster all may change due to altered dissolved CO₂ concentrations.

ECOLOGICAL CONSULTANTS

An Economic Report on the Recreational and Commercial Spiny Lobster Fisheries of California

Photo Courtesy of: California Department of Fish and Wildlife

Prepared by:

Dr. Steven C. Hackett
Dr. Sharon Kramer
M. Doreen Hansen
David Zajanc

3 April 2013

We are grateful for the participation of many recreational and commercial spiny lobster fishermen in the data-gathering component of this report. We thank Kristine Barsky and Kai Lampson of CDFW for their support and assistance. We also acknowledge the extensive assistance provided by staff at H. T. Harvey & Associates and at CDFW.

Executive Summary

- The project scope was to update annual expenditure estimates associated with commercial spiny lobster fishing in California from Hackett et al. (2009); to use the California Ocean Fish Harvester Economic (COFHE) model from Hackett et al. (2009) to estimate the economic impacts associated with ex-vessel commercial landings in California; to develop a spiny lobster recreational fishing sampling design and survey questionnaire; and to use the survey results to estimate recreational fishing expenditures in California.
- Based on 2012 interview data and prior “bottom-up” expenditure modeling from Hackett et al. (2009), we estimate that commercial fishermen targeting spiny lobster in California spent ~\$10,555,000 on fishing- and vessel-related expenditures in the 2011-12 fishing season.
- Based on the mean of total ex-vessel revenue from the 2009-10 through 2011-12 commercial fishing seasons in California, we estimate that the multiplier effect associated with commercial landings resulted in total annual statewide economic output of ~\$22,523,000 and 323 jobs. Of the California counties in which spiny lobster landings occurred, San Diego County experienced the largest share of statewide output and jobs. Based on 2012 survey data we estimate that annual expenditures in the recreational fishery in California were ~\$37,093,000. Note that not all of these expenditures necessarily occur in California. Also note that these are expenditures and not total economic impact, which is beyond the scope of this report.
- The average recreational fisherman has fished spiny lobster for nearly 9 years and spends an average of just over 2/3 of a day on a typical fishing trip. Spiny lobster fishing constitutes an average of just over 1/3 of a recreational fisherman’s total fishing effort in a given year. Private vessels provided just over 1/2 of all access to the recreational fishery, and on average about 8% of a vessel’s annual usage was estimated to be targeted at spiny lobster fishing.

Section 1.0 Introduction

The California spiny lobster, *Panulirus interruptus* (hereafter spiny lobster), occurs in shallow, rocky coastal areas from Point Conception (Santa Barbara County) into Mexico, including offshore islands and banks (Barsky 2003). A significant commercial and recreational fishery exists for spiny lobster, and the season in California runs from early October to mid-March, with approximately 2/3 of landings usually being made from October through December. Commercial fishermen targeting spiny lobster set baited, wire traps from vessels that usually range between 22 to 49 feet in length. Spiny lobster has been a relatively lucrative fishery. A total of 751,000 pounds of spiny lobster was landed by commercial fishermen in 2011 in California at a total ex-vessel value of ~\$12,910,000, yielding an average price per pound of ~\$17.00 (CDFW 2013). In 2012, preliminary data indicate roughly similar landings as 2011. Price per pound fluctuates throughout the season, and in the 2012/13 fishing season it ranged from \$12 to \$25 per pound. Export markets (e.g., China) have helped drive higher prices in the commercial fishery in recent years (Barsky, pers. comm., 2013).

This economic report provides an update of direct expenditure information by commercial fishermen described in Hackett et al. (2009). Commercial expenditure updating occurred by way of interviewing a set of commercial spiny lobster fishermen and identifying the extent to which mean expenditure levels by category have changed since 2007. This report also utilized the California Ocean Fish Harvester Economic (COFHE) commercial fishery economic impact model from Hackett et al. (2009) to estimate total economic impact. This was done by applying the COFHE multipliers (available at <http://www.dfg.ca.gov/marine/economic/structure.asp>) to the mean of total seasonal ex-vessel revenue averaged over the 2009-10, 2010-11, and 2011-12 fishing seasons. Commercial fishery economic impacts were estimated at the county, region, and statewide scales. Note that in Hackett et al. (2009) the spiny lobster fishery was grouped with crab in the “Lobster and Crab” operational configuration (OC). In contrast, this report focuses entirely on the targeted spiny lobster fishery.

This report also includes an estimate of the direct expenditures made by recreational fishermen targeting spiny lobster in the recreational fishery off the coast of California. These direct expenditures were estimated from survey data gathered in collaboration with California Department of Fish and Wildlife (CDFW) using the spiny lobster report card database. It is beyond the scope of this study to estimate economic impact. To do so one would need to “margin” the retail expenditures to get a wholesale estimate, group expenditures by appropriate economic sector category, and apply multipliers (e.g., RIMS II) or use economic impact software (e.g., IMPLAN).

In Section 2 below we summarize commercial expenditures in the spiny lobster fishery. In Section 3 we describe economic impacts associated with the mean of the last 3 season’s worth of ex-vessel revenue from commercial spiny lobster harvest. In Section 4 we summarize estimated expenditures in the spiny lobster recreational fishery. The survey instruments used to elicit commercial and recreational fishing data are provided in the Appendices to this report.

Section 2.0 Estimated Commercial Expenditures in the Spiny Lobster Fishery

The overall goal for this portion of the report was to update the expenditure information for the “lobster and crab” operational configuration (OC) from Hackett et al. (2009). Due to resource constraints, we were unable to reproduce the comprehensive survey methodology used in Hackett et al. (2009). Instead we used a key-informant interview methodology in which we asked commercial spiny lobster fishermen the extent to which (inflation-adjusted) expenditures by category (averaged at the individual fisherman level) reported in Hackett et al. (2009) reflected expenditures for a “typical” commercial fisherman. We asked contacts at CDFW to identify commercial fishermen who were likely to have a broad, industry-wide perspective and who would thus be able to reflect on the expenditures made by a typical commercial spiny lobster fisherman.

Annual average fixed and variable cost information from the lobster and crab OC in Hackett et al. (2009) was provided to the interviewees in numerical and pie-chart format (see Appendix A for an example used for the small-vessel stratum). These “cost sheets” were adjusted for inflation (2007 nominal expenditures from Hackett et al. (2009) were adjusted to 2012 values). Interviewees were asked to determine a percentage by which those expenditures should be increased or decreased to reflect the expenditure experience of a “typical” spiny lobster commercial fisherman. Some expenditure categories from Hackett et al. (2009) such as “electrical gear” and “other gear” purchases and repairs were consolidated into a “gear purchases” and “gear repairs” category. The cost sheets were stratified into vessel size classes used in Hackett et al. (2009) – small (< 26 feet), medium (26 to 36 feet), and large (> 36 feet). Cost sheets for a given size class were given to selected fishermen with vessels of the same size class, and afterwards personnel from H. T. Harvey & Associates called to interview the commercial fishermen and complete the questionnaire component of the cost sheets.

A total of 10 commercial fishermen participated in the interviews. We use the term “interviewee” below to refer to these commercial spiny lobster fishermen who were interviewed in 2012 to help us update Hackett et al. (2009) expenditures circa 2007. Of the 10 interviewee responses, 8 were determined to be useable, while 2 were not (addressed below). When participants reported a range of values (e.g., “bait expenses from the cost sheet need to be increased by 10-30%”), then the mean of the range (in this instance, 20%) was coded and used in the analysis. If a fisherman simply indicated that costs should “increase” or “decrease”, those data were treated as a blank (unanswered) and not used in the following analysis (there were very few of these responses). Percentage changes for each cost category were averaged within each vessel size class (small size class and a combined medium-large size class).

As noted above, we asked interviewees to report a “typical” commercial fisherman’s expenditures within a vessel size class in the spiny lobster fishery, and to indicate the percentage increase or decrease that should be made to the 2007 expenditure information from Hackett et al. (2009). Many of the interviewees indicated that expenditures we reported from the 2007 study were far too low, even after the figures were inflated to

current dollars, and suggested very large expenditure increases. When such expenditure increases were implemented fleet-wide, net revenues (e.g., ex-vessel revenue less reported expenditures) were estimated to be negative. Conversations with CDFW contacts indicated that negative net revenues were very unlikely for this lucrative fishery. We then turned to an analysis of activity level. An analysis of trip frequency determined that the interviewees selected by CDFW were more active fishermen than the average commercial fisherman. As a result it is likely that the interviewees were reporting “typical” expenditures that actually reflected the experience of the top 10-20% of commercial fishermen. As many categories of estimated expenditures increase with activity level, applying percentage increases from these highly active fishermen would result in a substantial over-estimate of fleet-wide expenditures. To correct for this likely overestimate of expenditures, we developed an “activity-based” weighting system.

First we used the expenditure estimation models by category from Hackett et al. (2009) and applied those to each commercial fisherman in the commercial spiny lobster fishery based on their vessel type, home port, and number of trips. Next we inflated these expenditures to current dollars. We then adjusted these expenditures using the mean percentage change by expenditure category provided by the commercial spiny lobster interviewees (one set of mean percentage change values was calculated from small-vessel interviewees, and another set was calculated from combined medium and large vessel interviewees). This percentage change is likely to be too high for most commercial spiny lobster fishermen, for reasons described in the preceding paragraph. Accordingly, we then applied the activity-based weight to each expenditure category for each commercial spiny lobster fisherman in a given vessel size class. The activity-based weight is a quotient equal to the individual fisherman’s total number of fishing trips in 2011 divided by the mean number of fishing trips by the relevant interviewee group in 2011. The effect of this activity-based weight is to deflate (inflate) the percentage change from the interviewee group when an individual fisherman’s level of activity is less than (greater than) that of the interviewee group. This weighting system was not applied to expenditure categories that are unlikely to be related to activity level – slip fees, member association fees, harbor fees, and interest.

Note that responses from 2 interviewees remained inexplicable and substantial outliers even after consideration of their vessel size, number of trips, and other observable characteristics. This raised concern about their reliability, ultimately resulting in those interviewee responses not being included in the analysis.

We also discovered that while we asked participants to provide an annualized value for engine, hull, and other major capital purchases, the responses were consistent with reporting an actual purchase price rather than an annualized “debt service” type value. For example, we might receive a reported annual expenditure of \$16,000 for engine purchase, when what we wanted was the “annualized” cost (which might be ~ \$1,800 per year as debt service on a 10 year loan). We thus needed to annualize these capital expenditure percentage change values from the interviewee group. To do so, we used data on frequency of capital purchases from Hackett et al. (2009) to develop an additional “annualized capital purchase” weighting system. The annualized capital purchase weight simply equals the frequency of non-blank and non-zero capital expenditure responses from the commercial fisherman survey in Hackett et al. (2009). Annualized engine and hull purchase expenditures for each commercial spiny lobster fisherman were thus estimated the same way as

other expenditure categories described in the preceding paragraph, except that the additional annualized capital purchase weight was also applied.

Commercial license, permit, and boat registration expenditures were calculated from CDFW 2011/12 fees. Once we estimated all expenditure categories for each individual commercial spiny lobster fisherman as described above, a fleet-wide expenditure total was built from the bottom up by summing expenditures estimated for each commercial fisherman. The resulting annual expenditure estimates for the commercial spiny lobster fishery are provided in Table 1. We estimate that commercial spiny lobster fishermen spent \$10,555,000 in expenditures related to spiny lobster fishing for the 2011-12 fishing season. Nearly one half of this figure was estimated to derive from crew wages, bait, and fuel.

Table 1. Annual Estimated Expenditures for the California Spiny Lobster Commercial Fishing Fleet for Fishing Season 2011-12

Section 3.0 Economic Impact Estimates for the Commercial Spiny Lobster Fishery

3.1 Overview of Economic Impact Assessment

The material below draws closely from Hackett et al. (2009). Firms in every industry are linked through their purchases and sales with firms in other industries and with households. Inter-industry linkages and the impact of activities in one industry on overall household income, employment, business sales, tax revenues, and other economic conditions are important but not always apparent by examining direct industry statistics. Input-output models display direct, indirect, and induced economic linkages, and measure impacts of changes or proposed changes in industrial activity or in government policies that are expected to change industrial activity. Direct impacts are associated with the direct purchases of inputs (e.g., labor and intermediate inputs) by an industry to support an increase in industry output. Indirect impacts are associated with additional “rounds” of inter-industry purchases and sales that are generated as a result of direct impacts. Induced impacts are from increases in household expenditures that result from increases in household income associated with direct and indirect impacts.

Input-output models form the core of modern economic impact assessment decision support tools. Hackett et al. (2009) offers economic impact assessment models for California’s commercial fisheries. To build these models, Hackett et al. (2009) collected statewide commercial fishing expenditure and earnings data in 2007 for 20 different OCs or fishery sectors that reflect vessel and gear types and the associated commercial fishing expenditures for target species groups. These expenditure data, combined with CDFW landings and revenue data, were used to develop input-output models with 20 detailed OCs for the state of California, 4 coastal regions within California, and 22 individual counties that make up those coastal regions. These 27 models, collectively called the COFHE Model, were developed by King and Associates, Inc. (coauthors in Hackett et al. 2009) from a widely used and respected regional economic modeling tool called the IMPLAN (Impact Analysis for PLANning) system (MIG 2013).

The COFHE models are designed to show the economic linkages and impacts of California’s commercial fish harvesting industries and how they are affected by external economic, regulatory, or environmental changes that affect ex-vessel revenues. These models show how each commercial fishing OC is linked with other industries and with households. The models were then used to develop economic “multipliers” that show the “ripple” effects of changes in fisheries and fisheries management decisions on the California economy. The multipliers developed through the COFHE model are presented per million dollars of direct sector output.

The most typical use for the COFHE model is to assess the economic impact associated with a regulatory change that has known impacts on ex-vessel revenues due to changes in landings. In this report we apply the COFHE model multipliers to total ex-vessel revenue at county, region, and statewide scales. The resulting economic impact is associated with the existence of the commercial spiny lobster fishery in California. If,

hypothetically speaking, this fishery were newly opened, then the economic impact figures provided below would provide an estimate of the additional economic activity associated with opening the fishery at different geographical scales. Key economic impact terms are defined in Table 2 below.

Table 2. Definitions of Economic Impact Terms Used in this Report

IMPLAN Term	Definition
Direct Effects	The impacts associated with the direct purchases of inputs (e.g., labor and intermediate inputs) by an industry to support a \$ 1 increase in industry output.
Indirect Effects	The impacts associated with additional "rounds" of inter-industry purchases and sales that are generated as a result of direct impacts. Indirect impacts include the direct impacts of purchases of inputs (e.g., labor and intermediate inputs) by industries that sell to the industry responsible for the direct impacts, and by the industries that sell to those industries, and so on.
Induced Effects	The impacts associated with increases in household expenditures that result from increases in household income associated with direct and indirect impacts. The inclusion of induced impacts based on "income effects" is what distinguishes Type II multiplier Effects from Type I multiplier effects.
Total Effects	The total of all direct, indirect, induced impacts.
Industry Output	Total industry production, equal to shipments plus net additions to inventory.
Jobs	Annual average number of full time-equivalent jobs, including self-employed individuals.
Employee Compensation	Total payroll costs, including wages and salaries plus benefits.
Indirect Business Tax	Sales, excise fees, licenses and other taxes paid during normal operation. This includes all payments to the government except for taxes based on income.
Labor Income	Sum of Employee Compensation and Proprietor's Income.
Other Property Income	Includes corporate income, rental income, interest and corporate transfer payments.
Proprietor Income	Income from self-employment.
Total Value Added	The value added during production to all purchased intermediate goods and services. This is equal to employee compensation plus proprietor's income plus other property income plus indirect business taxes.

3.2 Economic Impacts Associated with the Mean Value of Ex-Vessel Landings over the 2009-10 through 2011-12 Fishing Seasons

Below we provide economic impact estimates at the county, region, and state-wide scales. Note that these economic impact estimates are based on the mean value of ex-vessel landings over the 2009-10, 2010-11, and 2011-12 spiny lobster commercial seasons. We estimate that the multiplier effect associated with commercial landings resulted in total annual statewide economic output of ~\$22,523,000 and 323 FTE jobs (Table 3). Of the California counties in which spiny lobster landings occurred, San Diego County experienced the largest share of statewide output and jobs (Table 4).

Table 3. Economic Impacts for the State of California

California				
	Direct Effects	Indirect Effects	Induced Effects	Total Effects

Section 4.0 Estimated Expenditures in the Spiny Lobster Recreational Fishery

We developed a recreational survey instrument that, like other recreational fishing surveys, seeks expenditure information associated with spiny lobster fishing. Capital expenditures on vessel and non-specific gear are weighted by the reported percentage of targeted usage in the spiny lobster recreational fishery. The survey instrument is provided in Appendix B of this report. A stratified random sampling design was also developed for CDFW. In order to preserve confidentiality, CDFW conducted the telephone surveys and provided us with tabulated results. We begin with an overview of the survey methodology, and then provide demographic summary information and expenditure estimates drawn from the tabulated results of the survey.

4.1 Survey Methodology

A stratified random sampling design was developed for sampling spiny lobster recreational fishermen, as it is likely that there are substantially different levels and types of expenditure across groups of fishermen. Stratified sampling takes advantage of the ability to create groups where the target of interest (i.e., angler expenditures) is most similar among units (i.e., recreational fishermen) within a stratum, which helps reduce variation of the overall estimate (Thompson 1992, see Cochran 1977, for greater detail on stratified sampling). In this case we use strata that delineate groups based on home origin (i.e., the fisherman's residence), catch location, and gear type.

Stratification based on home origin regions was used in an attempt to account for potential differences in expenditure incurred by geographic area. Home origin is defined as the location where people live, and was determined based on the zip codes provided on spiny lobster report cards. The rationale for home origin groups is based on the likelihood that fishermen traveling to the catch location from further away have an increased likelihood of incurring a lodging expense. Catch location pertains to the area fished, as indicated by the location codes on the report cards. The rationale for catch location groups is based on the likelihood that fuel and related expenditures linked to additional vessel transit distance to the fishing grounds will vary across catch locations. This is especially the case for offshore and island catch locations where transit expenditures are expected to be considerably higher than catch locations that are closer to the coast.

We based our final decision on appropriate home origin regions on sample size considerations, geographical breaks related to population density (extent of urbanization), and graphical analyses. As illustrated in Figure 1 the majority of returned cards are from coastal zip codes immediately adjacent to the coast (1,174 of 4,640), or zip codes for locations outside the immediate coastal strip but within 50 miles of the coast (2,834 of 4,640). There was a large drop-off in the number of returned report cards beyond 50 miles from the coast (632 of 4,640), suggesting a substantial decrease in activity from fishers further than 50 miles from the coast, assuming that reporting rates do not differ with distance from the coast. In addition, most of the population

lives within 50 miles of the coast, and are more likely to take day trips to go fishing with reduced expenditures per fishing trip compared to those who would travel from further away and make longer trips.

In summary, we utilized the following home origin regions:

1. Coastal (zip codes directly adjacent to the coast)
2. Regional (i.e., close enough to the coast for reasonable day trip, < 50 miles, but beyond coastal)
3. Beyond (> 50 miles from the coast)

Figure 1. Map of Potential Home Origin of California Spiny Lobster Recreational Fisherman.
 Note that “Within 50 miles to Coast” includes zip code areas that are partially within this zone

In addition to home origin regions, we also pre-stratified based on catch location regions. Fishing grounds in coastal waters off San Diego, Los Angeles/Orange County, and Santa Barbara/Ventura were grouped into a “Not Offshore” category (3,679 of 4,640 report cards). Due to the potential for greater trip expenditures associated with catch locations in the Channel Islands and more distant offshore grounds, a second category, “Offshore and Islands” (961 report cards) was created.

Finally, gear type is an important consideration for pre-stratification in that the focus of the trip and behavior patterns/investment in the recreational fishery may differ a great deal. Anglers targeting spiny lobster generally utilize either some type of diving gear, or deploy some form of hoop net. The equipment associated with each method also differs, as does the expenditure of the equipment.

For the purposes of pre-stratification, we collapsed the 2 types of hoop netting (traditional basket-style hoop nets and rigid conical-style hoop nets) into one category, “hoopers”, and the 2 types of diving (skin and scuba) into another category, “divers” (Barsky 2003). Overall there were a greater number of returned report cards for hoopers (2,840) than divers (1,800). The CDFW’s 2007 creel survey of recreational lobster fishermen found that 80% used hoop nets and 20% were divers.

We had considered finer breaks in categories (e.g., between traditional and rigid hoop nets, or between scuba and skin diving), but concluded that differences in net technology did not warrant further stratification. Due to sample size considerations (i.e., relatively few skin divers), and the large degree of overlap between the 2 activities for many fishermen, we opted for a single comprehensive “divers” category.

Analysis of activity patterns also showed the strongest differences between gear types (see Figure 2), supporting the idea that the expenditures between hoopers and divers may be considerably different. Distributions of activity patterns were plotted using kernel smoothing techniques (Bowman and Azzalini 1997) to allow graphical comparisons among gear types. Kernel smoothing was used to estimate probability densities for the range of values of activity patterns found in the dataset. These probability densities were plotted against the number of trips to graphically represent distributions of activity patterns. In general, divers tended to take more trips per year than hoopers, and were more likely to make > 5 trips in a year/season.

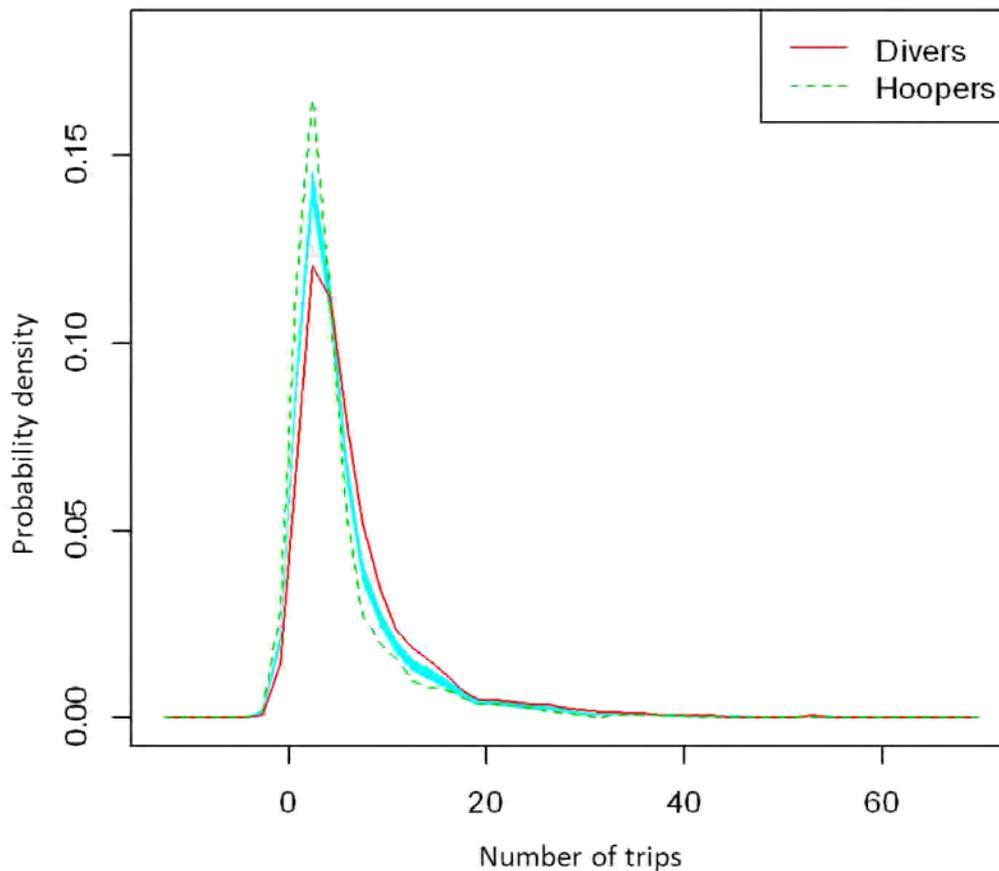

Figure 2. Smoothed Probability Density Distribution Curves for Activity Patterns by Gear Type. The turquoise band is a reference band of equality (see Bowman and Azzalini 1997); if both lines fall within the band, there is no difference between the 2 distributions.

To classify the data, we designated a dominant gear type used by a fisherman (defined as > 50% of trips, i.e., > 50% of trips diving resulted in classification as “divers”; > 50% of trips hooping resulted in classification as “hoopers”; 50/50% of trips for “divers”/“hoopers” resulted in classification as “both” (1 report card)). If no one category represented > 50% of the trips (27 report cards), we evaluated the detailed record of trips to determine the appropriate gear category (23 of 27 were deemed “both”). Due to the small number of fishermen in the “both” category however, we decided to lump this category with the category that had the most similar pattern of activity, the “hoopers.”

We developed stratum-specific sample sizes that are proportional to the stratum size (i.e., proportional allocation). If we had more information regarding variance of expenditures within each stratum, we could try to achieve optimal allocation of sampling effort using different sampling proportions per stratum, minimizing variance for a given expenditure; however, this information does not currently exist. Proportional allocation is the same as the optimal allocation scheme in that it minimizes variation for a given expenditure under certain conditions (i.e., when the stratum variances are equal and the costs of sampling each unit within a given stratum are equal) (Chambers and Clark 2012). For the purpose of this study, we are assuming that

both conditions hold. Although it would be desirable to allocate more effort to those strata that have greater variance, there are no data to support that allocation at this time. In addition, it is reasonable to assume that calling an angler from one stratum will have a similar cost to calling a fisherman in any other stratum. Table 5 provides the proposed stratum sizes and the sample sizes by stratum.

Table 5. Sample Sizes by Stratum

Home Origin	Location	Gear Type	Stratum Size	Proportion of Total	Proposed Sample Size	Actual Sample Size
< 50	Not offshore	Hoopers	1,711	0.37	111	140
< 50	Not offshore	Divers	708	0.15	46	64
< 50	Offshore	Hoopers	236	0.05	15	20
< 50	Offshore	Divers	179	0.04	12	17
Beyond	Not offshore	Hoopers	198	0.04	13	18
Beyond	Not offshore	Divers	114	0.02	7	10
Beyond	Offshore	Hoopers	44	0.01	3	4
Beyond	Offshore	Divers	276	0.06	18	24
Coastal	Not offshore	Hoopers	537	0.12	35	47
Coastal	Not offshore	Divers	411	0.09	27	37
Coastal	Offshore	Hoopers	114	0.02	7	10
Coastal	Offshore	Divers	112	0.02	7	10
Total			4,640		300	401

A minimum proposed sample size per stratum of 3 was selected, as this is the absolute minimum required to generate a reasonable estimate of variance. For the vast majority of strata, proposed sample sizes are much greater than 3 (see Table 5). The strata selected were a balance between the idea of lumping strata to provide the greatest sample sizes possible per stratum, and making sure that we had enough strata to capture the groups most likely to have relatively large differences in expenditures with similar expenditures within each group. This approach resulted in a recommendation of a total sample size of 300 completed interviews, which amounts to picking the sample size that allows us to use 3 at a minimum for any given stratum under proportional allocation.

Interviews were conducted by telephone by CDFW personnel based on a list of randomly selected spiny lobster report card identification numbers. CDFW personnel then linked the selected identification numbers to the appropriate phone numbers before making the telephone calls. Potential survey participants were selected from recreational fishery participants who returned a 2011 spiny lobster report card. Interviewers would call a number, and if they were unsuccessful with the target interviewee (no answer, refusal to

participate, language barrier), then they would move on to the next contact on the list. If they completed the list for a particular stratum and still had not met the target number of completed surveys, then they would start over from the top of the list in an attempt to reach target interviewees who did not answer the first time (skipping prior refusals, language barriers, and completed interviews). Under this procedure the maximum number of times that a contact could be called was twice. In contrast meeting the sample size for some of the stratum groups was easier (more people answered the phone, fewer refusals, language barriers, etc.) and interviewers did not have to call all of the contacts on the list. A few contacts were obviously erroneous or didn't have phone numbers: Interviewers did not attempt to contact these people. CDFW generally found anglers to be willing to participate, and as a result CDFW elected to increase sample size by about 1/3 overall, with increases spread as evenly as possible across all strata. The column “actual sample size” in Table 5 indicates the number of recreational fishers interviewed by CDFW.

4.2 Expenditure Estimates for the Spiny Lobster Recreational Fishery

4.2.1 Estimation Methods

Estimates of the mean expenditures were generated using a bottom-up approach, taking estimates of the mean expenditure from respondents and extrapolating to the total number of report cards that were sold. Estimates of expenditures (mean, standard deviation) were first generated by stratum in accordance with the stratified sampling design used to select participants for the telephone survey. Mean expenditure for each stratum was generated based on the following formula for stratified estimators from Cochran (1977):

$$\bar{y}_{st} = \sum \frac{N_b}{N} \cdot \bar{y}_b$$

where N_b is the number of spiny lobster report cards in stratum b , N is the total number of spiny lobster report cards sold in 2011 adjusted by the % of returned cards that did not fish (13.5%), $N = 28,868$, and \bar{y}_b is the estimated mean expenditure for stratum b . Once this estimate was obtained, the total was simply calculated as:

$$\hat{Y} = N \cdot \bar{y}_{st}$$

Estimates of the 95% confidence interval for total expenditures were calculated based on the estimated sampling variance as:

$$\hat{Y} \pm t \cdot \sqrt{\hat{V}(\hat{Y}_{st})}$$

where t is the appropriate t -value, and the sampling variance is estimated as:

$$\hat{V}(\hat{Y}_{st}) = \sum \frac{N_h(N_h - n_h)(s_h^2)}{n_h}$$

where N_h is as defined previously, n_h is the stratum sample size, and s_h^2 is the stratum variance (Cochran 1977).

All trip-related expenditures were attributed to spiny lobster fishing expenditures, as the survey instrument specifically asked for typical expenditures associated with spiny lobster fishing trips. In contrast, annual boat-related costs, which included items such as boat insurance and gear replacement, were attributed to spiny lobster fishing based on the percentage of annual boat or water craft usage that was reportedly dedicated to spiny lobster fishing in 2011. Note that these costs are subject to potential inestimable inaccuracies of the interviewee's perception of the percentage of their boat usage for spiny lobster fishing. The exceptions to the calculations based on the percentage of annual boat or water craft usage for spiny lobster fishing were fishing gear and related expenditures specifically linked to spiny lobster fishing. In calculating the average annual expenditure for the "other" costs (Question 10 of the annual, seasonal, one-time expenditure section), we assumed that these costs were strictly related to spiny lobster due to the way the question was worded (i.e., "...related to recreational lobster fishing..."), and so these costs were not adjusted based on vessel usage in the spiny lobster fishery.

In their 2006 estimation of the economic contribution of marine angler recreation in the U.S., Gentner and Steinback (2008) utilized a mail survey methodology applied to a sample of anglers originated from the Marine Recreational Information Program (MRIP) intercept survey to elicit angler expenditure information. As with the present study, Gentner and Steinback (2008) used a license-based random survey frame for their California angler expenditure estimates. They report the potential for avidity bias that could affect certain categories of durable expenditures, based on prior experience, and corrected for avidity bias using weights developed by Thomson (1991). One can argue that mail surveys such as those employed by Gentner and Steinback (2008) require an elevated level of commitment and initiative on the part of the angler to complete and return, and this commitment and initiative may be correlated with their level of avidity. In contrast, our telephone interview methodology at least partially addresses this issue and we therefore do not believe there is a strong case for avidity bias in our data, and consequently do not apply avidity weights.

For total annual travel expenditures, most categories of responses were multiplied by the respondent's number of trips (extracted from a separate CDFW database). We also applied \$0.55 per mile to reported spiny lobster fishing-related ground transportation based on the federal rate from 2011. To determine total annual respondent expenditures on dive or party boat trips, we multiplied the reported cost per trip fare by the reported number of such trips in 2011.

For the calculation of the 95% confidence interval (CI) for total cost for a particular expenditure category, we used a weighted average of the degrees of freedom based on the effective "n" (see Satterthwaite 1946, as cited

in Cochran 1977) for each cost type (i.e., annual boat purchase cost, boat insurance, etc.) to find the appropriate t-value; weights were based on the contribution of the cost type to the total annual cost.

4.2.2 Demographic Information and Estimated Expenditures in California's Recreational Fishery for Spiny Lobster

Means, totals, and standard deviations (SD) for expenditures are presented in Tables 6 through 10. The average recreational fisherman has fished spiny lobster for nearly 9 years and spends an average of just over 2/3 of a day on a typical fishing trip (Table 6). Spiny lobster fishing constitutes an average of just over 1/3 of a recreational fisherman's total fishing effort in a given year (Table 6). Private vessels provide just over 1/2 of all access to the recreational fishery (Table 7), and on average about 8% of a vessel's annual usage was estimated to be targeted at spiny lobster fishing (Table 8A).

Annual expenditures in the recreational fishery for spiny lobster in California are estimated to be \$37,093,000 (Table 9). The largest sources of expenditures were non-coastal residents who live within 50 miles of the coast who fished spiny lobster along the coast, and those who live more than 50 miles from the coast who dove for spiny lobster offshore (Table 9). Spiny lobster gear, boat/gear maintenance, and boat purchases were the largest annual expenditure categories (Table 8), while transportation, vessel fuel, meals and beverages, and dive/party boat fees were the largest trip-based expenditure categories (Table 10). Note that not all of these expenditures necessarily occur in California. Also note that these are expenditures and not total economic impact, which is beyond the scope of this report.

Appendix A. Commercial Expenditure Update Survey

Following is the cover letter and the questionnaire used in the key-informant interviews with commercial spiny lobster fishermen. We produced fixed and variable cost questionnaires for each of 3 vessel size class strata – large, medium, and large. Included below are the cover letter and questionnaire used for informants with small vessels.

H. T. HARVEY & ASSOCIATES
ECOLOGICAL CONSULTANTS

15 August 2012

Name of Recipient
1234 Street
City, CA 12345

Dear Commercial Lobster Fisherman:

A fishery management plan is in progress for the spiny lobster fishery, and we are updating expenditure information so that we better understand the positive economic contribution of commercial lobster fishermen to the state and to local economies in California.

In 2007 we did an economic survey of all commercial fishermen in California in order to generate expenditure information and to demonstrate their positive economic contribution. In this brief survey, we are providing you with average annual expenditures by category based on the 2007 survey results. We are asking you whether you feel that these averages are still a reasonable estimate of typical annual costs for a commercial lobster vessel less than 26 feet in length.

As you complete the survey, please note that we are not asking you to compare your expenditures to the averages, as each individual's annual expenditures on categories such as engine purchase will vary quite a bit. Instead we ask whether these averages are a reasonable estimate of typical annual costs for a commercial lobster vessel less than 26 feet in length.

If the answer is yes, then simply indicate that on the sheet. If they are not reasonable, then for a given cost category (such as bait or engine repair), please indicate to us how much higher or lower (in percentage terms) the typical annual expenditure should be.

We will call you within the next two weeks to get your responses. If you have any questions, please contact Sharon Kramer at skramer@harveyecology.com or (707) 822-4141 ext 101.

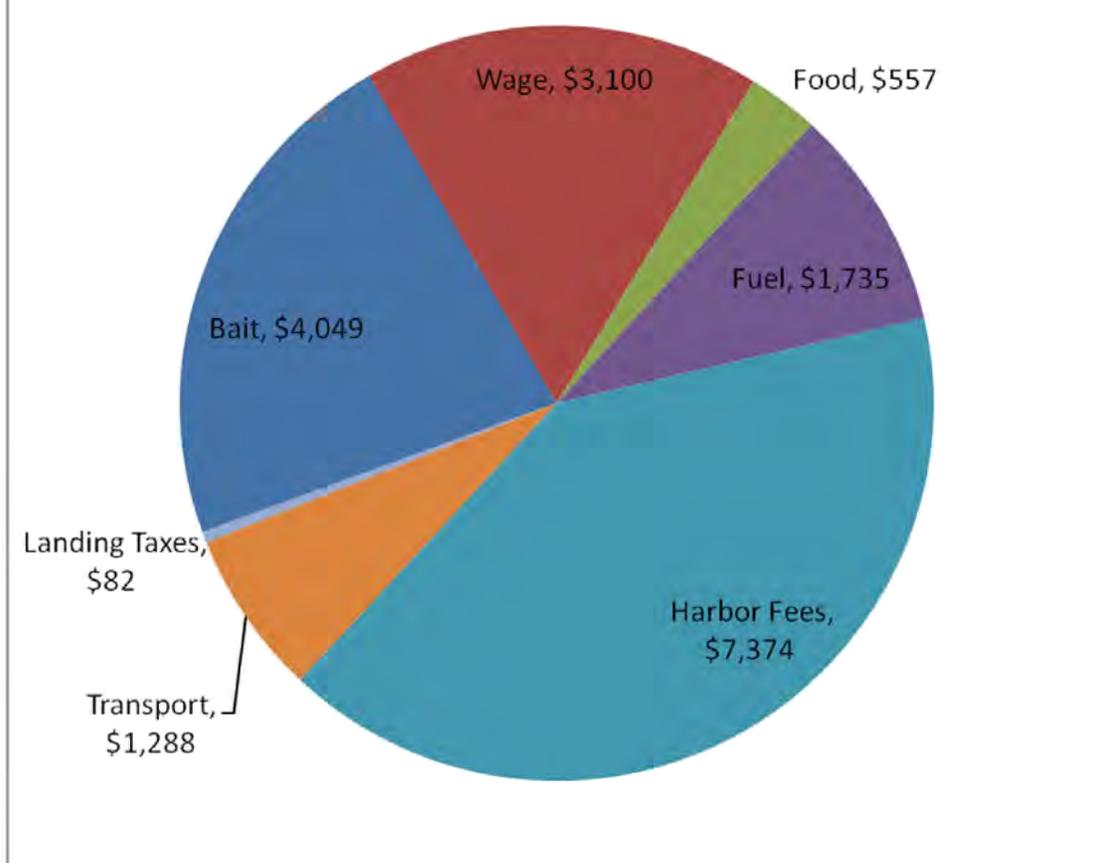

Please note that your individual responses will be kept confidential, and will be aggregated along with those from others to develop an updated estimate of total expenditures by all commercial lobster fishermen. Our goal is to generate an accurate estimate of the total positive economic contribution from commercial lobster fishing in California.

Thank you,

Dr. Steven C. Hackett
Humboldt State University

Dr. Sharon Kramer

Estimated Annual Average Variable Costs for Vessels Less than 26'

Variable Costs are costs that increase or decrease based on how much you fish. The above estimated annual variable costs (adjusted for inflation) are averaged across all responses to our 2007 survey. These costs imply an average per-trip cost of \$849.

Do you feel that these are a reasonable estimate of typical annual variable costs for a lobster vessel less than 26 feet in length? Yes / No (circle one).

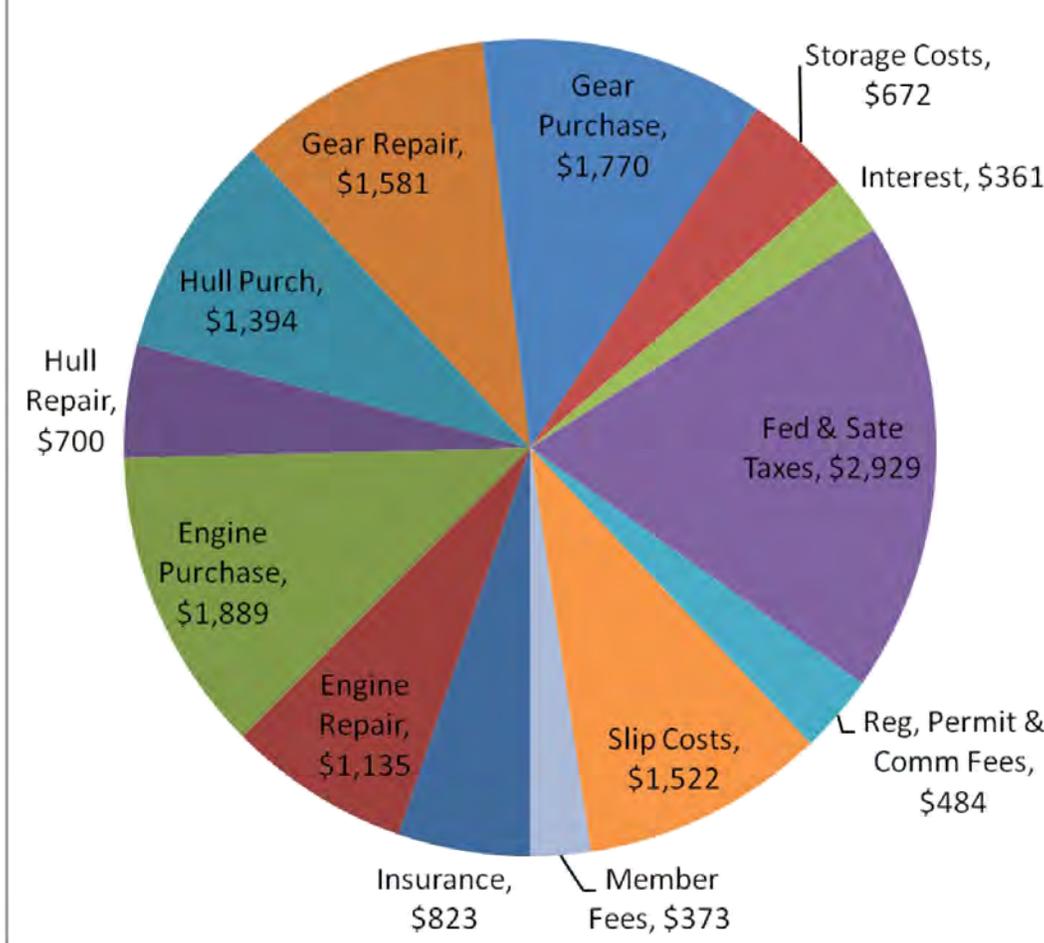

If not, then please correct the cost categories below. Circle whether the cost should increase or decrease, and indicate the correct percentage increase or decrease with an X.

Bait	increase / decrease	by:	<input type="checkbox"/> 0% - 20%	<input type="checkbox"/> 60% - 80%
Ann. Avg. = \$4,049	(circle one)		<input type="checkbox"/> 20% - 40%	<input type="checkbox"/> 80% - 100%
			<input type="checkbox"/> 40% - 60%	<input type="checkbox"/> 100% + (specify %)
Crew Wages/Comp.	increase / decrease	by:	<input type="checkbox"/> 0% - 20%	<input type="checkbox"/> 60% - 80%
Ann. Avg. = \$3,100	(circle one)		<input type="checkbox"/> 20% - 40%	<input type="checkbox"/> 80% - 100%
			<input type="checkbox"/> 40% - 60%	<input type="checkbox"/> 100% + (specify %)

<u>Food (fishing-related)</u> Ann. Avg. = \$557	increase / decrease (circle one)	by:	___ 0% - 20% ___ 20% - 40% ___ 40% - 60%	___ 60% - 80% ___ 80% - 100% ___ 100% + (specify %)
<u>Fuel & Lu be (vessel)</u> Ann. Avg. = \$1,735	increase / decrease (circle one)	by:	___ 0% - 20% ___ 20% - 40% ___ 40% - 60%	___ 60% - 80% ___ 80% - 100% ___ 100% + (specify %)
<u>Harbor Fees (ex: hoist)</u> Ann. Avg. = \$7,374	increase / decrease (circle one)	by:	___ 0% - 20% ___ 20% - 40% ___ 40% - 60%	___ 60% - 80% ___ 80% - 100% ___ 100% + (specify %)
<u>Transportation*</u> Ann. Avg. = \$1,288	increase / decrease (circle one)	by:	___ 0% - 20% ___ 20% - 40% ___ 40% - 60%	___ 60% - 80% ___ 80% - 100% ___ 100% + (specify %)
<u>Landing Taxes</u> Ann. Avg. = \$82	increase / decrease (circle one)	by:	___ 0% - 20% ___ 20% - 40% ___ 40% - 60%	___ 60% - 80% ___ 80% - 100% ___ 100% + (specify %)

* Transportation related to fishing (truck and auto)

Estimated Annual Average Fixed Costs for Vessels Less than 26'

Fixed Costs are costs that commercial fishermen incur whether they fish or not. The above estimated annual fixed costs (adjusted for inflation) are averaged across all responses to our 2007 survey.

Do you feel that these are a reasonable estimate of typical annual fixed costs for a lobster vessel less than 26 feet in length? Yes / No (circle one).

If not, then please correct the cost categories (ex. "Engine Purchase") needing adjustment. Circle whether the cost should increase or decrease, and indicate the correct percentage increase or decrease with an X.

Insurance (vessel)	increase / decrease	by:	<input type="checkbox"/> 0% - 20%	<input type="checkbox"/> 60% - 80%
Ann. Avg. = \$823	(circle one)		<input type="checkbox"/> 20% - 40%	<input type="checkbox"/> 80% - 100%
			<input type="checkbox"/> 40% - 60%	<input type="checkbox"/> 100% + (specify %)

<u>Engine Repair (vessel)</u> Ann. Avg. = \$1,135	increase / decrease (circle one)	by:	<input type="checkbox"/> 0% - 20%	<input type="checkbox"/> 60% - 80%

Ann. Avg. = \$1,522	(circle one)		___ 20% - 40%	___ 80% - 100%
			___ 40% - 60%	___ 100% + (specify %)

* The annual average cost reported for engine and hull purchases come directly from our 2007 survey. As these expenditures only occur infrequently (thankfully), the cost reported here can be thought of as an annualized cost, somewhat like an annual loan payment absent the interest. Vessel-related interest expenditures from vessel-related loan payments are listed separately above.

Appendix B. Recreational Fishery Expenditure Survey

Following is the telephone interview script used to gather demographic and expenditure information from participants in the spiny lobster recreational fishery. The sample frame was derived from CDFW's spiny lobster report card database of recreational fishery participants. Due to CDFW's confidentiality agreement associated with the report card database, the research team provided a survey methodology and sampling design and the calls were conducted by CDFW personnel.

RECREATIONAL LOBSTER PARTICIPANT SURVEY

Opening Script:

Introduce yourself

Describe purpose of call and of the project

DFG is trying to determine how much money is being generated by the recreational lobster fishery in the state of California. The information that we are interested in collecting goes beyond license sales. This survey will help DFG to accurately characterize the economic contribution of the fishery.

Responses will be protected, interviewee can contact Kristine Barsky for questions or comments [kbarsky@dfg.ca.gov, tel.# (805)985-3114]

Basic Questions Script:

I would like to start with some basic questions about your fishing history and how you fish. I will then turn to the economic questions.

1. How many years have you been fishing for lobster?
2. What is your most common type of access when you fish for lobster?
Do you fish from a Pier/dock, launch from a beach, use a private boat, go on a party boat, or use a personal watercraft (kayak, etc.)?
3. On average, how many hours or days does the average lobster fishing trip take you, including travel time to and from fishing grounds (fraction of day is ok). I'm only asking about trips that you just fished for lobster. Please tabulate as days (or fraction of days – xx hrs/24).
Trip definition = the time period in which a fisherman travels to the fishing grounds, seeks lobster, concludes fishing, and returns home
4. Approximately what percentage of your total fishing effort (including all fishing trips) was dedicated to lobster fishing in 2011?

Expenditure Questions Script:

Moving on to the economic questions. The first questions will address annual, seasonal, or one-time expenditures you have made that are linked to your lobster fishing activity. After that I'll ask about typical trip-related expenditures.

Do you own a boat or other watercraft that you use for lobster fishing or diving?
If they answered yes, start with question 1, otherwise skip to question 9.

1. Did you purchase your boat or watercraft this past year? If so, then how much did you spend?
2. What percentage of your annual boat or watercraft usage was for fishing for lobster?
3. How much do you spend per year on boat insurance?

4. Do you keep your boat in the water, (If yes) then how much do you spend in total cost annually on slip fees?
5. How much do you spend annually on DMV registration fees for your boat and trailer?
6. How much do you spend annually on taxes (e.g., property or luxury taxes) on your boat?
7. How much did you spend last year on maintenance (like hull cleaning) or replacement of boat gear & equipment (boat, engine, equipment)?
8. If you own a boat or other water craft, did you purchase any electronic gear (GPS, radio, fish finder, radar, etc) this past year that was used for fishing lobster? If so, then how much did you spend?
9. Did you purchase any lobster fishing gear (dive gear, hoop nets, other lobster equipment) this past year? If so, then how much did you spend?
10. Excluding the cost of fishing licenses and report cards, are there any other annual, seasonal, or one-time expenditures related to recreational lobster fishing that you would like to add in?
Ask for \$\$ and category

I would like to finish the survey with some questions about your typical expenditures associated with lobster fishing trips .

1. Did you purchase a spot on a dive boat or a party boat for lobster this last year (2011)?
2. If so, then how much do you typically spend on a single boat trip (just the cost of the trip fare)?
3. Did you rent dive gear for lobster fishing last year? If so, then how much do you typically spend on dive gear rentals per lobster fishing trip?
4. How much do you typically spend on gas for the boat you use (yours or a shared boat) on each lobster fishing trip?
5. How much do you typically spend on bait on a lobster fishing trip?
6. How much do you typically spend on lodging during a lobster fishing trip?
7. How much do you typically spend on meals and beverages during a lobster fishing trip?
8. How many miles (one-way) did you drive to a port, dock, or beach for each lobster fishing trip? [Note: Researchers will double on-way miles you record and multiply by the average total cost per mile driven from the Department of Transportation to get \$\$ expenditure]
9. If you trailer a boat to a launch facility for lobster fishing trips, then how much do you typically spend on harbor fees (boat launch, docking, or parking) per trip? (Includes smaller craft if relevant (kayak, paddle or surf board...)).
This should be entered as \$0 if (i) the fisherman keeps a boat in the water and already provided a cost earlier in the survey, or (ii) they don't use a boat to fish
10. Are there any other expenditures you usually make on a typical recreational lobster fishing trip you would like to add?
Ask for \$\$ and category; Examples = power wash, SCUBA tank air refills

Review Participants

CALIFORNIA OCEAN SCIENCE TRUST

California Ocean Science Trust is a boundary organization. We work across traditional boundaries, bringing together governments, scientists, and citizens to build trust and understanding in ocean and coastal science. We are an independent non-profit organization established by the California Ocean Resources Stewardship Act (CORSAs) of 2000 to support managers and policymakers on the U.S. West Coast with sound science, and empower participation in the decisions that are shaping the future of our oceans.

Ocean Science Trust served as the independent appointing agency in alignment with the Procedural Guidelines for the California Department of Fish and Wildlife's Ad Hoc Independent Scientific Advisory Committees. Ocean Science Trust convened the review committee and designed and implemented a scientific review process that promoted objectivity, transparency, and scientific rigor (see Appendix C).

SCIENTIFIC REVIEW COMMITTEE

John Field (chair)

Research Fishery Biologist, Fisheries Ecology Division, Southwest Fisheries Science Center, National Marine Fisheries Service (NOAA)

Michel Comeau

Head of the Lobster Section, Department of Fisheries and Oceans Canada

Robert Muller

Assessment and Modeling, Florida Fish and Wildlife Conservation Commission, Florida Wildlife Research Institute

Pete Raimondi

Chair/Professor, Department of Ecology and Evolutionary Biology, University of California, Santa Cruz

CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

The Mission of the Department of Fish and Wildlife is to manage California's diverse fish, wildlife, and plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public.

California Department of Fish and Wildlife staff were engaged throughout the review process. They delivered presentations to the review committee and supplied additional data, information, and feedback to Ocean Science Trust as necessary throughout the review process.

Background

Spiny lobster (*Panulirus interruptus*) populations support important commercial and recreational fisheries, and play a key role in the southern California kelp forest ecosystem. Over the last three years, the California Department of Fish and Wildlife (the Department) has developed a draft spiny lobster fishery management plan (FMP) to guide management of these fisheries in accordance with the Marine Life Management Act. An FMP assembles information, analyses, and management options, and serves as the vehicle for the Department to present a coherent package of information, and proposed regulatory and management measures to the California Fish and Game Commission (the Commission). The FMP becomes effective upon adoption by the Commission, following their public process for review and revision. Thus, it is important for the scientific underpinnings of the draft FMP to have undergone independent review prior to submission to the Commission.

The Department is committed to incorporating the best scientific information into management decisions. To this end, the Department approached the Ocean Science Trust to convene experts to conduct an assessment of key scientific and technical components within the FMP and supporting spawning potential ratio (SPR) cable model. Ocean Science Trust, an independent organization that works to advance independent science in management decisions, tailored this review to meet the science needs of the Department, and served as the appointed entity to design and coordinate all aspects of this review.

REVIEW SCOPE

Ocean Science Trust, in consideration of the management request, worked with the Department to develop a scope of review focusing on the scientific and technical underpinnings of the FMP and supporting materials. Thus, this was not a comprehensive review of the FMP, or the proposed approach to management contained therein. Rather, the central question of this review was:

Given the Department of Fish and Wildlife's available data streams and analysis techniques, are the technical components, models, and supporting documents that underpin the FMP scientifically sound and reasonable?

The review focused on the following components:

1. The three proposed reference point thresholds (i.e., catch, catch per unit effort (CPUE), and spawning potential ratio) that will serve as signals for when changes within the fishery may warrant management responses;
2. The underlying science that informed the decision to manage the fishery as a single stock;
3. The comprehensiveness of the data supporting the estimate of spiny lobster habitat contained within marine protected areas;
4. Estimates of stock productivity and its ability to support fishing (i.e., calculations for the lobster growth curves adopted in the Parrish Model for setting the spawning potential ratio threshold); and
5. The spawning potential ratio (SPR) model as presented in "DRAFT Report on the Cable-CDFW 1.0 Model and the Calculation of Spawning Potential Ratio" (cable model), including model assumptions, calculations, interpretation, and application of the model results in setting the SPR reference point threshold.

In addition to these specific sections of the FMP, reviewers were asked to identify priority research and monitoring gaps associated with the scientific and technical components of the FMP. Reviewers also provided recommendations for ways to work more closely with the academic community to collect and maintain the most up-to-date essential fishery information (EFI).

SUMMARY OF THE REVIEW PROCESS

This review took place from October 2014 – May 2015. Ocean Science Trust implemented a scientific review process¹ that sought to promote objectivity, transparency, candor, efficiency, and scientific rigor. A multidisciplinary, four-member review committee was assembled, representing international expertise in fisheries science and management, marine ecology, stock assessment, and modeling. Reviewer names remained anonymous until completion of this review to encourage candid feedback. Ocean Science Trust facilitated constructive interactions between reviewers and the Department through a series of remote meetings, where Department staff provided reviewers with the management context, presented an overview of the scientific and technical elements under review, and were available to answer reviewer’s questions. In addition, Ocean Science Trust convened reviewers independently to allow the review committee to candidly discuss the review materials and conduct their assessment. Ocean Science Trust worked with the review committee to assemble and synthesize their written and verbal responses to guiding questions, as well as discussion from remote meetings into this final report. This report is publicly available on the Ocean Science Trust [website](#)².

PROJECT MATERIALS UNDER REVIEW

The following materials were provided by the Department to the review committee for scientific and technical review:

- Draft Spiny Lobster Fishery Management Plan, For Technical Review, 11/4/2014³
- Draft Report on the Cable-CDFW 1.0 Model and the Calculation of Spawning Potential Ratio
- Draft Spawning Potential Ratio Cable-CDFW 1.0 Model

Additional data and information were provided by the Department at the request of the review committee to assist with their assessment throughout the review process.

¹ Available at <http://bit.ly/1Fd9A6X>

² Available at <http://bit.ly/1Fd9zA3>

³ Draft available on the Department of Fish and Wildlife website at <http://bit.ly/1Fda254>

Review and Recommendations

Foremost, the review committee valued the opportunity to provide independent scientific recommendations for consideration in management of the California spiny lobster fisheries. They acknowledged the extensive time and resources that went into the development of the FMP and supporting model by both the Department, the Lobster Advisory Committee, stakeholders, and outside experts, including modeler Dr. Richard Parrish. Reviewers appreciated the Department staff's constructive engagement throughout the course of the review, as well as their willingness to thoughtfully consider recommendations from this report. The Department produced an FMP that is user-friendly and readable by broad audiences, is well referenced, and incorporates the effects of no-take marine protected areas for the first time in a state-managed fishery. Reviewers noted that the FMP would complement the fairly robust management measures already in place.

This assessment is organized around the key focal points identified in the scope of review. These recommendations aim to improve the science supporting the proposed reference point thresholds prescribed in the draft FMP. Where possible, insight is provided on the implications of each recommendation.

The main recommendations concern the spawning potential ratio (SPR) cable model, several of which would need to be addressed before this model can provide a sound scientific basis for decision-making. Additional scientific guidance and considerations are included that would produce a more scientifically robust FMP, as well as longer-term recommendations, data and research needs that would strengthen the science contained within the model and FMP and its ability to inform management as new information and analyses become available.

This FMP is the first instance where state fisheries managers in California are employing a technical model (aside from a formal stock assessment) to inform the development of a harvest control rule. As such, reviewers thought it valuable to close the review with some insight into how scientific models are scoped, considered, and reviewed as FMPs are developed for other state fisheries in the future.

1. EVALUATION OF THE PROPOSED REFERENCE POINT THRESHOLDS

Three proposed quantitative reference points and associated thresholds – spawning potential ratio, catch, and catch per unit effort (CPUE) – are meant to serve as metrics to assess the state of the lobster fishery and stock. The FMP states that whenever a stock reaches a threshold reference point, resource managers must investigate the cause and potentially provide a response. The Department has to review the catch, catch per unit effort, and update the spawning potential ratio on an annual basis. This process is designed to monitor the fishery and its stock in order to prevent any of the metrics from reaching a threshold.

Below are the scientific review committee's recommendations for each reference point. For sections 1.1 (SPR) and 1.2 (catch, CPUE), recommendations are divided into those that reviewers suggest the Department address before adopting the FMP, and those that are longer-term considerations, which can be addressed after adoption of the FMP.

1.1 Spawning Potential Ratio (SPR) Cable Model and the SPR Reference Point

Much of the review focused on the SPR cable model, since it is the main measure of the spiny lobster spawning biomass structure and the only biological reference point in the FMP (i.e., it integrates information and assumptions about lobster growth, reproduction, and mortality). The model, starting with 1,000 recruits, calculates an equilibrium SPR value – a ratio of the number of eggs produced by the fished population over the number of eggs produced by the unfished population. Being an equilibrium model, it does not track cohorts or size trends over time, but does provide relative abundance estimates for the fixed number of recruits. Therefore, this SPR estimate is used to estimate an annual fishing mortality rate specific to a given year's observed mean size, with no temporal connection among the annual estimates. The FMP advises that when the $SPR_{CURRENT}$ falls below the “stable and productive” reference period between 2000-2010 ($SPR_{THRESHOLD}$, based on the average SPR value during this period), the Department is required to investigate the underlying cause and potentially provide a management response for the Commission to consider. The model also evaluates the effects that marine protected areas (MPAs) may have on the calculated SPR value of the lobster stock.

During the course of the review, reviewers were provided with three iterations of the SPR model. The model was originally developed by Dr. Richard Parrish, and underwent further development and revisions by the Department. The final version (referred to here as the cable model) is the version intended for use in the management of the fishery, and was the main focus of this assessment. The cable model includes the following revisions from the previous iterations:

1. a new growth model (i.e., changing the model from a von Bertalanffy growth model to a newly developed model)
2. changes to initial time step (i.e., size, age, season)

The draft FMP provided to reviewers for their work was developed based on the original model and did not reflect these revisions. The reviewers were instructed to assume that the draft FMP would be revised to reflect the most recent cable model. Additionally, following initial technical discussions between Department staff and the reviewers, the Department agreed to remove a prescribed value for the SPR threshold in order to allow for the ability to continually improve the model without amending the FMP.

1.1.1 Key Recommendations for Securing a Management-Ready SPR Model

Reviewers agreed that the cable model requires essential revisions before it can provide a scientific basis for management of the lobster fishery, but that these revisions are likely achievable before the FMP is adopted. In the longer term, more substantive data collection and research initiatives to better inform a model comparable to the current model, or an alternative modeling approach, are identified as priorities. Below are the key recommendations for securing a management-ready SPR model, organized around thematic areas.

Growth Model

- ***Rely on the von Bertalanffy growth modeling methods until the newly developed growth model can be robustly validated.***

The primary revision to the SPR model by the Department was the replacement of a von Bertalanffy growth model, with a new set of Gaussian 4-parameter growth curves that were developed by Department staff. These were based on raw data from three tag-recapture studies in order to estimate male and female lobster growth rates. Growth curves are central to determining a stock's ability to replenish itself. Reviewers acknowledged the inherent difficulties in obtaining reliable growth rates for crustaceans, such as lobsters, that grow through molting. Though von Bertalanffy growth models are widely used and accepted, they represent a generic growth response; the Department examined multiple growth models in an attempt to employ an alternative that better represented the growth of *P. interruptus*.

The reviewer's main concern with the current SPR cable model is with the application of the new Gaussian growth curves. While reviewers recognized that the Gaussian 4-parameter curves may better fit the data, they had concerns that these growth models have not been subject to rigorous scientific discussion. The results of the Gaussian curves are not consistent with the existing literature regarding the growth patterns of lobsters in similar ecosystems, and lead to potentially unrealistic SPR model behavior and results. In particular, they lead to growth rate estimates that are very slow such that mature individuals can reproduce many times prior to being vulnerable to full fishing mortality. Slow growth rates in this particular SPR model implementation translate into lower harvest rates and a reduced impact of fishing on population reproductive output; the slower you make growth, the lower the estimated relative exploitation rate is in the SPR model. This is contrary to what is typically understood about growth rates and stock productivity. The fact that this model estimates a "snapshot" of relative exploitation rate in a given year with assumed constant recruitment, rather than tracking exploitation and cohort strength (and potential feedback to recruitment) over time contributes to this somewhat counter-intuitive result, but the unusually slow growth is the primary driver. The net effect of the Gaussian growth model as applied in SPR cable model is that fishing mortality of most legal lobsters has a reduced impact on the estimated SPR, relative to SPR estimation based on the von Bertalanffy growth model.

These Gaussian growth curves are not necessarily incorrect – in fact, they may well be a more accurate representation of lobster growth – and should be improved with additional research. Reviewers commend the Department for making strides to move beyond the standard growth model. Further studies showing that the approach has some precedent with crustaceans and more investigation of the underlying data is necessary before the Gaussian growth model can be applied with confidence. If and when an alternative growth model is considered to be sufficiently developed to incorporate into the SPR model, the Department should consider whether that model is consistent with growth models of lobsters in other (similar) ecosystems, and ensure that sensitivity analyses are conducted to evaluate the effects of any new growth relationships on SPR model performance.

von Bertalanffy growth expands the resolution of the SPR model compared to the Gaussian growth curves

With current understanding, the von Bertalanffy growth model is more appropriate for a relative metric of exploitation as it is more responsive to changes in exploitation, produces results that are comparable to methods used elsewhere for similar fisheries, and expands the resolution of the SPR model (see Appendix A for further analyses conducted by reviewers). Thus, reviewers recommend that the Department rely on the more standard and widely used von Bertalanffy growth modeling methods, until the newer Gaussian curves can be robustly validated.

Longer-term considerations are included in section 1.1.2, including the need to routinely collect length or other size compositional data (length or weight distributions) and information on actual selectivity and maturity curves, which would provide the basis for a more robust SPR model (e.g., more accurate estimates of fishing mortality). Reviewers recognized that there is inherent variability in the growth data at small sizes using the available tag-recapture studies, and provide some recommendations that may increase comfort with new Gaussian growth curves based on these data.

- **Use SPR with caution at high exploitation rates.**

It is also important to note that the SPR cable model (with either growth model applied, although the problem is exacerbated at slower growth rates) becomes uninformative at very high exploitation rates (Appendix A). This is partially a result of the confounding of the maturity and selectivity curves described below. This constraint should be recognized explicitly in the SPR model documentation and the FMP, and the Department should be cautious when interpreting results at high exploitation rates.

- **Reconsider some of the tag-recapture data that were removed from the growth models.**

The growth models are based on a limited data set, from which some outliers and negative values were removed (per Department presentation to review committee). Juveniles can often show high growth rates in short timeframes, thus some of the data identified and removed might actually be informative. In addition, the Department should consider making the “negative growth” data points zero instead of removing them from the analyses if they are believed to be measurement error. Reconsidering how these data points are treated may reduce variability at small lobster sizes and lead to more accurate estimates of growth.

Model Functionality

- **Update the vulnerability relationship.**

In the cable model, the vulnerability function has precisely the same coefficients as maturity. If this is a true coincidence, it should be explained. However, recent data on female lobsters from Hovel et al. (2015) and Kay (2011) indicate that female lobsters may be reproductive at smaller sizes than previously thought. The Department should verify, and if appropriate, update this function in the cable model. In addition, the current function in the cable model is for the commercial fishery that uses traps. Traps have an upper limit based on the throat size of the trap while there is no upper limit in the recreational fishery. Therefore, there should be a separate vulnerability relationship for the recreational fishery in any future model that can account for recreational catch.

- **Revisit the natural mortality function.**

The natural mortality function assumes that natural mortality decreases as lobsters grow; however within the current cable model, a minimum rate occurs at an age of 17.92 years and then the rate increases again. This pattern of senescence is unusual, and the Department should provide additional references or data to support the assumption that older, larger lobsters experience higher natural mortality. If the proportion of ‘plastered females’ (i.e., female lobsters that have mated) is lower at larger sizes, suggesting that large females are not contributing as much to SPR, those data should be presented.

- **Explain the ramifications of SPR being independent year to year.**

Each model run begins with exactly 1,000 larvae, and ignores variable and episodic recruitment, and the relationship between spawning biomass and recruitment. The model also assumes constant carrying capacity and a constant function for density dependence, among other considerations. These limitations should be made more explicit in the FMP and model report.

Sensitivity Analyses

- **Make greater use of sensitivity analyses in explaining the model.**

Sensitivity analyses are important for understanding the impacts of a model's input variables. They can help identify parameters that are likely to have no effect on the output (and could potentially be removed), as well as variables that have a large effect (where attention should be focused on ways to reduce uncertainty around these values/inputs). The Department should conduct explicit sensitivity analyses each time the SPR cable model is revised, and make this information available in the accompanying report to provide additional credibility to the reasoning behind such revisions. Standard practice is to double and halve the variable of interest and observe the impact to the outputs. The Department should consider assembling and formally communicating the error and uncertainty associated with the cable model results.

1.1.2 Longer-Term Considerations for the SPR Model

The review scope charged reviewers with conducting an assessment of the SPR model based on the Department's currently available data streams that would not require additional information or research. However, the model may benefit considerably from and be more robust as a result of addressing the following longer-term recommendations after adoption of the FMP.

Research Needs

- **Explore alternative methods to estimate lobster growth.**

Novel methods for age validation and improved growth estimation continue to emerge and should be explored, either by the Department or by academic and other independent research institutions. For example, direct methods of growth and age determination are now possible for crustaceans by measurements of annual molt-independent growth bands. Detection of growth bands in calcified regions of the eyestalk or gastric mill using the cold cure epoxy resin technique has been reported for cold-water shrimps (*Sclerocrangon boreas* and *Pandalus borealis*), snow crab (*Chionoecetes opilio*) and American lobster (*Homarus americanus*) (Kilada et al. 2012). A similar technique could be used to better estimate growth for the California spiny lobster (even on a spatially explicit basis), and perhaps elaborate or modify the 2011 stock assessment model to include an age-based parameter. Identifying these as key research priorities in the FMP may incentivize outside researchers and funders to pursue this research.

Direct methods of growth and age determination are now possible for crustaceans

- **Explore additional technical models that can account for variable recruitment.**

Given that lobster recruitment is likely highly variable and episodic, a key longer-term research objective should be the development of a more sophisticated modeling approach that can track cohorts over time.

- **Develop a sampling program to collect individual lobster length or weight composition data from both sectors of the fishery.**

Estimates of fishing mortality used to obtain a corresponding SPR value each year are currently determined using average weight data from the commercial sector. The relevant parameters are derived using an extrapolation, linking logbook data to fish ticket data. These estimates would be greatly improved by a program in which actual length or weight measurements (by individual) could be collected. The sampling program needs to include the recreational sector as well because it accounts for approximately 30% of the landings and their vulnerable sizes may differ from commercial traps. Such data would be helpful in informing more sophisticated modeling approaches (e.g., that track cohorts over time) in the longer-term as well.

- **Prioritize obtaining intermediate recapture data, which could be useful for better understanding the dynamics of lobster growth rates.**

While alternative methods to estimate growth are ultimately necessary, reviewers provided a suggestion that may improve upon the existing estimates in the near term.

The growth curves were developed from data sets with gaps at important size ranges. Tag-recapture data gaps exist between the Engle (1979) and Hovel et al. (2015) data sets, in the 30 mm and 55 mm size classes. Currently, juvenile data must be extrapolated out in any growth curve model. Additional data would be valuable in “filling in” the points between data sets for a more accurate estimate of California spiny lobster growth.

Model Functionality

- **Develop a function or method to incorporate recreational catch into the model.**

Recreational catch is a substantial portion of overall catch and is not accounted for in the SPR model. This sector is potentially harvesting larger lobsters, thus, the vulnerability to fishing differs between the recreational and commercial sectors. It is important to parse out the proportion of the spawning potential coming from larger individuals. If this is the case, the vulnerability curve applied in the SPR cable model for the recreational sector should not be dome-shaped, but rather should be asymptotic, and there may be other facets of the recreational fishery of significance in accurately assessing SPR.

- **Revisit the SPR model as MPAs reach their full maturity.**

The SPR cable model assumption that South Coast MPAs have reached full maturity (thus, are having a threshold impact on the fishery) is unlikely given the MPAs are newly established. A number of factors will differ as MPAs reach full maturity, including the possibility of increased density dependence which could affect movement and reproduction as well as that spawning stock (given growth curves) may not yet be optimized through size and density. In other words, the current SPR model inputs may be over- or underestimating the effects of MPAs.

- **Formalize a process to review, revise, update, and evaluate the SPR model and its effectiveness in meeting management goals as new data, information, or analyses become available.**

Models like SPR will require continual refinement as new information and data are obtained. Many such improvements can be accomplished within this FMP framework. The reviewers commend the Department for removing a prescribed SPR threshold from the language of the draft FMP. This allows the ability to recalculate an appropriate threshold as the model is improved rather than needing to delay implementing these changes by waiting for the FMP to be formally amended. It would be valuable to formalize a process for considering revisions to the model – which may have substantial implications for the SPR outputs – as changes and updates are made. Reviewers recommend convening fishery managers and biologists with independent experts to evaluate the input data, coding, and effectiveness of the model at regular intervals.

1.2 Catch- and CPUE-based Reference Points

As noted previously, the process of reviewing current seasonal catch and CPUE data should permit the Department to monitor the fishery and its stock, and prevent any of the measures from reaching a threshold. However, reviewer consensus is that the Catch and CPUE-based reference points are not very robust or sensitive to picking up trends or slow declines. There is concern that “sliding” calculations will rarely exceed the established thresholds. Even when a threshold is exceeded, no specific management responses are required, thus these measures act more as indicators than as reference points. Section 1.2.1 contains key recommendations that would allow for a more robust method to monitor the condition or trajectory of the fishery, and should be addressed before adopting the FMP. Section 1.2.2 includes recommendations that could be addressed in the longer-term.

1.2.1 Key Recommendations for Catch and CPUE-based Reference Points

- **Describe the catch and CPUE thresholds as “fishery indicators” instead of reference points.**

A more informative approach to identifying declines in the fishery may be to present the proposed catch and CPUE reference points as indicators of fishery condition, and set the thresholds to more conservative levels. This could provide a more sensitive measure (i.e., reference thresholds would be crossed more easily, making for earlier “warning signs”) and allow the Department to elicit useful scientific information for interpreting any changes observed in SPR.

Reviewers conducted some additional analyses to explore the sensitivity of the threshold to detecting changes in the fishery (see Appendix B for a description of the full method). They compared California’s proposed approach to a method currently under development for the American lobster (*Homarus americanus*) in Canada. In 2014, Canada established a reference point for the American lobster using commercial catch based on the Precautionary Approach (PA) for the southern Gulf of St. Lawrence fisheries. Employing the PA on a 123-year long data series, American lobster landings were below an upper stock reference point 85 times (Appendix B, Figure 1). However, applying the California spiny lobster approach to the same American lobster data revealed that California’s proposed 0.8 catch-based reference point would only be exceeded two times (Appendix B, Figure 2), indicating it may not be a very sensitive measure for detecting fishery declines.

Reviewers then applied Canada’s Precautionary Approach to the California spiny lobster commercial landings data (Appendix B, Figure 3). Based on the PA and using a three year running average for landings, California spiny lobster commercial landings would have dropped below an upper stock reference point 31 times between 1935 and 2013, compared to 11 times as indicated in the draft FMP using the current 0.8 catch-based reference point (FMP Figure 4-6).

Based on these preliminary analyses, the 0.8 thresholds are not very sensitive to picking up trends in the fishery. If catch and CPUE data were used as contextual information for interpreting SPR, the thresholds could be set to more conservative levels to allow for greater sensitivity to detect fishery declines.

Another approach for detecting trends would be to report both a static number for $CATCH_{threshold}$ and $CPUE_{threshold}$ in addition to the moving averages, along with a discussion of the pros and cons of each method and what information they can provide.

- **Clarify rationale for the use of 0.8 thresholds prescribed in the FMP.**

The FMP should provide more clarity about how the thresholds were derived. They appear to be derived from the Hilborn 2010 citation referenced in the FMP. That study made the point that a broad range of relative abundance levels are typically associated with a more narrow range of relative yield (e.g., most give 80% or more of theoretical maximum), such that declines below 80% of the theoretical maximum could indicate substantial stock declines (if not driven by declines in effort or markets). This is an important aspect of the Catch and CPUE component, and should be better explained in the text.

- **Report the CPUE statistic in mass per unit effort.**

The current approach to calculating the CPUE statistic in the FMP is in numbers of individual lobster, not total weight of catch. Using weight (linked to fish tickets) may be more appropriate and is a more typical metric used in such fisheries.

- **Include greater discussion of the reliability of recreational catch estimates.**

Recreational catches are a substantial portion of the total catch for spiny lobsters, but seem to have a different trajectory, and one might expect trends to vary from commercial trends in the future as well. The Department should discuss the uncertainty around these recreational catch estimates in greater detail, and clarify whether they were adjusted or tuned to account for non- or under-reporting. Understanding the magnitude and significance of recreational catch is key in considering control rules.

1.2.2 Longer-Term Considerations for Catch and CPUE Data

Again, the review scope charged reviewers with conducting an assessment of the existing reference points and associated thresholds. However, the model may benefit considerably from, and be more robust as a result of addressing the following longer-term recommendations.

- **Explore other technical models to obtain additional or alternative biological reference points that account for inter-annual variability in recruitment and other variables.**

The Department could consider estimating the annual fishing mortality rates with a modified Delury depletion model (González-Yáñez et al. 2006, Puga et al. 2013) rather than the moving average approaches for catch and CPUE from average size used in the FMP. A Delury model includes the total numerical catch, the effort and the index of abundance in number (CPUE) as input data, which also takes into account inter-annual variability in recruitment. This approach would allow for both the commercial and recreational sectors to be modeled and there are extensions of the model that include a stock-recruit relationship for obtaining biological reference points. If size composition data become available in the future, the Department may also want to consider a more robust population dynamics analysis similar to one used for Australian southern rock lobsters (*Jasus edwardsii*) (Punt and Kennedy 1997). Additional age-structured analyses (Muller et al. 1997) or yield or egg production models that account for individual variability in growth (Fogarty and Idoine, 1988) may also be informative and should be explored further.

- **Standardize commercial and recreational catch data to the same spatial reference points.**

Commercial and recreational fishermen report location at different spatial scales. In comparing Figures 2-3 and 2-10 in the FMP, it appears that commercial fishermen report by Department of Fish and Wildlife block, while recreational fishermen may report by various specific locations (e.g., each of the Channel Islands has a single location code). This discrepancy will confound comparisons in evaluating questions such as the extent of spatial overlap in the commercial and recreational fisheries (e.g., line 825-26 in the FMP).

2. SCIENCE SUPPORTING THE DECISION TO MANAGE AS A SINGLE-STOCK

The FMP provides evidence to suggest that California spiny lobster larvae are well mixed throughout the Southern California Bight (“...complete population mixing due to the species’ protracted larval phase”). Accordingly, the Department proposes considering the entire lobster stock within the U.S. border with one spawning potential ratio (SPR) value and threshold. However, Department data show that individuals in the northern Channel Islands are notably larger than the minimum legal size, while lobsters in the south are generally caught very close to the legal size, suggesting northern lobsters participate in more spawning seasons than southern lobsters before capture.

Reviewer’s evaluation of the literature and existing research on the population structure of California spiny lobster suggests there is some potential for localized recruitment, and that the species does not maintain a single homogenous population despite the extended pelagic larval duration (Iacchei et al. 2013). However, reviewers recognize that the decision on single-stock management must take into account social, economic, and other factors in addition to the science. It is ultimately up to the Fish and Game Commission to determine the most appropriate method to manage the stock.

- **Assess and report any spatially explicit differences between regions of the fishery.**

Available data suggests there are clear regional differences in size distribution, catch, timing of catch, and effort – several of which are meaningful to the calculation of SPR and to determining how it varies in space and time. There is also evidence that growth and reproduction differ spatially, which could lead to spatially structured source-sink dynamics that may interact with fishing in a way inconsistent with single stock

predictions. While lobsters have an extended larval period with extreme dispersal potential (which could lead to assumptions of complete larval mixing), studies in other lobster species suggest substantial localized recruitment (Iacchei et al. 2013).

Reviewers recommend reporting any spatial differences among regions of the fishery to assist decision-makers with parsing out trends in catch and life history traits across the region, and assess whether current harvest control rules are adequately meeting management goals.

Reporting spatial differences among regions of the fishery can help decision-makers parse out trends in catch and life history traits

- **Interactions with the Mexican spiny lobster stock should be considered and discussed in greater detail throughout the FMP.**

The reviewers expressed concern about the decision to neglect potential interactions between California and Mexico lobster populations. Given how the biology and management of Mexico's portion of the stock has implications for the entire range of the species, the FMP should include discussion of the potential uncertainty in SPR calculations associated with neglecting potential contributions from the south.

For example, regardless of the genetic structure of California spiny lobster, if the larval pool for California's population includes a large contribution from the Mexican portion of the stock, the actual SPR may be insensitive to management actions in California. The Department should discuss uncertainty around larval transport and reproductive interactions between California and Mexico's lobster populations. This should include a more comprehensive review of the literature (e.g., bolstering literature citations supporting the idea that stock is, or is not, well mixed).

- **Prioritize longer-term research needs relating to regional differences in the species' biological parameters.**

The Department should prioritize collection of data aimed at better understanding lobster population genetics, plankton connectivity modeling, and the benthic stage. This could provide greater insight into source and sink populations, interactions with Mexican spiny lobster populations, and how management in California will affect the population.

Evidence from multiple lobster fisheries suggests local recruitment processes are possible. A recent microsatellite and mitochondrial DNA study in California spiny lobster suggests that the genetic structure of the *P. interruptus* exhibits genetic patchiness (Iacchei et al. 2013). The species does not maintain a single homogenous population, despite the species' 240-to 330-day pelagic larval duration. Instead, these lobsters appear to either have substantial localized recruitment or maintain planktonic larval cohesiveness whereby siblings more likely settle together than disperse across sites. However, DNA analysis in the Caribbean lobster (*P. argus*) suggest that populations of this spiny lobster are highly interconnected throughout its range, with a single genetic stock structure (Truelove et al. 2014, Lipcius and Cobb 1994; Silberman and Walsh 1994), except for a few sites where self-recruitment is enhanced by persistent offshore gyres. Lastly, a genetic study in the American lobster (*Homarus americanus*) indicated a genetic homogeneity of the northern region of the lobster population (suggesting a single genetic stock) within the Gulf of St. Lawrence (Kenchington et al. 2009). However, a larval transport model for this species also showed an extensive pelagic connectivity with some level of local recruitment (Chassé and Miller 2010) and no physical features that restrict benthic stage exchanges (Comeau and Savoie 2002).

Research suggests California spiny lobster populations exhibit localized recruitment

3. ESTIMATE OF LOBSTER HABITAT CONTAINED WITHIN MARINE PROTECTED AREAS

The FMP factors in the effects of California’s network of MPAs by including them as a component of the fishing mortality calculation in the SPR cable model. The model includes an estimate that 14.6% of all available lobster habitat is protected by MPAs. This is based on available hard-bottom habitat data, augmented by proxy information where suitable bottom-type data are not available, for all the areas that comprise lobster habitat. Only areas that prohibit both recreational and commercial take were used for this calculation. In the near term, reviewers would like to see additional discussion in the FMP of the data sources used, and going forward, refinements to these estimates as the model is improved. Given other uncertainties in the spatial analyses, reviewers suggested that an estimate of 15% is likely adequate.

- ***Provide greater discussion of the data sources used to estimate suitable lobster habitat.***

Reviewers acknowledge the rigor of the hard bottom data set used to generate the estimate, however the Department should provide more clarity on the locations where information was not available from this data set. It would also be informative to report a rough percent of unmapped habitat and percent of the estimate that was calculated using kelp canopy.

- ***Continue to refine the MPA estimate as new information becomes available.***

The data used to estimate lobster habitat contain critical data gaps within the shallow nearshore regions (typically 10-15 meter depths) where remote sensing techniques are generally infeasible (known as the “white zone”). New research is providing better information to bridge these data gaps.

Ongoing research through UC Santa Cruz, the California Department of Fish and Wildlife (staff contact: Paulo Serpa), and Ocean Science Trust is making progress on estimating sand versus rocky habitats across the State within this white zone. The first stage has been completed in the North Central coast and may be expanded statewide over the coming years, and could potentially provide an additional data source to incorporate into the Department’s MPA estimate. The Seafloor Mapping Lab at California State University, Monterey Bay developed a shallow water mapping vessel, the R/V Kelp Fly, uniquely able to map the white zone. As these new data sources become available, the Department should include them as refinements to the cable model. The Department should also explore the contribution of habitat from breakwaters and artificial jetties.

- ***Consider developing a function or method to consider actual marine protected area sizes in the SPR cable model.***

The SPR cable model makes coarse assumptions about the size and spacing of MPAs within the lobster range. The actual values of these parameters are well known, and accounting for California’s actual MPA sizes and spacing – which differ regionally – could have implications for regional estimates of vulnerability because of the assumptions of movement that interact with the size and location of MPAs.

4. RESEARCH AND MONITORING

- ***Continue to update and prioritize research and data needs in the FMP.***

The FMP includes Table 5-1, a prioritized list of research and data needs. Throughout this report, reviewers have identified additional research and data needs that would support more robust management of the fishery (some of which parallel those noted in the FMP). Additional recommendations from this review should be incorporated in the table as well. These science needs could provide further impetus for collecting the information identified and prioritized. A resource with up-to-date research and monitoring needs

provides independent researchers (and potential funders), with the basis for assessing the applicability of given research or other proposals to spiny lobster management and/or state information needs. The Department should continue to update this prioritization and guidance.

5. ADDITIONAL RECOMMENDATIONS

This section contains additional recommendations reviewers considered important, but were not clearly outlined in the formal scope of review.

- ***The harvest control rule matrix should include predetermined management options.***

While reviewers recognized that this recommendation might be outside of the review scope, they agreed that scientific recommendations are most successful when they are accompanied by predetermined management actions. The lack of pre-determined management response options when one or more of the management thresholds are exceeded has the potential for inaction if the indices or data suggest there are troubling in the fishery. Table 4-2 in the draft FMP lists the suggested management response sequence, including four scenarios in which “No response is required,” and another four in which a response is required. However, the required response in these scenarios is an investigation of underlying causes and confirmation with multiple models and approaches; if management action is required, the FMP guidance is to “tailor management response to prevailing conditions.” The reviewers found these requirements vague.

One of the key benefits of pre-specified harvest control rules is a higher certainty of the actions that will be taken when reference points are exceeded. This allows models to be used to evaluate the effectiveness of these actions to restore the fishery to the desired condition.

Other fisheries that have used SPR for developing harvest control rules may provide good resources for identifying appropriate management responses to thresholds that have been exceeded. Consider supplementing FMP Table 4-1 (summary of SPR thresholds for other lobster fisheries) with a discussion of the management response are in those various management scenarios, as well as whether any of those fisheries also include target SPR rates.

- ***Clarify the information required for setting total allowable catch (TAC).***

Lines 1964-1965 state that “Creating a TAC for the CA lobster fishery would likely require the Department to estimate the total biomass of the stock...”. This is not necessarily true. For example the Market Squid fisheries established a TAC based on historical high catch levels in the absolute absence of total biomass estimates or idealized CPUEs. For many groundfish and other exploited fishes, a common practice in the absence of a quantitative guidance for stocks or stock complexes is to set a TAC at some fraction (e.g., 0.5, 0.75) of the peak historical catch. Any TAC that might be implemented should have a rationale, but it does not mean it requires a sophisticated model.

Looking Forward: Considerations for developing scientific models for state fishery management plans

The California spiny lobster FMP represents one of the first examples of a state fishery management plan including the use of a technical model to obtain harvest control rules. The experts who participated in this review have experience developing and using fisheries models at the federal and international levels, and thought it valuable to provide insight into processes employed elsewhere.

When considering the development and use of other technical models going forward, the Department should ensure that the plan for producing the science is decoupled from any management concerns. This will include scoping the objectives, approaches, reporting requirements, and responsibilities of various participants in advance. Model development should take place from a position of academic freedom focused on developing the best model, given the resources and data. The Department should ensure the process is inclusive and transparent from the outset.

Reviewers also suggest decoupling the review of technical models from review of the FMP that such models inform. Future model reviewers should have the responsibility of ensuring that the models represent the best available science and the most robust methods. This review committee acknowledges that ideally an in-person, multi-day review workshop with the model development team would allow more detailed technical discussion and model improvement. It is advantageous to have several days to review, so that modelers can be given “homework” on sensitivity tests or alternative analyses that come up during the review and report back. Any future review team should include scientists from outside the region and fishery, and if possible, international expertise. A goal should be to ensure that the model is clearly understandable to those with no background in the particular fishery under consideration. Only models that have been accepted by reviewers as the best available science are advanced to managers. This way, managers can make recommendations and develop harvest control rules based on a model that has been independently recognized as scientifically rigorous.

As noted in this report, models like SPR will require continual refinement and review to ensure they are effectively meeting management goals. Formalizing a process to periodically review the model coding and configuration, and incorporate recent information is recommended. Groups like SouthEast Data, Assessment and Review¹ (SEDAR) and NOAA PFMC Stock Assessment Review (STAR) Panels may provide informative examples of successful approaches that vary in detail and level of time and analyses required.

Appendices

Appendix A: von Bertalanffy and Gaussian Growth Curve Comparison, and Appendix B: Applying the Canadian Precautionary Approach to California Department of Fish and Wildlife Commercial Landings contain additional analyses that were conducted by the review committee as part of their assessment in support of the recommendations contained within this report.

Appendix C: Scientific and Technical Review Process details the process Ocean Science Trust developed and implemented for this review.

APPENDIX A: VON BERTALANFFY AND GAUSSIAN GROWTH CURVE COMPARISON

We (the review committee) compared the von Bertalanffy and Gaussian growth models to determine which would be most appropriately applied in the SPR model. The first step was to examine the cumulative fecundities, in millions of eggs, over the projected 25-year lifetime. The age-specific fecundities from the Cable 6.0 model, which uses a von Bertalanffy growth curve, and those from the CDFW 1.0 model, that uses their new growth model, are shown in Figure 1 plotted at the same scale. The main difference is the levels of fecundity. In the Cable model, the cumulative fecundity at $F = 0$ is 147.2 million eggs while the fecundity at $F = 0$ in the CDFW model is 46.4 million. At high fishing mortality rates, the fecundities are similar (17.7 vs. 15.8 million eggs at $F = 3.0$) which means that the SPR ratio will be much higher in the CDFW model; the higher SPR is just the result of the much lower unfished cumulative fecundity (Figure 2).

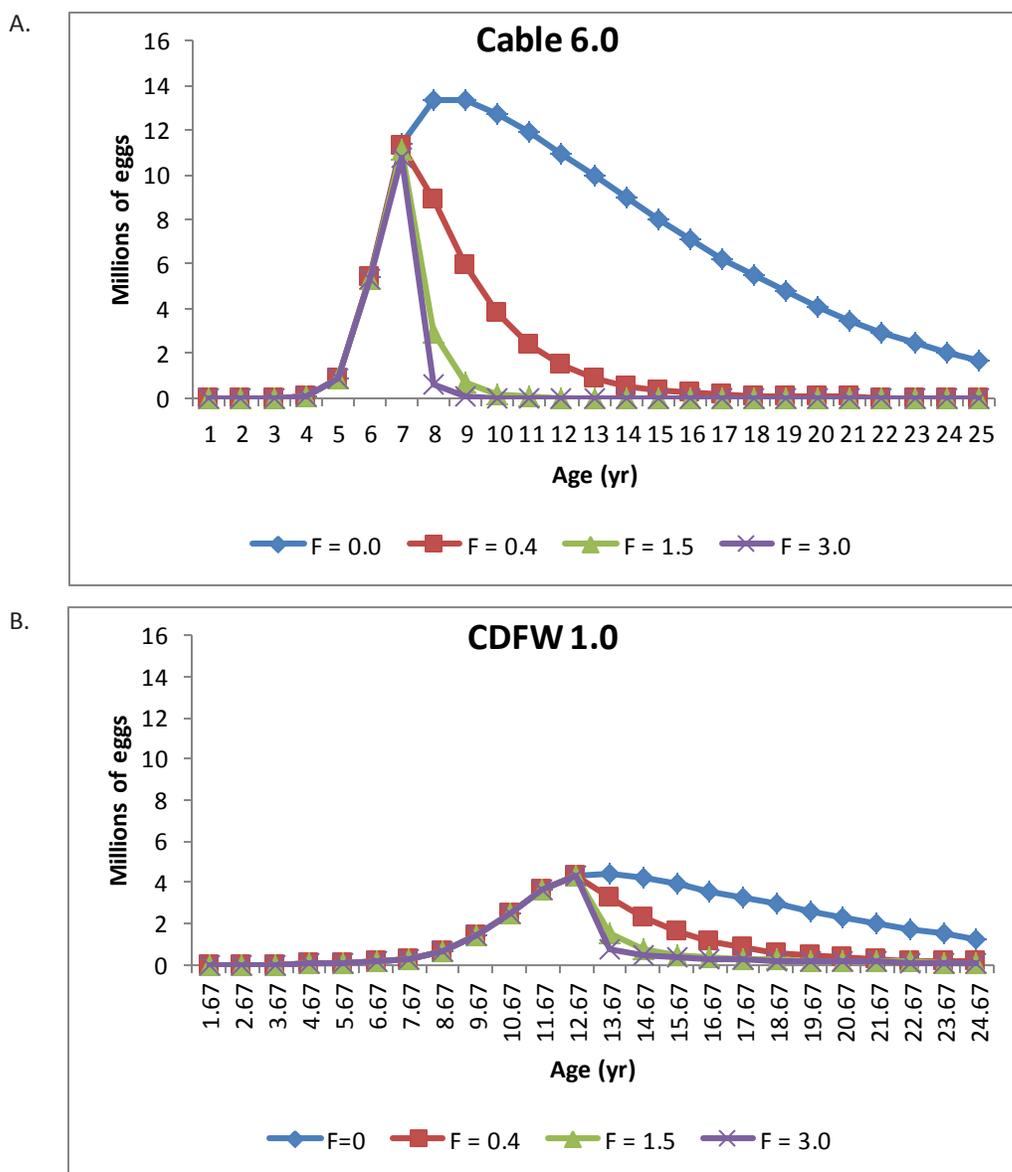

Figure 1. Fecundity by age for the two SPR models: a) the Cable 6.0 and b) CDFW 1.0 for a range of fishing mortality rates.

Even for a high fishing mortality rate of 3.0 per year, the CDFW model still has a SPR value of 34%. However, when we plotted the corresponding average lobster weight against fishing mortality (Figure 3), which is the basis of the control rule, we found that neither model would be a very sensitive way of determining fishing mortality and the corresponding fishing mortality rate that would be used to obtain the SPR value each year. Note that the axes in Fig. 3 are plotted to reflect that the average weight is what is measured so as to estimate the fishing mortality rate. With the current SPR model, fishing mortality would be undefined at average weights less than 1.40 lb. For comparison, the average weight at legal size (82.5 mm CL is 1.25 lb for males and 1.38 lb for females).

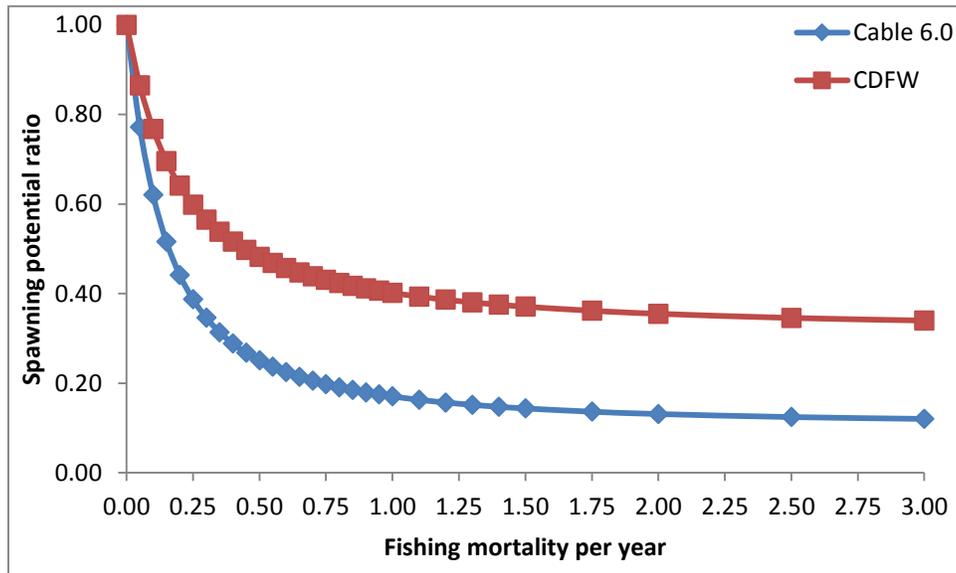

Figure 2. Spawning potential ratios for the two SPR models (Cable 6.0 and CDFW 1.0) for a range of fishing mortality rates.

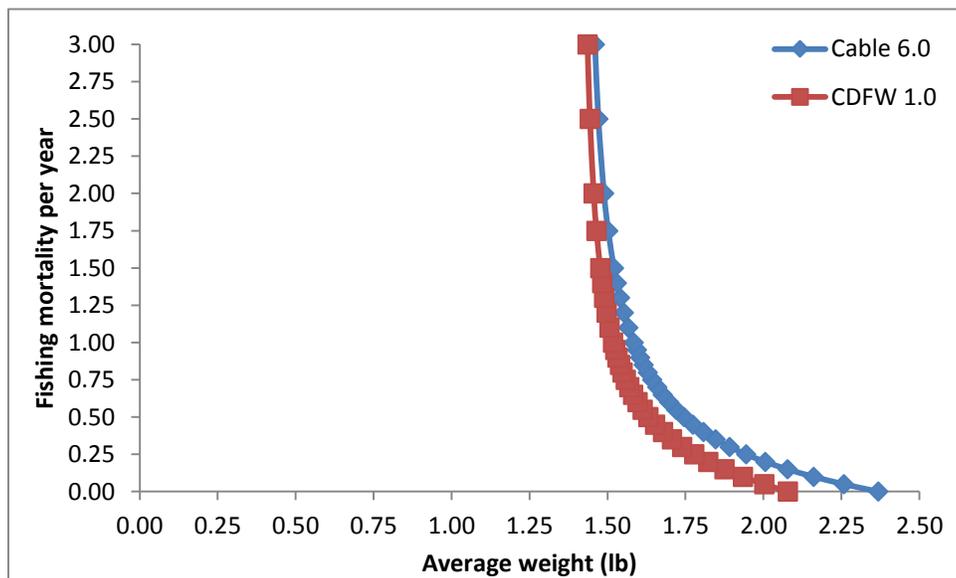

Figure 3. Average spiny lobster weights and the corresponding fishing mortality rates from the two SPR models (Cable 6.0 and CDFW 1.0).

APPENDIX B: APPLYING THE CANADIAN PRECAUTIONARY APPROACH TO CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE COMMERCIAL LANDINGS

We compared the sensitivity of the Department’s proposed catch-based threshold approach with another strategy in use for the American lobster in Canada. In 2014, Canada established a reference point for their southern Gulf of Saint Lawrence lobster fisheries using commercial catch based on the Precautionary Approach. Based on this approach, if landings are between an upper stock reference (USR) and the limit reference point (LRP, i.e., the caution zone) it automatically triggers management considerations. These harvest control rules are pre-set management actions aimed at exiting the caution zone and re-entering the healthy zone (i.e., above the upper stock reference point). Based on a 123-year data series for the southern Gulf of Saint Lawrence, management considerations would have been triggered for the American lobster 85 times, and 12 times in a recovery mode (i.e., drastic reduction of effort to a no fishing situation) (Figure 1). However, applying the California spiny lobster approach to the same American lobster data revealed that California’s proposed 0.8 reference point would only be exceeded two times (Figure 2).

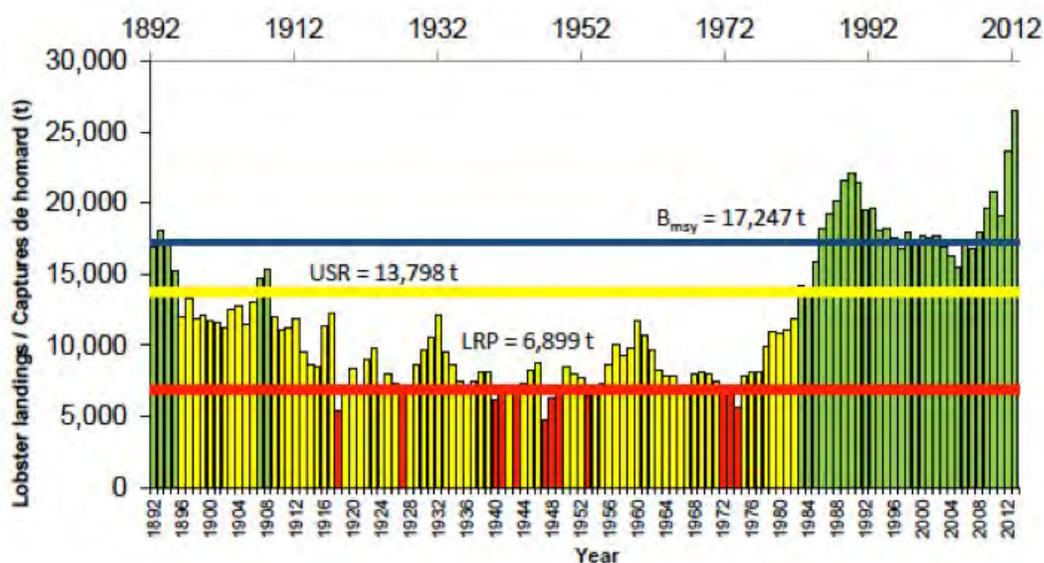

Figure 1. American lobster landings (1893-2013) in the southern Gulf of St. Lawrence; years in the healthy zone (i.e., above the upper stock reference [USR]) in green, caution zone (i.e., between the USR and the limit reference point [LRP]) in yellow, and below LRP in red. The biomass for the maximum sustainable yield (B_{msy}) is estimated at 17,247 t.

We then applied Canada’s Precautionary Approach to the Department’s California spiny lobster commercial landings data. To do this, we calculated a hypothetical biomass at maximum sustainable yield (B_{msy}) based on a time period from low landings followed by a “recovery” to higher and more sustained landings. Based on the information in the draft spiny lobster FMP, the lowest landings (with information available on effort) were observed in 1974 followed by increasing landings (with fluctuations) until 2013. Based on the trap pull haul (webinar presentation fig. 2.6), it seems that the effort level (traps hauled) increased 4 times: 200,000-400,000 between 1973-1979; 400,000-600,000 (with a drop in 1991-2) between 1980-94; \pm 800,000 between 1995-2011; and above 1 million in 2012-3. A reasonable assumption is that the stock could sustain the 800,000 trap haul level (16 years) since the landings did not drop during the time. Hence, the time period could be established between 1974 and 2011. However, please note that based on the CPUE reference values (see fig. 4.7 in FMP document), one could reasonably argue that the stock does not seem to react well to the level of effort in the last 7 years and that the time period should/could be 1974-2007. Nevertheless, using the 1974-2011 period

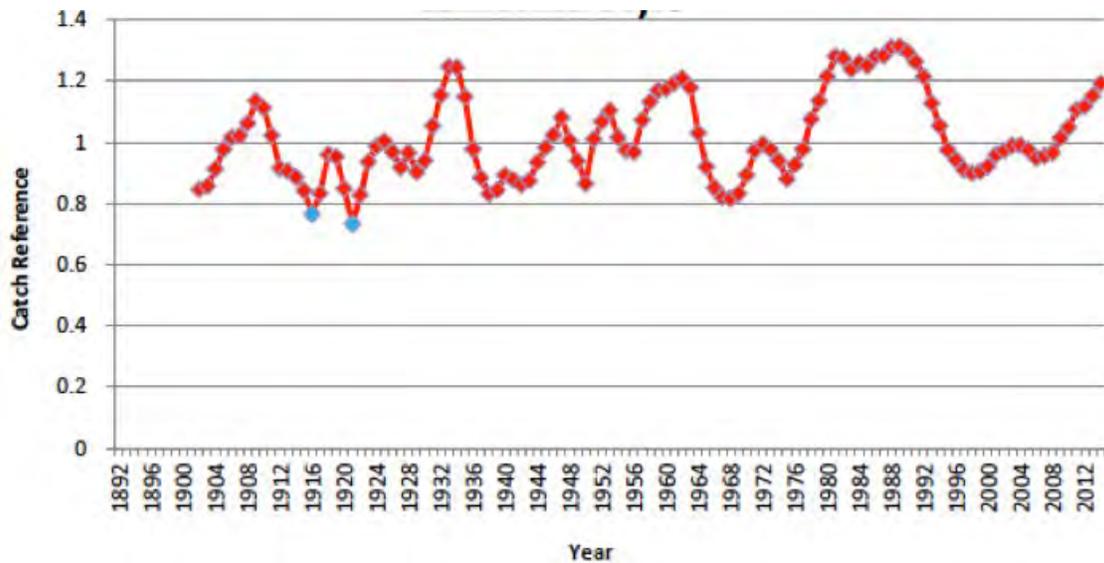

Figure 2. Catch reference for the American lobster landings (1892-2013) in the southern Gulf of St. Lawrence using the California spiny lobster catch-based threshold approach.

the B_{msy} is estimated at 587,409, given an upper stock reference (80% of B_{msy} ; USR) of 469,927, and the limit reference point (40% of B_{msy} ; LRP) of 234,963 (Figure 3). The draft FMP (Figure 4.6) indicates that between 1935 and 2013 management considerations would have been triggered 11 times, mostly between 1960-74. Based on the precautionary approach and using a 3-year running average for landings, the spiny lobster fishery was below LRP in 1975-6 (critical zone; normal because the time period stated at low values), which would trigger a recovery period (i.e., drastic reduction of effort to a no fishery situation). Since 1935, landings were between LRP and USR (caution zone) 31 times (latest 1977-87) that would have triggered immediate management actions from pre-established harvest control rules (mainly effort reductions) to, hopefully, exit the caution zone and re-enter the healthy zone. Landings between USR and B_{msy} was observed 9 times (latest 1993-5) but does not trigger urgent management considerations, but could be used by managers to start a dialogue with the industry (e.g., to be cautious).

Figure 3. Application of Canada's Precautionary Approach to California spiny lobster commercial landings data; years in the healthy zone (i.e., above the upper stock reference [USR; yellow line]), caution zone (i.e., between the USR [yellow line] and the limit reference point [LRP; red line]), and below LRP. The biomass for the maximum sustainable yield (B_{msy}) is estimated at 587,409 lbs.

APPENDIX C: SCIENTIFIC AND TECHNICAL REVIEW PROCESS

The California Department of Fish and Wildlife (the Department) asked California Ocean Science Trust to coordinate an external scientific and technical review of the reference point thresholds prescribed in the California Spiny Lobster Fishery Management Plan (FMP) and supporting materials. Specifically, the Department sought an independent assessment of whether the technical components, spawning potential ratio model, and supporting documents that underpin the proposed reference point thresholds prescribed in the FMP are scientifically sound and reasonable given the Department’s currently available data streams and analysis techniques. See the “Scope of Review” for details on the charge to reviewers.

Ocean Science Trust designed and implemented all aspects of the review process, including compiling appropriate background materials, drafting instructions to guide reviewers throughout the process, scheduling and hosting remote meetings as appropriate, and working with reviewers to produce a written final summary report, among other activities. Upon completion of the review, the final report was delivered to the Department and made publicly available on the Ocean Science Trust website. Throughout, Ocean Science Trust facilitated constructive interactions between the Department and reviewers as needed in order to ensure reviewers provide recommendations that are valuable and actionable, while maintaining the independence of the review process and outputs

Scientific Review Principles

In any review, it is our intent to provide an assessment of the work product that is balanced, fairly represents all reviewer evaluations, and provides feedback that is actionable. When building a scientific and technical review process, we seek to balance and adhere to six core review principles. These principles help guide the design and implementation of each review, and shape the final outputs:

- **Scientific rigor:** the process must yield an evaluation of whether scientific and technical components contained within products are valid, accurate and thorough.
- **Transparency:** given the context for the review, the process must include the appropriate level of information disclosure and openness in order to facilitate social recognition and accountability.
- **Legitimacy:** the process must yield an output that is viewed as authoritative in the eyes of scientific community, the requesting agency, and other constituents.
- **Credibility:** the process will seek to be unbiased and incorporate the best available science.
- **Salience:** the process will consider the most relevant scientific information while balancing management needs and timelines.
- **Efficiency:** the process will be as cost-effective as possible, and utilize time, resources, and effort in a proficient manner to create the most robust output possible.

Review Process

The review took place from October 2014 through May 2015. A timeline of each task is provided below.

Milestone	2014			2015				
	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May
Task 1 - Review Preparation								
Scope and process development; budget and administrative preparation; reviewer solicitation and selection process; collateral material development	X							
<i>CDFW delivery of draft FMP to Ocean Science Trust</i>		X						
Task 2 – Conduct Review								
Webinar 1: Initiation of Review (Attendees: CDFW, Review Committee, Ocean Science Trust)			X					
Webinars 2: FMP Assessment (Attendees: Review Committee, Ocean Science Trust)				X				
<i>CDFW delivery of draft SPR model and report to Ocean Science Trust</i>						X		
Webinar 3: SPR Model Assessment (Attendees: CDFW, Review Committee, Ocean Science Trust)						X		
Webinar 4: Cont. SPR Model Assessment, Develop Review Recommendations (Attendees: Review Committee, Ocean Science Trust)							X	
Task 3 – Finalize Summary Report								
Deliver final report to CDFW and make available online; publish membership of review committee; present findings to the Fish and Game Commission								X

Assembling the Review Committee

Ocean Science Trust implemented a reviewer selection process to assemble a review committee composed of four external scientific experts. Ocean Science Trust consulted with and accepted reviewer recommendations from the Ocean Protection Council Science Advisory Team (OPC-SAT), as well as Ocean Science Trust's own professional network among the academic and research community. Membership included experts from academia, research institutions, and government entities in order to deliver balanced feedback and multiple perspectives. Reviewers were considered based on three key criteria:

- **Expertise:** The reviewer should have demonstrated knowledge, experience, and skills in one or more of the following areas:
 - Fisheries biology, stock assessments and modeling, including spawning potential ratio analyses and application
 - Invertebrate ecology and/or population biology, with an understanding of California's coastal ecosystems, and how invertebrate stocks respond to fishing pressure, climate change and marine protected areas
- **Objectivity:** The reviewer should be independent from the generation of the product under review, free from institutional or ideological bias regarding the issues under review, and able to provide an objective, open minded, and thoughtful review in the best interest of the review outcome(s). In addition, the reviewer should be comfortable sharing his or her knowledge and perspectives and openly identifying his or her knowledge gaps.
- **Conflict of Interest:** Reviewers will be asked to disclose any potential conflicts of interest to determine if they stand to financially gain from the outcome of the process (i.e. employment and funding). Conflicts will be considered and may exclude a potential reviewer's participation.

Final selections for the review committee were made by the Ocean Protection Council Science Advisor (Ocean Science Trust Executive Director). Ocean Science Trust selected one member of the review committee to serve as chair to provide leadership among reviewers, help ensure that all members act in accordance with review principles and policies, and promote a set of review outputs that adequately fulfill the charge and accurately reflect the views of all members.

Series of Review Webinars

All meetings took place via a series of remote online meetings (webinars) and phone calls. At the outset of the review, Ocean Science Trust worked with the Department to develop detailed reviewer instructions that encouraged focused scientific feedback throughout the process. Instructions included directed evaluation questions and delegated tasks for reviewers based on their individual areas of expertise. The instructions were used to guide the development of meeting agendas, and track progress throughout the course of the review. For each meeting, advanced work was required of participants (e.g., conducting analyses, drafting responses to guiding questions, preparing presentations) in order for all parties to come prepared for meaningful discussions. Ocean Science Trust notified CDFW of additional requested materials and data prior to the first "Initiation of Review" webinar in mid-November.

- **Webinar 1: Initiation of Review (December 2014)**

Ocean Science Trust hosted an initial remote meeting (webinar) to provide the review committee and Department staff an overview of the scope and process, and clarify the roles and responsibilities of each participant. The Department provided a summary of the relevant management context to ensure reviewers understood the role of the review in the FMP development process, and how the outputs would be considered. The bulk of the webinar focused on a presentation by the Department of the scientific and technical components

of the draft FMP. The webinar was an opportunity to develop a shared understanding of the tasks and allow reviewers to ask the Department any clarifying questions about the review materials before they convened independently to conduct their technical assessment.

- **Webinars 2-4: Reviewers convened with Ocean Science Trust to conduct review (*January through April 2015*)**

Ocean Science Trust convened three remote one- to two-hour webinars with the review committee to conduct an in-depth evaluation of the components identified in the Scope of Review. In advance of each webinar, reviewers were asked to prepare responses to guiding evaluation criteria questions from the review instructions. During each webinar, reviewers discussed their findings and developed conclusions and recommendations. Outputs from each webinar, as well as reviewer responses to the questions, guided the development of the final report.

Final Summary Report

Ocean Science Trust worked with the review committee to synthesize reviewer assessments (responses to the review instructions and input during webinars) into a cohesive, concise final report. The final report was delivered to the Department in May 2015, and made publicly available on Ocean Science Trust's website along with the identities of the review committee members. Ocean Science Trust presented the review results on behalf of the review committee at the June 10, 2015 California Fish and Game Commission public meeting in Mammoth, California.

Appendix XIII – CA Lobster FMP Edits in Response to Scientific Peer Review Comments

The scientific foundation for the California Spiny Lobster Fishery Management Plan (CA lobster FMP) underwent an independent, external peer review by a panel of academic and government scientists, expert in lobster fisheries and marine invertebrates. Reviewers focused on the reference points used within the harvest control rule (HCR), the model used to calculate spawning potential ratio (SPR), methods for incorporation of the effects of marine protected areas on the stock and fishery, and the decision to manage CA lobster as a single stock. The primary changes to the previous draft of this FMP in response to peer review include:

- A von Bertalanffy growth model was used to describe lobster age at a given size within the model used to calculate SPR.
- Catch and catch per unit effort (CPUE) reference points were made more sensitive by setting the threshold levels at 0.9 rather than 0.8.
- Expanded discussion of possible reference points and associated models was added to the FMP along with increased explanation of the selected approach.
- Information on regional differences within the stock was added and better understanding of these differences was highlighted as an information need.

The responses below address each specific recommendation made by the panel and highlight what changes, if any, were made to the draft FMP in response. California Department of Fish and Wildlife (CDFW) responses to comments follow the same outline structure within the panel's final report (Appendix VIII to the CA lobster FMP). The Cable model was originally developed by Dr. Richard Parrish under contract with the South Bay Cable Liaison Committee (Parrish 2013), and ongoing revision of it has been necessary to address some panel recommendations. References to the CDFW-Cable model in this document are for the most recent version that was developed through collaboration among CDFW staff and CDFW contractors, including assistance from Dr. Parrish.

1 Evaluation of the proposed reference point thresholds

1.1 Spawning Potential Ratio (SPR) Cable Model and the SPR Reference Point

1.1.1 Key Recommendations for Securing a Management-Ready SPR Model

Growth Model

Comment: Rely on the von Bertalanffy growth modeling methods until the newly developed growth model can be robustly validated.

Response: CDFW fit a von Bertalanffy model to existing growth data from tag-recapture studies generating a new equation to relate size and age within the CDFW-Cable model. Separate male and female equations resulted in greatly underestimated maximum size, which lead to unrealistic model results. Given this, von Bertalanffy parameters derived for the Mexican CA spiny lobster stock were taken from Vega (2003). Equations with separate parameters for males and females were input to the CDFW-Cable model (see Appendix VII to the CA lobster FMP).

Comment: Use SPR with caution at high exploitation rates.

Response: Discussion of the limitations to the CDFW-Cable model at high exploitation rates were added to the FMP within section 4.3.1 and the corresponding Figure 4-9.

Comment: Reconsider some of the tag-recapture data that were removed from the growth models.

Response: Growth increments of 0 mm were retained as recommended. The occurrence of negative growth increments as well as outliers was re-examined. After accommodating the data filtering requirements designed to ensure a molt had occurred between lobster measurements (>150 days at liberty and measurements before and after the molting season) negative values fell out of the data set. Two extreme outliers remained and were removed. As stated above, the resulting von Bertalanffy model was unrealistic and was not used.

Model Functionality

Comment: Update the vulnerability relationship.

Response: Lobster vulnerability to traps is described by a size-dependent equation within the CDFW-Cable model. This equation simulates low vulnerability for small lobsters that are able to escape through escape ports, grows to high vulnerability for legal-size lobsters, then low vulnerability again for very large lobsters that are too large to enter trap funnels. Parameters determine the rate at which vulnerability increases then decreases again. Equations for vulnerability and female sexual maturity are of a similar form because maturity also increases quickly as females increase in size. The parameter guiding this increase was the same in an earlier model version by coincidence. The parameter for female maturity was set based on published observations of sizes of berried females. The parameter for vulnerability was set based on sizes of lobsters typical in traps. That parameter was then “tuned” within the model to produce a simulated percentage of shorts in the catch that matched this percentage from commercial log data. This tuning procedure was repeated on the most recent model version, which utilizes a different growth model, resulting in slightly different vulnerability parameters.

Comment: Revisit the natural mortality function.

Response: The CDFW-Cable model natural mortality function is size-based and results in high natural mortality for young lobsters which decreases to a value of 0.17 for most size classes before increasing again for large lobsters. CDFW performed a sensitivity analysis to examine differences in model output using natural mortality equations with and without increasing natural mortality for old, large lobsters (senescence). Senescence had little impact on model results because few lobsters live to achieve the size at which senescence is relevant. Therefore simulated senescence was removed from the natural mortality function. Additional references were added to the FMP within section 5.2, subsection on total mortality. The referenced studies also used natural mortality rates of approximately 0.17 although typically used a constant rate rather than size-based. Temperature and von Bertalanffy parameters were also used to calculate an estimate for natural mortality following methods described in Hearn (2008) and again achieved a result of approximately 0.17.

Comment: Explain the ramifications of SPR being independent year to year.

Response: Additional discussion of the drawbacks to equilibrium modeling was added to section 4.3.1.3. The constant recruitment used within the CDFW-Cable model, and therefore lack of a stock-recruitment relationship, is described as the reason for using an SPR threshold based on a set of reference years rather than knowledge of a sustainable spawning stock biomass based in MSY. Additional discussion of this issue has been added to CDFW's report on the Cable-CDFW Model.

Sensitivity Analyses

Comment: Make greater use of sensitivity analyses in explaining the model.

Response: In response to requests by the review panel for additional sensitivity analyses during the review process, CDFW analyzed model sensitivity to natural mortality equations of multiple forms, MPA and movement related parameters, vulnerability parameters, and ghost fishing. Results from these analyses have been added to CDFW's report on the model. Results of further sensitivity analyses on changes in model output resulting from growth model changes requested by the review panel were also added. CDFW will continue to use these analysis techniques when future model changes are considered.

1.1.2 Longer-Term Considerations for the SPR Model

Research Needs

Comment: Explore alternative methods to estimate lobster growth.

Response: This was identified as a research priority in section 5.2 on Essential Fisheries Information (EFI) and subsection on age and growth. Emerging techniques for direct identification of crustacean age were described and referenced. Available tag-recapture data and modeling efforts of CDFW to date were also described. The CDFW-Cable model report provides more detail. A statement that CDFW will look to collect more growth data and develop new models was added to the natural history section (3.2) subsection on growth. The importance of regionally specific growth information, if the CDFW-Cable model is to be used in a regionally specific way, was added to section 4.3.1.3.

Comment: Explore additional technical models that can account for variable recruitment.

Response: There are currently no adequate data on lobster recruitment that can be used to develop a stock-recruitment relationship for CA lobster. This is one of the reasons for the choice to use equilibrium modeling to estimate SPR. However, CDFW recognizes the drawbacks of equilibrium modeling and will seek to improve understanding of CA lobster recruitment in the future. CDFW has demonstrated a relationship between CA lobster landings and the abundance of phyllosoma larvae in CalCOFI samples (Koslow et al. 2012) but this may not translate into a relationship between landings and recruitment. The MSE model has options for the use of either a Beverton-Holt or Ricker recruitment curve and CDFW hopes to further improve the MSE model and use it to provide context for future management decisions. Models for calculating reference points that incorporate stock-recruitment relationships are noted in section 4.2.4.

Comment: Develop a sampling program to collect individual lobster length or weight composition data from both sectors of the fishery.

Response: This is noted as a research priority in section 5.2 covering EFI, subsection on stock composition. Improvements that these data could provide to models are noted in section 4.3.1.3.

Comment: Prioritize obtaining intermediate recapture data, which could be useful for better understanding the dynamics of lobster growth rates.

Response: This was noted as a priority in section 5.2 on EFI, subsection on age and growth.

Model Functionality

Comment: Develop a function or method to incorporate recreational catch into the model.

Response: The CDFW-Cable model calculates SPR based on input data on average weight of individuals in the commercial catch. Currently, there are not adequate data on average weight of lobsters taken in the recreational fishery. Other aspects of the model, such as vulnerability, are based on data describing the vulnerability of lobsters to traps and not to hand take. An intensive research program and annual monitoring would be required to generate appropriate equations, parameters, and input data for recreational take. Additionally, improvement in recreational catch estimates as report card return rates improve would be necessary for confident inclusion of recreational dynamics in models. Additional data sources, such as annual telephone surveys of fishermen who did not return their report card would help, but require additional capacity and resources to undertake.

Comment: Revisit the SPR model as MPAs reach their full maturity.

Response: Additional discussion of the “credit” given to the simulated lobster stock from MPAs was added to section 4.3.1.3. CDFW agrees that MPAs are unlikely to have achieved their full potential and may not for some time and now state within the FMP “... it is unlikely that the MPAs, implemented in 2012 as a result of the south coast MLPA process, have actually achieved equilibrium and their full potential. Given that the average weight during the 2014-15 fishing season was above the average of the reference years, $SPR_{CURRENT}$ for 2014-15 was also above $SPR_{THRESHOLD}$ with or without the model benefit from MPAs. CDFW will monitor average weight and SPR closely until further research illustrates substantial benefit of MPAs to CA lobster and that the model-simulated enhancement to reproductive potential is warranted.”

Comment: Formalize a process to review, revise, update, and evaluate the SPR model and its effectiveness in meeting management goals as new data, information, or analyses become available.

Response: Section 4.3.1.3 notes that equations and parameters in the model will be revised as information becomes available. Section 6.2.2 on the amendment process states that revising calculations within the Cable-CDFW model to include new EFI would not require an amendment but removal or addition of a different reference point would.

1.2 Catch and CPUE-based Reference Points

1.2.1 Key Recommendations for Catch and CPUE-based Reference Points

Comment: Describe catch and CPUE thresholds as “fishery indicators” instead of reference points.

Response: The Canadian precautionary approach described in the peer-review report as well as other reference point approaches were explored. Discussion of these approaches relative to the approach used in the CA Lobster FMP was added to sections 4.2.4, 4.2.5, and 4.3.1.3. CDFW asserts the catch and CPUE reference points play a valuable role in the HCR and therefore were not removed from the HCR or reclassified as “indicators.” However, as recommended by the review panel, the effects of making the catch and CPUE reference points more sensitive were explored and threshold levels were increased from 0.8 to 0.9. Descriptions of stock history relative to those thresholds are given in sections 4.3.1.1 and 4.3.1.2. Previously the FMP stated that investigations would be initiated if the catch or CPUE declined for seven consecutive seasons. This was intended to bring additional attention to declining catch or CPUE even if they remain above the reference point threshold. In recognition that consistent declines have not been seen previously, investigations will instead be initiated if the catch or CPUE reference points decline for six consecutive seasons. This adds additional sensitivity to the reference points and is better aligned with stock history.

Comment: Clarify rationale for the use of 0.8 thresholds prescribed in the FMP.

Response: Additional explanation of the rationale for using moving averages and the revised threshold values of 0.9 for the catch and CPUE reference points was added to sections 4.3.1.1 and 4.3.1.2.

Comment: Report the CPUE statistic in mass per unit effort.

Response: CPUE is calculated as number of lobsters caught per trap pull because both of these data are collected on the commercial log. Reporting mass per unit effort would require linking logs to landing receipts which requires a variety of assumptions and results in removal of a large amount of data. Therefore no change was made in response to this comment.

Comment: Include greater discussion of the reliability of recreational catch estimates.

Response: Additional discussion of the reliability of these data was added to section 2.2. Table 2-1 was updated with new estimates of the total weight of recreational landings and 95% confidence intervals, as well as the percent of total landings represented by recreational landings. However, these confidence intervals cannot reflect uncertainty “due to poaching or the potential that catch on returned report cards is not representative of catch on un-returned report cards.”

1.2.2 Longer-Term Considerations for Catch and CPUE Data

Comment: Explore other technical models to obtain additional or alternative biological reference points that account for inter-annual variability in recruitment and other variables.

Response: Discussion of, and references to, other types of models for generating reference points was added to sections 4.2.4, 4.2.5 and 4.3.1.3. CDFW is open to further exploration of these model options. These options, particularly a Delury depletion model which may not require new data streams, could be useful if prompted to investigate stock status by the HCR.

Comment: Standardize commercial and recreational catch data to the same spatial reference points.

Response: CDFW commercial fishing blocks, which are 10 x 10 nm, are a long-standing reporting requirement on commercial logs. This level of detail is not tractable on a recreational report card. Existing report card catch locations can be overlaid with and attributed to commercial blocks. However a variety of assumptions are required where boundaries are not well aligned. In the future, CDFW will seek to better define recreational take locations so that they align well with commercial blocks, where possible.

2. Science Supporting the Decision to Manage as a Single-Stock

Comment: Assess and report any spatially explicit differences between regions of the fishery.

Response: A new section (3.10) was added to the natural history chapter to describe what is known about regional differences within the stock. The spatial limitations of the CDFW-Cable model and the concerns of using the model to produce regionally specific results are discussed in section 4.3.1.3. Some analyses of differences in effort and catch were performed as part of an effort to refine our analyses of average weight. This helped inform the discussion of regional differences in section 3.10. Another new section (3.4) was added to describe existing literature on genetic population structure. This literature suggests that management as a single stock is appropriate and that while mixing across the border with Mexico occurs, it likely doesn't dominate CA dynamics.

Comment: Interactions with Mexico's spiny lobster stock should be considered and discussed in greater detail throughout the FMP.

Response: A new section (4.4.1) was added to describe Mexico's stock status and management. Additional discussion of how recruitment from Mexico would affect our use of SPR as a reference point was added to section 4.3.1.3.

Comment: Prioritize longer-term research needs relating to regional differences in the species' biological parameters.

Response: Additional description and references for larval recruitment data were added to section 5.1.2 in the larval collectors subsection. The potential use of these data to understand regional differences and population sources and sinks is noted in section 5.2 on recruitment. The importance of understanding regional differences in age at maturity and fecundity is noted in section 5.2, subsection on reproduction. Regionally-specific estimates of fishing mortality were already given the highest research priority in section 5.2, subsection on Mortality. The importance of information in all these categories if the CDFW-Cable model is to be used for regionally-specific results is noted in section 4.3.1.3. Genetic population structure/larval mixing was added as a data type in Table 5-1.

3. Estimate of Lobster Habitat Contained within Marine Protected Areas

Comment: Provide greater discussion of the data sources used to estimate suitable lobster habitat.

Response: Sources for different lobster habitat categories were foot noted in section 3.1. Table 4-2 was added to provide the relative areas of hard and soft habitat types and unknown regions, as well as their mapping resolution within regions of the Southern California Bight (SCB). The amount of hard bottom area estimated using kelp canopy as a proxy was also noted.

Comment: Continue to refine the MPA estimate as new information becomes available.

Response: Improvement of habitat information is given the highest priority in section 5.2 and Table 5-1. Its importance to calculation of SPR within the CDFW-Cable model is noted.

Comment: Consider developing a function or method to consider actual marine protected area sizes in the SPR cable model.

Response: The CDFW-Cable model was designed as an equilibrium model. It is run only a single time under each scenario with no stochasticity or variability in parameters. MPA size and spacing represents an average of the actual variation along the entire SCB coast. One method for incorporating a range of MPA parameters could be to average outputs from multiple runs using different MPA parameter settings. However, using the CDFW-Cable model to produce regionally-specific results based on MPA parameters without including regionally specific biological parameters for many of the functions may not be appropriate. A much more complex model would be more appropriate for inclusion of realistic MPA size and spacing and could concurrently include variable recruitment and other regional differences. An individual-based model like the MSE model is better structured for these functions and CDFW hopes to continue improvement of that model in the future.

4. Research and Monitoring

Comment: Continue to update and prioritize research and data needs in the FMP.

Response: The data needs and research priorities outlined in Chapter 5 of the FMP were closely reviewed. CDFW is undergoing a systematic review of data needs and existing data streams for the lobster fishery as well as all other fisheries. CDFW is also working towards developing a public-facing repository for our research and data needs.

5. Additional Recommendations

Comment: The harvest control rule matrix should include predetermined management options.

Response: The HCR was designed to be discretionary as predetermined management options were not supported by the LAC. Inclusion of multiple reference points was intended to help provide a more complete picture of stock status and influences. Based on these relatively nuanced reference points, management responses can be flexible because of multiple toolbox options and also because investigations prompted by the HCR should provide further guidance on stock influences. Edits were made to both Table 4-3: Harvest Control Rule Matrix and Table 4-4: Control Rule Toolbox to clarify potential reasons for reference point positions and suggested responses.

Comment: Clarify the information required for setting total allowable catch (TAC).

Response: Additional description of TACs, methods for their determination, and references were added to section 4.3.3.

Appendix IX: LAC Regulatory Recommendations and CDFW Memorandum to the Commission on LAC Recommendations

[Page left intentionally blank]

DRAFT

California Department of Fish and Wildlife

CDFW Feedback on Implementation Details of the Lobster Advisory Committee Commercial Recommendations:

The California Department of Fish and Wildlife (CDFW) recently met with the Lobster Advisory Committee (LAC) Commercial Representatives to discuss details regarding implementation of the proposed regulatory changes to the commercial lobster fishery recommended by the LAC. Input from CDFW Marine Region and Law Enforcement Division (LED) is provided in **Blue Font** below. This information is being disseminated to refine the details prior to the formal regulatory process which takes place after the Fisheries Management Plan (FMP) has been adopted in 2015. The LAC recommendations will part of the Lobster FMP implementing regulations that will be formally introduced to the Fish and Game Commission in mid-2015. Any new regulations that are adopted would not be implemented until the 2016-2017 lobster season.

LAC Commercial Proposal

Table 1. COMMERCIAL TRAP LIMIT

CATEGORY	NUMBER OF TRAPS	PROVISIONS
"300" Transferable Permit (T) "300" Non-transferable permit (NT)	300	<ul style="list-style-type: none"> • May stack another permit for a maximum of 2 permits (2 x 300 traps = 600 trap maximum) • The second permit remains transferable • Death provision applies only to transferable permits (NT permits are not transferable – even due to death)
<p>CDFW supports the proposed LAC trap limit of 300 traps with the ability to stack another permit for a maximum of 2 permits (2 permits X 300 traps = 600 trap maximum). The second permit remains transferable, and the death provision only applies to transferable permits.</p>		
Phase-In Stacking Permit	300	<ul style="list-style-type: none"> • Available to either transferable or non-transferable permittees • Non-transferable permit • Only available for three years (must be renewed annually) • Permit funds would go for commercial lobster research & monitoring – (\$5,000 - \$10,000 annual permit fee) • Would become effective when trap limits go into effect
<p>CDFW recognizes that a "Phase-In Stacking Permit" may no longer be necessary given the projected timeline for the proposed implementing regulations. New regulations would become effective for the 2016/2017 season.</p>		

Table 2. GENERAL PROVISIONS

- Death provision applies only to transferable permits
CDFW Proposed Details:
 - non-transferable permits can never be transferred - even upon death

- All traps must be tagged (on trap or buoy or both)(must be purchased annually); details to be worked out with LED
CDFW Proposed Details:
 - Traps shall be tagged w/ Dept. issued trap tags
 - 300 trap tags shall be issued once a year to each permittee before the start of the season
 - Program costs to be incorporated into permit fees, and tags will not be purchased separately

- Catastrophic gear loss provision; details to be worked out with LED (application would include requirement to report details of loss)(Information could be shared with permitted recovery projects)
CDFW Proposed Details:
 - The Department is considering defining catastrophic loss as the loss of 75 or more tags per permit. Catastrophic loss claims will be formally submitted to the Department for approval. LED will determine whether to approve or deny catastrophic loss claims. Claim information must include a detailed description of the circumstance that caused the loss, date of loss, number of traps lost along with their tag numbers, and location of lost traps (Latitude and Longitude coordinates).
 - Catastrophic loss tags_would be uniquely identifiable.

- Allow scuba equipment on board commercial vessels to retrieve lost traps or remove line from prop (not allowed to “fish” when on scuba)
CDFW Proposed Details:
 - Scuba gear already allowed per T14 122. Cannot be used for “take”
 - Provide clarification that no lobsters can be taken or possessed w/scuba gear, or any other underwater breathing apparatus (including hookah). However, this equipment can be used to locate and secure (retrieve) traps
 - Provide clarification that lobsters contained in a trap that has been secured using scuba gear, or any other underwater breathing apparatus equipment (including hookah), can be possessed after the trap has been serviced aboard the vessel

- More than one permittee may operate from a single vessel; each permittee whose traps are being pulled must be aboard
CDFW Proposed Details:
 - Dual Permittee on board – both permittees will be responsible for any violation found on vessel

- 7 day soak time using “Federal Rules” regarding weather
CDFW Proposed Details:
 - Adopt similar language to CFR Title 50 §660.230(3)
 - Traps must be attended at least once every 7 days. No specific weather exemption. If traps cannot be pulled due to weather, fishermen will be responsible for burden of proof (e.g. NOAA weather advisory, or other formal documentation from a government weather agency)

- Limit use of “note” to fish traps by other than permit holder. May open (and retain the lobsters within) or retrieve traps belonging to another lobster fisherman with a note and notification to DFW LED (details to be worked out with LED); may not bait or fish traps for another permittee

CDFW Proposed Details:

- Formalize the “note” process by requiring permittees to submit a waiver request to the Department. Waiver should be similar to the Dungeness Crab Waiver to Pull Traps
- Specific protocol and procedures for the Lobster Waiver to be established by LED
- CDFW will determine each waiver request on individual case basis. The information submitted in the waiver request will be used to determine the conditions. Lobsters may not be retained unless specified by CDFW as a condition on the waiver
- Department to be notified in advance
- Responsibility for violations is transferred to the individual permittee that has permission to pull
- Traps need to be either removed from water or wired open as specified by CDFW as a condition on the waiver.
- Establish provision to allow other fishermen targeting other species to recover lost or derelict gear (if found more than 9 days after the close of lobster season). This would be modeled after the existing provision for the recovery of up to 6 Dungeness crab traps.

- Allow commercial fishermen to start hauling their traps to sea before the season starts on the Monday before opening week (9 days before the commercial opener) and allow traps with doors open to remain in the water not more than 9 days after the close of the season

CDFW Proposed Details:

- Allow traps to be deployed (unbaited and doors wired open) 9 days before the commercial opener, and allow traps to remain in the water (unbaited and doors wired open) not more than 9 days after the close of the season. Traps must be out of the water no later than 9 day after the close of the season.
- “Bait day” remains the same

- Branding of floats allowed (details to be worked out with LED)

CDFW Proposed Details:

- This is already allowed under current regulations and so a regulatory change is not necessary to implement it. Therefore, the following clarification is provided as guidance to encourage effective compliance. Each buoy identifying a lobster trap would display the commercial fishing license identification number of the lobster operator permit holder followed by the letter P. The commercial fishing license number and the letter P would be at least one (1) inch in height and at least one-eighth (1/8) inch in width, and either branded on the buoy in a way that is clearly readable or painted in a color that contrasts with that of the buoy. All lobster permit holders would maintain lobster trap buoys in such a condition that buoy identifying numbers are clearly readable.

- **Additional Issue (Not addressed by the LAC):** Traps that are wired open and unbaited still need to be serviced every 96 hours per FG9004

CDFW Proposed Details:

- Traps that are wired open and unbaited would be exempt from the trap service requirement for a period up to 14 days. Traps that have not been serviced after 14 days will be considered

abandoned.

Prepared by CDFW February 20, 2015

Spiny Lobster Fishery Management Plan Lobster Advisory Committee Recreational Lobster Fishery Management Recommendations

The California Department of Fish and Wildlife (CDFW) recently met with the Lobster Advisory Committee (LAC) Recreational Representatives to discuss details regarding implementation of the proposed regulatory changes to the recreation lobster fishery recommended by the LAC. Input from CDFW Marine Region and Law Enforcement Division (LED) is provided in [Blue Font](#) below. This information is being disseminated to refine the details prior to the formal regulatory process which takes place after the Fisheries Management Plan (FMP) has been adopted in 2015. The LAC recommendations will be part of the Lobster FMP implementing regulations that will be formally introduced to the Fish and Game Commission (Commission) in mid-2015. It is expected that any new regulations adopted by the Commission would be implemented at the start of 2016-2017 lobster season.

Please Note: Proposals to prohibit or “ban” the use of conical hoop nets or to establish a seasonal limit were not part of the LAC’s consensus recommendations for the recreational fishery. CDFW will not be forwarding these proposals to the Commission as part of the LAC recommendations.

Full consensus was achieved by the Lobster Advisory Committee for the following:

Issue: Lobster caught by recreational fishermen is being illegally sold in the commercial market place. Requiring sport fishermen to clip or punch the center tail flap makes it possible for law enforcement to identify lobsters caught in a recreational fishery that end up in the market and take appropriate legal action. This proposal will give law enforcement a tool to address buyers and markets that purchase lobster from recreational fishermen.

Proposal: Recreationally caught lobsters are to be tail-clipped (removing the bottom half of the central tail flap) or tail-punched in the central tail flap (Australia requires a 10 mm minimum hole). Additional details will be worked out with LED (e.g. clipped when landed?).

LAC Action: The LAC achieved consensus on the tail-clipping proposal above.

CDFW Proposed Details:

- Allow both tail clipping and tail punching as an option: remove at least the bottom half of central tail fin or single hole punch the center tail fin with a hole no less than ¼ inch in diameter

- The tail must be clipped or punched at the same time the catch information is reported on the report card (T14 29.91(C): When the cardholder moves to another location code, or finishes fishing for the day, he or she must immediately record on the card the number of lobster kept from that location
-

Issue: Use of mechanized pullers has made it easier to rob from commercial traps.

Proposal: Restrict the use of mechanized pullers only to persons in possession of proof of disability/medical (Disabled Mechanized Hoop Net Puller Permit). This restriction would only pertain to power driven mechanized pullers and not hand operated davits with single pulley systems.

Clarification: This restriction only applies to individuals targeting or in possession of lobster, not persons solely targeting crab.

Proposed CDFW Disabled Mechanized Hoop Net Puller Permit Form:

The following conditions must be met to qualify for issuance of a Disabled Mechanized Hoop Net Puller Permit: “For the purposes of this permit a disability means a permanent loss, significant limitation, or diagnosed disease or disorder, which substantially impairs an individual’s ability to physically pull by hand and retrieve a hoop net for the purpose of targeting lobster.” A medical physician must sign the permit application form.

LAC Action: The LAC achieved consensus on the mechanical puller restriction proposal above.

Some members noted that the broad wording of the disability option could render the management measure ineffective and suggested that the LAC work with LED to ensure the new rule has “teeth” when it is applied.

CDFW Recommendation:

- Mechanized pullers should not be restricted beyond current legal use
 - The potential for illegal use given the circumstance is not viewed as a reasonable justification for restriction
 - Illegal use of mechanized pullers is not a commonly observed problem. LED reported one case over ten years ago, with four lobsters taken from a commercial trap using a mechanized puller
 - The creation of disabled hoop net puller permit creates an unnecessary burden on disabled persons through the potential added expense and time to obtain the necessary note from a physician in order to obtain a permit
-

Issue: The midnight opener creates a “rush” mentality that fuels conflicts between recreational users and poses a safety risk. The current lobster opener date and time can be difficult to understand (confusion regarding when the season actual “starts”) and constituents are having trouble following the law. CDFW has been asked to consider an alternate start time.

Proposal: Make the lobster opener 6:00 a.m. on Saturday instead of 12:01 a.m. on Saturday.

Key discussion points:

- New time is workable for LED
- Proposal improves safety conditions
- Regulatory change has no impact on the resource
- Commercial season dates would not change

LAC Action: The LAC achieved consensus on the lobster opener proposal above. The group acknowledged concerns regarding the economic impact this proposal may have on some dive charters.

LAC recommendation is for a 6:00 a.m. Saturday start time (lobster opener)

CDFW Recommendation:

- Proposed 6:00 am Saturday start time is easier to facilitate enforcement patrols
 - Promotes a safer environment for both boaters and divers on opening day
 - Reduces the “rush” mentality which fuels negative diver/hoop netter interactions at harbors and jetties
-

Issue: Marking hoop net floats will improve accountability and safety among recreational fishermen, and may help reduce illegal commercialization.

Proposal: Hoop net floats should be marked with unique ID (DL, Go ID, etc. — details to be worked out with LED).

LAC Action: The LAC achieved consensus on the marked hoop net proposal above.

CDFW Proposed Details:

- Buoy identification should be required with GO ID number. This number shall be legible, but there will be no size or color specification. Go ID number helps maintain fishermen’s confidentiality, and minimizes the risk of identity theft
 - LED can easily verify this number in the field as it can be cross referenced with the fishing license
-

Issue: Spear fisherman have been harassed or cited for carrying a spear gun while in the pursuit of lobster. Constituents have asked for clarity on the definition of a “hooked” device.

Proposal: Keep change simple. Ensure regulatory language focuses on how lobster can be taken (i.e. “skin and scuba divers may take lobsters by hand only”) and not how it cannot be taken; remove “hooked device” term from current regulations. The proposal allows for possession of a spear gun or pole spear underwater while hunting lobsters. Misuse of this equipment to take lobster (lobster can only be taken by hand) would remain illegal.

LAC Action: The LAC achieved consensus on the hooked device proposal above.

CDFW Recommendation:

- Remove “hooked device” for clarification
-

Memorandum

2015 MAY 29 PM 2:55

Date: May 22, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Briefing Binder Submission for the June 10-11 Fish and Game Commission Meeting Regarding the Spiny Lobster Fishery Management Plan**

Background

An extensive public scoping process was used by the Department of Fish and Wildlife (Department) to develop implementing regulations for a Spiny Lobster Fishery Management Plan (FMP). The Department established the Lobster Advisory Committee (LAC) as a formal stakeholder group who met over a period of two years to make management recommendations, including regulation changes. The LAC consisted of seated representatives from a broad spectrum of constituencies. Through consensus, the LAC approved a management framework that established proposed mechanisms to promote an orderly fishery while assuring sustainability and also taking into account the economic implications of that same framework. The Department supports the efforts of the LAC, and has made every effort to recommend FMP regulations that are consistent with the LAC consensus-based proposals. The Department and LAC regulatory recommendations were transmitted to the Commission for consideration at its April 8th, 2015 meeting.

The Department is requesting direction from the Commission on options to include in a regulatory package that is associated with the FMP. The enclosed table summarizes the LAC and Department commercial and recreation spiny lobster regulatory recommendations. This table provides a summary of the recommendations transmitted to the Commission at its April 8th, 2015 meeting. The Department will also be requesting direction from the Commission on four additional Department recommendations for the commercial spiny lobster fishery that are included in the table.

The additional recommendations include:

1. Require each lobster operator permit holder to report the number and location of traps lost at the end of each season. This will allow the Department to estimate gear loss for the fishery and help facilitate recovery efforts.

Sonke Mastrup, Executive Director
Fish and Game Commission
May 22, 2015
Page 2

2. Extend the lobster operator permit death provision transfer period from one to two years. This is recommended by the Department's License and Revenue Branch (LRB) to provide families or estates an extra year to transfer a permit.
3. Add a prohibition on the transfer of lobster operator permits to include pending violation(s). Current regulations allow permits to be transferred when a permit holder has pending violations. This recommendation was added at the request of LRB and Law Enforcement Division to prevent transfers from occurring before results of the pending violation(s) are known.
4. Require a Department application for the transfer of lobster operator permits.

If you have any questions or need additional information, please contact Dr. Craig Shuman, Regional Manager of the Marine Region, by telephone at (805) 568-0216 or by email at craig.shuman@wildlife.ca.gov.

Summary Table of the Lobster Advisory Committee and Department of Fish and Wildlife spiny lobster regulatory recommendations

Background: The Department of Fish and Wildlife (Department) is requesting direction from the Fish and Game Commission (Commission) on options to include in the regulatory package that is associated with the Spiny Lobster Fishery Management Plan. This table provides a summary of the Lobster Advisory Committee (LAC) and Department commercial and recreation spiny lobster regulatory recommendations transmitted to the Commission at its April 8th, 2015 meeting. The table also includes additional Department recommendations not addressed by the LAC.

LAC Consensus and Department Recommended Lobster Regulatory Changes	
1	Regulations to implement the lobster Fishery Management Plan (FMP). <i>Identifies the purpose and scope, harvest control rules, management responses, and lists definitions specific to the FMP.</i>
Recreational Recommendations	
Change Summary	
Purpose	
2	Require the hole-punching or fin-clipping of all retained lobsters. <i>To reduce illegal commercialization of sport caught lobsters.</i>
3	Change recreational season opener from 12:01 am to 6 a.m. on Saturday. <i>To increase safety during the season opener.</i>
4	Require hoop net operators to mark hoop net floats with GO-ID numbers. <i>Allows Enforcement to easily identify the owner of a hoop net.</i>
5	Clarify methods of take for crustaceans. <i>Clarifies that spear gear can be possessed by divers while targeting or in possession of lobsters so long as the gear is not used in the taking of lobster.</i>
Commercial Recommendations	
Change Summary	
Purpose	
6	Trap limit of 300 traps per permit with the ability to purchase a second permit for a maximum 600 traps. <i>To improve the commercial fishery and create a more orderly fishery.</i>
7	Add fees and forms associated with trap tag program. <i>Required to add new fees and other administrative requirements for the trap tag program.</i>
8	Catastrophic trap tag loss provision. Catastrophic loss defined as the loss of 75 or more tags per permit. <i>To allow for the replacement of tags lost over a season.</i>
9	Clarify use and possession of SCUBA equipment from commercial lobster vessels. <i>Amended for clarification purposes.</i>
10	More than one permittee may operate from single vessel. <i>Added for clarification purposes. Each permittee whose traps are being pulled must be aboard and both permittees will be responsible for any violation found on vessel.</i>
11	Require traps to be serviced at least every 7 days (currently 4 days). <i>Proposed as part of the trap limit proposal.</i>
12	Waiver requirement for allowing lobster operator permit holders to service another fishermen's traps. <i>To formalize the process to meet enforcement and fishermen's needs.</i>
13	Add a provision to allow fishermen to recover up to 6 lost traps. <i>To allow for the retrieval of lost gear.</i>
14	Extend the period (from 6 to 9 days) for deploying and retrieving traps before and after the season. <i>Proposed as part of the trap limit proposal.</i>
15	Allow branding of trap buoys. No regulatory change needed: Already covered by existing regulations and will be clarified.

Summary Table of the Lobster Advisory Committee and Department of Fish and Wildlife spiny lobster regulatory recommendations

Additional Department Recommendations Not Addressed by the LAC		
	Change Summary	Purpose
16	Define abandoned traps. Traps considered abandoned if not retrieved 14 days after the season ends.	To define when a trap is considered abandoned.
17	Improving fishery dependent data collection.	Department recommends modifying lobster logbooks and landing receipts to gather essential fishery information to better manage the fisheries.
18	Prohibit the transfer of a lobster operator permit when there are pending violation(s).	Added as an enforcement need.
19	Extend the lobster operator permit death provision transfer period from 1 to 2 years.	Added at the request of the Departments Licenses and Revenue Branch to allow more time to transfer a permit.
20	Require an application for the transfer of lobster operator permits.	Require an application to transfer a permit. Add appeal requirements when a transfer is denied. Add criteria for transfer of permit under a tag system.
21	Reporting of commercial trap loss.	At the end of each season, require commercial fishermen to report the number and location of traps lost over the season.
LAC Consensus Recommendations Not Supported by the Department		
	Change Summary	Rationale for not Supporting
22	Restrict the recreational use of mechanized pullers to only disabled fishermen.	Proposed by the LAC due to concerns of the illegal use of mechanized pullers to poach commercial traps. Law Enforcement Division indicates that illegal use of mechanized pullers is not a commonly observed problem. Proposed regulation would penalize the lawful anglers using mechanical pullers due to the very few anglers that may abuse the use of mechanized pullers.
23	Three-year phase-in trap limit approach.	The Department does not support this recommendation as the projected timeline for the proposed implementing regulations is later than anticipated by the LAC. This gives industry more time to prepare for the proposed new trap limit. In addition, it will be difficult for the Department to implement and administer the program as proposed by the LAC.

Appendix X: Cable-CDFW Model Report

The version of the Cable-CDFW Model Report that was provided to the independent scientific review committee is available at <https://www.wildlife.ca.gov/Conservation/Marine/Lobster-FMP>. CDFW is working to revise the report in response to committee comments and will post a fully revised report before the February, 2016 Fish and Game Commission meeting.

FMP Contents

- Meets MLMA requirements for FMPs
- Natural history and history of the fisheries
- Harvest Control Rule
- Essential fisheries information and research objectives

Rafael Rivera

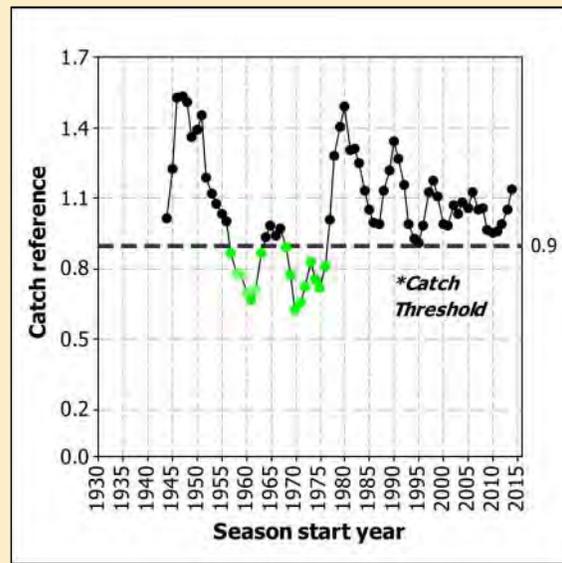

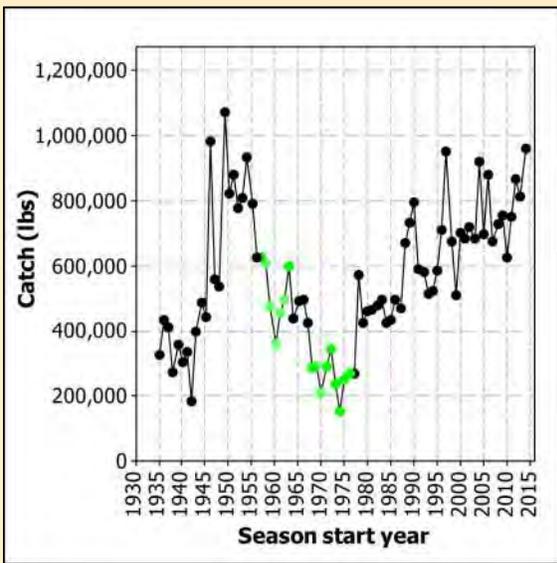

Harvest Control Rule (HCR) Components

- **3 Reference Points:** gauge status of the stock and commercial fishery
- **Matrix:** links reference point status with interpretation of stock/fishery status and possible management response
- **Toolbox:** 8 management tools available

HCR Reference Points: Catch

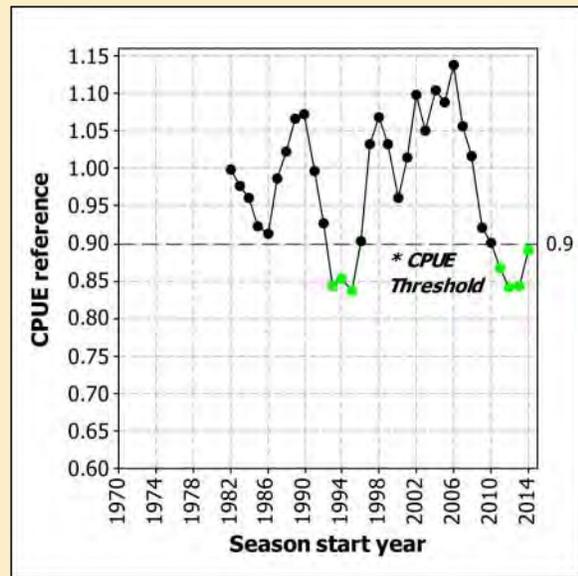

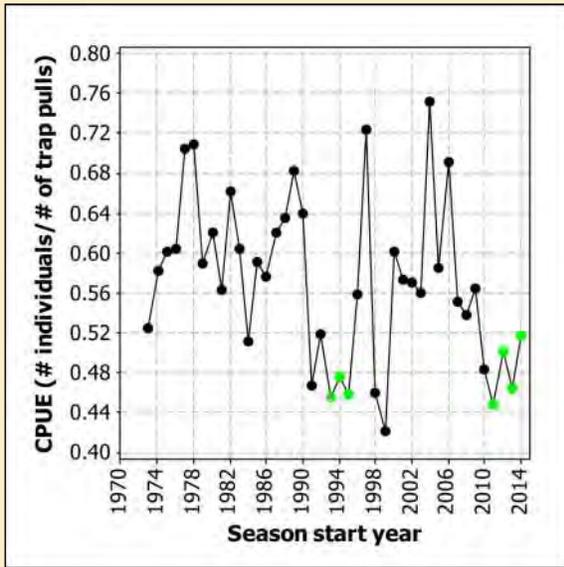

- Moving average
- $\text{Catch Ref} = (\text{avg last 3 seasons}) / (\text{avg last 10 seasons})$
- Threshold = 0.9

HCR Reference Points: Catch per Unit Effort

- Moving average
- $CPUE\ Ref = (avg\ last\ 3\ seasons) / (avg\ last\ 10\ seasons)$
- Threshold 0.9

HCR Reference Points: Spawning Potential Ratio (SPR)

- Measure of reproductive potential
= (eggs from current stock) / (eggs from unfished stock)
- Calculated by the Cable-CDFW model
- Threshold = average SPR 2000-01 to 2007-08 seasons
- MPA benefit to lobster reproductive potential

HCR Matrix

Scenario	Reference Point			Interpretation/ possible causes	Suggested management response sequence
	CATCH	CPUE	SPR		
6	↓	↑	↓	<ul style="list-style-type: none"> • Stock overfished • Possible catchability increase (effort creep due to technology, etc.) 	<ol style="list-style-type: none"> Investigate underlying causes Confirm/monitor CPUE (misreporting?) Confirm SPR trends and model inputs If action is needed, implement one or more of the eight regulatory options in the control rule toolbox as appropriate

HCR Management Toolbox

- Change commercial trap limit
- Change recreational bag limit
- Total allowable catch (TAC)
- District closures
- Change season length
- Change minimum size
- Impose maximum size
- Sex-selective fishery

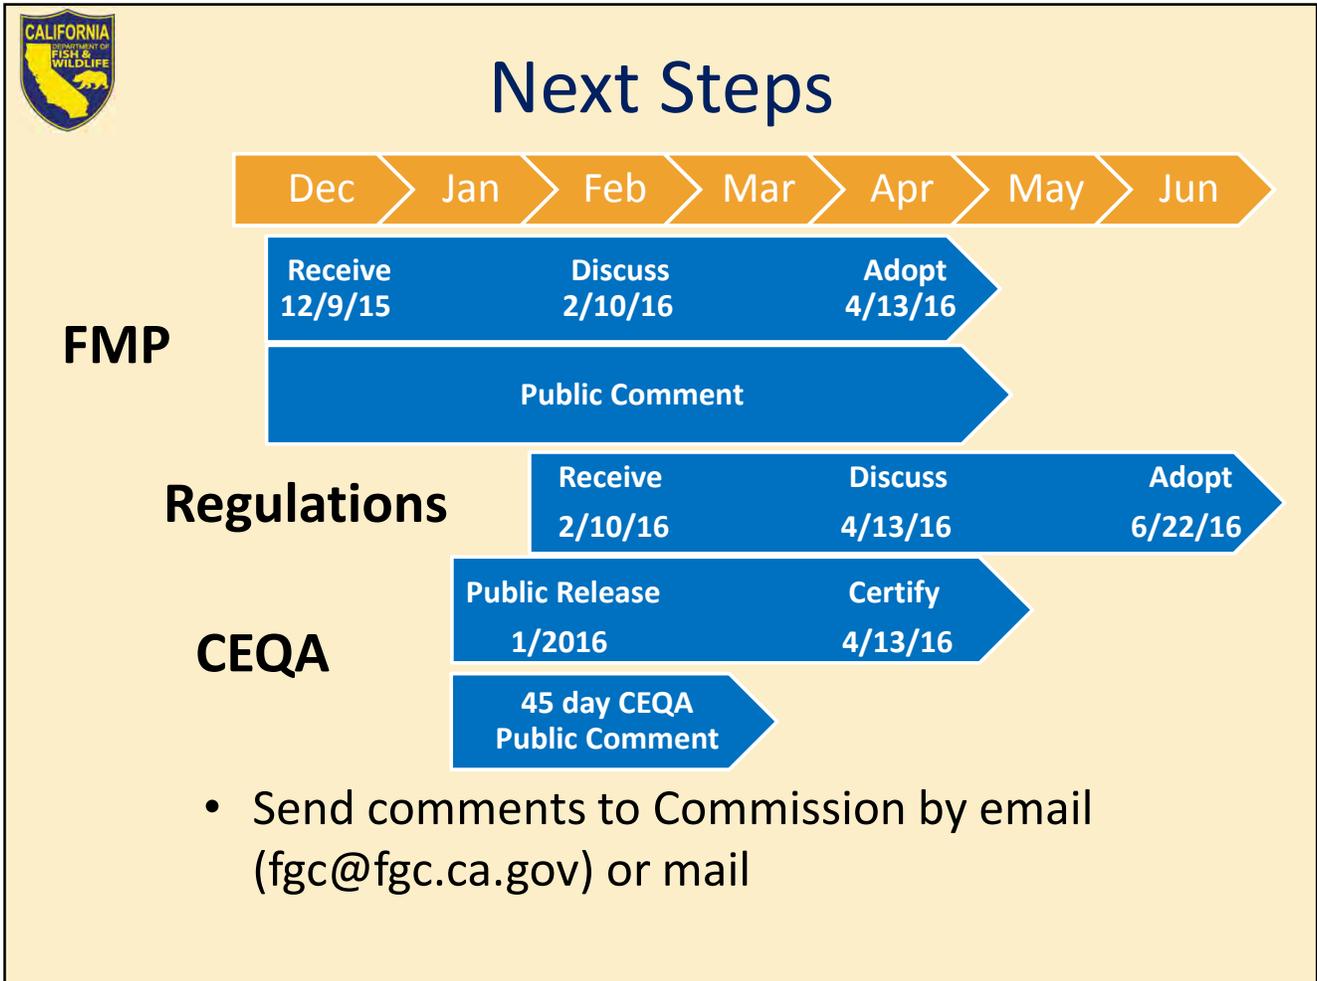

Peer Review

Focus	Outcome
Cable-CDFW model	Changed lobster age-growth relationship Recognition of other modeling options
Reference points	Increased sensitivity of catch & CPUE reference points (0.8 to 0.9)
MPAs	Look to increase sophistication of MPA dynamics in model Monitor MPA effects on lobster relative to “credit” given by model
Management as a single stock	Expanded discussion of regional differences within the stock Essential fisheries information research priority

MARINE LIFE PROTECTION ACT

Master Plan for Marine Protected Areas

Updated Draft

California Fish and Game Commission Meeting

December 9, 2015 • San Diego, CA

Adam Frimodig

California Department of Fish and Wildlife

Presentation Outline

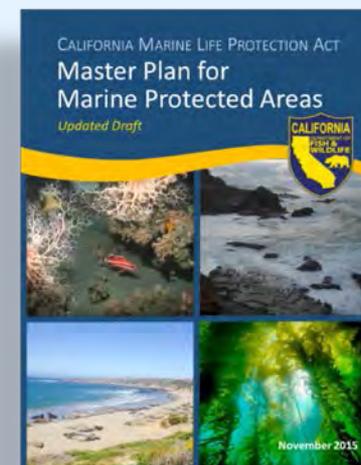

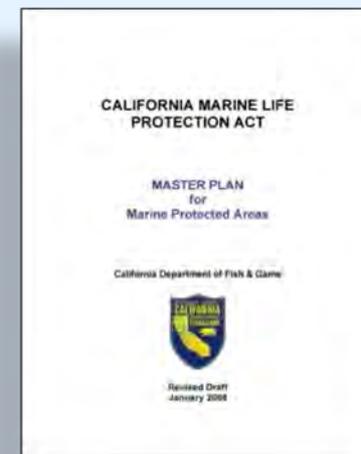

1. Background
2. Purpose and Approach
3. Updated Master Plan Components
4. Timeline

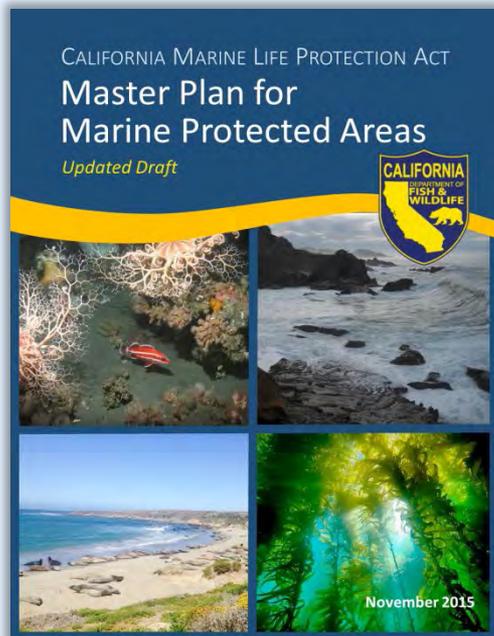

Background

- CDFW required to develop, Commission to adopt
- 2005: framework developed
- 2008: draft plan adopted
- 2013-15: visioning to update plan

Purpose and Approach

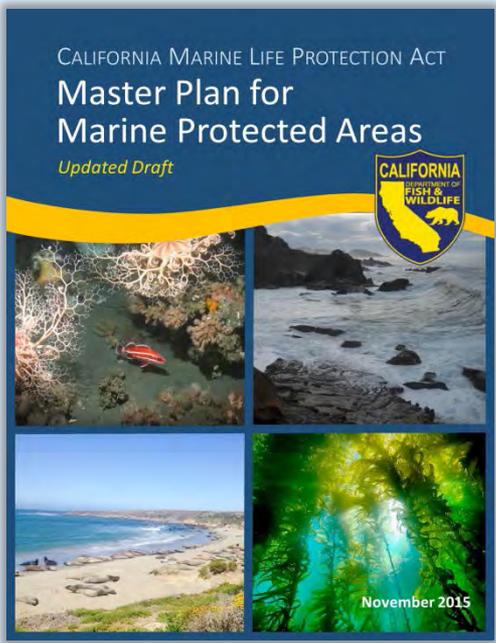

- Sets forward looking, programmatic guidance
- Shifts focus from planning to managing a statewide network
- Align priorities with state partners

Key Components

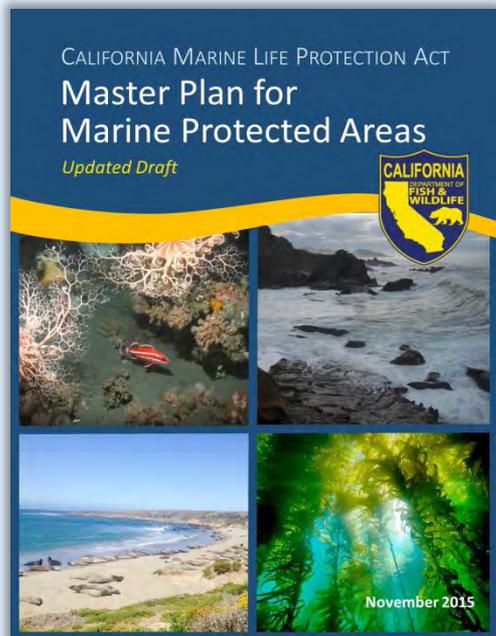

- Operationalizes the Marine Life Protection Program
- Clearly describes governance and partnerships
 - Including processes for collaboration
- Provides network guidance and emphasizes adaptive management

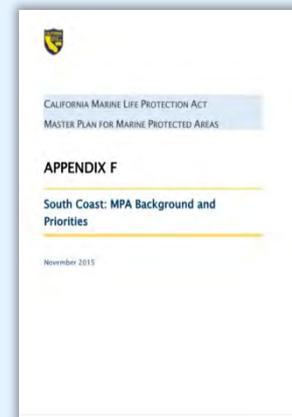

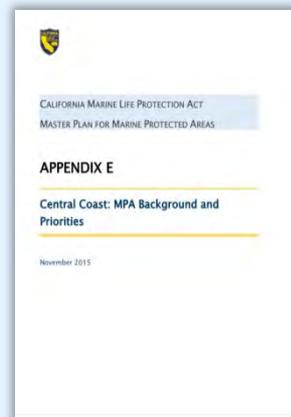

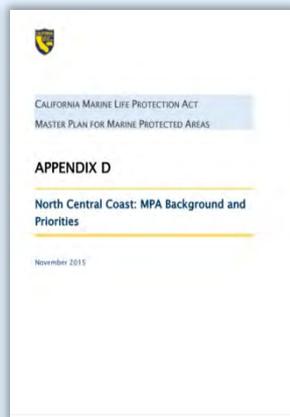

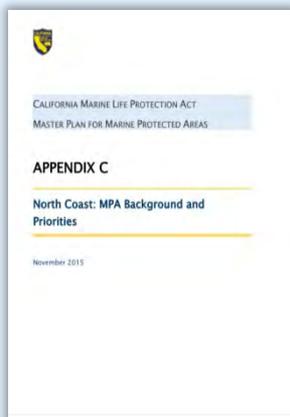

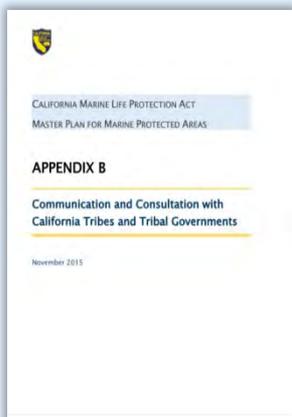

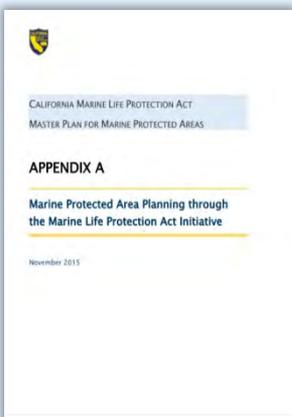

Key Components, Continued

- 10-year formal management review
 - Exceptions may be considered
- Statewide MPA monitoring program
- Includes historical and unique regional considerations

Timeline

- **December 2013 – present:** updates at MRC and FGC meetings
- **February 6, 2015:** notified Tribal governments
- **September 25, 2015:** released preliminary draft to Tribes upon request
- **December 2015:** draft released to Commission
- **February 2016:** potential discussion hearing
- **April 2016:** potential Commission adoption

Questions More Information

Memorandum

Date: November 13, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting**
Re: Receipt of the Draft Updated Master Plan for Marine Protected Areas, Marine Life Protection Act.

The Department of Fish and Wildlife (Department) is pleased to transmit the draft updated Master Plan for Marine Protected Areas (updated Master Plan for MPAs) to the Commission for receipt at its December meeting, which will begin the public comment period. A discussion hearing is anticipated at the Commission's February 2016 meeting, followed by potential adoption at the April 2016 meeting.

The Marine Life Protection Act (MLPA) requires the Department to develop, and the Commission to adopt, a master plan that guides the implementation of a Marine Life Protection Program to adopt and manage California's MPAs to the extent possible as a statewide network. The previous draft Master Plan for MPAs, adopted by the Commission in January 2008, focused on designing and siting MPAs through a regional approach. The updated plan provides statewide guidance for MPA management to meet the goals of the MLPA, including an MPA monitoring program that draws from existing regional components to gather sufficient information and informs a ten-year review cycle to evaluate MPA network efficacy and adaptive management.

The updated Master Plan for MPAs is the culmination of over two years of work and represents a close collaboration with the Commission, Ocean Protection Council, and Ocean Science Trust. Over the course of its development, the Department has regularly updated the Commission and Marine Resources Committee, and solicited open communications with California Tribal governments and tribes, including releasing a preliminary draft to tribes upon request in September 2015.

If you have any questions regarding this item, please contact Dr. Craig Shuman, Regional Manager, Marine Region at (805) 568-1246. The public notice for this document should identify Environmental Scientist, Adam Frimodig as the Department's point of contact. He can be reached at (707) 445-5397 or via email at Adam.Frimodig@wildlife.ca.gov.

Executive Summary

PURPOSE AND APPROACH

California's coastal ocean waters are among the most biologically productive in the world, and California's living marine resources are vital to the state's coastal economy and provide numerous ecosystem benefits. In response to threats to marine ecosystems from human impacts and natural fluctuations, California has taken a proactive approach by managing marine resources for long-term sustainability. Since the 1990s, California has a history of numerous pieces of legislation, programs, and plans that chart a course for ocean management, including through marine protected areas (MPAs). In 1999, California Legislature passed the Marine Life Protection Act (MLPA) requiring California to reevaluate all existing MPAs, which were at that time largely ineffective and disconnected, and design new MPAs that together function as an interconnected statewide network. The goals of the MLPA are:

1. Protect the natural diversity and abundance of marine life, and the structure, function and integrity of marine ecosystems.
2. Help sustain, conserve, and protect marine life populations, including those of economic value, and rebuild those that are depleted.
3. Improve recreational, educational, and study opportunities provided by marine ecosystems that are subject to minimal human disturbance, and manage these uses in a manner consistent with protecting biodiversity.
4. Protect marine natural heritage, including protection of representative and unique marine life habitats in California waters for their intrinsic values.
5. Ensure California's MPAs have clearly defined objectives, effective management measures, and adequate enforcement and are based on sound scientific guidelines.
6. Ensure the state's MPAs are designed and managed, to the extent possible, as a network.

The MLPA required the California Department of Fish and Wildlife (CDFW) to develop, and the California Fish and Game Commission (Commission) to adopt, a master plan that guides the implementation of the Marine Life Protection Program (MLPP) to redesign the state's MPA network. The MLPP includes all state MPA governance and management mechanisms and institutions as well as California's MPA network itself. A master plan framework was developed in 2005, and the Commission formally adopted the draft *California Marine Life Protection Act Master Plan for Marine Protected Areas* in 2008 following the implementation of the Central Coast MPAs. The 2008 Master Plan guided the three following regional siting and design processes, whereas this 2015 Master Plan sets a statewide foundation for MPA management moving forward to meet the goals of the MLPA.

The MPA network depends on the participation and support of numerous entities that provide specialized knowledge, ensure cost-effective management of the MPA network, and ensure participation from a wide array of stakeholders. Partners in MPA management have signed several memoranda of understanding (MOUs) committing to collaborative planning and management of the MPA network, including an updated 2015 MOU between 15 government and non-governmental entities. The Commission is the primary regulatory decision-making authority for California's MPA network, CDFW is the primary managing agency and implements and enforces regulations set by the Commission and provides scientific expertise, and the California Ocean Protection Council (OPC) is responsible for the direction of policy of the state's MPAs. The MLPP also seeks input from bodies including California Tribes and Tribal governments, an MPA Statewide Leadership Team (MSLT) that is

comprised of agencies and partners that have significant authority related to MPAs or marine sanctuaries, and partners in the California Collaborative Approach.

MPA NETWORK DESIGN AND SITING PROCESS

The six goals of the MLPA recognize the importance of protecting marine resources for various purposes, and therefore it is important to use multiple types of marine managed areas (MMAs) to achieve these distinct goals. MPAs are a subset of MMAs and include three MPA classifications (State Marine Reserve [SMR], State Marine Conservation Area [SMCA], and State Marine Park [SMP]) and one MMA classification (State Marine Recreational Management Area [SMRMA]). Special Closures are not MMAs, but also contribute to the goals of the MLPA. Each of these classifications includes varying levels and types of protection such as allowed take, scientific research, and recreational and commercial harvest.

The MLPA Initiative was a science-based and stakeholder-driven MPA planning process that utilized the best readily available science in a comprehensive, highly collaborative, and transparent process to establish MPAs. The MLPA Initiative directed and informed four iterative regional siting and design processes (Central Coast, North Central Coast, South Coast, and North Coast, in chronological order) between 2004 and 2012. Three planning bodies – the Blue Ribbon Task Force (BRTF), Science Advisory Team (SAT), and Stakeholder Advisory Group – supported the design and siting of each region. The overall aim of the process was for the BRTF to select a set of alternative MPA proposals, including a preferred alternative, for each region and for the Commission to adopt one of the alternatives.

Completed in 2012, California's MPA network generally reflects the integration of the science and science-based MPA design guidelines from the MLPA, the 2008 Master Plan, and SAT guidance. For example, compared to California's 63 MPAs in 1999, the existing network of 124 MPAs and 15 special closures represents increased proportion of state waters protected, number and size of all MPA types, and representation and replication of marine habitats within MPAs.

MANAGEMENT

The MLPA emphasizes the importance of effective management for California's MPAs, which consists of strong oversight and a process for implementing the legal mandate; comprehensive management planning and permitting; effective enforcement, research, monitoring, evaluation, and outreach; and strong social capital and long-term sustainable financing that is enhanced by partnerships. Another key component of management, discussed later, is a process for adaptive management. To manage California's MPA network, the MLPP is focusing on a variety of management activities related to the components of effective management.

Outreach and Education

Educating the public about the MPA network is one of the MLPP goals identified in the MLPA. CDFW is committed to work with partners throughout the state to build public awareness and understanding of California's MPA network, including the identification of priorities, approaches, and coordinated efforts. The dissemination of MPA based regulatory, interpretive, and educational materials can improve outreach efforts statewide by reaching out to California's diverse public in a consistent, cohesive and multi-faceted outreach approach.

Enforcement

The MLPA emphasizes the importance of adequate enforcement as a goal of the MLPP, and identifies CDFW as the primary agency responsible for MPA enforcement. With the key intent of ensuring compliance with regulations, the objectives of enforcement revolve around operational ability (e.g., identify of areas of high priority, hire personnel, etc.); cooperative efforts (e.g., coordinate with allied agencies, utilize judicial system, etc.); and public awareness, outreach, and education (e.g., establish an outreach program, hold public forums, etc.).

CDFW is responsible for enforcing marine resource management laws and regulations, including MPAs, over a vast area spanning California's coastline out to three nautical miles, and will therefore emphasize patrol of priority areas. CDFW also enforces or shares jurisdiction for some federal laws and regulations. Given CDFW's broad enforcement mandates, additional personnel and assets will be needed to effectively enforce the entire MPA network.

Regional MPA Background and Priorities Documents

To help achieve the management goals of the MLPA, Regional MPA Background and Priorities documents provide historical planning information and regional MPA design considerations and priorities moving forward; which together provide important context to base informed statewide MPA management decisions upon. They are not meant to contain specific details for management protocols and methodologies; and instead are intended as living documents that are readily accessible for reference and adaptive management, and serve as a logical starting place for guiding regionally-based activities. Each Regional MPA Background and Priorities document includes unique regional features and considerations taken into account when designing the MPAs, regional goals and objectives, summaries of regional MPAs, and regional plans for scientific and enforcement considerations.

Aligning MPAs and Other Marine Resource Management Efforts

Collaborative efforts will be crucial for taking an ecosystem-based approach in which managers across agencies and jurisdictions recognize the numerous interactions within an ecosystem, including humans, instead of focusing on a specific issue, species, or ecosystem service. The MLPA is aligning or could align with management of fisheries, water quality, climate change, marine debris, invasive species, and other existing and emerging marine management efforts. The effort to align MPA management with other marine resource management efforts is largely unprecedented and may lead to lessons learned regarding cooperative management.

ADAPTIVE MANAGEMENT

Adaptive Management and Management Objectives of the MLPP

The MLPP is coordinating with partners to develop a process of adaptive management. Adaptive management, required by the MLPA, is a process that facilitates learning from program actions helps evaluate whether the MPA network is making progress toward achieving the six goals of the MLPA. Adaptive management will help improve management and provide a way to broadly share information about the effectiveness of the MPA network.

To inform the adaptive management process, the MLPP established a formal 10-year cycle of review for California's MPA network. The 10-year reviews will serve to evaluate network efficacy and for the Commission to determine whether changes in management are warranted. This timescale was chosen based on recent scientific findings on the time scales needed to demonstrate ecological change,

lessons drawn from regional MPA implementation, and administrative feasibility. The formal 10-year management review will emphasize ecological, socioeconomic, and governance aspects of the network, including scientific assessment of MPA monitoring results.

The MLPP has defined six management objectives, constructed from the MLPA goals, that will determine whether the mandates of the MLPA are being met and thus help guide adaptive management. The management objectives include themes such as protecting and improving native marine life and ensuring MPA functioning as a network, while allowing sustainable opportunities for human use. These management objectives may be modified as part of the adaptive management process or in response to changing ocean conditions and threats.

Statewide Monitoring Program

The need for long-term monitoring is described in the MLPA, requiring monitoring, research, and evaluation at selected sites to facilitate adaptive management and ensure that the MPA network meets its goals. Monitoring seeks to understand ecosystem condition and trends and to scientifically evaluate MPA design and to inform adaptive management. As such, long-term monitoring will form an important component of the formal 10-year management reviews.

Effective monitoring requires a partnership-based approach that leverages existing capacity across the state. CDFW partnered with OST to develop a scientifically rigorous statewide MPA monitoring framework, in the form of regional MPA monitoring plans and a statewide framework diagram. This approach was adopted by the Commission and to date, the framework has been used primarily to guide baseline monitoring efforts and provide a foundation for regional monitoring plans. Moving forward, OST, in partnership with OPC and CDFW, is leading a process to develop a statewide MPA monitoring program based on the statewide monitoring framework and regional monitoring plans. This will be coordinated with the MSLT. Statewide MPA monitoring is composed of three interconnected components; the first two components satisfy the requirements of the MLPA, and thus take precedence over the third component, which goes beyond the scope of the MLPA.

1. **Network Scientific Evaluation Questions and Metrics:** CDFW, OST, and partners are committed to developing scientific network evaluation questions and metrics to be integrated in a statewide MPA monitoring plan. The regional MPA monitoring plans provide a starting point for developing network evaluation questions and metrics.
2. **Regional MPA Monitoring:** The state has launched a two-phase approach to MPA monitoring in each region: 1) baseline monitoring and 2) long-term monitoring. Data and information collected during baseline monitoring in the first five years of implementation describes the benchmark state from which to measure MPA performance during long-term monitoring. To date, regional monitoring plans for three regions have been developed and baseline monitoring has begun in all four regions. Long-term monitoring will be implemented at selected sites for selected metrics in each region, with the built-in ability to look at ecosystem conditions and trends at a statewide network scale.
3. **Beyond the MLPA:** While long-term MPA network monitoring is primarily informed by the requirements of the MLPA, it can also provide useful information for other aspects of California's ocean resource management, such as fisheries, climate change, marine debris, and invasive species.

To supplement monitoring, cutting-edge research and development can realize new possibilities for MPA monitoring and adaptive management. Research consists of scientific exploration to address relevant questions that are outside the goals and objectives of long-term monitoring. Development can

advance scientific knowledge and technological capacity, such as through the development of new methods or technical solutions for data collection.

Adaptive Management Process

The MLPP has defined a process for adaptive management, described below.

1. **Identify and Update Objectives:** The MLPP will select statewide objectives that work toward the goals of the MLPA and other relevant policy and statutes. Baseline monitoring takes place based on the statewide goals and objectives.
2. **Long-Term Monitoring:** Following baseline monitoring and an associated five-year review, long-term monitoring takes place. Concurrently, additional information may be collected to inform interim evaluation and assessment activities between 10-year reviews.
3. **10-Year Management Review:** Scientific evaluation, public scoping meetings, panel discussions, and other forums will draw on monitoring information to shed light on the status, function, and possible changes to the network for the Commission to consider at the 10-year reviews. Findings from the 10-year reviews may feed back into adaptive management of the objectives or the approach to long-term monitoring.

Throughout the entire adaptive management process, there will be the need for learning, communicating lessons, and developing and carrying out targeted research and development projects that can support monitoring and inform adaptive management.

PROGRAM PARTNERS AND OPERATIONS

The MLPP depends on collaboration to leverage existing human and financial resources, and CDFW and its partners are committed to working together to identify ways to continue to achieve the goals of the state in an efficient and effective way. The MLPP can work with partners to identify opportunities that consider jurisdictions and mandates to leverage core competencies related to MPA management. Based on their strengths and abilities, partners from different sectors will also have different roles relating to identifying, assessing, and securing funding sources. OPC, CDFW, and partners developed and updated a list of potential funding sources for the 2015 Master Plan, and will continually reevaluate existing and new potential funding sources to secure a diversified funding portfolio that ensures long-term financial sustainability.

SETTING A PATH FORWARD

To operationalize the elements of the 2015 Master Plan, the MLPP will implement a number of steps relating to its core MPA management responsibilities. Throughout the steps outlined below, the overall goal is statewide coordination to achieve effective adaptive management of California's MPA network to meet the goals and objectives of the MLPA.

- **Monitoring, Research, and Evaluation:** Select statewide metrics and evaluation questions, update and adapt regional monitoring plans as necessary, report results, link MPA and other monitoring efforts, and identify and support key MPA related research needs
- **Enforcement:** Identify tools to support enforcement
- **Partnership Coordination:** Build partnerships
- **Outreach and Education:** Prioritize outreach efforts
- **Identification of Long-Term Funding Sources:** Enhance capacity for CDFW's MPA project and prioritize potential funding sources

CHAPTER 1

Purpose and Approach

California's coastal ocean waters are among the most biologically productive in the world, enriched by seasonally persistent upwelling zones associated with coastal currents such as the California Current. California's living marine resources are vital to the state's coastal economy and support a variety of economic sectors, including commercial and recreational fisheries, tourism, and non-consumptive recreation that together contribute tens of billions of dollars to California's gross domestic product.¹ These sectors provide services and benefits that enhance human well-being, including healthy sources of high-quality protein, recreational experiences, and employment and revenue in coastal communities. California's coastal ocean waters not only provide natural resources, but also spectacular scenery and aesthetic values enjoyed by Californians and visitors alike.

In the past century, humans and natural fluctuations have increased threats to marine ecosystems, which affect ocean habitats from the local to global scales. In response to these threats, California has set itself apart as a leader by taking a proactive approach to managing marine resources for long-term sustainability, thereby helping to ensure their existence for future generations. For example, the California Ocean Resources Management Act (CORMA), passed in 1990,² created an Ocean Resources Task Force³ to prepare a report regarding existing ocean resources management activities and impacts.⁴ In 1997, the California Resources Agency (now called the California Natural Resources Agency [CNRA]) released *California's Ocean Resources: An Agenda for the Future* (Ocean Agenda)⁵. The Ocean Agenda recommended the state evaluate its array of over 20 coastal managed area classifications to develop a more effective and less complicated statewide system (Baird et al. 1999). Between 1998 and 2000, the California Legislature passed the Marine Life Management Act (MLMA, 1998),⁶ the Marine Life Protection Act (MLPA, 1999),⁷ and the Marine Managed Areas Improvement Act (MMAIA, 2000).⁸ These foundational pieces of legislation have charted the course for ocean management, specifically regarding sustainable fisheries management and ecosystem conservation and protection, in California. In addition, the California Ocean Resources Stewardship Act (CORSAs), and the California Ocean Protection Act (COPA) were integral in paving the way for the partnership-based approach to managing California's marine resources. These pieces of legislation all set the stage for the Marine Life Protection Act (MLPA), from which this Master Plan originates. Table 1 provides a list and descriptions of relevant legislation, programs, and plans enacted in California since 1990 (see Appendix A, Section 2 for more historical information on California's marine management policies and regulations).

Table 1. Summary of Recent Ocean and Coastal State Legislation, Programs, and Plans in California

Policy and Year	Overview
California Ocean Resources Management Act - 1990	Declares state policy for ocean resource planning and management ⁹
Marine Life Management Act - 1998	Requires ecosystem-based management of ocean fisheries and establishes a process for such management ¹⁰
Marine Life Protection Act - 1999	Requires California to reevaluate all existing MPAs and design new MPAs that together function as a statewide network; ¹¹ amended by the legislature in 2013 to grant the California Ocean Protection Council (OPC) the responsibility for the direction of policy of MPAs ¹²
Marine Managed Areas Improvement Act - 2000	Establishes a new, simplified classification system for state marine managed areas (MMAs) ^{13,14}
California Ocean Resources Stewardship Act - 2000	Aims to improve the coordination of ocean resource management science in California ¹⁵
Coastal Non-Point Source Pollution Program - 2000	Provides a single unified, coordinated statewide approach to dealing with non-point source pollution ¹⁶
California Ocean Protection Act - 2004	Improves integration and coordination of the state's efforts to protect and conserve ocean resources ¹⁷
California's Ocean Action Plan - 2004	Guides the state's future resources protection and management efforts and seeks to maintain California's role as a national leader in ocean affairs ¹⁸
West Coast Governors' Agreement on Ocean Health - 2006	Constitutes a proactive regional collaboration, which protects and manages the ocean and coastal resources along the entire West Coast ¹⁹

Recognizing the importance of California's diverse marine species and ecosystems to public health and well-being, ecological health, and ocean-dependent industries, the California Legislature passed the MLPA in 1999. Prior to the MLPA and the ensuing MPA design and siting process, California's existing MPAs were largely ineffective and disconnected rather than a system designed to function as an interconnected network that could enhance conservation returns for Californians.

The MLPA requires the California Department of Fish and Game (now California Department of Fish and Wildlife [CDFW]) to develop, and the California Fish and Game Commission (Commission) to

adopt, a master plan that guides the implementation of a Marine Life Protection Program (MLPP)²⁰ to address the siting of new MPAs and modifications of existing MPAs - thereby redesigning the state's MPA network.²¹ To improve the design and management of California's MPAs, the MLPA guides the Commission to adopt the MLPP²². The MLPP has statewide goals that focus on protecting, sustaining, and conserving marine life; improving socioeconomic activities and marine heritage provided by marine ecosystems; and ensuring that the state's MPAs are designed and managed to the extent possible as a network and have clearly defined objectives, are based on scientific guidelines, and have effective management measures and enforcement.²³ Through extensive collaboration with partners, CDFW developed a master plan framework in 2005 and then a full master plan document following the adoption of the Central Coast MPAs. The Commission formally adopted the draft *California Marine Life Protection Act Master Plan for Marine Protected Areas (2008 Master Plan)*²⁴ as a "living" document in February 2008. The 2008 Master Plan integrated the 2005 framework, memorialized the guidance used to develop alternative MPA proposals in the Central Coast planning region, and successively guided the development of alternative MPA proposals in the North Central Coast, South Coast, and North Coast planning regions (see Chapter 2.2 and Appendix A).

Developed through partner collaboration, this 2015 Master Plan is a programmatic guidance document that describes how the MLPP will undertake tasks and activities to manage California's MPAs to the best of its ability to meet the goals of the MLPA and MMAIA.²⁵ Whereas the 2008 Master Plan described the process for designing and siting MPAs through a regional approach, the 2015 Master Plan focuses instead on setting a statewide foundation for MPA management, moving forward that will include regional components. Thus, the 2008 Master Plan and the 2015 Master Plan are complementary documents reflecting the continuing evolution of the MLPP. The 2015 Master Plan is intended to provide guidance to the MLPP and other natural resource management agencies, California Tribes and Tribal governments, the California Legislature, and the general public. The 2015 Master Plan is also complemented by *The California Collaborative Approach: Marine Protected Area Partnership Plan* (the Partnership Plan [see Chapter 1.1]).²⁶

The 2015 Master Plan includes background information on California's heritage and a high-level description of California's MPA design and siting process; readers can refer to Appendix A and the 2008 Master Plan for more detailed information on these topics. The 2015 Master Plan primarily shares the operational and contextual information for management of the MPA network to meet the MLPA goals and objectives. This includes statewide guidance relative to the management and adaptive management – including monitoring, research, and development – as well as operations and funding of the MPA network and next steps to take for MPA management. In this document, management and adaptive management are discussed separately because, while the MLPP has defined its general approach to management of California's MPA network, the MLPA emphasizes the importance of an adaptive and evolving approach to management. This adaptive management process, while closely tied to existing MPA management, is a distinct process meant to build upon and feed back into MPA management. For a more detailed historical description of MPA planning through the California Marine Life Protection Act Initiative (MLPA Initiative) that led to the designation of California's MPAs pursuant to the MLPA, see Appendix A. Also appended to the 2015 Master Plan are four Regional MPA

Background and Priorities documents that capture region-specific MPA planning considerations and priorities moving forward; which together provide important context to base future informed statewide MPA management decisions upon (see Appendices C-F).

To enhance the effectiveness of California's MPAs, the MLPA has six primarily ecosystem-based goals that guided the design and siting, and continue to guide the management, of MPAs:

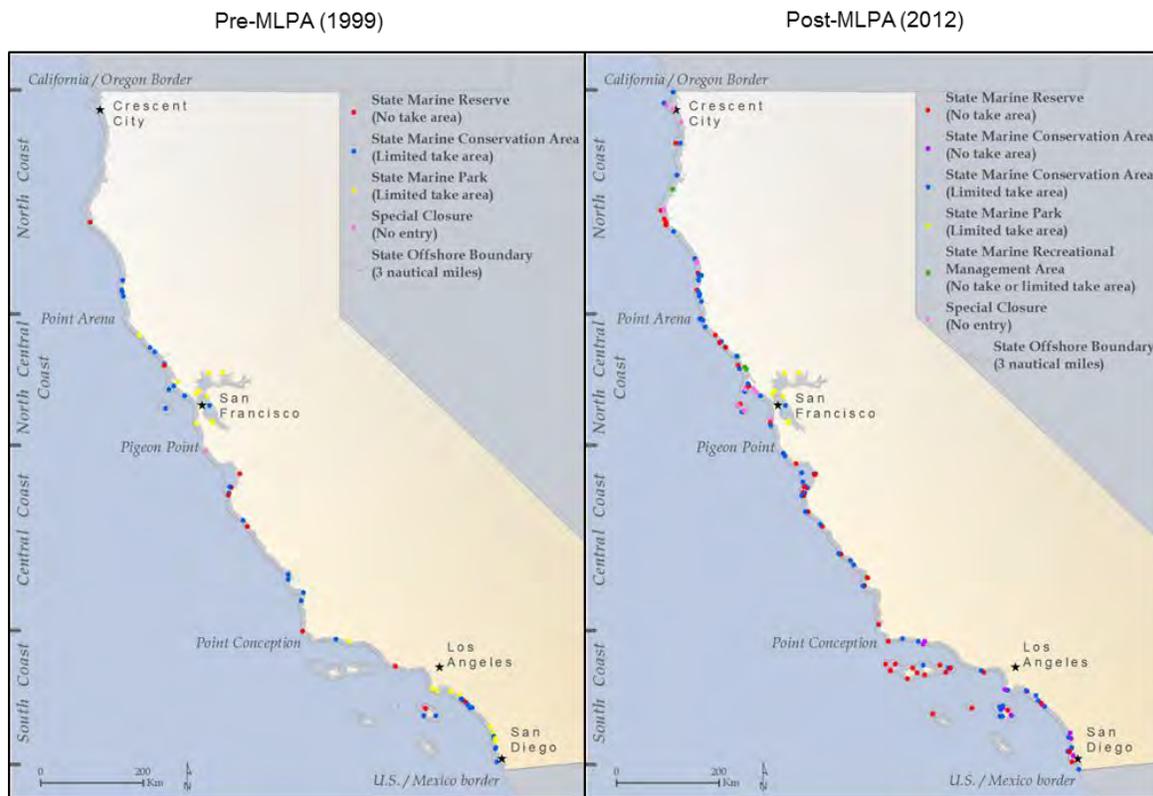

1. Protect the natural diversity and abundance of marine life, and the structure, function and integrity of marine ecosystems.
2. Help sustain, conserve, and protect marine life populations, including those of economic value, and rebuild those that are depleted.
3. Improve recreational, educational, and study opportunities provided by marine ecosystems that are subject to minimal human disturbance, and manage these uses in a manner consistent with protecting biodiversity.
4. Protect marine natural heritage, including protection of representative and unique marine life habitats in California waters for their intrinsic values.
5. Ensure California's MPAs have clearly defined objectives, effective management measures, and adequate enforcement and are based on sound scientific guidelines.
6. Ensure the state's MPAs are designed and managed, to the extent possible, as a network.

Guided by these six goals, the MPA design and siting process (see Chapter 2.2) resulted in the creation of a true network of 124 MPAs (Figure 1).²⁷ Together, this network makes up 60% of the total MPA coverage in the contiguous United States (US), placing California as a leader on MPAs both nationally and globally (Saarman & Carr 2013). Furthermore, the actions undertaken to fulfill the mandates of the MLPA, MLMA, and MMAIA put California on track to help meet the vision of the US National Ocean Policy of stewardship that “ensures that the ocean, our coasts, and the Great Lakes are healthy and resilient, safe and productive, and understood and treasured so as to promote the well-being, prosperity, and security of present and future generations.”²⁸

²⁷ Total number of MPAs includes 111 new or redesigned MPAs and 13 MPAs previously established in 2003 at the northern Channel Islands that were retained without change. Total number of MPAs does not include previously existing San Francisco Bay MPAs.

Figure 1. Map of California's MPA Network before and after Implementation of the MLPA²⁹

1.1 NATURAL AND HUMAN DIMENSIONS OF CALIFORNIA'S COASTAL RESOURCES

California's MPA network is situated in a geography of rich ecological and human heritage. The combination of California's bathymetry, ocean currents, and seasonal wind patterns provide the necessary conditions that lead to significant abundance and richness of its coastal ocean waters. California's shallow continental shelf is quite narrow, yet includes features such as underwater canyons, islands, offshore rocks, and rocky reefs (Johnson & Sandell 2014). Beyond this coastal zone two major currents meet around Point Conception, creating a rich transition zone that supports vast amounts of life. California's waters host a diversity of species of invertebrates, fish, reptiles, birds, mammals, marine plants, and algae, which can be found in a wide variety of habitats ranging from rocky intertidal shores to deep submarine canyons. For approximately 30,000 years, California's inhabitants have depended on the state's marine and coastal resources (Nies 2012). For countless generations, California Tribes have utilized marine resources and stewarded marine and coastal ecosystems across California's approximately 1,100-mile coastline. Today, California's inhabitants and visitors continue gain significant benefits from the state's oceans and coasts, including economic, nutritional, recreational, cultural, spiritual, and educational, as well as climate regulation and protection from coastal hazards. Many California Tribes continue to regularly harvest marine resources within their ancestral territories and maintain relationships with the coast for ongoing cultural uses, including spiritual and ceremonial purposes.

²⁹ In the pre-MLPA map, three ecological reserves, one state park and one natural preserve are shown as State Marine Conservation Areas (SMCAs) for comparative purposes. Regulations are consistent with current SMCAs.

California has the nation's second largest ocean economy and largest non-oil and/or gas economy,³⁰ with oceans contributing more than \$44 billion to California's 2012 gross domestic product.³¹ Ocean sectors that depend on marine and coastal ecosystems, including tourism, recreation, and fisheries, contributed nearly \$18 billion. California's oceans also have direct impacts on the job market, producing almost 490,000 jobs in 2012, more than 365,000 of which were within the ocean and coastal tourism and recreation sectors alone.³² The coasts also provide extensive recreational opportunities; beachgoers make more than 150 million trips to California's beaches per year³³ and in 2013 registered over 820,000 recreational vessels.³⁴

A wide range of natural and human-caused factors directly and indirectly influence the abundance and diversity of populations of marine life and the habitats where they live, including shifts in oceanographic conditions (e.g., El Niño and La Niña) and numerous human activities (National Research Council 1995; Parrish & Tegner 2001; Sheehan & Tasto 2001). The development and growth of California's population and economy leads to stresses including chemical pollution and urban runoff, ocean acidification, alteration of physical habitat, invasion of exotic species, and harvest of living marine resources (National Research Council 1995; Jackson et al. 2001; Sheehan & Tasto 2001, Doney et al. 2012; Samhoury & Levin 2012; Kelly et al. 2013). Climate change also poses a significant risk to California's marine resources (Ruckelshaus et al. 2008; Chen et al. 2014). While MPAs may not be appropriate for reducing the impacts of all the threats mentioned above, they can provide a tool for addressing and mitigating many of these threats.

1.2 COLLABORATIVE MPA GOVERNANCE AND POLICY

To protect California's marine natural and cultural heritage, the MPA network depends on the participation and support of numerous entities. Throughout the world, the creation of management partnerships has been shown to greatly enhance the effectiveness of MPA network planning and implementation (Kelleher 1999).³⁵ By tapping into the specialized knowledge of state and federal agencies, California Tribes and Tribal governments, non-governmental organizations (NGOs), academic institutions, and community-based user groups, managing agencies can leverage existing capacities and increase efficiencies on activities such as outreach and education; monitoring, research, and evaluation; building compliance through enforcement; and policy and permitting. Leveraging existing human and financial resources can help ensure cost-effective management of the MPA network. Furthermore, the inclusion of a large and diverse group of stakeholders increases public knowledge, participation, and support for the network (Kelleher 1999).

As the science-based and stakeholder driven process to redesign the state's MPA network progressed in each region from design to designation and implementation (see Chapter 2.2), it became increasingly

³⁰ Texas has the largest ocean economy in the nation at \$121 billion; however, \$113 billion is contributed by the minerals sector.

clear that the scale and scope of the redesign process required the state to revisit how management responsibilities were allocated. Although the primary management of the state MPA network is assigned by statute to CDFW,^{36,37,38} no one agency or group has the authority, capacity, or resources to successfully manage the MPA network in isolation. The state has therefore committed to a partnership-based approach to fulfill its management obligations, which requires a sustained focus on implementing policies that facilitate communication and collaboration among both state and private partners in supporting MPA management.

To memorialize this approach, partner entities have signed several memoranda of understanding (MOUs) committing to collaborative planning and management of the MPA network. In August 2004, CNRA, CDFW, and the Resources Legacy Fund Foundation (now Resources Legacy Fund [RLF]) signed an MOU that launched an effort to implement the MLPA. The 2004 MOU established the MLPA Initiative, a public-private partnership, in all four planning regions (see Appendix A). The 2004 MOU was followed by amended MOUs in 2006/2007 and 2008. In 2010, a separate MOU was signed by 11 government and non-governmental entities to memorialize their commitments to effective management of California's MPA network. The 2010 MOU is titled "Memorandum of Understanding for Implementation of the California Marine Life Protection Act." The 2010 MOU was amended in 2015 to include additional federal signatories, signed by 15 government and non-governmental entities (see Box 1).

The MLPP's philosophy on governance and policy of the MPA network, as well as further activities and entities that are focused on a collaborative approach to management of California's MPA network, are described below.

MPA Governance and Policy

Governance includes the interactions among structures, processes, and traditions that determine how and by whom decisions are made, and how stakeholders have a say in the process (Lockwood et al. 2010). MPA governance in California is comprised of three general categories of regulatory authority, management, and policy that interact to facilitate the design, implementation, and adaptive

³⁶ FGC §2855(b)(1)-2863

³⁷ PRC §36600-3690

³⁸ Pursuant to PRC §36725: California State Parks and Recreation (State Parks) may designate, delete, or modify State Marine Reserves (SMRs), State Marine Parks (SMPs), State Marine Conservation Areas (SMCAs), state marine cultural preservation areas, and State Marine Recreation Management Areas (SMRMAs). State Parks may not designate, delete, or modify a SMR, SMP, or SMCA without the concurrence of the Commission on any proposed restrictions upon, or change in, the use of living marine resources. State Parks may manage SMRs, SMPs, state marine cultural preservation areas, and SMRMAs. The State Water Resources Control Board (SWRCB) may designate, delete, or modify state water quality protection areas. The SWRCB and the California regional water quality control boards may take appropriate actions to protect state water quality protection areas. The SWRCB may request the Department or State Parks to take appropriate management action.

management of the MPA network to achieve the goals of the MLPA. These components are led by the Commission, DFW, and OPC, respectively.

The Commission is the primary regulatory decision-making authority for regulations related to California's MPAs. The Commission provides a venue for public comment and formal review to act upon MPA proposals, stakeholder petitions, and regulatory changes.

CDFW is responsible for implementing and enforcing the regulations set by the Commission, as well as providing biological data and expertise to inform the Commission's decision-making process.³⁹ CDFW manages California's MPAs through enforcement; monitoring, research, and evaluation; and outreach and education.

In 2013, Senate Bill 96 delegated to the OPC the responsibility for the direction of policy of the state's MPAs.⁴⁰ To fulfill this mandate, OPC works with both agency and private partners to identify areas that would benefit from policy development. Recommendations are developed collaboratively and then brought to the OPC for consideration. Once adopted, these policies direct all agencies under CNRA in their actions related to MPAs. This approach is grounded in the foundational agency relationship between OPC, CDFW, and the Commission that informs actions in support of the MPA network. This support takes several forms, from formalizing and leading coordination bodies like the MPA Statewide Leadership Team (MSLT) to actively engaging private partners in collaborative dialogues with state agencies.

Marine Life Protection Program

Core to the MPA design and siting process, as well as to the ongoing management of California's MPA network, is the MLPP, established pursuant to the MLPA. The MLPP is a diverse program that includes groups involved in MPA policy and permitting, enforcement and compliance, research and monitoring, and outreach and education. The MLPP also encompasses the California's MPA network itself, as designated under the MLPA and MMAIA. Therefore, the MLPP constitutes a wide range of entities and activities that all contribute to achieving the goals of the MLPA. Importantly, the components of the MLPP are described in statute⁴¹ and may change based on evolving needs and the outcomes of the ongoing adaptive management process.

Consultation with California Tribes and Tribal Governments

As the traditional users and stewards of California's marine resources, partnership with California Tribes and Tribal governments is particularly important to the state government and the MLPP for MPA management. The state is committed to engaging in meaningful collaborations with California Tribes and Tribal governments, and Tribes can participate in many facets of MPA management, including, but not limited to, education and outreach, stewardship, research and monitoring, and compliance and enforcement. CNRA,⁴² CDFW,⁴³ and the Commission⁴⁴ all have approved Tribal consultation policies to guide effective cooperation, communication, and consultation with Tribes and to enable California

Tribes and Tribal governments to provide meaningful input for natural resource management (see Appendix B).

MPA Statewide Leadership Team

California's MSLT, led by OPC and nested within the larger MLPP, currently includes agencies and partners that have significant authority related to MPAs or marine sanctuaries. The MSLT was convened with the goal of increasing communication and collaboration among agencies and partners to ensure the state is effectively managing the statewide MPA network. The MSLT has in effect been active through collaborations on organically occurring projects and products, but was formalized in 2015. Further formalizing a commitment to communication and collaboration for MPA management, the MSLT finalized its two-year workplan in September 2015.⁴⁵ The MSLT's work is also informed by discussions with key non-profit organizations, Tribes, fishermen, academics, and other federal agencies that play a direct or support role in the management of the MPA Network. The MSLT has identified four focal areas around which to organize its work:

- Outreach and education
- Research and monitoring
- Enforcement and compliance
- Policy and permitting

Partnership and the California Collaborative Approach

Partnership is a common theme and core strategy underlying the MLPP and the ongoing management of California's MPA network. This section specifically highlights the MLPP's approach to partnership and collaboration, which forms the foundation of all aspects of the state's MPA network, including siting and design, management and adaptive management, monitoring, operations, and other emerging aspects as the MLPP evolves.

Building on momentum from the publically-driven design and siting phase of California's network of MPAs (see Chapter 2.2 and Appendix A), CDFW, OPC, and other partners recognized the need to institutionalize an organized and mutually beneficial approach to partnership around management of the MPA network. Therefore, CDFW, OPC, and partners developed and agreed upon an experimental partnership model – the California Collaborative Approach. The California Collaborative Approach, which is documented in the Partnership Plan,⁴⁶ takes advantage of overlapping government mandates, public interest, and science to provide support and create opportunities for the management and governance of the MPA network across sectors and geographic and political scales. Because it is the first partnership model of its kind focused on MPA network management, it will be adapted as needed as new priorities, needs, and information arise.

Table 2 describes a sample of past and ongoing collaborations among diverse entities including agencies, researchers, citizen scientists, and more, that work toward achieving the Partnership Plan objectives. Each of these partnerships has or will potentially inform MPA management as the MLPP evolves. MLPP partners and others will continue to identify and build new partnerships as opportunities and needs arise.

The MSLT created four overarching management objectives that span the entire network, linked to the six MLPA goals, and complement the regional objectives. The four management objectives, as described in the Partnership Plan, include the following:

1. Governance and management process is effective and adaptive.
2. Objective, reliable, and timely scientific information and enforcement data are used in management decisions for stewardship of the statewide network.
3. Compliance with the regulations and participation in management and stewardship of the statewide MPA network is high due to effective enforcement, education, and broad awareness of the MPAs across sectors and by all key stakeholder groups.
4. State MPA network is effectively financed and sustainable over the long term.

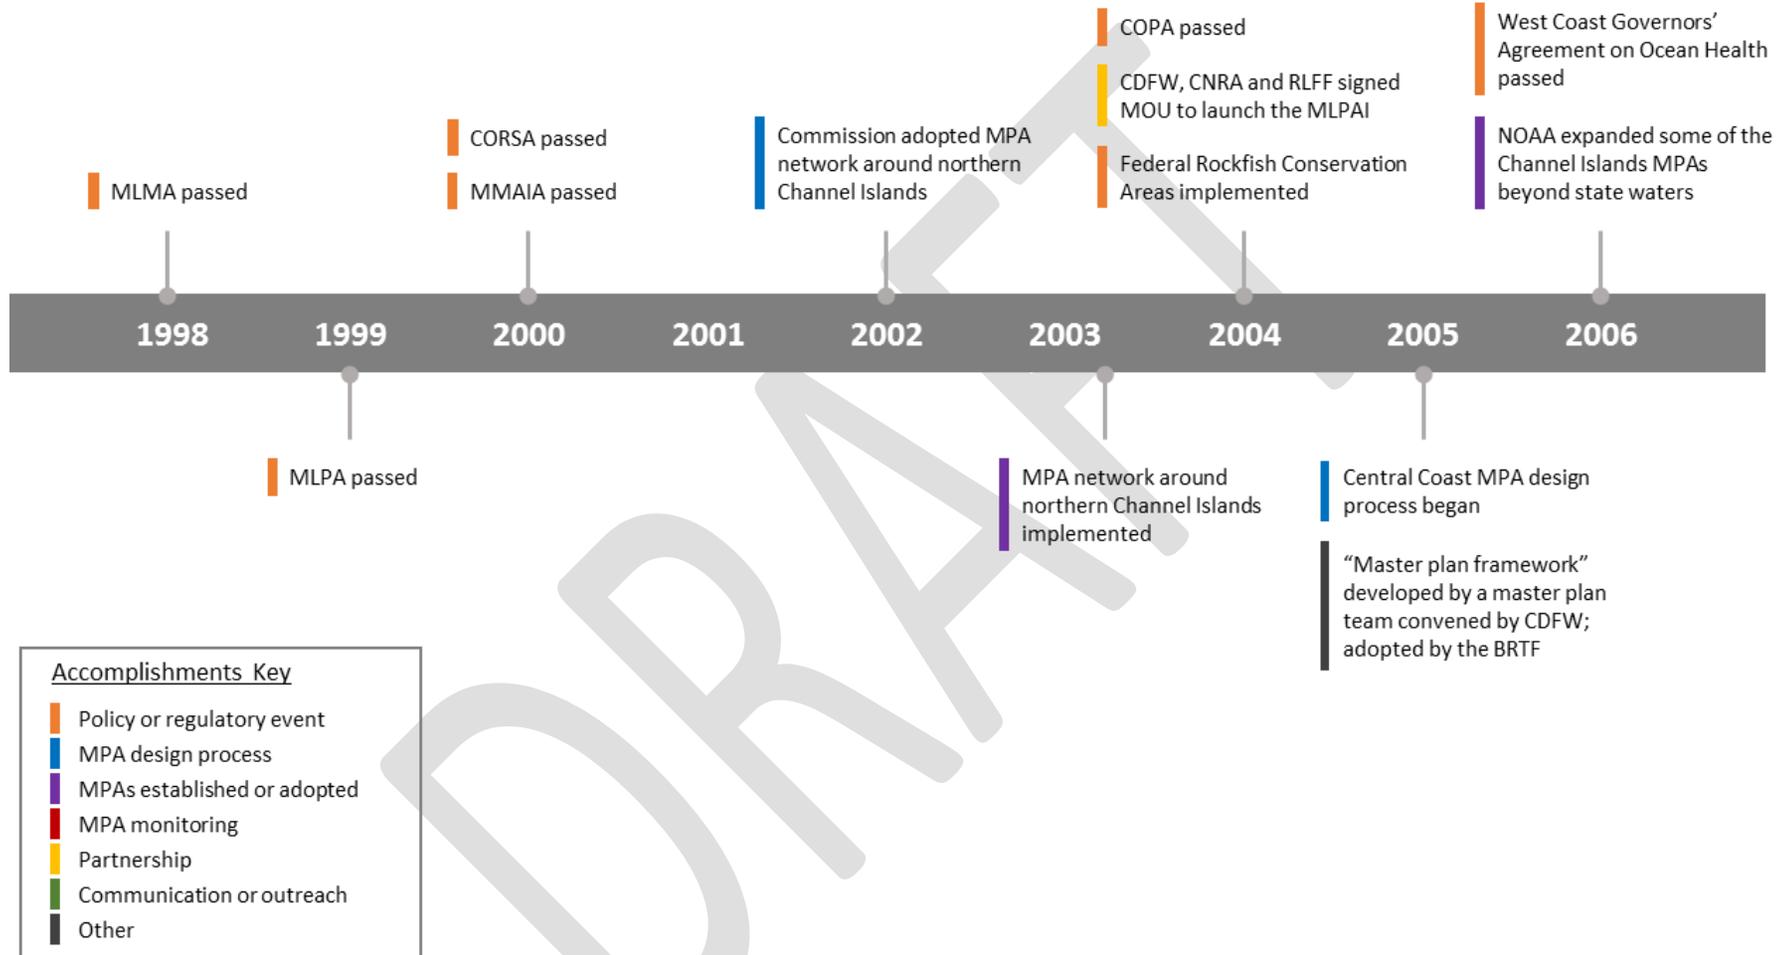

In working together to achieve these management objectives, partners will seek to follow the guiding principles of the California Collaborative Approach, including leveraging resources, ensuring transparency, and engaging in partnerships.

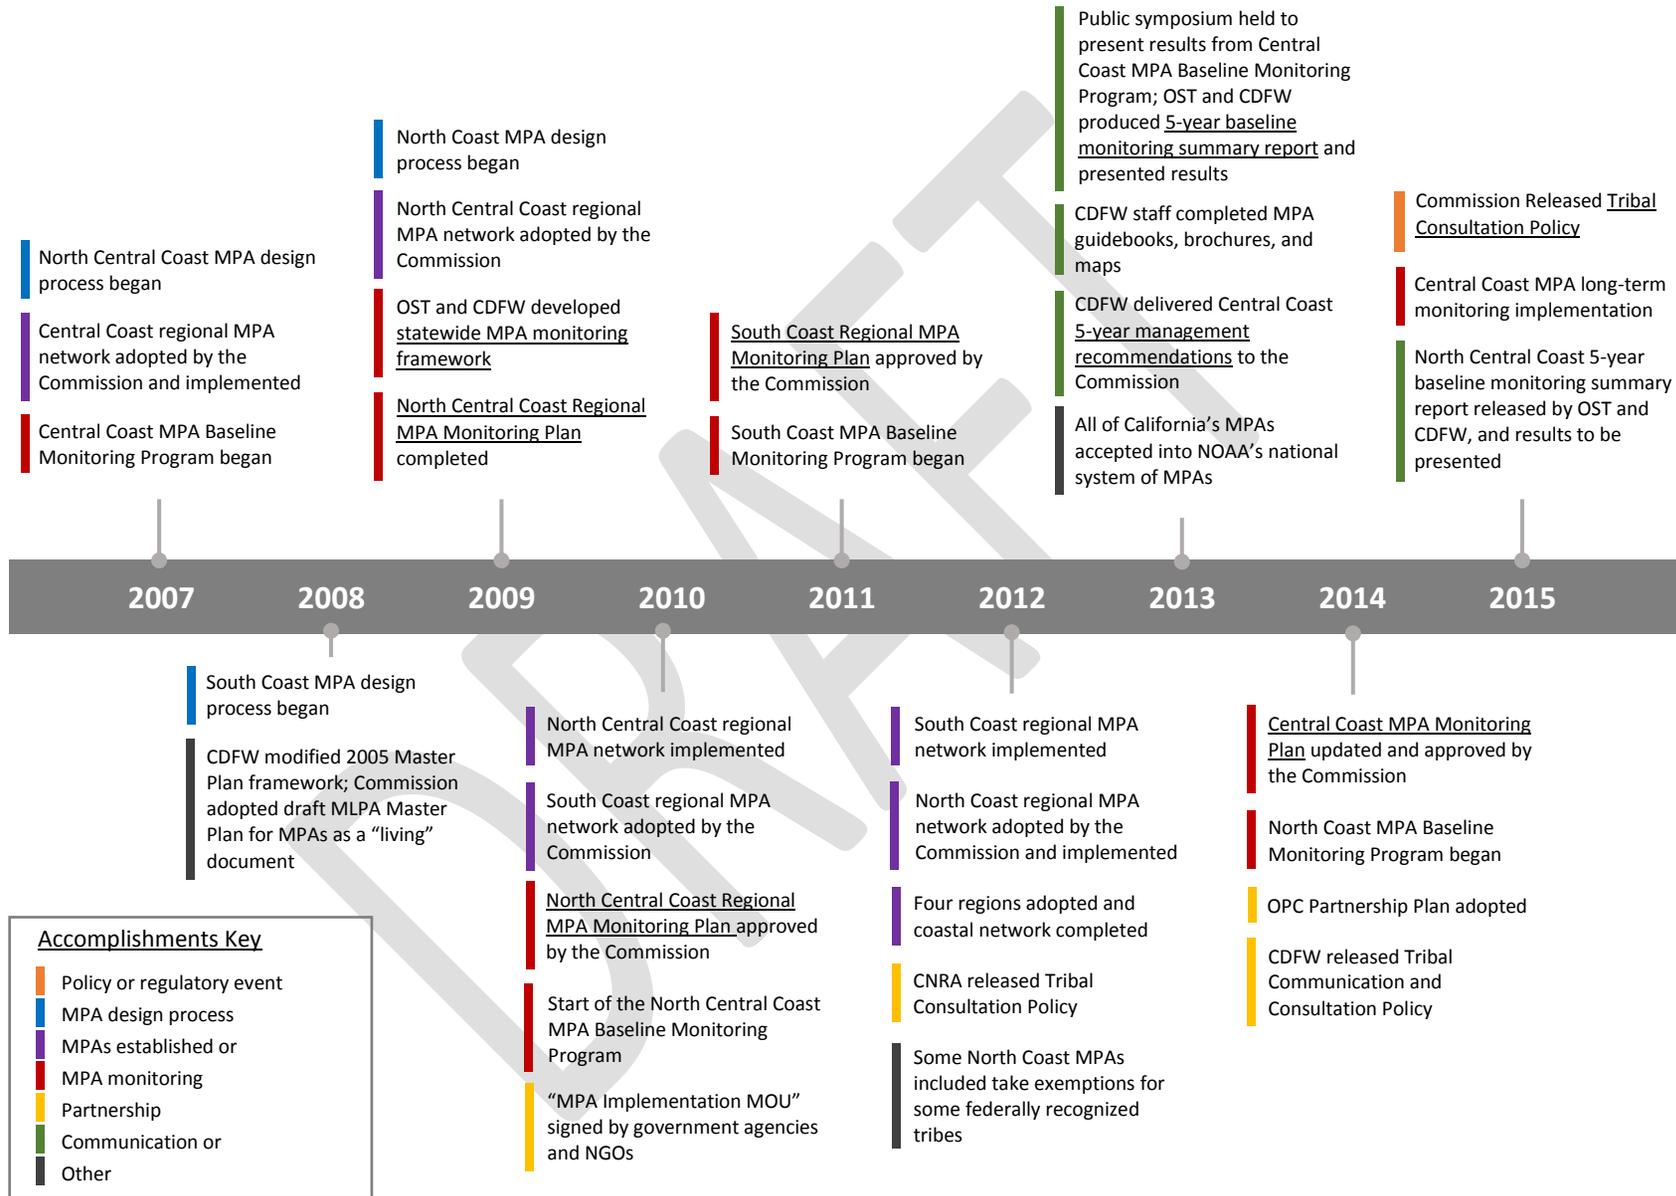

As one component of the Collaborative Approach, Community Collaboratives (Collaboratives) reflect the local-scale community focus of the approach. There are currently 14 Collaboratives, together comprising the Collaborative Network. Each Collaborative offers local partners and stakeholders an opportunity to engage with and have an active voice and participation to potentially inform MPA management in a way that reflects their unique community's priorities and needs. The Collaboratives are designed to be self-sufficient and provide a platform for locally-based stakeholders to organize around and support their local MPAs, while supporting the MSLT to achieve the network-wide management objectives and the MLPA goals.

1.3 CALIFORNIA'S MARINE MANAGEMENT POLICIES AND MPA MILESTONES

Since the passage of the MLPA, the MLPA Initiative, MLPP, and the state achieved a number of accomplishments. These accomplishments relate to policies and regulation, MPA design and establishment, MPA monitoring, partnerships, communication and outreach, and other achievements. Figure 2 illustrates a timeline of some of these milestones between 1998 and 2015.

Figure 2. California's Key MPA-Related Milestones

CHAPTER 2

MPA Network Design and Siting Process

The MLPA, expertise provided by advisory groups, and rigorous stakeholder engagement processes informed the design and siting process for California’s MPA network. Throughout the siting and design process, decision-makers used the best readily available science to designate MPAs with varying degrees of protection (i.e., no-take or limited take) and to integrate MPAs into a statewide network. This chapter describes the types of MPAs that comprise California’s MPA network, the MLPA Initiative design and siting process, and summary statistics describing California’s MPA network.

2.1 TYPES OF MARINE MANAGED AREAS

The six goals of the MLPA recognize the importance of protecting marine resources for various purposes (protecting natural diversity and abundance of marine life, sustaining and rebuilding species of economic value, and improving recreational and educational opportunities in areas subject to minimal disturbance). Thus, it is important to use multiple types of MMAs, as defined in the MMAIA, to achieve these distinct goals.⁴⁸ MPAs are a subset of MMAs (however throughout this document the more common term “MPA” is used as an umbrella to refer to all types of protected areas), and include three MPA classifications (State Marine Reserve [SMR], State Marine Conservation Area [SMCA], State Marine Park [SMP]⁴⁹) and one MMA classification (State Marine Recreational Management Area [SMRMA]). The special closure designation, which is not an MPA, is used by the Commission for relatively small, discrete marine areas to also contribute to the goals of the MLPA through protections complementary to MPAs.⁵⁰ General definitions for these classifications of the protected areas adopted pursuant to the MLPA are described in Table 3 below. For regulations pertaining to areas declared by the Commission to be MPAs, MMAs, and special closures, see California Code of Regulations (CCR), Title 14, Section 632^{51,52} and the descriptions of California’s MPAs on CDFW’s website.⁵³

To date, there has been relatively little direct comparison between the relative benefits of multiple use areas such as marine parks and marine conservation areas compared to no-take marine reserves (Lester & Halpern 2008; Coleman et al. 2013; Kelaher et al. 2014). Because approximately 42% of California’s MPA area (or 6.5% of California’s total state waters⁵⁴) is in SMCAs, SMCA/SMPs, and SMRMAs – which allow multiple uses including limited take – California’s MPA network will provide an opportunity to build scientific knowledge about the effects of different types of MMAs.

⁴⁸ FGC §2852[c]

⁴⁹ The State Park and Recreation Commission has purview over the addition of SMPs.

⁵⁰ Special closures derive from the ecological reserve authority in FGC 1583 to protect terrestrial resources such as nesting sites and pup haul-out areas

⁵¹ CCR. Retrieved Mar 4, 2015 from <https://govt.westlaw.com/calregs/>

⁵² CCR, Title 14, Section 632 defines provisions for a number of prohibitions and allowances on topics such as access, anchoring, transit or drifting through MPAs or other MMAs, public safety, and Tribal take

⁵³ Descriptions of California’s MPAs are provided on the CDFW website:

<https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Network>

⁵⁴ The boundary of state waters is from mean high tide to three nautical miles offshore of all intertidal rocks and mouths of embayments, including large open bays. This method of measurement creates instances where the state water boundary is further offshore than three nautical miles (e.g., Monterey Bay and the area around Reading Rock)

The MLPP recognizes that designating a network that includes multiple types of MPAs may prove to be problematic relative to enforcement and public understanding of different regulations within contiguous areas. Differences in regulations in MMAs can lead to unintentional infractions and a degradation of the function of MPA network. Therefore, as regulations are developed and continually updated, care must be taken to ensure that regulations are understandable, observed by the public, and enforced as necessary.

2.2 MLPA INITIATIVE PROCESS AND OUTCOMES

The MLPA passed in 1999, followed by the MMAIA in 2000. Following two unsuccessful attempts to implement the MLPA due to lack of funding and resources, CDFW entered into a public-private partnership called the MLPA Initiative to undertake implementation of the MLPA. This section describes the MLPA Initiative and the design, siting, and implementation process that was carried out between 2004 and 2012 (see Appendix A). In addition, this section shares the results of this process at the statewide and regional scales.

Following the statewide goals, the MLPA outlined guidelines for the design and siting of the MPA network. The MLPA required the network to comprise areas with various levels of protection, including the following elements:⁵⁵

- 1) An improved marine life reserve component [known as the backbone of the network] consistent with the guidelines for the preferred siting alternative (see Appendix A, Boxes 1 and 3).
- 2) Specific identified objectives, and management and enforcement measures, for all MPAs in the system.
- 3) Provisions for monitoring, research, and evaluation at selected sites to facilitate adaptive management of MPAs and ensure that the system meets the goals stated in this chapter.
- 4) Provisions for educating the public about MPAs, and for administering and enforcing MPAs in a manner that encourages public participation.
- 5) A process for the establishment, modification, or abolishment of existing MPAs or new MPAs established pursuant to this program.

MLPA Initiative: Establishment and Design and Siting Process

The MLPA Initiative was a comprehensive, highly collaborative, transparent, and iterative process guided by MOUs and enhanced by the advice of stakeholders, scientists, resource managers, and interested members of the public. Over the course of 2004 to 2012, the MLPA Initiative worked together to match public and private resources to direct and inform four regional science-based, stakeholder-driven processes (see Figure 3).

⁵⁵ FGC §2853(c)

Table 3. Definitions and Overview of MMA Classifications

Classification	Definition	Summary	Additional Information
State Marine Reserve (SMR)	<p>In a state marine reserve, it is unlawful to injure, damage, take, or possess any living geological, or cultural marine resource, except under a permit or specific authorization from the managing agency for research, restoration, or monitoring purposes. While, to the extent feasible, the area shall be open to the public for managed enjoyment and study, the area shall be maintained to the extent practicable in an undisturbed and unpolluted state. Access and use for activities including, but not limited to, walking, swimming, boating, and diving may be restricted to protect marine resources. Research, restoration, and monitoring may be permitted by the managing agency. Educational activities and other forms of nonconsumptive human use may be permitted by the designating entity or managing agency in a manner consistent with the protection of all marine resources.⁵⁶</p>	<ul style="list-style-type: none"> Prohibits all take and consumptive use (commercial and recreational, living or geologic); scientific research and non-consumptive uses are allowed⁵⁷ Definition is consistent with “marine life reserve” in MLPA 	<ul style="list-style-type: none"> Scientific collecting permits (SCP) may be issued by CDFW pursuant to Section 650 of the CCR, Title 14, or specific authorization from the Commission for research, restoration, or monitoring purposes Boating, diving, research, and education may be allowed, to the extent feasible, as long as the area is maintained “to the extent practicable in an undisturbed and unpolluted state,” but activities may be restricted to protect marine resources, including non-extractive activities¹⁵ Restrictions must be based on specific objectives for an individual site and the goals and guidelines of the MLPA⁵⁸ Does not imply that navigation will necessarily be restricted though MPAs or that other non-extractive activities will be regulated
State Marine Conservation Area (SMCA)	<p>In a state marine conservation area, it is unlawful to injure, damage, take, or possess any living, geological, or cultural marine resource for commercial or recreational purposes, or a combination of commercial and recreational purposes that the designating entity or managing agency determines would compromise protection of the species of interest, natural community, habitat, or geological features. The designating entity or managing agency may permit research, education, and recreational activities, and certain commercial and recreational harvest of marine resources.⁵⁹</p>	<ul style="list-style-type: none"> May allow select recreational and commercial harvest to continue; scientific research and non-consumptive uses are allowed 	<ul style="list-style-type: none"> SCPs may be issued by CDFW pursuant to Section 650 of the CCR, Title 14, or specific authorization from the Commission for research, education, or recreational purposes and certain commercial and recreational harvest, provided it does not compromise protection Fishing restrictions may vary by focal species, fishing gear, habitats, and goals and objectives of individual MPA⁶⁰

⁵⁸ FGC §2852(c)

⁵⁹ PRC §36710(c)

Classification	Definition	Summary	Additional Information
No-Take State Marine Conservation Area (no-take SMCA)	See SMCA definition.	<ul style="list-style-type: none"> Prohibits all take and consumptive use, except for the take incidental to existing permitted activities such as infrastructure maintenance or water quality operations 	<ul style="list-style-type: none"> Pre-existing activities and artificial structures including, but not limited to, wastewater outfalls, piers and jetties, maintenance dredging, and beach nourishment occur throughout heavily urbanized areas Activities are regulated by other federal, state, and local agencies whose jurisdiction cannot be pre-empted through designation of MPAs pursuant to the MLPA⁶¹ The Commission identified MPAs with existing structures, and designated them as no-take SMCAs and <i>only</i> these regulated activities are allowed to continue under current permits
State Marine Park (SMP)	In a state marine park , it is unlawful to injure, damage, take, or possess any living or nonliving marine resource for commercial exploitation purposes. Any human use that would compromise protection of the species of interest, natural community or habitat, or geological, cultural, or recreational features, may be restricted by the designating entity or managing agency. All other uses are allowed, including scientific collection with a permit, research, monitoring, and public recreation, including recreational harvest, unless otherwise restricted. Public use, enjoyment, and education are encouraged, in a manner consistent with protecting resource values. ⁶²	<ul style="list-style-type: none"> Prohibits commercial take, but may allow select recreational harvest to continue; scientific research and non-consumptive uses are allowed Prohibits injuring, damaging, taking, or possessing for commercial use any living or non-living marine resources⁶³ 	<ul style="list-style-type: none"> Other uses that would compromise the protection of living resources, habitat, geological, cultural, or recreational features may be restricted, while all other uses are allowed, consistent with protecting resources SCPs may be issued by CDFW pursuant to Section 650 of the CCR, Title 14, or specific authorization from the Commission for research, monitoring, and education and certain recreational harvest in a manner consistent with protecting resources State Parks Commission designates SMPs Fishing restrictions may vary by focal species, habitats, and goals and objectives of individual MPAs⁶⁴

⁶⁰ At present, the large fishery closures known as the Cowcod Conservation Areas and the Rockfish Conservation Area may function as *de facto* SMCAs in that bottom fishing for finfishes is prohibited but other types of fishing are allowed, though the specific regulations in these areas are subject to change dependent on stock assessments

⁶¹ For example, wastewater discharge permitted by the SWQCB is not considered to involve take within MPAs, and for the purposes of MPA management, the relation of wastewater discharge to allowable take is at the discretion and jurisdiction of the State and Regional Water Quality Control boards.

⁶² PRC §36710(b)

⁶³ PRC §36700-36900

⁶⁴ At present, the large fishery closures known as the Cowcod Conservation Areas and the Rockfish Conservation Area may function as *de facto* SMCAs in that bottom fishing for finfishes is prohibited but other types of fishing are allowed, though the specific regulations in these areas are subject to change dependent on stock assessments

Classification	Definition	Summary	Additional Information
State Marine Conservation Area / State Marine Park (SMCA/SMP)	See SMP definition.	<ul style="list-style-type: none"> MPA designated as SMCA by the Commission and SMP by California State Park and Recreation Commission 	<ul style="list-style-type: none"> Only one MPA (Cambria SMCA/SMP) currently has this dual designation, as it was adopted by both Commissions at separate times with the same set of regulations and boundaries (Pope 2014) Cambria SMCA/SMP is jointly managed by CDFW and State Parks
State Marine Recreational Management Area (SMRMA)	In a state marine recreational management area , it is unlawful to perform any activity that, as determined by the designating entity or managing agency, would compromise the recreational values for which the area may be designated. Recreational opportunities may be protected, enhanced, or restricted, while preserving basic resource values of the area. No other use is restricted. ⁶⁵ The Fish and Game Commission may designate, delete, or modify state marine recreational management areas for hunting purposes. ⁶⁶	<ul style="list-style-type: none"> Provides subtidal protection equivalent to an MPA while allowing legal waterfowl hunting, scientific research, and non-consumptive uses 	<ul style="list-style-type: none"> MMA designation Recreational opportunities may be protected, enhanced, or restricted while preserving basic resource values of the area
Special Closure	A special closure is an area designated by the Commission that prohibits access or restricts boating activities in waters adjacent to seabird rookeries or marine mammal haul-out sites.	<ul style="list-style-type: none"> This designation, which is not categorized as an MMA, is used by the Commission for relatively small, discrete marine areas to also achieve the goals of the MLPA 	<ul style="list-style-type: none"> Integrated into the MLPA process and used to reduce disturbance of nesting or roosting seabirds or hauled out or breeding marine mammals that would not otherwise be protected by MPA designation within the same geographical region Special closures provide an exception to allow CDFW employees and employees of other specified government agencies to enter the area Special closures also include an allowance for CDFW to grant permission to access the area at its discretion

⁶⁵ PRC §36710(e)

⁶⁶ PRC §36725(a)

MLPA Initiative staff varied among planning regions, and worked with CDFW staff with scientific expertise and/or knowledge of state policy and resource management, CDFW enforcement staff, California Department of Parks and Recreation (State Parks) staff, Regional Stakeholder Groups, Master Plan Science Advisory Team (SAT) members, the Statewide Interests Group (SIG), and/or professional contract staff with other required skills to accomplish MPA planning, project management, decision support tool development, facilitation, and mediation. The MLPA Initiative established an MLPA Blue Ribbon Task Force (BRTF), together with a SAT and a stakeholder advisory group (Stakeholder Group) to oversee the achievement of several initial objectives for overall MPA planning in each region.⁶⁷ See Figure 4 for a description of the primary roles of each of the three main MLPA Initiative bodies.

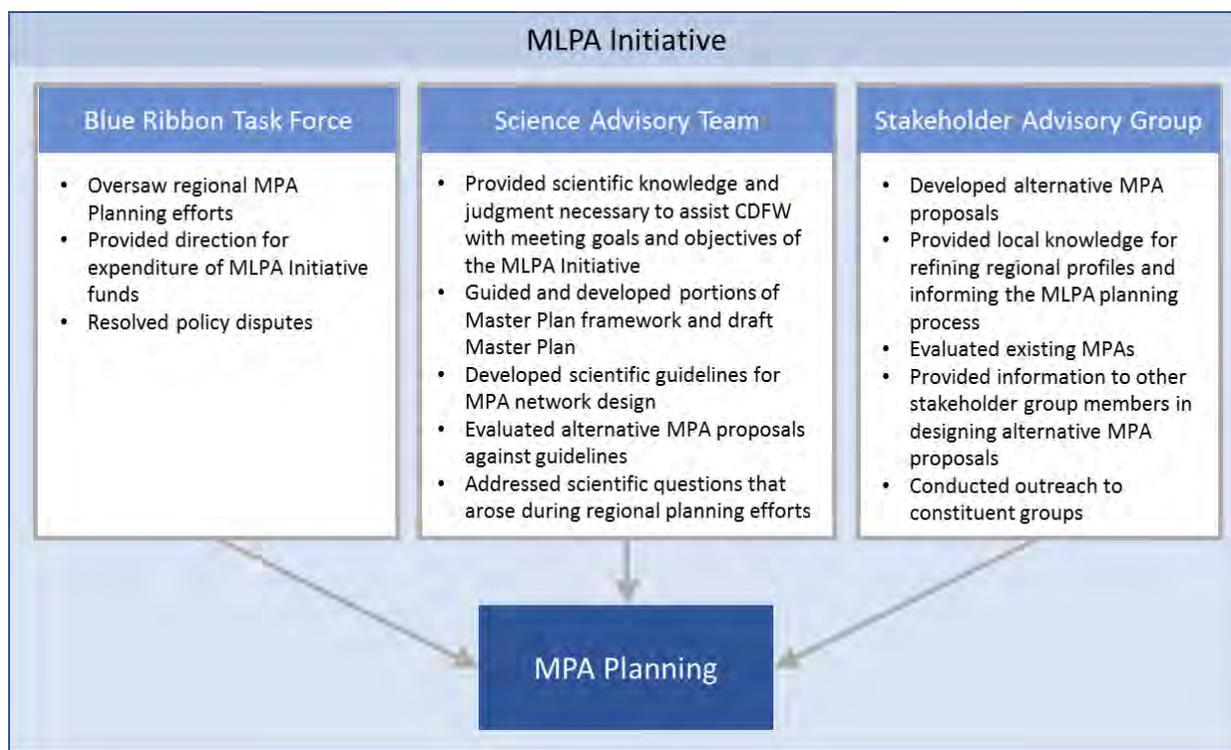

Figure 3. Map Highlighting the Five Planning Areas and Planning Periods

The first of the planning objectives for the MLPA Initiative was to complete a master plan framework, adopted by the BRTF in 2005, which included guidance based on the MLPA for the development of alternative MPA proposals statewide. Other important early objectives included establishing a timeline, organizational structure, requirements, work products, and funding for MPA planning. Rather than attempting to design a single MPA network for the entire state at one time, the MLPA Initiative called for the redesign of a statewide network of MPAs by 2011 through a series of geographic planning regions. The state was split into five distinct regions – North Coast, North Central Coast, Central Coast, South Coast, and the San Francisco Bay (see Figure 3). Each region held its own regional MPA public planning process, except the San Francisco Bay. MPA planning in San Francisco Bay will be influenced by the results of the Sacramento-San Joaquin Rivers Delta process and, therefore, MPA planning will occur once that process is complete (see Appendix A).

⁶⁷ Complete lists of BRTF, SIG, SAT, and Stakeholder Group (or Regional Stakeholder Group [RSG]) members can be found on CDFW's website: <https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Planning-Process>

Figure 4. Description of Three Planning Bodies that Supported the Design and Siting Phase for Each Planning Region

Scientific Foundation for MPA Network Design

In order to prepare the master plan and take full advantage of scientific expertise on MPAs, the MLPA directed CDFW to appoint a Master Plan Team, including science advisors, for advice and assistance.⁶⁸ CDFW staff and Master Plan Team scientists played a significant role in guiding and developing components of both the master plan framework adopted by the BRTF in 2005 and the draft Master Plan adopted by the Commission in 2008, resulting in: 1) more specific guidelines for how to implement the broad guidance in the MLPA, and 2) detailed guidance on a variety of scientific considerations in the design of MPAs (see the 2008 Master Plan, Chapter 3). The overall MPA network design guidance addressed statutory requirements for MPA network design and provided a foundation for the SAT to apply a methodology to evaluate alternative MPA proposals in each planning region (Kirlin et al. 2013). The MLPA Initiative was a science-based and stakeholder-driven MPA planning process that utilized the best readily available science,⁶⁹ and accordingly, the MPA planning process drew from an existing body of work on both the science underlying MPA design and siting as well as previous MPA management efforts from around the world. Throughout the MPA design process, some of

⁶⁸ FGC §2853(c)

⁶⁹ For more information on CDFW's approach to using the best readily available science, see the California Fish and Game Commission, *Final Statement of Reasons for Regulatory Action* documents: http://www.fgc.ca.gov/regulations/2007/165_632fsor.pdf for the Central Coast (2007); <http://www.fgc.ca.gov/regulations/2009/632fsor.pdf> for the North Central Coast (2010); <http://www.fgc.ca.gov/regulations/2010/632fsor.pdf> for the South Coast (2011); and <http://www.fgc.ca.gov/regulations/2012/632ncfsor.pdf> for the North Coast (2012)

the top MPA scientists worldwide played active roles in both the development and review of regional proposals. To pave the way for positive outcomes of California’s MPA network, the MLPP utilized three primary sources of scientific guidance to guide MPA network design: the MLPA, the 2008 Master Plan, and the SAT (see Appendix A, Section 4).

Influence of Science in California’s MPA Network

California’s MPA network generally reflects the integration of the science and science-based MPA design guidelines from the MLPA, the 2008 Master Plan, and SAT guidance. When compared to California’s MPAs in 1999 (prior to the MLPA), there is a dramatic increase in the proportion of state waters protected and an increase in the number and size of all MPA types (see Table 4). The redesigned MPA network represents a substantial increase in the representation and replication of marine habitats within MPAs, including sandy beaches, rocky shores, kelp, shallow rocky reef/kelp forest (0-30m), mid-depth rocky reef (30-100m), deep rocky reef (100-3000m), shallow sand 0-30m, mid-depth sand (30-100m), deep sand (100-3000m), estuaries, marsh, and eelgrass habitats. There is also a reduction in the distance between habitats protected in MPAs (Saarman et al. 2013; see Tables 1-4 in Appendices C-F, Section 4 for more detailed statistics on each region).

Table 4. Comparison of Protected Areas prior to the MLPA in 1999 and Present

Protected Area	Pre-MLPA (1999) ^{70,71}					Post-MLPA (2015) ⁷²				
	Count	Min Size	Max Size	Total Area	Mean Size	Count	Min Size	Max Size	Total Area	Mean Size
No-Take ⁷³	10	0.04	2.5	12.1	1.2	61	0.01	40.7	497.4	8.2
Limited Take ^{74,75}	53	0.01	30.8	129.8	2.4	63	0.06	23	354.7	5.6
Special Closure	2	0.64	2.2	2.8	1.4	15	0.01	1	3.3	0.2

While science guidelines strongly influenced the design of California’s MPA network, the nature of the highly participatory, stakeholder-driven process led to some tradeoffs between ecosystem protection and socioeconomic considerations in California’s MPA network (Gleason et al. 2013; Saarman et al. 2013). For example, one third of the MPAs considered sufficiently protective to contribute to the conservation goals of the MLPA fell below the minimum MPA size recommended by the SAT (Saarman et al. 2013). Examples like this, where science guidelines were not universally followed, highlight the multiple considerations taken into account during MPA planning, which encompass both ecological and socioeconomic priorities.

Iterative Development of Alternative Regional MPA Proposals

⁷⁰ Includes only coastal MPAs (excludes existing San Francisco Bay MPAs); area units are in square miles

⁷¹ Pre-dates MMAIA; areas included are more variable in designation but are included due to similarity to current MPA take regulations

⁷² Includes only coastal MPAs; area units are in square miles.

⁷³ For the purposes of this table comparison, “No-Take” includes SMRs, SMRMAs, and no-take SMCAs

⁷⁴ Limited take includes SMRMAs, SMCAs, SMPs, State Parks, State Marine Natural Preserves, and Ecological Reserves

⁷⁵ Restrictions are highly variable across all designations, however pre-MLPA areas are generally less restrictive compared to post-MLPA areas

The BTRF selected the Central Coast region as the initial planning region from which to launch the MLPA Initiative (2005-2007).⁷⁶ The Central Coast planning region was followed by the North Central Coast (2007-2010), South Coast (2008-2012), North Coast (2009-2012), and the San Francisco Bay (timing to be determined).⁷⁷ The same general iterative process for MPA design was used in each planning region (see Box 2 below), most of which the stakeholder groups and SATs undertook. The overall aim was for the BTRF to select a set of alternative MPA proposals, including a preferred alternative, for each region and for the Commission to adopt one of the alternatives (see Appendix A).⁷⁸

Box 2. Process for Regional MPA Planning

1. **Regional Planning:** Preparation of a regional profile,^a engagement of Stakeholder Group and SAT; development of additional advice; and identification of alternative approaches to networks and potential MPA sites.
2. **MPA Planning:** Stakeholder Group development of proposals for MPAs after evaluation of existing and new MPAs and other management activities.
3. **Evaluating Proposals:** SAT, BTRF, and CDFW analysis and evaluations; SAT evaluation of MPA proposals developed by the stakeholder group against the goals of the MLPA; BTRF evaluation of proposals based on factors including SAT guidelines, CDFW feasibility criteria, socioeconomic impacts, and cross-interest support^b and forwarding a preferred alternative and other alternatives to the Commission; CDFW feasibility analysis, comments on alternatives, and development of initial regulatory documents based on Commission direction.
4. **Commission Action on Alternative MPA Proposals:** Preparation of regulatory analyses, including California Environmental Quality Act review; public testimony; and action by the Commission.

^a Regional profiles for each planning region can be found on the CDFW website:
<https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Planning-Process>

^b MLPA Initiative. (2010). *Updated Summary of Key Guidance Provided in Previous Marine Life Protection Act Study Regions for the Development of Marine Protected Area Proposals*. Retrieved Sept 21, 2015 from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=17238&inline=true>

Alternative MPA proposal development in each planning region was an adaptive, flexible, and iterative process that incorporated multiple rounds of MPA design, evaluation, feedback, and redesign (Figure 5). While the same general MPA planning process structure was used throughout the four coastal planning regions, specific details regarding alternative MPA proposal development varied and the iterative nature of the process allowed for adaptation based on lessons learned and unique characteristics of each region. For example, in the North Coast MPA planning process, due mostly to relatively small population size and strength of public involvement, external groups were supported to develop MPA proposals for the first round prior to convening the stakeholder group. Multiple rounds of MPA proposal development also

⁷⁷ Options for a planning process in the fifth region, San Francisco Bay, have been developed for consideration at a future date. See Appendix A and CDFW's website for more information:
<http://www.wildlife.ca.gov/Conservation/Marine/MPAs/Network/San-Francisco-Bay>

⁷⁸ CDFW. (2015). *Overview of Alternative Marine Protected Area Proposals: The Marine Life Protection Act Initiative (2004 – 2012)*. Retrieved Sept 21, 2015 from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=107532&inline>

provided stakeholder groups with evaluations of the extent to which their draft proposals would meet science and feasibility design guidelines, built trust among stakeholders, increased awareness of constituencies' particular interests, allowed the stakeholder group to develop improved cross-interest proposals, accommodated decision support-tools such as MarineMap that allowed stakeholders to collaboratively develop MPA designs, and increased and facilitated interactions between MLPA Initiative bodies and interested members of the public (Gleason et al. 2010; Fox et al. 2013a, b; Merrifield et al. 2013). In addition, in the South Coast and North Coast planning regions, State Parks and MLPA Initiative staff evaluated MPA proposals for recreation and public access opportunities. All alternative MPA proposals that were considered and reviewed by the Commission, but ultimately not selected for each planning region, can be found on the CDFW website.⁷⁹

MPAs Adopted Pursuant to the MLPA

Drawing from science guidance and expert advice, California redesigned its system of MPAs into a more cohesive statewide network (see Figure 1 above). Completed in December 2012, California's MPA network currently represents the largest scientifically-based network in the contiguous US to date, and thus the MLPA Initiative process may offer valuable insights for MPA network planning elsewhere in the US and around the world (Gleason et al. 2013).

Statewide MPA Summary

California's 63 existing MPAs prior to the MLPA were primarily established in an ad hoc manner, were mostly small (covering 2.7% of state waters with less than 0.25% in no-take MPAs), and were considered to be ineffective. Since the passage of the MLPA and the completed redesign of California's MPA network, California now has 124 MPAs (covering about 16% of state waters, approximately 9.4% of which in no-take MPAs) and 15 special closures. The majority of MPAs are in SMCAs and SMRs, with substantially less area in no-take SMCAs, SMRMAs, and SMCA/SMPs, respectively (see Figure 6).

Figure 6. Percent of Each Type of MPA across California's MPA Network⁸⁰

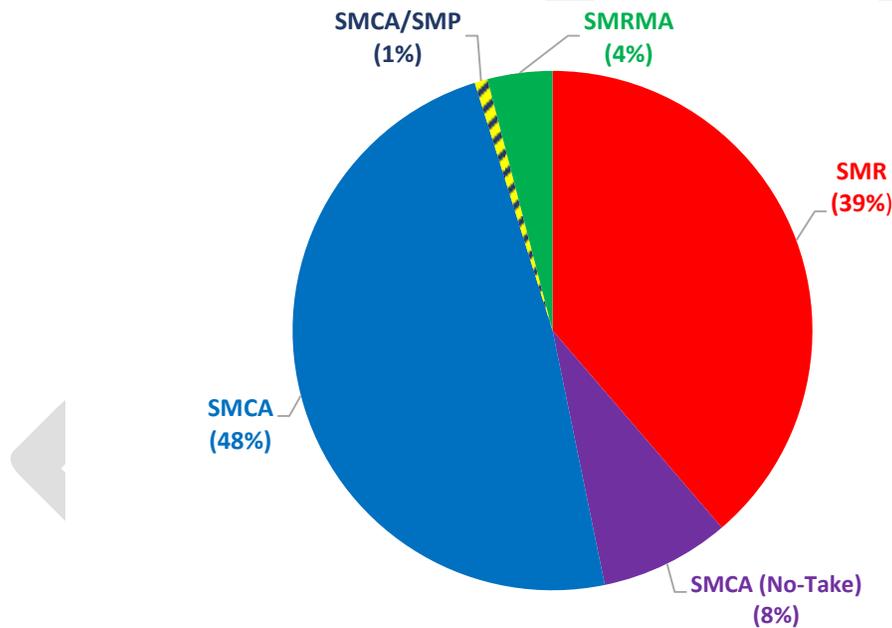

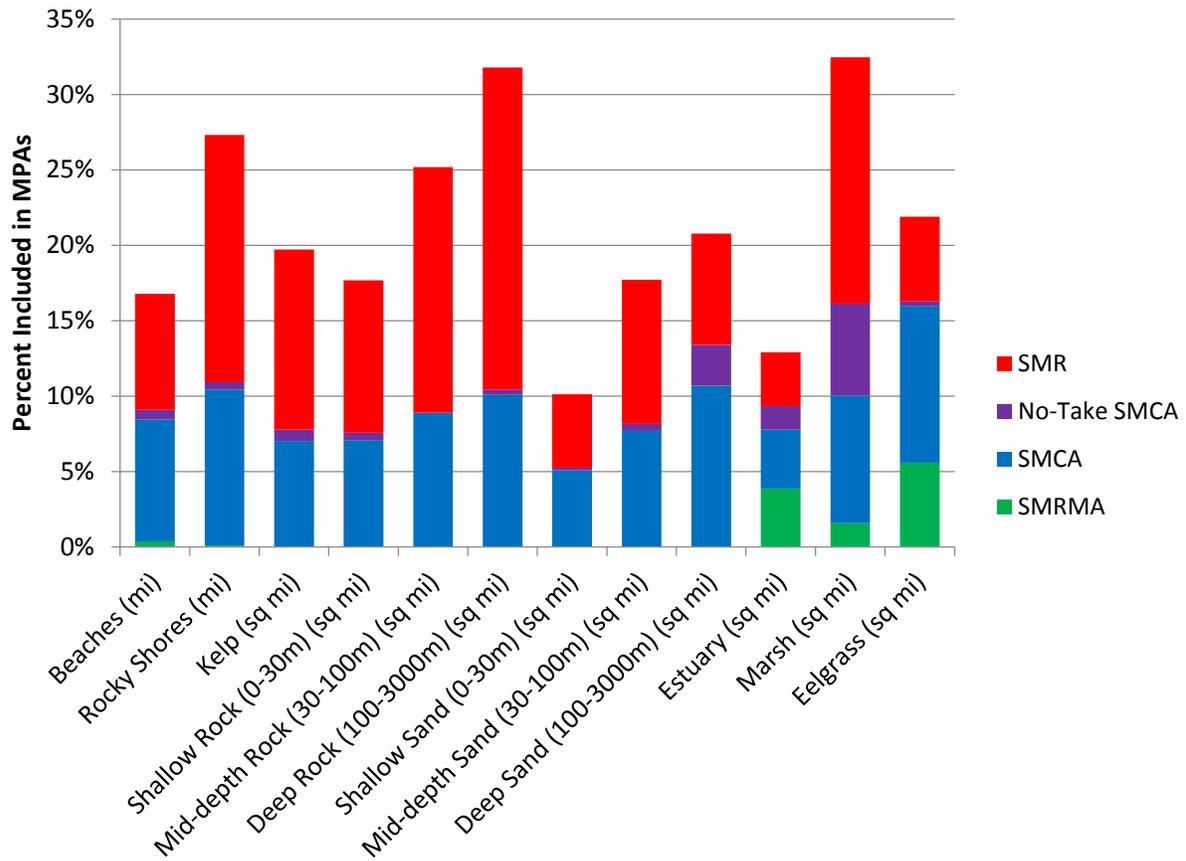

Figure 7 illustrates the percent of 12 of California's most representative habitats protected statewide in MPAs, by MPA designation type. Marsh, deep rock, and rocky shores are the most represented habitats, with shallow sand, estuary, and eelgrass showing the least representation. The majority of habitats are represented in SMRs and SMCAs. See Appendices C-F, Section 4 for detailed statistics of California's most representative habitats in individual MPAs.

⁸⁰ All numbers represent rounded values and totals include all MPAs in the North Coast, North Central Coast, Central Coast, and South Coast regions; and do not include existing San Francisco Bay MPAs or special closures

Figure 7. Percent of Representative Habitats in MPAs by Designation Type throughout the Entire State Waters of California⁸¹

⁸¹ All numbers represent rounded values and totals include all MPAs in the North Coast, North Central Coast, Central Coast, and South Coast regions; and do not include existing San Francisco Bay MPAs or special closures. The single SMCA/SMP designation in California's statewide network (Cambria SMCA/SMP) is too nominal to report.

Summary of Regional MPAs Adopted

Resulting from the design and siting phase, each planning region contained a unique set of MPAs of varying types (see Table 3 for an overview of MPA types). Table 5 provides a summary of the number of MPAs in each region and the area of coverage for each type. The North Central Coast has the largest coverage of MPAs (20.0%) and the North Coast has the least (13.4%). In addition, the South Coast has the largest area of state waters under protection (355.4 square miles and 15.1% of the region). Figure 8 provides an overview of the percent of coastal area within each type of MPA for each planning region; below is additional detail on each of the four planning regions.

Table 5. Summary Statistics of MPAs within State Waters across All Planning Regions⁸²

Type of MPA	North Coast		North Central Coast		Central Coast		South Coast	
	MPAs (number)	Area of State Waters (square miles)	MPAs (number)	Area of State Waters (square miles)	MPAs (number)	Area of State Waters (square miles)	MPAs (number)	Area of State Waters (square miles)
SMR	6	51.3	10	84.2	13	86.3	19	241.5
No-Take SMCA ⁸³	0	0.0	0	0.0	0	0.0	10	33.6
SMCA	13	85.3	12	67.6	14	111.2	21	80.4
SMCA/SMP	0	0.0	0	0.0	1	6.3	0	0.0
SMRMA	1	0.8	3	0.6	1	3.1	0	0.0
Special Closures	7	0.2	6	1.2	0	0.0	2	1.9
Total⁸⁴	20	137.4	25	152.4	29	206.8	50	355.4

North Coast: Covers approximately 1,027 square miles of state waters from the California/Oregon border south to Alder Creek near Point Arena (Mendocino County). MPAs and closures were adopted June 6, 2012 by the Commission and went into effect on December 19, 2012.

North Central Coast: Covers approximately 763 square miles of state waters from Alder Creek near Point Arena south to Pigeon Point (San Mateo County). MPAs and closures were adopted August 5, 2009 by the Commission and went into effect May 1, 2010.

Central Coast: Covers approximately 1,144 square miles of state waters from Pigeon Point, south to Point Conception (Santa Barbara County). MPAs were adopted April 13, 2007 by the Commission and went into effect September 21, 2007.

South Coast: Covers approximately 2,351 square miles of state waters from Point Conception south to the California/Mexico border, including state waters around the Channel Islands. MPAs and closures were adopted December 15, 2010 by the Commission and went into effect on January 1, 2012.

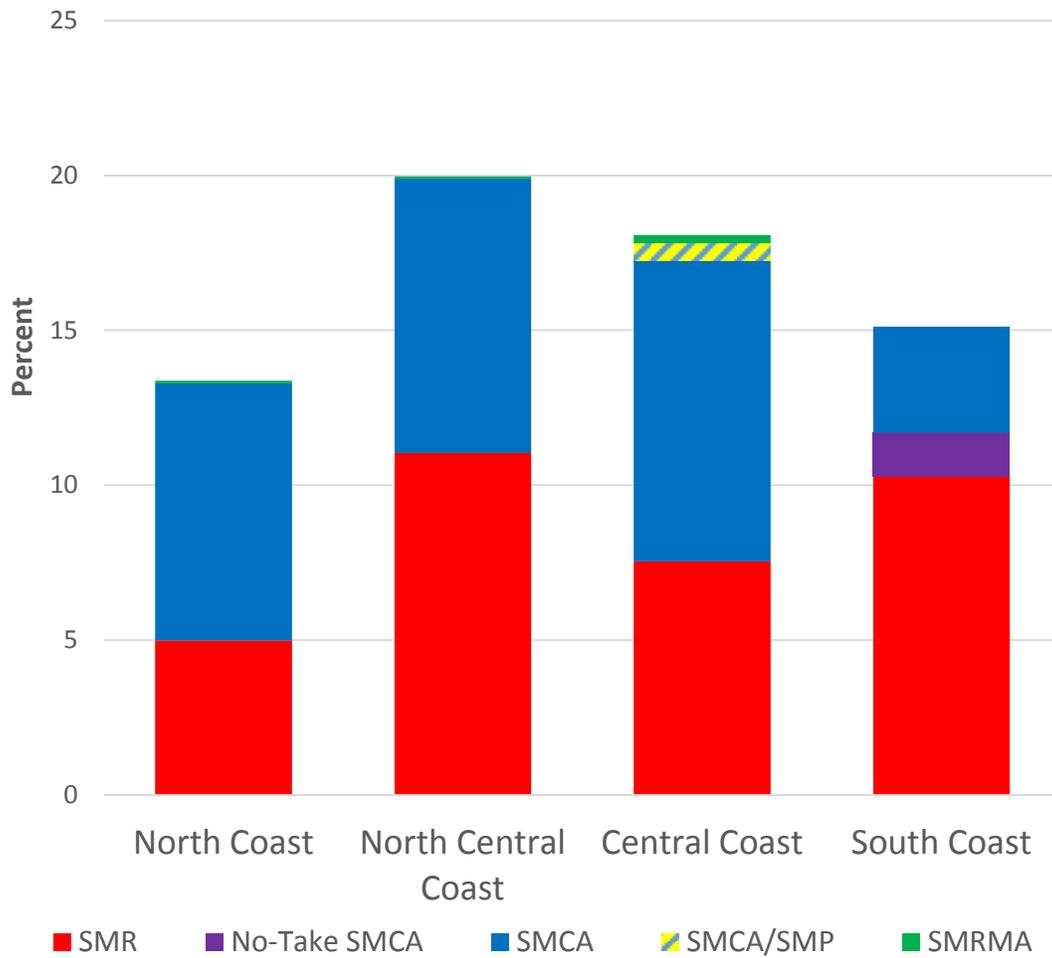

⁸² Statistics are from CDFW's Marine Region Geographic Information System unit. Values are current as of January 2015 and are subject to change as improvements in geographic data become available:

<https://www.wildlife.ca.gov/Conservation/Marine/GIS>

⁸³ No-take SMCA is an administrative term for an SMCA that would have been an SMR but for certain pre-existing permitted activities onsite (see Table 3)

⁸⁴ Totals do not include existing San Francisco Bay MPAs or special closures

Figure 8. Percent of Planning Region State Waters Covered by Each MPA Type⁸⁵

⁸⁵ Totals include all MPAs in the North Coast, North Central Coast, Central Coast, and South Coast regions; and do not include existing San Francisco Bay MPAs or special closures

CHAPTER 3

Management

The MLPA emphasizes the importance of effective management measures for California's MPAs. For California's MPA network, effective management consists of an MPA network that has strong oversight and a process for implementing the legal mandate; comprehensive management planning and permitting; effective enforcement, research, monitoring, evaluation, and outreach; and strong social capital and long-term sustainable financing that is enhanced by partnerships. Another measure of effective management is a strong process for adaptive management that enables learning and course-correction based on monitoring findings and lessons learned throughout ongoing management. This chapter describes the MLPP's approach to managing California's MPA network, while Chapter 4 describes the approach and process for continually improving MPA management through adaptive management. Through these management elements, the MPA network may meet its stated goals and objectives.

The MLPA states that California's MPAs should be designed and managed, to the extent possible, as a statewide network.⁸⁶ Following this direction, significant efforts were made to ensure that MPAs were designed as science-based, stakeholder-driven, and ecologically connected statewide network during the MPA siting process (Gleason et al. 2013; Saarman et al. 2013; see Chapter 1 and Appendix A). To manage California's MPA network, the MLPP is focusing on a variety of management activities to support the MLPP and other legislated goals and requirements in the MLPA, MLMA, and MMAIA. See Table 6 for a summary of roles in MPA management, which together aim to meet the goals and objectives of the MLPA.

3.1 OUTREACH AND EDUCATION

Building public awareness through outreach, education, communication, and interpretation efforts (collectively referred to as outreach) is an important component of an effective MLPP. Outreach has been identified as an activity that should be carried out at several levels even when other management activities (e.g., monitoring) are not yet fully implemented. Effective outreach efforts designed to inform potential user groups of MPA regulations and management requirements can have a direct bearing on MPA effectiveness. Increased compliance by an informed public that adheres to specific take regulations allows for MPAs to function in the manner they were designed.

⁸⁶ FGC §2853(b)(6)

Table 6. Overview of MPA Management Responsibilities and Roles to Support the MLPP

Responsibility	Role	Description
Enforcement	Enforcement of Regulations	<ul style="list-style-type: none"> • Ensure adequate enforcement of MPA regulations to increase compliance • Statutory authority to administer and enforce MPA regulations • Support the Commission through implementation of regulations • Conduct searches, inspections, and has citation authority
Identification of Long-Term Funding Sources	Secure Funding	<ul style="list-style-type: none"> • Continue to support the pursuit of long-term funding to adequately support MPA management activities into the future
Monitoring, Research, and Evaluation	MPA Monitoring Planning, Reporting, and Review	<ul style="list-style-type: none"> • Adhere to processes for MPA review and adaptive management, which are inherently linked to monitoring activities (see Chapter 4) • Continue to advance and provide oversight on all aspects of MPA monitoring, research, assessment/evaluation, and reporting to inform adaptive management • Support the Commission by reporting results of research and monitoring • Actively explore how MPAs may be incorporated into fisheries management
Partnership Coordination	Build and Participate in Partnerships	<ul style="list-style-type: none"> • Continue to work with the MSLT and explore potential new partnerships throughout the state • Collaborate with State Parks to manage marine parks and MPAs that are offshore of existing coastal State Park units • Engage in other partnership platforms, such as Collaboratives and/or the Collaborative Network
	Integration with Management Efforts	<ul style="list-style-type: none"> • Actively communicate with other agencies on how MPAs may be incorporated into other management efforts
Outreach and Education	Guidelines and Partnerships	<ul style="list-style-type: none"> • Continue to work with partners throughout the state to build public awareness and understanding of California's MPA network through outreach, education, communication, and interpretation activities • Set guidelines for outreach materials (e.g., color scheme, messages, etc.) • Improve compliance through education and outreach materials
Permitting	Scientific Collection Permitting	<ul style="list-style-type: none"> • Maintain a decision framework for issuing SCPs within MPAs
Regulation, Policy, and Decision-Making	Regulatory Support	<ul style="list-style-type: none"> • Provide advice and information to the Commission to help inform management decisions • Make recommendations on management decisions • Develop rulemaking packages and scoping through the Administrative Procedure Act and Office of Administrative Law • Primary statutory authority for recommending designation of and managing MPAs

A significant amount of outreach has been accomplished to date by CDFW and partners that include many of the components described in this section. Numerous regulatory guidebooks and brochures have been created and distributed to the public in printed and electronic form throughout the state. Informational kiosks, developed through a collaborative process with agencies and partners, are located in various ports and provide location specific information. A statewide signage project was completed by the MLPP and partners providing interpretive information on MPAs. In addition, no fishing signs were placed near SMRs. Partners and agencies have developed numerous posters, blogs, and videos to help disseminate information to the public about MPAs. CDFW and State Parks have also developed an MPA focused curriculum to incorporate into the Parks Online Resources for Teachers and Students (PORTS) program. To date more than 8,000 students have viewed this module.

While much has been accomplished, there is more to be done. The fundamental tools identified below include: a statewide outreach strategy with regional components, a CDFW guide to developing outreach materials, and staff support for the coordination and review of products developed by outreach participants. Together, they provide a consistent structure and approach to the development and implementation of MPA outreach materials statewide. This enables all levels of government (federal, state, Tribal, and local), the private sector, NGOs, communities, educators, and stakeholders to work together to provide reliable, efficient, and appropriately focused MPA information to the public. This section describes CDFW's responsibilities regarding MPA outreach and actions the MLPP could take to implement effective outreach.

Outreach Priorities

CDFW, through the MLPP, has the responsibility to provide MPA regulations to the public. Recognizing this responsibility, CDFW's outreach goals are to: increase MPA awareness and understanding, facilitate MPA regulatory compliance, support enforcement, and encourage informed enjoyment and stewardship of MPAs while decreasing unintentional violations. In order to meet these goals, an approach focused on informing users of regulations is CDFW's core function. In this approach to outreach, the initial focus of providing user groups the basic knowledge needed to understand and enjoy MPAs (e.g., locations, boundaries, allowed uses) is an effective measure. It is expected that this approach will support the long-term positive effects of the MPA network, as over time there will be greater voluntary compliance with MPA take regulations.

Additional outreach efforts developed at a more interpretive level, which focus on closely related marine issues and how they interact with and relate to MPAs, would serve to supplement initial regulatory-based outreach efforts. This would allow for a layered outreach approach that uses a variety of actions designed to further increase public understanding and encourage acceptance, while providing incentive for shared stewardship commitments that go beyond the requirements of the law. For achieving its effective outreach and compliance-building goals, the MLPP have prioritized the following actions:

- **Broadly and collaboratively disseminate information:** Continue to distribute information/products to the public through agencies, ocean-related organizations and businesses, and local citizen groups, to improve public understanding of regulations
- **Develop statewide, regional, and local-scale outreach projects:** Statewide and regional outreach efforts can support individual outreach projects by providing information on MPA locations, allowed uses, and benefits; providing localized input on individual MPA signs, panels, and brochures; and helping bring attention to individual

MPA habitats and living marine resources, conservation objectives, and rules intended to achieve them

- **Encourage community involvement:** Community involvement can help foster compliance, especially when working directly with CDFW enforcement and outreach staff; guidance regarding community and citizen actions can be provided to support effective involvement and accurate messaging in materials development
- **Provide targeted outreach:** Conduct directed outreach as needs arise, adapted to address special compliance and enforcement concerns and address public misconceptions; employ a combination of traditional methods and newer technologies to reach a diversity of audiences
- **Focus interpretive outreach on the purpose of MPAs:** Focus additional outreach efforts on raising understanding about the conservation goals and values identified in the law, the role of MPAs as a tool for effective resource management, and the rationale and objectives for individual MPAs, and raise awareness about the particular habitats and/or species found within the specific location

Approach to MPA Outreach

To achieve the goal of the MLPA to “ensure that the state’s MPAs are designed and managed, to the extent possible, as a network,”⁸⁷ a statewide MPA outreach strategy should be developed to:

- Identify overarching outreach goals, strategies, general priorities, and standards to apply statewide
- Identify the role of partners and CDFW in outreach and education activities
- Guide the development of regional outreach, interpretation, and education plans that implement the statewide strategy at the regional scale in a manner that supports statewide consistency and coherency.
- Develop regionally-specific outreach plans

Regionally-specific outreach plans for implementing the statewide outreach strategy should be developed as components of Regional MPA Background and Priorities document. Each regional outreach plan may:

- Consider the unique outreach needs of the region and identify appropriate regional approaches
- Identify existing regional programs and assets
- Identify information gaps, priorities, and prospective strategies to fill gaps
- Identify potential partners in the region with specific outreach expertise and capacity

Coordination of Outreach Efforts

Effective regional collaboration and coordination among outreach participants has been found to be helpful for sharing information and experiences, identifying common priorities, and finding

⁸⁷ FGC §2853[b][6]

collaborative solutions.⁸⁸ Therefore, a comprehensive MPA outreach program will utilize CDFW and other MLPP partner resources and build effective outreach partnerships. Directed partner contributions can assist and supplement existing outreach activities, leverage skills, expand resources and expertise beyond those of CDFW, and help to reach new target audiences (see the Partnership Plan for more information).

However, in order for materials developed by outreach participants to effectively serve the public and supplement CDFW efforts, they should adhere to specific product standards and be developed in coordination with CDFW. Product standards developed by CDFW and provided to outreach participants through written and verbal guidance along with a defined product review process will help to ensure accurate messaging, increase regulatory compliance, and ensure the use of biologically accurate information regardless of who developed the product. An MPA outreach program should be established with this in mind and work to provide a central point for coordination of, and responsibility for, activities associated with MPA outreach and its oversight at all levels. This will include the following core actions:

- **Establish structure and procedures for coordination:** Identify processes and associated procedures that facilitate coordination and cooperation between MLPP and other partners
- **Develop outreach standards:** Develop standards including protocols for outreach information and signage to achieve reliable outcomes both internally and from partners
- **Provide written outreach and partners guide:** Issue outreach standards and guidance in written format as a “Partners Guide.” Provide an additional review process to augment the written guide
- **Conduct outreach product oversight and review:** Provide individual guidance, input, and product review where possible, to ensure that partner outreach products are delivered to the public consistent with laws, regulations, policies, standards, and best practices

3.2 ENFORCEMENT

The MLPA identified enforcement as one of the chief deficiencies in California’s previously existing MPAs. Therefore, the MLPA emphasizes the importance of adequate enforcement as a goal of the MLPP⁸⁹ and the inclusion of enforcement measures for all MPAs,⁹⁰ and that the Master Plan includes recommendations for improving enforcement. This section describes enforcement objectives for the MPA network and, because CDFW is the primary agency responsible for MPA enforcement, describes CDFW’s responsibilities for ongoing MPA enforcement.

⁸⁸ National Marine Protected Area Center. (2014). *Updated Framework for the National System of Marine Protected Areas of the United States*. Retrieved Sept 21, 2015 from <http://marineprotectedareas.noaa.gov/pdf/national-system/framework-mpa-oct14.pdf>

⁸⁹ FGC 2853(b)(5)

⁹⁰ FGC 2853(c)(2)

Enforcement Plan Objectives

Because the main objective of an MPA enforcement plan is to ensure compliance with regulations, CDFW views outreach and education as a primary tool to support enforcement (see Chapter 3.1). Effective outreach and education of MPA regulations, including MPA boundaries, and the potential benefits of MPAs, builds understanding and buy-in for MPAs and leads people to follow regulations voluntarily, thereby helping alleviate demand on marine resources. In addition to these front-end efforts through outreach and education, compliance is enhanced through on-the-water enforcement efforts such as visible and consistent patrols. Given current CDFW resources, additional enforcement personnel and assets will be needed to effectively enforce the entire MPA network. Increased use of cooperative agreements with other agencies may be a partial solution, but additional funding for enforcement will also be necessary.

Box 3. Priority Area Identification

Enforcement priorities are developed based on the potential for resource impact, level of use, and potential for violations. High priority areas include habitats that are particularly vulnerable to damage, areas with high aggregations of critical species or species at low abundance, and areas where violations are likely to occur or have occurred at high rates in the past.

Within the primary objective of ensuring compliance with regulations, the objectives of the enforcement plan is comprised of the following categories:

Operational Ability

- Identify areas of high priority, biological sensitivity, or enforcement need (see Box 3)
- Determine MPA network enforcement needs
- Hire additional enforcement officers
- Evaluate potential remote observation technology and techniques

Cooperative Efforts

- Maintain and enhance cooperative enforcement efforts with allied agencies
- Effectively utilize judicial system resources
- Develop a standardized training program
- Seek and support ongoing and enhanced MOUs

Public Awareness, Outreach, and Education

- Establish an MPA outreach program (see Chapter 3.1)
- Develop outreach materials for enforcement staff to distribute
- Develop standardized signage protocols
- Establish an education advisory board
- Hold public forums to educate specific groups

CDFW Enforcement Responsibilities

CDFW's enforcement staff is charged with enforcing marine resource management laws and regulations over an area encompassing approximately 1,100 miles of coastline out to three nautical miles, resulting in 5,280 square miles of state waters. To do so, CDFW will emphasize patrol of areas of particular concern or at particular risk (see Box 3 above) and use advanced technology and surveillance systems, to the extent practicable, as called for in the MLPA.

In addition to enforcing MPA laws in state waters, CDFW staff also provide enforcement of federal laws and regulations within state waters as well as federal waters, which extend from three to 200 nautical miles out to sea (the US Exclusive Economic Zone). Enforcement duties include all commercial and sport fishing statutes and regulations, all California Fish and Game Code (FGC) and Title 14, CCR, respectively, marine water pollution incidents, homeland security, and general public safety. General fishing regulations and other restrictions apply within MPAs in addition to MPA-specific restrictions.

CDFW shares jurisdiction for federal regulations including the Magnuson Stevens Fishery Conservation and Management Act, the Endangered Species Act, Marine Mammal Protection Act, the National Marine Sanctuaries Act, and the Lacey Act. A significant portion of both commercial and recreational fishing effort, and subsequently CDFW enforcement effort, occurs in federal waters. Therefore, the existing patrol effort beyond state waters and outside MPAs is important to consider in the plan. How effectively state and federal regulations are enforced within and around the MPAs will affect the MPAs' effect on conserving and protecting marine resources.

Given CDFW's other broad mandates to enforce both state and federal marine resource regulations, current assets are not adequate to redirect to MPA-specific patrols.⁹¹ The increased focus on MPAs suggested by the MLPA and the comprehensive network the act mandates will necessitate not only a detailed enforcement plan, but additional enforcement assets as well (see Appendices C-F, Section 6).

3.3 REGIONAL MPA BACKGROUND AND PRIORITIES DOCUMENTS

The 2015 Master Plan focuses on statewide guidance relative to MPA management, and emphasizes the importance of an adaptive and evolving approach to management. In recognition of the science-based and stakeholder driven MPA design and siting processes that led to the completion of California's statewide MPA network (see Appendix A), Regional MPA Background and Priorities documents are included as appendices to the 2015 Master Plan to include region-specific MPA design considerations and priorities moving forward; which together provide important context to base future informed statewide MPA management decisions upon. In the 2008 Master Plan, previous iterations of these documents, then called "regional management plans," were contained in a single appendix.⁹² The updated regional MPA Background and Priorities documents include unique regional features and design considerations, regional goals and objectives, summaries of regional MPAs, and regional plans

⁹¹ Detailed information about existing enforcement assets and personnel can be found in Section 6 of each regional MPA Background and Priorities document

⁹² CDFW. (2008). *Draft Master Plan for Marine Protected Areas. Appendix O, page O-6*. Retrieved Sept 21, 2015 from <https://www.wildlife.ca.gov/Conservation/Marine/MPAs/Master-Plan>

for scientific and enforcement considerations moving forward (Table 7). Regional MPA Background and Priorities documents are not meant to contain specific details for management protocols and methodologies; they instead are intended to be living documents that are readily accessible for reference and adaptive management, and serve as a logical starting place for guiding regionally-based activities. While MPAs are actively managed at the local and regional scales, the MLPP will always consider management from the perspective of the statewide network as a whole, informed by lessons and best practices from finer scales across the state. All regional MPA Background and Priorities documents have a standardized structure and are included as separate appendices, recognizing the varying ecological, social, and economic conditions along California’s coast (see Appendices C-F).

Table 7. Overview of Regional MPA Background and Priorities Documents’ Standardized Structure

Section	Description
Introduction	Describes the role of Regional MPA Background and Priorities documents and their relationship to the Master Plan, and provides a brief overview of the information they contain
Description of Region	Provides a description of information unique to the region that is relevant to MPA management
Considerations for Designing Regional MPAs	Describes region-specific goals and objectives, stakeholder priorities and objectives, design considerations, and implementation considerations
Summary of Regional MPAs	Summarizes MPAs in the region, including information on area, along-shore span, depth, primary habitat types, regulations, boundaries, a summary of objectives, detailed objectives, and a map depicting the location
Scientific Information	Describes scientific information relevant to regional MPA management, including information on the regional monitoring plan, with links to the specific baseline and long-term monitoring plans, and a description of and link to a list of species most likely to benefit from MPA protection, which may inform monitoring and evaluation of MPA effectiveness
Enforcement Plan	Includes information pertaining to enforcement challenges and opportunities specific to each MPA, an inventory of personnel and equipment, and current and potential enforcement partnerships

3.4 ALIGNING MPAs AND OTHER MARINE RESOURCE MANAGEMENT EFFORTS

The MLPP is coordinating to connect MPA science and management with other efforts and activities, such as fisheries, water quality, climate change, and other management efforts as they emerge. As such, collaborative efforts will be crucial for taking an ecosystem-based approach to management, in which managers recognize the numerous interactions within an ecosystem, including humans, instead of focusing on a specific issue, species, or ecosystem service (Christensen et al. 1996). Furthermore, coordination will be essential for planning and carrying out an effective approach to adaptive management.

While CDFW and the Commission retain jurisdiction over the management and take of species within state waters, including within MPAs, the MLPA cannot supersede otherwise lawful activities that are not within the authority of the Commission to regulate.⁹³ Regulatory agencies should take into consideration the existence of MPAs in their review of the environmental

⁹³ FGC §2852(d)

impacts of authorizing a given activity. CDFW may also coordinate with non-regulatory entities such as the OPC and other key partners.

The effort to align MPA management with other marine resource management efforts is largely unprecedented and therefore experimental in nature (see Fox et al. 2013b; Appendix A, Section 3.3: *MPA Design and Management Considerations*). This section shares an overview of how the MLPP is aligning or could align with management of fisheries, water quality, climate change, marine debris, invasive species, which are among some of the most pressing areas for management (Halpern et al. 2009). In addition, this section shares brief summaries of other current and emerging efforts.

Fisheries Management

Overall, while the MLPA calls for by-in-large ecosystem protection,⁹⁴ it also envisions integration of MPAs and fishery management.⁹⁵ The MLPA states that “MPAs and sound fishery management are complementary components of a comprehensive effort to sustain marine habitats and fisheries”⁹⁶ and requires that MPA management be carried out “with the advice, assistance, and involvement of participants in the various fisheries.” For example, MPAs can serve as an effective conservation and recovery tool for species at risk, vulnerable species, and species with the greatest conservation need by providing protections for essential fisheries habitat and ecosystems. This connection is further reinforced in California’s 2015 State Wildlife Action Plan, which includes linking MPA monitoring as a component of its Data Collection and Analysis conservation strategy.⁹⁷ Efforts have been made to align MPAs with fisheries management. For example, CDFW convened a 2011 workshop focused on MPA and fisheries integration⁹⁸ to share information and ideas, and OST and CDFW have developed options to better align fisheries monitoring and MPA monitoring through the development of regional MPA monitoring plans.^{99,100,101} The MLMA Master Plan for Fisheries is slated to undergo revision by 2017, and represents an opportunity to build upon existing efforts to integrate MPAs and fisheries management.¹⁰²

Water Quality

Water quality is closely tied to the health of California’s coastal ecosystems, including within MPAs. Point-source and non-point source pollution lead to harmful algal blooms, human health issues, heavy metal sedimentation, and beach closures, which can have impacts on local

coastal economies (Abraham & Parker 2000; Bay et al. 2003; Anderson et al. 2002; He & He 2008). Aquaculture effluent, once-through cooling from power plants, and brine run-off from desalination plants can also impact water quality.¹⁰³ To reduce negative impacts on water quality,¹⁰⁴ the SWRCB, which is named as a managing agency in the MMAIA, sited and implemented State Water Quality Protection Areas (SWQPAs) along the California coast, with the purpose of supporting biodiversity and unique species. These areas include areas of special biological significance and general protection areas (SWQPA-GP), with SWQPA-GPs being designated specifically to protect water quality within MPAs. In addition, SWRCB amended their California Ocean Plan in 2012 to address the designation of new SWQPAs and MPAs.¹⁰⁵ The regional MPA monitoring plans developed by OST, in partnership with CDFW, include guidance for monitoring of species that are sensitive to water quality and encourage partnerships with existing water quality monitoring programs that maintain and gather water quality data.

Climate Change

MPAs are also linked to marine management efforts related to climate change. CDFW recognizes the effects that climate change has on marine resources¹⁰⁶ and partners on numerous climate change-related projects and issues such as hypoxia, ocean acidification, and the State Wildlife Action Plan process. Although the MLPA does not require consideration of climate change in MPA management, the MLPP recognizes that climate change will likely have an effect on MPAs. At the same time, California's MPAs could potentially help buffer California's living marine resources against the negative impacts of climate change by providing areas of reduced pressures exerted on the resources (Micheli et al. 2012). Furthermore, MPAs can act as "living laboratories" to help scientists and decision-makers understand differences in ecosystem responses to climate change both within and outside MPAs. The MLPP is building partnerships with groups that have aligned and complementary expertise and missions regarding the impacts of climate change on California's MPAs in order to ensure coordination and reduce duplication of effort.

Marine Debris

Marine debris can lead to mortality of marine life through ingestion, entanglement, and ecosystem alteration.¹⁰⁷ CDFW's Office of Spill Prevention and Response maintains a Marine Wildlife Veterinary Care and Research unit that conducts opportunistic research on marine debris' impacts on marine life and is coordinating with CDFW staff to link MPA and marine debris monitoring (Rosevelt et al. 2013). Additional collaborations to address the impact of marine debris are also occurring with organizations including the University of California Davis, OPC, the SCC, the Northwest Straits Commission, and the National Oceanic and Atmospheric Administration's (NOAA) Marine Debris Program. In addition, beach clean-up programs such as the Coastal Clean-up Day managed by the CCC, while offering only temporary alleviation from marine debris, can help to reduce entry of land- and ocean-based marine debris into the

oceans. Current research and monitoring of marine debris may help document the extent to which marine debris impacts MPAs and can help to inform efforts to reduce marine debris within or adjacent to MPAs.

Invasive Species

The impact of aquatic invasive species is not widely understood, especially related to MPAs. MPAs could be effective tools for limiting the spread of invasive species and providing safe harbors for native marine species within their boundaries (Francour et al. 2010). However, there is also some research indicating that invasive species thrive in MPAs, which could thereby undermine the MPAs' integrity (Otero et al. 2013). The MLPP will work to identify opportunities to link MPAs and aquatic invasive species management, both internally and with other agencies responsible for managing invasive species, such as the SLC. In addition, OSPR's Marine Invasive Species Program (MISP) conducts biological monitoring in coastal and estuarine waters to determine the level of invasion by non-native species and works to coordinate with the SLC. CDFW Marine Region staff will work to integrate MPA considerations into future biological monitoring by MISP and help to detect new introductions that may impact MPAs.

Other Marine Management Efforts

In addition to fisheries, water quality, climate change, marine debris, and invasive species, the MLPP may take into consideration the relative impacts of other activities occurring in MPAs when managing the MPA network. This section briefly describes marine management efforts related to these other activities.

- **Non-extractive Uses:** While MPAs can provide opportunities and enhance non-extractive uses of MPAs, such as scuba diving or boating, these uses should be effectively managed to avoid negative impacts caused by overuse beyond the carrying capacity of an MPAs. The MLPP is aware of the potential impact of these uses and will be available to coordinate management of non-extractive uses in MPAs in a way that is consistent with the goals, objectives, and regulations of each individual MPA. Furthermore, the MLPP will take lessons from individual cases and apply them to other sites and the broad network.
- **Oil and Gas Drilling and Transport:** There are currently federal and state moratoriums or bans on leasing of offshore areas for oil and gas mining activities.^{108,109} However, offshore oil drilling in federal and state waters on existing leases and gas extraction, including hydraulic fracturing, are occurring in federal waters. Therefore, it is important to consider that potential risks from oil or chemical spills could impact MPAs if they were to occur. CDFW is not responsible for managing these operations, but routinely communicates and trains with other agencies, including the Bureau of Ocean and Energy Management, SLC, CCC, and the US Coast Guard to ensure that oil spill prevention and response plans consider catastrophic impacts to MPAs.

http://www.boem.gov/uploadedFiles/BOEM/Oil_and_Gas_Energy_Program/Leasing/Five_Year_Program/2012-2017_Five_Year_Program/01_Introduction_Purpose_Need.pdf

- **Hydrokinetic Power Projects:** California currently has no hydrokinetic power projects, although a past project proposed near Point Cabrillo SMR by Pacific Gas and Electric Company was denied by the Federal Energy Regulatory Commission.¹¹⁰
- **Military Exercises (including Naval Sonar):** MMA classifications may not be inconsistent with US military activities deemed mission critical by the US Military (See Appendix A, Section 3.3: *MPA Design and Management Considerations*; Appendix F, Section 3.3; and Fox et al. 2013b).^{111,112}
- **Other Forms of Acoustic Pollution:** Regulatory agencies and commissions, such as the CCC, have the authority to protect and oversee coastal uses that may impact MPAs, including seismic imaging for various uses (e.g., oil and gas exploration). The CCC is now beginning to consider the impacts of acoustic pollution on MPAs in their decision-making. For example, the CCC rejected a permit application requesting use of seismic air guns in central California due to potential “damage to marine protected areas.”¹¹³ CDFW and the Commission provided consultation on this ruling by raising concerns that there could be impacts on four MPAs within or adjacent to the proposed survey area, based on the project as proposed.¹¹⁴

The MLPP will continue to work to determine if and how to link MPA management to these growing or emerging management themes in the future.

CHAPTER 4

Adaptive Management

The MLPP is coordinating with partners to develop a process of adaptive management for California's MPA network that helps evaluate whether the MPA network is making progress toward achieving the six goals of the MLPA. This section describes the purpose and objectives of adaptive management of the MLPP; monitoring, research, and development that is used to inform adaptive management; and the process used to carry out adaptive management.

4.1 ADAPTIVE MANAGEMENT OF THE MLPP

Adaptive management, as defined by the MLPA, is a process that seeks to improve management by learning from program actions such as monitoring and evaluation of ecosystem, and management effectiveness (see Box 4). Based on this definition, the MLPP will follow a process for adaptive management of California's MPA network.

Box 4. MLPA Definition of Adaptive Management

The MLPA describes adaptive management as:

“Adaptive management,” with regard to marine protected areas, means a *management policy that seeks to improve management of biological resources, particularly in areas of scientific uncertainty, by viewing program actions as tools for learning. Actions shall be designed so that, even if they fail, they will provide useful information for future actions, and monitoring and evaluation shall be emphasized so that the interaction of different elements within marine systems may be better understood* (FGC 2852[a]).

CDFW already carries out many activities that fit under the umbrella of adaptive management. For example, in 2014, CDFW proposed and the Commission adopted amendments to clarify complex regulations to improve compliance and enforceability.¹¹⁵ Soon thereafter, in 2015, CDFW drafted amendments to improve boundary accuracy and clarify regulatory language to improve network compliance and enforceability. In the near future, regulatory amendments may also be drafted to address existing and emerging management issues with the network, such as extending Tribal take allowances within MPAs in all the regions.¹¹⁶ As with any new program, especially of the magnitude of California's MPA network, ongoing regulatory adjustments to align MPAs with their original intent or to address management or enforcement concerns may be warranted. Collaborative MPA management, guided in part by the Partnership Plan, will support additional partnership-based adaptive management efforts into the future. The adaptive management process (outlined in Chapter 4.5 below) below will provide a framework for implementing future adaptive management measures.

¹¹⁵ California Fish and Game Commission. (2014). *Marine Protected Areas Clean Up*. Approved regulatory language: <http://www.fgc.ca.gov/regulations/2014/632fregs.pdf>

¹¹⁶ CCR, Title 14, Section 632(a)(11) and (b)(1-2, 6, 8-9, 15-16, 20-21, 25, 27)

Purpose of Adaptive Management

The MLPP recognizes that adaptive management can be appropriate in cases where there is uncertainty about the impacts of management actions¹¹⁷ or about the costs and benefits of collecting different types of data and information, as in the case of California's MPAs. Adaptive management can also serve an important role in resource management by providing a framework for responsive change in management measures based on current or emerging stressors. Importantly, the MLPP also views adaptive management as a mechanism for sharing information about the effectiveness of the MPA network in reaching its goals not only with agencies, but also with Californians at large.

Ten-Year Formal MPA Management Reviews

To inform the adaptive management process (see Chapter 4.5), there is the need for a formal review cycle of California's MPA network on a time scale that is both biologically appropriate, and administratively feasible and cost effective. Furthermore, the MLPA requires California's MPAs are designed and managed, to the extent possible, as a network.¹¹⁸ Significant efforts were made to ensure California's MPAs were designed to function as an ecologically connected statewide network (see Appendix A, Boxes 1-3), through four incremental science-based and stakeholder driven regional MPA planning processes resulting in the staggered adoption of MPAs across the state; the Central Coast MPAs in September 2007, North Central Coast MPAs in May 2010, South Coast MPAs in January 2012, and North Coast MPAs in December 2012 (see Chapter 2.2 and Appendix A). Prior to the completion of the statewide MPA network in 2012, the 2008 Master Plan recommended comprehensive reviews of monitoring results to the Commission every five years for each of the four regional MPA networks, in addition to annual reporting on monitoring results, and triennial MPA petition hearings scheduled by the Commission.¹¹⁹ However, based on the best readily available science and lessons drawn from regional MPA implementation, an ongoing five-year MPA review cycle for incrementally adopted MPAs across four regions is not biologically appropriate or administratively sustainable. The MLPP has therefore set a 10-year cycle of formal management reviews for the statewide MPA network, and is leading the design of a statewide MPA monitoring program, which includes and draws from regional components, to gather sufficient information to evaluate network efficacy and inform the formal 10-year MPA management review (see Chapter 4.3).

The timeframe for the 10-year review is more biologically appropriate, drawing from scientific empirical research and theoretical modeling demonstrating that variables such as biomass, species density, species richness, and size of marine organisms increase with time in no-take reserves (Lester et al. 2009, McCook et al. 2010, Caselle et al. 2015), but may not be realized or easily detected on short timeframes (Babcock et al. 2010, Moffitt et al. 2013, White et al. 2013). This is particularly true in highly dynamic temperate ecosystems such as the California Current and for species such as rockfishes that are long-lived, slow growing, and late to mature (Botsford et al. 2014, Starr et al. 2015). For example, monitoring fish biomass on nearshore rocky reefs in the northern Channel Islands MPAs over the first five years of implementation did

¹¹⁷ Ballard, A., Birss, H., Botta, R., Cantrell, S., Gonzales, A., Johnson, B., Spautz, H., Torres, S., & Yamamoto, J. (2014). *Incorporation of Adaptive Management into Conservation Planning and Resource Management*. Retrieved Mar 4, 2015 from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=86989&inline=1>

¹¹⁸ FGC §2853(b)(6)

¹¹⁹ FGC §2861(a)

not allow enough time to observe dramatic changes,¹²⁰ but after 10 years, Caselle et al. (2015) demonstrated that the biomass of target fish species increased consistently inside MPAs. However, monitoring nearshore fishes in Central Coast MPAs over seven years, Starr et al. (2015) determined that 20 years or more may be needed to detect significant changes due to MPA implementation. The timing (i.e., short or long response times), direction (i.e., increase, decrease, or no change), and magnitude of these changes to MPA implementation depends on factors such as MPA age (number of years implemented), size, geography (i.e., whether an MPA is located in southern California versus northern California), and degree of protection (i.e., no-take or limited take), the life history characteristics of target species (i.e., age of maturity, movement, natural mortality rate, lifespan, and larval dispersal pattern), habitat, fishing intensity outside MPAs, and other environmental factors such as complex oceanographic patterns or other indirect effects (Babcock et al. 2010, White & Rogers-Bennet 2010, Carr et al. 2011, White et al. 2011, Moffitt et al. 2013; Botsford et al. 2014, Baskett & Barnett 2015, Caselle et al. 2015, Starr et al. 2015, Young & Carr 2015). These interdependent factors may cause difficulty interpreting monitoring data on short timeframes; for example, fished species may slowly increase, decrease, or oscillate immediately after MPA implementation, even when the long-term trajectory would include an increase in abundance (White et al. 2013). In summary, both empirical evidence from California and theoretical modeling affirm the need for long-term monitoring to detect changes that are attributable to MPAs and an appropriately long timeframe, such as every 10 years, for a management review cycle. Monitoring and the ability to detect and adapt to ecological changes is key to track progress and determine whether changes in management are warranted (Lubchenco & Grorud-Colvert 2015, Schindler & Hilborn 2015). Management adjustments should be made with caution to allow sufficient time to effectively evaluate MPA effects before adjustments are made (Gleason et al. 2013, Moffitt et al. 2013).

The formal 10-year management review will emphasize ecological, socioeconomic, and governance aspects of the network and may include, but not be limited to, a scientific evaluation, public scoping meetings, and panel discussions to determine the status, function, and possible changes to the network. The scientific evaluations that inform the formal 10-year management review will encompass multiple elements, including a scientific assessment of ecological and socioeconomic MPA monitoring results (see Chapter 4.3), together with other data streams such as MPA enforcement data. Based on the 10-year reviews, the Commission may take adaptive management actions if data and information support a change. During the adaptive management cycle, the MLPP may also refine and adjust management tools, measures, and strategies based on the management review and progress made toward achieving the specified objectives. Management tools, measures, and strategies fall into three primary categories: 1) MPA Design, including size and spacing; 2) MPA Access, including permitting, take in relevant MPA types, and use; 3) Enforcement; and, 4) Outreach and Education.

4.2 MLPP MANAGEMENT OBJECTIVES

The six goals of the MLPA are inextricably connected and provide guidance for developing management objectives to determine how the MLPP is performing and, ultimately, if the mandates of the MLPA are being met. The MLPA goals recognize the intrinsic value of marine

¹²⁰ CDFW, PISCO, CINMS, and Channel Islands National Park. (2008). *Channel Islands Marine Protected Areas First 5 Years of Monitoring: 2003-2008*. Airamé, S. and J. Ugoretz (Eds.). 20 pp. Retrieved Aug 7, 2015 from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=31325&inline=true>

natural heritage for all Californians, including Tribes and Tribal governments, and establishing objectives helps take steps towards protecting these places of importance. This section outlines management objectives to effectively and adaptively manage the MLPP, which includes California's MPA network as well as all state MPA governance and management mechanisms and institutions (for information about the management activities to support the MLPP, see Table 6). Management objectives provide guidance to the MLPP and increase partner and public understanding of MPA management priorities.

These management objectives are not intended to be comprehensive, nor specific to each of the six goals of the MLPA, but rather to address the goals holistically, inform the design of the statewide monitoring program, and enable the evaluation of MPA network performance towards meeting the goals of the MLPA. Some objectives speak to the MLPA goals at a high level, while others focus on management tools, measures, and strategies available to support and advance the MLPP. Furthermore, the MLPP management objectives may change during the ongoing adaptive management cycle (see Chapter 4.5). The MLPP will also need to evaluate the objectives in the context of changing ocean conditions and multiple ocean threats, such as climate change, fishing pressure, water quality degradation, marine debris, invasive species, and other existing and emerging issues. As traditional understanding and the components of ecosystem structure (i.e. species and functional groupings) and function (i.e. ecological interactions) may change significantly in the future. Evaluating the effectiveness of the MPA network at achieving the management objectives will need to account for this reality.

Below are the management objectives that the MLPP will address to effectively manage California's MPA network and provide management recommendations to the Commission for the formal 10-year management review, as a part of the adaptive management cycle.

MLPP Management Objectives:

- Protect the structure and function of marine ecosystems
- Improve native marine life populations, including those of economic value
- Ensure minimal disturbance while allowing for sustainable opportunities for recreation, education and research
- Ensure comprehensive representation of all key habitats, including unique habitats
- Use learning acquired through administration of the MLPP to adaptively manage the objectives, management measures, enforcement efforts, and scientific guidelines to inform management decisions
- MPAs and the MLPP function as a cohesive statewide network

4.3 STATEWIDE MONITORING PROGRAM

Knowledge about the efficacy of MPA networks that cover a geographic scale as large as California is limited due to the limited empirical data from large-scale MPA networks (Gaines et al. 2010a, b; Grorud-Colvert et al. 2011, 2014). Therefore, California's MPA network offers a unique grounds for collecting data and information to learn about the effects of a large-scale MPA network and inform management (NOAA 2013). Based on scientific findings which suggest relatively long time scales for detecting the effects of MPAs, there is the need for long-term monitoring to gather sufficient information to evaluate network efficacy and inform adaptive management (see Chapter 4.1: *Ten-Year Formal MPA Management Reviews*).

This need is described in the MLPA, which requires “monitoring, research, and evaluation at selected sites to facilitate adaptive management of MPAs and ensure that the [MPA] system meets the goals.”¹²¹ Therefore, monitoring results and additional information potentially collected from other scientific data, governance and management review, workshops, and public forums is an accumulation of information that could be used to inform adaptive management which is a response to that information (see Chapter 4.5). The MLPA, together with policy guidance including the Partnership Plan, have guided and will continue to guide the MPA monitoring approach outlined in this section, which will be used to inform adaptive management of California’s MPA network.

Current Status of MPA Monitoring

CDFW partnered with OST to develop a scientifically rigorous statewide MPA monitoring framework relative to the goals of the MLPA, in the form of regional MPA monitoring plans.¹²² Adopted by the Commission as an appendix to the MLPA Master Plan, this framework guides monitoring across the California’s MPA network through an ecosystem-based approach. With this approach, monitoring seeks to understand ecosystem condition and trends (including human uses), and to scientifically evaluate MPA design and management decisions. Figure 9 illustrates this high-level, statewide approach to MPA monitoring. Notably, although evaluation activities are distinct from monitoring, evaluation constitutes one of the core components of the monitoring framework, as illustrated in Figure 9. Furthermore, as described in the MLPP adaptive management process (see Chapter 4.5), research and development play important roles throughout the MPA monitoring framework (see Chapter 4.4).

To date, the statewide monitoring framework has been used primarily to guide baseline monitoring efforts and has served as the foundation for the development of regional monitoring plans and long-term monitoring needs. Moving forward, it will inform the process of building out a more detailed plan for statewide MPA network monitoring.

CDFW, OST, and OPC have taken significant steps towards establishing a long-term, statewide MPA monitoring program based on the statewide monitoring framework and the existing regional monitoring plans. Figure 10 below illustrates the timeline and milestones of baseline monitoring activities in each region and the first formal 10-year management review, anticipated to take place in 2022. Baseline monitoring will be followed by long-term monitoring in each region, and results from monitoring will inform the formal 10-year statewide management review.

Regional monitoring plans for the North Central Coast (2010), South Coast (2011), and Central Coast (2014) regions have been developed to provide guidance on implementation of both baseline and long-term monitoring.¹²³ The regional monitoring plans align with the statewide MPA monitoring framework while incorporating unique characteristics of each region.^{124,125,126,127}

¹²¹ FGC §2853(c)(3), §2852(a), and §2856(a)(2)(H)

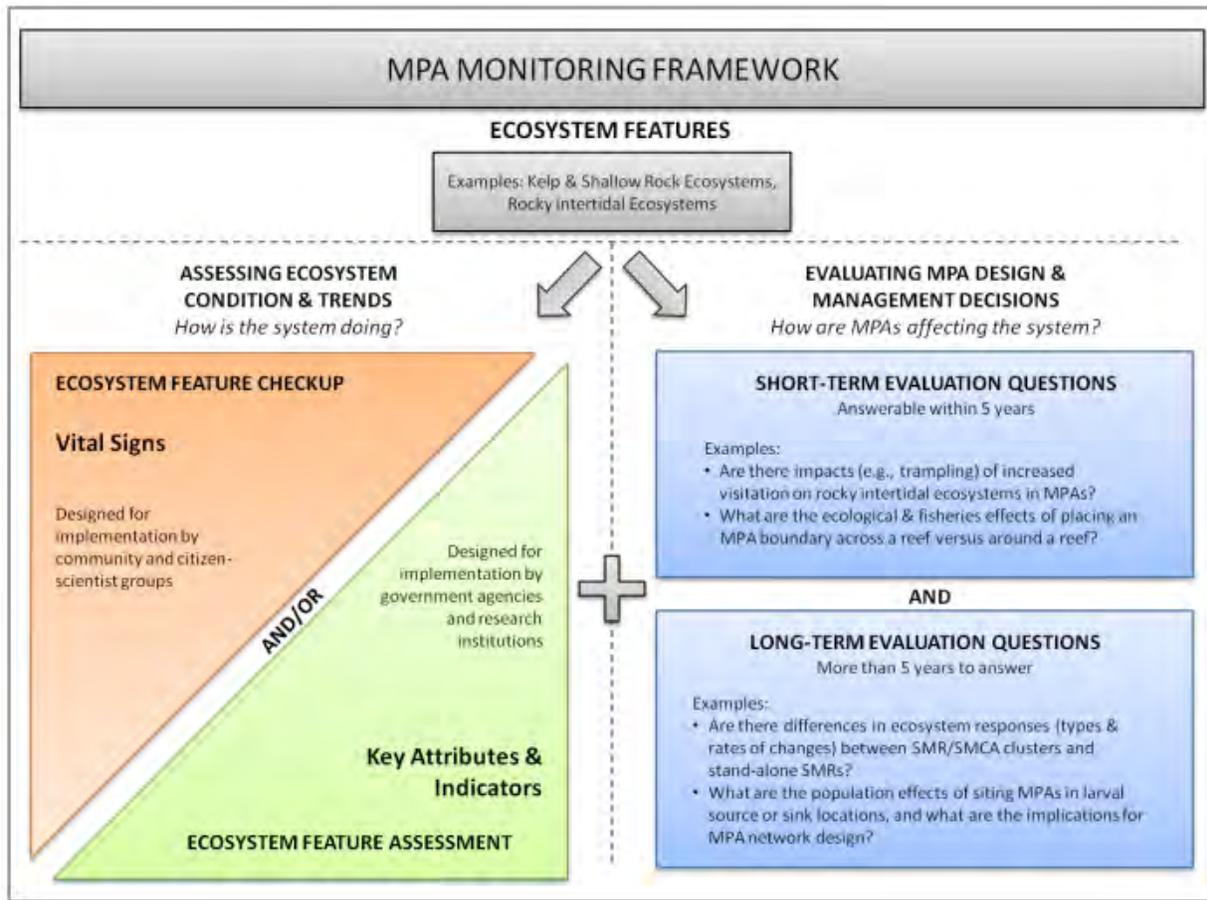

¹²² The North Central Coast MPA Monitoring Plan was adopted by the Commission April 7, 2010, the South Coast MPA Monitoring Plan was adopted by the Commission on August 3, 2011, and the updated Central Coast MPA Monitoring Plan was adopted by the Commission on October 8, 2014

Figure 9. California's Statewide MPA Monitoring Framework¹²⁸

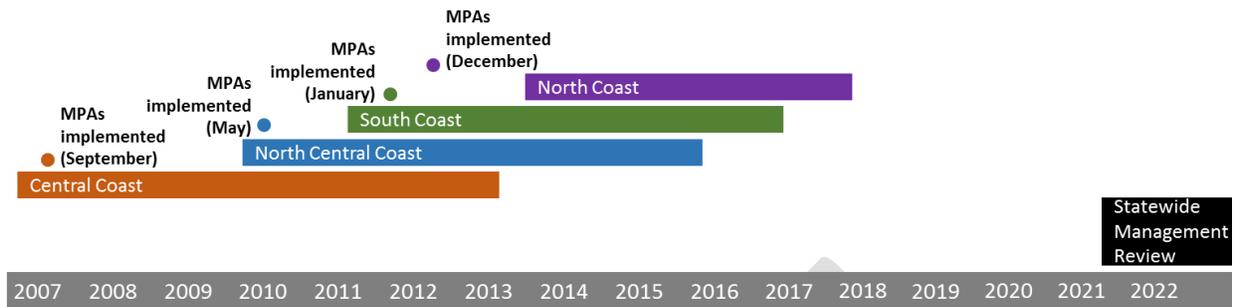

Once MPAs are implemented in each planning region, baseline monitoring data is collected to inform a five-year management review of the baseline conditions, followed by a transition to long-term monitoring. At the time of development of this document, the Central Coast region is the only region to have completed its baseline data collection and five-year review of baseline conditions. Beginning in 2015, efforts are underway between OST, CDFW, and OPC to develop a Central Coast MPA Monitoring Workplan which will serve as the first example of an approach to long-term monitoring that can be adapted to other regions and scaled towards the entire state (see Chapter 4.3: *Long-Term Monitoring*).

Figure 10. Timeline for Baseline Regional Monitoring and Formal 10-Year Statewide MPA Management Review¹²⁹

MPA monitoring results will inform the ongoing process of scientific assessment and evaluation, such as interim evaluations and assessments (see Chapter 4.5), and the evaluation and assessment of data and information for Commission consideration in the formal 10-year MPA management reviews. MPA management will therefore evolve over time through adaptive management and based on monitoring results, and MPA monitoring will likewise be adaptive to remain useful and rigorous as science advances and as management needs change.

Using a Partnership-Based Approach

The MLPA states that monitoring and evaluation shall take into account existing and planned monitoring and evaluation efforts.¹³⁰ Monitoring California's MPA network is not a small task, and thus cannot be carried out by any one agency or organization. Effective, cost-efficient monitoring requires a partnership-based approach that leverages existing capacity across the state and engages the existing wealth of expertise in data collection, analysis and synthesis, and results sharing.

California's approach of establishing a public-private partnership increased the capacity of the state to implement monitoring and builds value and durability for California beyond simply meeting the requirements of the MLPA. To complement the public-private partnership, the Partnership Plan (see Chapter 1) contributes policy guidance for MPA monitoring.¹³¹

To date, the partnership-based approach to MPA management has involved more than 70 agencies, California Tribes and Tribal governments, and organizations in regional baseline MPA monitoring programs. Long-term monitoring will build on this experience, continuing to leverage capacity and establish partnerships to build a cost-effective, sustainable monitoring program statewide. The MSLT has developed a workplan that emphasizes the ongoing need to build partnerships, broaden participation, include knowledge from diverse sources, and build a deeper understanding of ocean health.¹³² The MSLT workplan reflects the philosophy that all

quality science may be useful in building a robust monitoring program, including academic, local, traditional, and citizen science contributions. Citizen science programs provide monitoring support through activities such as trainings to gather biological data in key habitats and recording observations of consumptive and non-consumptive uses of MPAs.

Furthermore, a valuable source of scientific and research expertise lies in California's university systems. California is home to some of the top marine science researchers in the world, and those researchers have an important role to play in enhancing monitoring efforts. These and other top academic institutions can ideally direct their research priorities to align with marine monitoring needs.

Statewide MPA Monitoring

OST, working in partnership with OPC and CDFW, is leading the design of a collaborative process to develop a statewide monitoring program based on the existing statewide monitoring framework and regional monitoring plans. The statewide monitoring program will integrate across the existing policy and management responsibilities of multiple state partners to guide a scientifically rigorous, sustainable program that advances California's policy goals for a healthy and productive coast and ocean and fulfills the mandates of the MLPA. Many of the technical and programmatic pieces built during baseline MPA monitoring will readily support this process.

Statewide MPA monitoring is comprised of three interconnected components: 1) scientific network evaluation questions and metrics; 2) regional MPA monitoring; and 3) beyond the MLPA. The first two components satisfy the requirements of the MLPA, and thus take precedence over the third component, which goes beyond the scope of the MLPA. However, the third component may be useful in identifying how MPA monitoring can help inform other state priorities, such as fisheries, water quality, climate change, marine debris, and invasive species, thereby driving progress towards a shared vision of a healthy and productive coast and ocean. This component will also play into the adaptive management process, which will help to effectively deploy resources to achieve management goals (Douve & Ehler 2011; Williams 2011; Steltzenmuller et al. 2012; also see Chapter 4.1).

In summary, network scientific evaluation questions and metrics inform the design of a statewide MPA monitoring plan, and regional MPA monitoring results can, to a large extent, be integrated across regions to inform network-wide evaluation. In the third component, considering the significance of MPAs within the context of other state priorities allows for greater efficiency among ocean management efforts. The three components of the statewide MPA monitoring program inform the formal 10-year management review (see Figure 11) and are described in more detail below.

Scientific Network Evaluation Questions and Metrics

To meet the MLPP management objectives, CDFW, OST, and partners are committed to developing scientific network evaluation questions and select metrics, based on network-wide objectives (see Chapter 4.2), to inform the development of a statewide MPA monitoring plan. Evaluation questions and metrics within regional monitoring plans provide a starting point for the development of network evaluation questions and metrics, specifically to gain an understanding of ecosystem condition and trends across the state and to assess network performance and thus progress towards MLPA goals.

Like other aspects of MPA management, scientific network evaluation questions and metrics are subject to the process of adaptive management, and therefore may evolve over time. To

capture a holistic view of the statewide network performance and effectively guide monitoring, network evaluation questions and metrics will focus on primarily ecological and socioeconomic information. Though the collection of new socioeconomic data is not required by the MLPA, current and future partners who are putting effort toward MPA social sciences, such as economics, management, and governance, can be engaged by incorporating their data into MPA monitoring. For example, as stated in the Partnership Plan, OPC is leading the effort to undertake a management effectiveness evaluation and will utilize data collected from long-term monitoring, including on socioeconomic, management, and governance metrics. This information can feed into the formal 10-year management review. The following are examples of metrics that could be included in the statewide MPA monitoring program:

- **Biological and ecological metrics:** Focal species (commercial and non-commercial) abundance, biomass, size frequency, diversity, and density; biogenic habitat condition; productivity; and/or community structure and composition
- **Socioeconomic metrics:** Governance and management effectiveness, use of marine resources (consumptive and non-consumptive), number of participants in MPA-related activities, geographic patterns of use in and around MPAs, and/or volunteer and community engagement in monitoring and education

Regional MPA Monitoring

Regional monitoring of MPAs helps track progress toward meeting the goals of the MLPA and provides important local-scale results to help inform regulatory and management decisions. Regional MPA monitoring plans are guided by the statewide MPA monitoring framework, and underpinned by the same basic principles and programmatic priorities. Furthermore, the process for building MPA monitoring workplans for each region will consider activities and plans in other regions as well as the need for connectivity and consistency on issues such as site selection.

The state has developed a two-phase approach to MPA monitoring in each region: 1) establishing a benchmark through baseline monitoring and 2) long-term monitoring. These two phases are explained in more detail below.

Baseline Monitoring

Data and information collected during baseline monitoring establishes a regional benchmark of the ecological and socioeconomic conditions when each regional MPA network took effect and documents any initial changes resulting from MPA implementation. As such, the baseline serves as an important set of data against which future MPA performance can be measured. Baseline programs have been launched or completed in each of the four coastal MPA regions. These programs are designed, implemented, and coordinated by CDFW, OPC, OST, and CASG. Each regional MPA baseline program is administered near MPA implementation (Figure 10), and consists of securing funding, establishing a mechanism for disbursing funds, several years of data collection, data analyses and reporting, disseminating results to as wide an audience as possible, and a five-year monitoring and management review of baseline conditions.

When all baseline programs are completed in 2018 (Figure 10), California will have an unprecedented understanding of ecological and socioeconomic conditions along the entire California coast. Results from baseline monitoring, all of which are made publicly available through OceanSpaces.org, inform the initial five-year monitoring and management reviews of the regional MPA baseline conditions. In addition, results guide the development of collaborative, efficient, and cost-effective long-term MPA monitoring program.

The model established through the first regional management review in the Central Coast includes summarizing baseline monitoring results into a five-year 'State of the Region' report shared broadly in advance of the five-year management review. This information can inform the development of management recommendations, including recommendations to continue to improve monitoring and research, education and outreach, and enforcement and compliance. If management recommendations are identified, they will be presented to the Commission during the formal 10-year management reviews.

Long-Term Monitoring

Building on existing capacity in the state and guided by the regional monitoring plans and workplans, long-term monitoring will be implemented on a regional scale with the built-in ability to look at ecosystem conditions and trends across regions at a statewide network scale. Long-term monitoring will launch first in the Central Coast and subsequently in other regions as the five-year baseline period is completed for each. In each region, the monitoring program will be designed to provide management decision support within the context of the statewide adaptive management review process.

MPA monitoring workplans specify a monitoring program for a stated duration based on available funding, partnership opportunities and capacity in the region, and priorities of CDFW and other partners. These documents include detailed information about recommended budget allocations and funding mechanisms, the specific questions that monitoring should seek to address, design features of ecosystem condition assessments such as temporal frequency and spatial sampling, and incentive structures for encouraging relevant and useful work on the part of organizations and researchers operating in the region.

Not every MPA can be monitored each year, and baseline monitoring results are useful in making strategic choices for long-term monitoring. As directed in the MLPA, long-term monitoring of the MPA network will occur in selected sites. These sites are within the subset of MPAs in the statewide network where the MLPP will focus continued monitoring efforts, and will serve as a frame of reference for assessing the effects of the network as a whole. The process for selecting sites for long-term monitoring is built into workplan development, and balances rigorous scientific design with additional considerations including local priorities and funding availability, management priorities, and opportunities to align with neighboring regions and advance statewide monitoring priorities. For example, the Central Coast workplan for long-term MPA monitoring will include prioritization of sites for tracking change in particular ecosystem features and also considers likely monitoring sites in neighboring regions towards a statewide scale.

Beyond the MLPA

California's MPAs compose a network of living laboratories from which we can gain a greater understanding of the effects of existing and emerging stressors and begin to understand how MPAs may improve resilience to various impacts. While long-term MPA network monitoring is primarily informed by the mandated requirements of the MLPA, it is also developed to provide useful information for other aspects of California's ocean resource management, such as fisheries, climate change, marine debris, and invasive species, as well as other existing and emerging marine management efforts. Comprehensive, partnership-based MPA monitoring can help realize the value of the MPA network in aligning with these other ocean issues.

The MLPP can ensure that the adaptive management process provides a responsive framework for changes in management measures by linking statewide MPA monitoring to ocean issues that go beyond the MLPA.

4.4 RESEARCH AND DEVELOPMENT

Progress in science and technology changes what is possible in MPA monitoring and adaptive management. Realizing those possibilities requires engagement with relevant cutting-edge research and innovative development (see Box 5 for an explanation of the difference between monitoring and research). Just as the design and siting process of the MPA network relied on cutting-edge science, long-term monitoring and adaptive management of the network must continue to do so as well.

Given the size and scope of MPAs in California's statewide network, research activities will be needed to gain a better understanding of the underlying biological, chemical, and physical phenomena and human dimensions (such as socioeconomic effects and effectiveness of governance and management measures) relevant to particular MPAs or the network as a whole. Information gleaned from regional and statewide monitoring about a specific ecosystem or metric may raise questions that can only be addressed through a program of focused research. In addition, research will almost certainly make use of the datasets collected through baseline and long-term monitoring. Applied research will be needed to develop new monitoring methods, metrics, modeling approaches, or other analytical methods as needs arise during the adaptive management process.

To complement research, development can play an important role in learning about marine ecosystems and the effects of MPAs. While research can gain information about MPAs through the use of systematic hypothesis testing, development can advance scientific knowledge and technological capacity beyond the scope of traditional research endeavors. This can include the development of new or improved methods and approaches for increasing accuracy, efficiency, and effectiveness of data and information collection. Development can play an important role in supporting research, such as by creating technological solutions that enable researchers to carry out

Box 5. Making the Distinction between Monitoring and Research

While monitoring and research can be closely linked and inter-related, they can serve distinct purposes for natural resource management. For the purposes of the 2015 Master Plan, monitoring and research are defined as follows:

Monitoring: An ongoing process, sometimes directed by law, of data collection to inform evaluation of changes and progress over time toward goals and objectives. Monitoring can take place on a set of key metrics at representative sites. Consistent monitoring at an appropriate frequency can shed light on the effectiveness of management actions, and this information can inform adaptive management efforts.

Research: Scientific exploration that addresses emerging or otherwise relevant questions that are outside the goals and objectives of long-term MPA monitoring. Research questions can be driven by monitoring gaps or findings and feed into monitoring, such as by testing new scientific methods or providing insight on emerging threats that could affect management. Research can provide pure science to continue learning about MPAs, but is not necessary for ongoing monitoring and evaluation.

projects more effectively or efficiently. Research can similarly support monitoring; for example, new developments in technology for monitoring ocean chemistry could be implemented to increase monitoring capacity of the MLPP (Boehm et al. 2015).

Existing partnerships, especially with academic institutions including the University of California and California State University can be drawn upon to assess research and monitoring gaps and technological development needs, and identify and carry out focused research programs or development projects to fill those gaps. Funding can provide specific incentives to conduct relevant and useful research and development that includes engagement with natural resource managers and other ocean users.

Through these activities, CDFW, OST, OPC, and state partners will continue to foster the naturally occurring overlap and feedback between monitoring, research, and development and the evaluation and adaptive management processes at the individual MPA, regional, and statewide levels. The results of each of these activities will help ensure that the statewide MPA monitoring program utilizes the best readily available science, as required by the MLPA.

Both research and monitoring, as well as potentially development, if unregulated and unchecked, have the potential to have negative impacts on marine environments, such as through collection of specimens. In an effort to prevent negative impacts, CDFW has a process for evaluating and coordinating the permitting of scientific collection activities, as described in Box 6. Some MPAs also require a scientific collection permit (SCP) from State Parks, in addition to CDFW's requirements.¹³³ High-level planning by the MSLT and individual state partners will focus on increasing coordination between these two permitting processes.

Box 6. Scientific Collection in Marine Protected Areas

CDFW uses a decision tree to determine whether to approve or deny SCP requests within MPAs. CDFW reviews proposals for scientific collection and educational activities on an individual, case-by-case basis, but it does not resolve potential cumulative impacts from the effects of multiple activities permitted within an MPA. Therefore, CDFW and OPC's SAT are developing an ecological impact assessment tool to identify potential cumulative impacts prior to issuing an SCP. The ecological impact assessment tool will be used by CDFW to objectively evaluate SCP requests within MPAs.

4.5 ADAPTIVE MANAGEMENT PROCESS

The MLPA goals and statutory directives, MPA objectives, and design considerations will serve as the cornerstone for adaptive management actions, in a manner that recognizes the original intent identified through the science-based and stakeholder driven process by which California's MPAs were developed. For example, in recognition that individual MPA goals and objectives are not static, a review of whether an MPA's stated goals and objectives are still relevant or may need to be adjusted is an appropriate adaptive management action.

The adaptive management process for the MLPP is illustrated in Figure 11 below. The process begins with the selection of statewide objectives (step 1 in Figure 11; also see Chapter 4.2) that work toward the goals of the MLPA and other relevant policy and statutes. Informed by the

¹³³ California State Parks. *Crystal Cove State Park*. Retrieved Aug 10, 2015 from <http://www.crystalcovestatepark.org/research-in-the-park/>

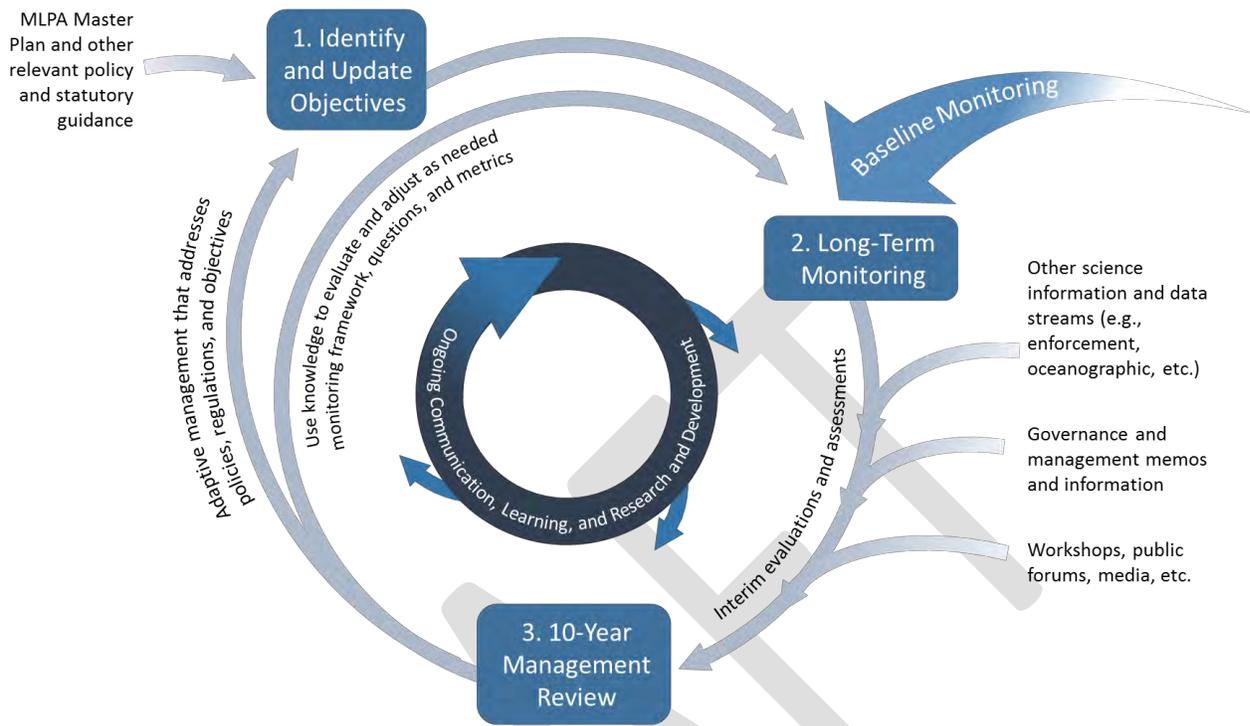

statewide goals and objectives, the MLPP developed and is implementing a program of baseline monitoring for the four regions. After the baseline monitoring period concludes for each region, long-term monitoring, which will be based on the regional and statewide objectives, will begin and continue into the future (step 2 in Figure 11; also see Chapter 4.3). Long-term monitoring results, as well as additional information potentially collected from other scientific data, governance and management review, workshops, and public forums could be used to inform interim evaluation and assessment activities. These activities may take place at the regional scale and serve to inform the public about the state of the network and build understanding support for the MPAs. These assessments and evaluation can also feed into the formal 10-year management review (step 3 in Figure 11, and this Chapter 4.5).

A process for MPA management review is an important component of adaptive management. Therefore, the Commission will initiate a formal management review of statewide MPA network performance at least once every decade (step 3 in Figure 11; also see Chapter 4.1: *Ten-Year Formal MPA Management Reviews*). This review will emphasize ecological, socioeconomic, and governance aspects of the network and may include, but not be limited to, a scientific evaluation, public scoping meetings, and panel discussions to determine the status, function, and possible changes to the network. In addition, the Commission receives petitions for the additions, modifications, or deletions of MPAs on a continual basis,¹³⁴ favoring those petitions that are compatible with the goals and guidelines of the MLPA. Meritorious petitions at the discretion of the Commission may be incorporated into the decadal review unless circumstances dictate addressing the petition earlier.¹³⁵ Exceptions to the decadal review process may be considered if a petitioner makes a substantial case that not taking immediate action will cause significant harm to public safety or public welfare, or identifies scientific or technical issues that significantly impact MPA management or compromise MPA performance. Based on the findings of the Commission's formal 10-year management review, there may be the need for adaptive management actions, such as refining management objectives, policies, and strategies or revising long-term monitoring questions and metrics.

¹³⁴ FGC §2861a

¹³⁵ CCR, Title 14, Section 660.1

Figure 11. MLPP Adaptive Management Process

Throughout the entire adaptive management process, there will be the need for learning, communicating lessons, and developing and carrying out targeted research and development projects that can support monitoring and inform adaptive management (see Chapter 4.4). Learning serves an important role in the adaptive management process, specifically by sharing findings with and engaging a broader audience beyond scientists and management bodies. The MLPP can increase public knowledge about California’s MPA network by translating and sharing the results of the evaluation, assessment, and review process and providing opportunities for partners to be involved in MPA management. Toward this end, the MLPP can identify and develop platforms for broader learning, which could include workshops, symposia, public forums, or web and print media. In addition to building knowledge, learning can help support the MPA network further by building public interest and compliance with MPA regulations. Increasing the reach of knowledge about the state’s MPAs can also lead to new collaborations and partnerships that will build on monitoring and research capabilities. Due to the unprecedented nature of California’s MPA network, the MLPP’s approach to monitoring, evaluation, and adaptive management is accordingly a pioneering effort that will inevitably lead to significant learning that can help inform future efforts in California, the US, and beyond.

CHAPTER 5

Program Partners and Operations

Operational support as well as adequate funding for CDFW and partners will be crucial for leading effective management of California's MPA network. This section describes the core competencies of partners supporting ongoing management of California's MPA network, potential funding sources that CDFW and its partners could pursue, and the importance of leveraging the human and financial resources of CDFW and partners to achieve sustainable funding.

5.1 PARTNERS AND OPERATIONAL CAPACITY

Building from the roles and responsibilities described in Section 4.2 of the Partnership Plan, the MSLT workplan, and the MPA management roles and responsibilities described in Table 6. CDFW can work with partners to identify opportunities that consider jurisdictions and mandates to leverage human resources. Table 8 below provides a brief overview of CDFW's current partners in ongoing MPA management, along with a summary of their core competencies in relation to MPA management.

Table 8. Current Partners Supporting Management of California's MPA Network and Their Core Competencies Related to MPA Management

Partner	Sample of Core Competencies Related to MPA Management
CDFW ¹³⁶	<ul style="list-style-type: none">• Marine science design and implementation, including MPA siting and design• Management and enforcement to implement natural resource trustee agency responsibilities including the MLPA• MPA monitoring, research, evaluation, including issuance of scientific collection permits• Outreach and education relating to MPAs
Commission ¹³⁷	<ul style="list-style-type: none">• Primary regulatory decision-making authority for regulations and rules related to SMRs and SMCAs• Authority and expertise to review MPA proposals and petitions and decide on management actions• Provides venue for public comment and review of the Master Plan
CNRA ^{138,139}	<ul style="list-style-type: none">• Restoration, protection, and management of California natural resources, including terrestrial, coastal, and marine• High-level direction to agencies including CDFW and State Parks• Oversight on state actions regarding ocean resources including through OPC, OST, West Coast Governors' Agreement on Ocean Health, Thank You Ocean Campaign, and Coastal Impact Assistance Program
State Parks ¹⁴⁰	<ul style="list-style-type: none">• Management and enforcement of state parks, including terrestrial, coastal, and marine

Partner	Sample of Core Competencies Related to MPA Management
California Environmental Protection Agency ¹⁵⁰	<ul style="list-style-type: none"> • Restoration, protection, and enhancement of the environment • Environmental health, hazard assessment, toxic substances control, water resources control, emergency response, and enforcement
SCC ¹⁵¹	<ul style="list-style-type: none"> • Protection, restoration, and enhancement of coastal resources • Expansion of public access to the shore in partnership with local governments, agencies, non-profits, and private landowners • Distribution of grant funds to improve things like public access to beaches, coastal zone restoration, protection of coastal land, and other issues that help achieve the Conservancy's goals
West Coast Regional Office of National Marine Sanctuaries ¹⁵²	<ul style="list-style-type: none"> • Conduct monitoring and data collection that could inform adaptive management • Maintain authority to patrol, research, inspect, and cite violations of federal regulations (NOAA office of Law Enforcement) • Foster partnerships with State, Tribal, Federal, and non-governmental organizations • Support Joint Enforcement Agreement with CDFW • Provide funding to State to enforce federal regulations in state waters, in federal offshore waters, and in bays, estuaries, rivers, and streams

5.2 POTENTIAL FUNDING SOURCES

Securing a diversified funding portfolio can help ensure long-term financial stability that is able to withstand future shifts in funding availability. Areas that have been identified as priority gaps in need of support through partners include monitoring, compliance and enforcement, engagement with Collaboratives, and Tribal collaboration and coordination.¹⁵³ The 2008 Master Plan contains a list of potential funding sources the MLPA Initiative identified (Appendix N).¹⁵⁴ Building on the list of potential funding sources identified in the MLPA Initiative process, OPC, CDFW, and its partners developed an updated list of potential funding sources, including federal, state, and local government; private philanthropy; and the private sector to help cover priority gaps. As funding sources are continuously changing and CDFW is now solidifying its operational needs for MPA management, there is the need to continually reevaluate existing and new potential funding sources.

5.3 ROLE OF PARTNERS IN LEVERAGING FINANCIAL AND HUMAN RESOURCES

The MLPP depends on collaboration to leverage existing human and financial resources, and CDFW and its partners are committed to working together to identify ways to continue to achieve the goals of the state in an efficient and effective way. CDFW, OPC, the Resource Legacy Fund, and the Commission have contributed human or financial resources to support

MPA management in the past. Additional partnerships could provide more diversified funding on multiple scales and through various sectors, especially in cases where partners have access to funding sources that CDFW cannot tap into itself, such as foundation or other charitable sources. Based on their strengths and abilities, partners from different sectors will have different roles relating to identifying, assessing, and securing various funding sources.

DRAFT

CHAPTER 6

Setting a Path Forward

California's MPA network is unique in the world due to its size and coast-wide extent, as well as its strong emphases on science-based design principles and scientifically-informed adaptive management (see Section 2.2 and Appendix A).¹⁵⁵ Therefore, MPA management will involve an adaptive management approach with a continual learning process, which will provide an opportunity from which California and other states and countries can learn. The MLPP will use the adaptive management framework laid out by the MLPA, as well as their experiences in data collection, management, and governance, to address and adapt to new threats and challenges, both environmental and socioeconomic.

To operationalize the elements of the 2015 Master Plan, the MLPP will implement a number of steps to set a course for its core MPA management responsibilities including monitoring and evaluation, enforcement, and outreach and education. The following steps are built from the MPA management responsibilities outlined in Table 6 and will be implemented on either a regional or statewide basis, depending on the scope and focus of the action. Throughout all steps, the overall goal is statewide coordination to achieve effective adaptive management of California's MPA network to meet the goals and objectives of the MLPA. This section details the steps that the MLPP will take to continue to meet the goals and objectives of the MLPA.

6.1 MONITORING, RESEARCH, AND EVALUATION

- **Implement a Statewide MPA Monitoring Plan:** CDFW, OST, and other partners, will develop a statewide monitoring plan to serve as the foundation for assessing MPA network performance. A set of network evaluation questions will also be developed, which will build from the network-wide objectives described in Chapter 4.
- **Update Monitoring Plans:** The MLPP will coordinate to update and adapt regional monitoring plans as necessary based on their learning from long-term monitoring and management actions
- **Report Results:** The MLPP will develop an approach that concisely displays the results of monitoring and evaluation. This approach will be used for communicating the results of California's MPAs to broad audiences
- **Link MPA and Other Monitoring Efforts:** The MLPP will partner with other monitoring entities, such as state fisheries managers and ocean acidification researchers (e.g., West Coast Governors Alliance and the West Coast Ocean Acidification and Hypoxia Science Panel). These groups can identify data collection that is relevant to MPA monitoring and assist in efforts to integrate that data into MPA monitoring, evaluation, research, and adaptive management.

¹⁵⁵ Ballard, A., Birss, H., Botta, R., Cantrell, S., Gonzales, A., Johnson, B., Spautz, H., Torres, S., & Yamamoto, J. (2014). *Incorporation of Adaptive Management into Conservation Planning and Resource Management*. Retrieved Mar 4, 2015 from <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=86989&inline=1>

- **Identify and Support Key MPA Related Research Needs:** The MLPP will identify and support research projects that focus on key science questions, including those related to network functioning as well as the effect of MPAs on fisheries

6.2 ENFORCEMENT

- **Identify Tools to Support Enforcement:** New and emerging technology options such as remote surveillance, vessel management systems, global positioning system data logger systems, and others may provide options for increased enforcement efficiency. CDFW's Law Enforcement Division would also benefit from a Records Management System as an effective way to collect, organize, and track the vast amount of information that is collected. This will help document CDFW's patrol effort and help identify any geographical or technological areas where changes are needed. Activities associated with research and development can support the identification of these tools.

6.3 PARTNERSHIP COORDINATION

- **Build Partnerships:** Through the Partnership Plan and the MSLT, as well as other partnership tools, the MLPP and its constituent partners will renew their commitments to existing, effective partnerships and build new partnerships to help further the MLPP's objectives and fulfill the MLPA mandate. The MLPP will pursue partnerships, such as among local, state, and federal governments, California Tribes and Tribal governments, the University of California and California State University systems, NGOs, the private sector, and citizen science groups.

6.4 OUTREACH AND EDUCATION

- **Prioritize Outreach Efforts:** CDFW, in collaboration with partners through the MLPP, will prioritize the key messages, audiences, and communication mechanisms to raise awareness, support, and participation in MPA management. CDFW will also coordinate its outreach with other outside efforts of organizations with aligned priorities.

6.5 IDENTIFICATION OF LONG-TERM FUNDING SOURCES

- **Enhance Capacity for MPA Project:** To fulfill its commitment to the MLPP, CDFW established an MPA project under the Habitat Conservation Program. Through the MPA project, CDFW ensures that staff time and resources are allocated to MPA management. However, enhanced capacity will be important to meet the ongoing commitments of the MLPP, and the future needs of California, as the MLPP evolves.
- **Prioritize Potential Funding Sources:** To help secure the resources necessary for continued investment in the MPA network, the MLPP will support OPC and other appropriate partners, including CDFW, to identify the top potential funding sources to fill gaps in financial support for MPA management activities

Appendices

[THE FOLLOWING IS A DRAFT LIST OF APPENDICES TO THE MASTER PLAN AND MAY BE MODIFIED]

Appendix A: Marine Protected Area Planning through the Marine Life Protection Act Initiative

Appendix B: Communication and Consultation with California Tribes and Tribal Governments

Appendix C: North Coast: MPA Background and Priorities

Appendix D: North Central Coast: MPA Background and Priorities

Appendix E: Central Coast: MPA Background and Priorities

Appendix F: South Coast: MPA Background and Priorities

Glossary

Abundance: *Natural abundance* is the total number of individuals in a population protected from, or not subjected to, human-induced change (adapted from Department 2004 and Kelleher 1992). *Relative abundance* is an index of fish population numbers used to compare populations from year to year (Department 2002a).

Adaptive management: With regard to marine protected areas, is a management policy that seeks to improve management of biological resources, particularly in areas of scientific uncertainty, by viewing program actions as tools for learning. Actions shall be designed so that, even if they fail, they will provide useful information for future actions, and monitoring and evaluation shall be emphasized so that the interaction of different elements within marine systems may be better understood.

Biodiversity: A component and measure of ecosystem health and function. It is the number and genetic richness of different individuals found within the population of a species, of populations found within a species range, of different species found within a natural community or ecosystem, and of different communities and ecosystems found within a region (PRC §12220[b]).

Baseline monitoring: Baseline monitoring establishes a regional benchmark of the ecological and socioeconomic conditions when each regional MPA network took effect and documents any initial changes resulting from MPA implementation. As such, the baseline serves as an important set of data against which future MPA performance can be measured.

Biogeographical regions: The following oceanic or near shore areas, seaward from the high tide line or the mouth of coastal rivers, with distinctive biological characteristics, unless the master plan team establishes an alternative set of boundaries (emphasis added):

- (1) The area extending south from Point Conception.
- (2) The area between Point Conception and Point Arena.
- (3) The area extending north from Point Arena.

Bycatch: In fishing, removal or mortality of species other than the declared target species.

Deep: Greater than 330 feet (100 meters).

Ecosystem: The physical and climatic features and all the living and dead organisms in an area that are interrelated in the transfer of energy and material, which together produce and maintain a characteristic type of biological community (Department 2002b).

Groundfish: A species or group of fish that live on or near the ocean bottom.

Habitat: The living place of an organism or community, characterized by its physical or biotic properties (Allaby 1998).

Intrinsic value: The value that that thing has “in itself,” or “for its own sake,” or “as such,” or “in its own right” (Zimmerman 2004).

Marine life reserve: A marine protected area in which all extractive activities, including the taking of marine species, and, at the discretion of the Fish and Game Commission and within the authority of the Fish and Game Commission, other activities that upset the natural ecological functions of the area, are prohibited. While, to the extent feasible, the area shall be open to the public for managed enjoyment and study, the area shall be maintained to the extent practicable in an undisturbed and unpolluted state.”

California Fish and Game Code § 2860 (b) further clarifies permissible activities in “marine life reserves”: “Notwithstanding any other provision of this code, the taking of a marine species in a marine life reserve is prohibited for any purpose, including recreational and commercial fishing, except that the Fish and Game Commission may authorize the taking of a marine species for scientific purposes, consistent with the purposes of this chapter, under a scientific collecting permit issued by the Department of Fish and Wildlife.” (emphasis added)

Marine managed areas: A broad group of named, discrete geographic areas along the coast that protect, conserve, or otherwise manage a variety of resources and uses, including living marine resources, cultural and historical resources, and recreational opportunities.

Marine protected area (MPA): A named, discrete geographic marine or estuarine area seaward of the high tide line or the mouth of a coastal river, including any area of intertidal or subtidal terrain, together with its overlying water and associated flora and fauna that has been designated by law, administrative action, or voter initiative to protect or conserve marine life and habitat. An MPA includes marine life reserves and other areas that allow for specified commercial and recreational activities, including fishing for certain species but not others, fishing with certain practices but not others, and kelp harvesting, provided that these activities are consistent with the objectives of the area and the goals and guidelines of this chapter. MPAs are primarily intended to protect or conserve marine life and habitat, and are therefore a subset of marine managed areas, which are broader groups of named, discrete geographic areas along the coast that protect, conserve, or otherwise manage a variety of resources and uses, including living marine resources, cultural and historical resources, and recreational opportunities.

Natural community: A distinct, identifiable, and recurring association of plants and animals that are ecologically interrelated (California Fish and Game Code subsection 2702[d]).

Natural diversity: The species richness of a community or area when protected from, or not subjected to, human-induced change (drawn from Allaby 1998 and Kelleher 1992).

Reef fish: A species or group of fish that live on or near the reef.

Shallow: 330 feet (100 meters) or less.

**REQUEST FOR EXTENSION OF TIME TO TRANSFER THOMAS L. PTAK'S
TRANSFERRABLE SOUTH COAST REGION NEARSHORE FISHERY PERMIT**

Dear Fish and Game Commission:

At its meeting on December 3, 2014, in Van Nuys, the California Fish and Game Commission (the "Commission") approved a request for extension of time to transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Permit. The Commission extended the time in which this permit could be transferred to December 15, 2015. This is a formal request to the Commission for an additional one year extension of time to transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Permit.

I.

Background

Thomas L. Ptak died on March 13, 2012. Christine Allen, Mr. Ptak's partner of 16 years immediately retained the law firm Greenman, Lacy, Klein, Hinds, Weiser & Heffron (hereinafter "Attorneys") to assist her in administering Mr. Ptak's affairs. This included getting Christine Allen appointed as Executor of Mr. Ptak's probate estate and communicating with the Department of Fish and Wildlife regarding Mr. Ptak's commercial fishing permits. The probate estate of Mr. Ptak is still open today and Christine Allen remains the duly appointed Executor by order of the Superior Court of California, County of San Diego.

Attorneys began communication with the California Department of Fish and Wildlife upon Mr. Ptak's death regarding the procedure in which to transfer Mr. Ptak's commercial fishing permits, including the transferrable Nearshore South Coast Region Nearshore Fishery Permit that is the subject of this request for additional time to transfer.

Attorneys stayed in regular communication with Ms. Debbie Noriega at the Department of Fish and Wildlife from the time Mr. Ptak died and relied on the information and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's permits. On June 5, 2014, the probate estate of Mr. Ptak followed transfer instructions provided by Ms. Noriega and sold Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit. The Department of Fish and Wildlife approved the transfer and issued the permit in the name of the buyer.

On June 22, 2014, Christine Allen, the buyer of the permit, and Attorneys were notified that the successful transfer of Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit was rescinded. Attorneys immediately contacted Ms. Noriega who informed Attorneys that the transfer was rescinded because more than one year had passed since Mr. Ptak's death. Ms. Noriega stated she "felt horrible and was as surprised as we were."

Attorneys filed an Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferrable South Coast Region Nearshore Fishery Permit with the Commission on August 22, 2014. The main grounds for the appeal was that Attorneys began communicating and working with Ms. Noriega within six (6) days of Mr. Ptak's death, were in regular communication with Ms. Noriega since March 13, 2012, and followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit.

A copy of the Appeal for Denial of Application to Transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Permit, including all exhibits filed with said appeal is attached to this Request for Extension of time as **Exhibit "A"** and incorporated herein.

On December 19, 2014, Attorneys and Executor Christine Allen received a letter from the Commission approving an extension of time until December 15, 2015 to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement. A copy of this letter from the Commission is attached to this Request for Extension of time as **Exhibit "B"** and incorporated herein.

II.

Estate of Thomas L. Ptak Puts Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement Up For Sale

Christine Allen, in her capacity as Executor of the probate estate of Thomas L. Ptak, began marketing Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit

immediately after receiving the Commissions approval extending the time of transfer to December 15, 2015.

Christine Allen also continued to operate Mr. Ptak's commercial fishing business as an ongoing business concern of the Estate of Thomas L. Ptak as she had done since Mr. Ptak's death. The goal of continuing to operate the commercial fishing business was to attempt to generate sufficient income to pay of the creditor of the Estate of Thomas L. Ptak.

In order for Christine Allen to continue operating Mr. Ptak's commercial fishing business as an ongoing business concern of The Estate of Thomas L. Ptak, she continued to enlist the services of Eric Allen. Eric Allen is Mr. Ptak's long time crew member and an experienced commercial fisherman who has been involved in assisting the Estate of Thomas L. Ptak since Mr. Ptak died.

When Mr. Ptak died, the Superior Court of California, County of San Diego, appointed Eric Allen as the Special Administrator of the Estate of Thomas L. Ptak. Eric was appointed due to his familiarity of Mr. Ptak's commercial fishing business and due to his long history of working with Mr. Ptak. Eric Allen held the role of Special Administrator of the Estate of Thomas L. Ptak until the Court appointed Christine Allen Executor of the Estate of Thomas L. Ptak on September 18, 2012. At all times since, Christine Allen has enlisted the services of Eric Allen to operate Mr. Ptak's commercial fishing business as an ongoing business concern of the Estate of Thomas L. Ptak with the goal of generating sufficient income to pay off the creditors of the estate.

III.

Department of Fish and Wildlife Seizes Mr. Ptak's Commercial Fishing Permits

On March 18, 2015, Eric Allen was fishing on behalf of the probate Estate of Thomas L. Ptak aboard the vessel Donna Marie, a vessel that was an asset of probate estate. Mr. Allen was fishing using a General Gill/Trammel Net Permit that was current and issued in the name of Thomas L. Ptak. This permit is an asset of probate Estate of Thomas L. Ptak and has been listed and valued on an Inventory and Appraisal filed with the Superior Court of California, County of San Diego, on February 6, 2013.

It is important to know that on March 18, 2015, Eric Allen was not fishing with the transferrable South Coast Region Nearshore Fishery Permit or Transferrable South Coast Region Nearshore Fishery Trap Endorsement in which the Commission granted the extension of time to transfer until December 15, 2015.

While fishing on March 18, 2015, Eric Allen was boarded by the Department of Fish and Game. The Department of Fish and Game escorted Eric Allen and the vessel Donna Marie back to the vessel's slip in Oceanside Harbor and issued Eric a citation for the following: No Commercial Fishing License; Permittee (Thomas L. Ptak) required to be on vessel;

Department of Fish and Game Boat Registration Required; and Department of Fish and Game Boat Registration required aboard at all times.

Once at Oceanside Harbor Eric Allen went to his truck to obtain the following documents and permits, all of which were seized by the Department of Fish and Game: one transferrable South Coast Region Nearshore Fishery Permit issued in the name of Thomas Ptak; one transferrable South Coast Region Nearshore Trap Endorsement issued in the name of Thomas Ptak; one General Gill/Trammel Net Permit issued in the name of Thomas Ptak; one Lobster Operator Permit issued in the name of Thomas Ptak; one Southern Rock Crab Permit issued in the name of Thomas Ptak; the boat registration for the vessel Donna Marie; and one current Commercial Fishing License issued in the name of Thomas Ptak.

All permits seized were assets of the probate Estate of Thomas L. Ptak and were listed as such with the Superior Court of California, County of San Diego, and valued by a probate referee in an Inventory and Appraisal of assets owned by the probate Estate of Thomas L. Ptak filed with said Court on February 6, 2013.

Eric Allen being boarded by the Department of Fish and Game on March 18, 2015 resulted in two pending misdemeanor charges against Eric Allen. The first is for Fishing Without a Commercial License. The second is for Failure to Apply for Commercial Boat Registration.

The misdemeanor charges are not the subject of this request for extension of time. However, the events that have transpired are directly relevant to the reason the Estate of Thomas L. Ptak is requesting additional time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Report.

Christine Allen, as the Executor of the Estate of Thomas L. Ptak has not been able to market or sell Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit since March 18, 2015 because the Department of Fish and Game seized the permits on March 18, 2015 and the Department of Fish and Wildlife will not return the permit to Christine Allen or the Estate of Thomas L. Ptak.

The result is that Christine Allen was granted a one year extension of time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit but has been deprived of approximately nine (9) months of this one year extension because the permit has been held by the Department of Fish and Wildlife rather than being in the possession of Christine Allen.

//

//

//

IV.

Estate of Thomas L. Ptak Attempts To Regain Permits From Department of Fish and Wildlife

Attorneys, on behalf of Christine Allen, Executor of the Estate of Thomas L. Ptak, contacted David Kiene at the California Department of Fish and Wildlife, Office of the General Counsel on April 3, 2015. Attorneys discussed with Mr. Kiene the seizure of Mr. Ptak's permits that are assets of the probate Estate of Thomas L. Ptak. In particular, Attorneys requested that Mr. Ptak's transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement be returned to the Estate of Thomas L. Ptak so these permits could be marketed and sold by December 15, 2015, the time in which the Commission granted their extension for transfer.

Mr. Kiene stated that he would look into the matter but that the permits may not be able to be returned to the Estate of Thomas L. Ptak because they have potential evidentiary value for the citations issued against Eric Allen. Attorneys explained that The Estate of Thomas L. Ptak was no longer fishing, would not fish the permits if returned, and that the vessel Donna Marie (the fishing boat owned by the Estate of Thomas L. Ptak) was parked and listed for sale. Attorneys again requested return of Mr. Ptak's transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement so these permits could be sold before the extension of time granted by the Commission expired. Attorneys explained to Mr. Kiene that they did not understand how the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement had evidentiary value that was any different or more substantive than a copy of the permits would have.

Mr. Kiene informed Attorneys he would discuss the issue with his enforcement division and get back to Attorneys regarding Attorneys request for the return of the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement. Mr. Kiene never responded to Attorneys or to Christine Allen via telephone, letter, email, or any other form of communication.

Attorneys followed up with Mr. Kiene via telephone but never received a call back. To date, Attorneys and Christine Allen have received no communication, written or otherwise, from the Department of Fish and Wildlife since April 3, 2015.

V.

Why The Estate of Thomas L. Ptak Needs Additional Time to Transfer Permit

The probate Estate of Thomas L. Ptak has not been afforded sufficient opportunity to transfer the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement because these permits have been held by the Department of Fish and Wildlife since March 18, 2015.

VI.

Additional Pertinent Information

The Estate of Thomas L. Ptak sold the vessel Donna Marie and is no longer fishing. The Estate of Thomas L. Ptak has not fished since March 18, 2015 and has no plans to fish. The Estate of Thomas L. Ptak sold the vast majority of the commercial fishing equipment owned by the Estate of Thomas L. Ptak. Any remaining fishing equipment owned by the Estate of Thomas L. Ptak is for sale. The probate of the Estate of Thomas L. Ptak is still an open case with the Superior Court of California, County of San Diego. Christine Allen is still the duly appointed Executor of the Estate of Thomas L. Ptak.

In addition to Mr. Ptak's transferrable South Couth Coast Region Nearshore Fishery Permit and Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement, The California Department of Fish and Wildlife is holding the following permits that are assets of the Estate of Thomas L. Ptak: one General Gill/Trammel Net Permit; one Lobster Operator Permit; and one Southern Rock Crab Permit (collectively referred to hereafter as "The Five Permits"). All of The Five Permits were seized by the Department of Fish and Wildlife on March 18, 2015 and have not been returned to the Estate of Thomas L. Ptak, thus depriving the Estate of Thomas L. Ptak the ability to transfer these permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak.

VII.

Request for Additional Extension of time

Based on the information addressed in this Request For Extension of Time To Transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Permit, the Estate of Thomas L. Ptak respectfully requests from the Commission an additional one (1) year extension of time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit.

VIII.

Request for Right to Renew Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to allow the Estate of Thomas L. Ptak to renew The Five Permits so The Five Permits will not expire and so the Estate of Thomas L. Ptak has the opportunity to transfer the permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak.

IX.

Request for Return of Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to return The Five Permits to the Estate of Thomas L. Ptak. Return of these permits is necessary because the Estate of Thomas L. Ptak cannot transfer the permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak unless the Estate of Thomas L. Ptak is in possession of these permits. The instruction should direct The Five Permits be returned to Christine Allen, Executor, The Estate of Thomas L. Ptak,

X.

Final Comments

Thank you for your time and consideration in reviewing the Estate of Thomas L. Ptak's requests contained in this document.

Very Truly Yours,

APPEAL OF DENIAL OF APPLICATION TO TRANSFER THOMAS L. PTAK'S TRANSFERABLE SOUTH COAST REGION NEARSHORE FISHERY PERMIT

Dear Fish and Game Commission:

This appeal is in response to the July 3, 2014 Notice of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Permit addressed to Christine Allen as Executor of the Estate of Thomas L. Ptak. A copy of this Notice of Denial is attached to and incorporated herein as Exhibit A.

I.

Reason Given for Denial

The application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit was denied because the application was submitted more than one year after Mr. Ptak's date of Death.

II.

Basis for Appeal

Thomas Leonard Ptak died on March 13, 2012. A copy of his death certificate is attached to and incorporated herein as Exhibit B.

Christine Allen, Mr. Ptak's partner of 16 years, immediately retained the law firm Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys") to assist her in administering Mr. Ptak's affairs. This included communicating with the California Department of Fish and Wildlife regarding Mr. Ptak's commercial fishing permits and handling the Probate of Mr. Ptak's Estate.

Attorneys enlisted the assistance of commercial fisherman Ken Bates due to his understanding of the unique nature of the commercial fishing permits owned by Mr. Ptak. On behalf of Attorneys, Ken Bates first contacted Debbie Noriega at the Department of Fish and Wildlife on March 19, 2012 only six (6) days following Mr. Ptak's death. Ken Bates notified Ms. Noriega that Mr. Ptak died, confirmed that Mr. Ptak owned five commercial fishing permits, obtained information on how Mr. Ptak's permits could be transferred, and obtained instruction on how Mr. Ptak's personal representative Christine Allen could apply for the transfer of Mr. Ptak's commercial fishing permits. Ms. Noriega provided invaluable assistance and shared extensive knowledge regarding the permits owned by Mr. Ptak. However, at no time did Ms. Noriega explain to Mr. Bates that there was a time frame in which Mr. Ptak's permits must be transferred.

Attorney Kurt Weiser of the law firm Greenman, Lacy, Klein, O'Harra & Heffron spoke directly to Ms. Noriega two times within one year of Mr. Ptak's death. Attorney Weiser's first conversation with Ms. Noriega took place on or about May 16, 2012. His second conversation with Debbie Noriega took place on or about August 22, 2012. The purpose of these conversations was to discuss the procedure for transferring Mr. Ptak's commercial fishing permits.

Attorney Weiser explained that Mr. Ptak's estate was subject to Probate with the Superior Court of California, County of San Diego and therefore Mr. Ptak's commercial fishing permits would become probate assets. Under the California Probate Code assets, including the permits, can not transfer prior to the time the Probate Court's order to distribute estate assets is issued.

Attorney Weiser informed Ms. Noriega that the Probate of Mr. Ptak's estate would be a lengthy process because no probate can be completed until creditors of the estate are paid. Ms. Noriega informed Attorney Weiser that Mr. Ptak's commercial fishing permits could be retained in Mr. Ptak's probate estate and could be transferred once the probate was complete. Attorneys were appreciative of Ms. Noriega's analysis. However, Ms. Noriega analysis of the transfer of Mr. Ptak's permits never included reference to time frames in which applications to transfer Mr. Ptak's permits must be submitted to the Department of Fish and Wildlife. All of Mr. Ptak's commercial fishing permits are still assets of Mr. Ptak's Probate Estate as of the date of this appeal.

Attorney Weiser and Christine Allen relied on Ms. Noriega's instruction and expertise as a Department of Fish and Wildlife analyst. Attorney Weiser relied on Ms. Noriega's thorough analysis and advice (and lack of any mention of a time limitation). On that basis Attorney Weiser understood that the time frames in which Mr. Ptak's permits could be transferred would be tolled during the probate. A declaration by Attorney Weiser is attached to and incorporated herein as Exhibit C.

III.

Summary of the Probate of The Estate of Thomas Ptak

Attorneys, on behalf of Petitioner Christine Allen, promptly filed a Petition for Probate of Mr. Ptak's Last Will and Testament and for Letters Testamentary with the Superior Court of California, County of San Diego, on June 1, 2012.

The Superior Court issued an order appointing Christine Allen as the Executor of Mr. Ptak's Will and issued Letters Testamentary to Christine Allen as the Executor of the Will of Mr. Ptak with full authority to administer Mr. Ptak's Probate Estate on September 18, 2012.

Multiple creditors filed creditor's claims against Mr. Ptak's Probate Estate. Claims by creditors of the decedent are very common in probates and occur when the decedent dies with legitimate debt. Attorneys and Christine Allen have worked diligently with these creditors to plan for the payoff of Mr. Ptak's debt so that Mr. Ptak's Probate Estate can generate enough income to pay off these creditors. Attorneys also maintained frequent communication with Ms. Noriega from Mr. Ptak's date of death until present day. These communications include Attorneys providing Ms. Noriega with frequent status updates on the probate of Mr. Ptak's estate. Ms. Noriega continued to provide Attorneys with advice and guidance.

Ms. Noriega advice to hold Mr. Ptak's permits in Mr. Ptak's Probate Estate until the close of probate never wavered. As recently as April 28, 2014, Ms. Noriega advised attorney Weiser that Mr. Ptak's commercial permits could be transferred once the probate of Mr. Ptak's estate is completed. Specifically, Ms. Noriega confirmed with attorney Weiser and attorney Christopher Shourds of Greenman, Lacy, Klein, O'Harra & Heffron that the best way to transfer Mr. Ptak's commercial permits was to continue to hold the permits in Mr. Ptak's probate estate until the probate is complete. Ms. Noriega stated that Attorneys should wait until they receive a court order for distribution of Mr. Ptak's probate assets issued by a Judge of the Superior Court and then submit the court order along with an application to transfer Mr. Ptak's permits to Eric Allen to the Department of Fish and Wildlife.

Further, Ms. Noriega stated that she had communicated with her supervisor and advised Attorneys that this process would result in the successful transfer of Mr. Ptak's permits to Eric Allen. A declaration by attorney Shourds is attached to and incorporated herein as Exhibit D.

IV.

Attorneys Sought Additional Ways to Transfer Permits to Eric Allen Prior to the Close of Mr. Ptak's Probate Estate

Attorney Weiser informed Ms. Noriega that Christine Allen desired to transfer Mr. Ptak's

Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Eric Allen, Mr. Ptak's long time deckhand and crew member, without the requirement that Eric Allen need to purchase any ancillary permits or endorsements. Ms. Noriega informed Attorney Weiser that this could not be accomplished because Eric Allen was not a blood relative of Mr. Ptak and because the owner of the permits was not a commercial entity in which Eric Allen possessed an ownership interest. Again, Ms. Noriega was cooperative and knowledgeable. Attorneys appreciate the assistance and insight she provided.

On October 7, 2013 attorney Weiser submitted a letter to Ms. Noriega asking the Department of Fish and Wildlife to consider allowing the transfer of Mr. Ptak's permits to Eric Allen, without the need for Eric Allen to acquire any ancillary permits, under the theory that Mr. Ptak and Eric Allen operated the fishing business as a general partnership entity. A general partnership can be legally recognized as a commercial entity in the state of California.

Attorney Weiser's letter informed Ms. Noriega that Eric Allen was paid a "crew share" for the past twelve years. It also explained that Mr. Ptak and Eric Allen split profits, each contributed to expenses, shared equally in the responsibility of maintaining the boat and the rest of the fishing operation, and had the ability to bind each other to contracts and other liabilities. Under these circumstances, attorney Weiser urged the Department of Fish and Wildlife that Mr. Ptak's Probate Estate should be able to transfer the permits to Eric Allen prior to the close of probate without the requirement that Eric Allen purchase any ancillary permits.

Attorneys never received a definitive response to attorney Weiser's October 7th letter despite placing numerous follow up calls to Ms. Noriega between December 16, 2013 and December 30, 2013. Ms. Noriega was supportive in trying to obtain a written response from her supervisors to attorney Weiser's letter. On December 30, 2013, attorney Shourds reached Ms. Noriega via telephone. Ms. Noriega still did not have a response to attorney Weiser's letter. However, Ms. Noriega stated that one or more of Mr. Ptak's permits could be sold prior to the close of probate if the Department of Fish and Wildlife did not approve the transfer of Mr. Ptak's permits to Eric Allen based on the theory that Mr. Ptak and Eric Allen were operating as a general partnership.

Attorneys relayed Ms. Noriega's comments to Christine Allen. Upon hearing Ms. Noriega's statement that one or more of Mr. Ptak's permits could be sold out of Mr. Ptak's Probate Estate, Christine Allen decided that the quickest way to generate income necessary to pay off creditors and close Mr. Ptak's Probate Estate would be to sell one or more of Mr. Ptak's permits.

Four months passed and Attorneys still did not receive a definitive response to their request to transfer Mr. Ptak's permits to Eric Allen based on the theory that Mr. Ptak and Eric Allen were operating as a general partnership. Attorney Weiser left a voicemail for Ms. Noriega on April 7, 2014 expressing Christine Allen's desire to sell Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Attorneys never received a response to this voicemail.

V.

Department of Fish and Wildlife's Approval of Transfer

On or about April 16, 2014 Christine Allen began working with a broker to sell Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Christine Allen was introduced to buyer Brian Kiyohara on or about April 21, 2014. On or about April 28, 2014, Attorneys Weiser and Shourds spoke to Ms. Noriega to inform her that Christine Allen was selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

Attorney Weiser informed Ms. Noriega that the sale of these permits would generate enough income to pay off the creditors of Mr. Ptak's Probate Estate so that the probate could be closed. Again, Ms. Noriega stated that any unsold permits could be held in Mr. Ptak's Probate Estate and transferred to Eric Allen at the close of probate by submitting a court order for distribution issued by a Judge of the Superior Court along with applications to transfer Mr. Ptak's remaining permits to Eric Allen to the Department of Fish and Wildlife.

Christine Allen relied on the information provided by Debbie Noriega and sold Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara.

The Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara on June 5, 2014 and re-issued the permits in the name of Brian Kiyohara. Copies of the Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement issued to Brian Kiyohara are attached to and incorporated herein as Exhibit E.

The sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement generated enough proceeds that Christine Allen was less than one week away from issuing payment in full to all creditors of Mr. Ptak's Probate Estate. Issuing these payments to creditors would have allowed Christine Allen to close Mr. Ptak's Probate Estate.

VI.

Department of Fish and Wildlife's Rescission of Transfer

On June 12, 2014, Christine Allen, Brian Kiyohara, and Attorneys were notified that the successful transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement was rescinded by the Department of Fish and Wildlife even though transferee Brian Kiyohara

was already in possession of newly issued permits.

Attorney Weiser immediately contacted Ms. Noriega who informed him that the transfer of the permits was rescinded because more than one year had passed since Mr. Ptak's death. Ms. Norriega stated that she "felt terrible and was surprised as we were."

Christine Allen had already deposited the proceeds from the sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement into the bank account for Mr. Ptak's Probate Estate and wrote checks to pay off the creditors of Mr. Ptak's Probate Estate. Fortunately, the checks to the creditors were not yet mailed and were able to be voided.

Christine Allen refunded transferee Brian Kiyohara the full amount that Mr. Kiyohara paid for Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

VII.

Additional Pertinent Information

The Probate of the Estate of Mr. Ptak is still ongoing as of the date of this Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Permit.

Attorneys began communicating and working with Ms. Noriega within six (6) days of Mr. Ptak's death. Attorneys and Christine Allen have not delayed or neglected to attempt to transfer Mr. Ptak's commercial fishing permits. Attorneys have been in regular communication with Ms. Noriega since March 19, 2012 and have followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's permits.

The Estate of Mr. Ptak owns one Transferrable South Coast Region Nearshore Fishery Permit, one Transferrable South Coast Region Nearshore Fishery Trap Endorsement, one General Gill/Trammel Net Permit, one Lobster Operator Permit, and one Southern Rock Crab Trap Permit. All of these permits have exceeded the time frame for approval of transfer due to the probate of Mr. Ptak's estate and the same facts contained in this appeal.

Attorneys are hopeful the Fish and Game Commission will approve the request for extension of time (below) and apply it to all permits owned by the Estate of Mr. Ptak. Attorneys are prepared to apply for transfer of each permit owned by the Estate of Mr. Ptak and to appeal any denial to the maximum extent possible.

Attorneys are hopeful this situation can be resolved and the extension of time requested below can be granted without the need to appear at a hearing in front of the Fish and Game Commission.

Attorneys sincerely appreciate the time and resources the Fish and Game Commission put

into reading and investigating this Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Permit.

VIII.

Request for Relief

Attorneys and Christine Allen, Executor of the Estate of Thomas L. Ptak, hereby request an extension of time to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit. Specifically, Attorneys and Christine Allen, Executor of the Estate of Thomas L. Ptak, formally request from the Fish and Game Commission a nine (9) month extension to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit with the extension beginning on the date that Attorneys and Christine Allen are notified by the Fish and Game Commission that the extension of time has been granted.

Christine Allen plans to use this extension of time to sell Mr. Ptak's Transferable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. This sale will generate enough proceeds that creditors of Mr. Ptak's Probate Estate can be paid off and Attorneys' can file a petition with the Superior Court to close the probate and distribute Mr. Ptak's remaining assets.

Christine Allen, at the time probate can be closed, plans to transfer all of Mr. Ptak's remaining permits to Eric Allen so the fishing business can be maintained. The inability to transfer Mr. Ptak's permits by selling one or more permit and transferring the remaining permits at the close of probate will irreparably harm Christine Allen and Eric Allen. Christine and Eric's main source of income comes from the operation of the fishing business Mr. Ptak spent his life developing with the help of Eric Allen as his crew member and deckhand. If the Fish and Game Commission does not grant an extension of time to allow Christine Allen to transfer Mr. Ptak's permits then the Allen family will likely lose everything, including but not limited to the house they live in and the income source they live off of. The extension of time requested above is the best foreseeable way to save the Allen family from financial hardship that would occur if Mr. Ptak's permits become non-transferrable due to the passage of time following Mr. Ptak's Death.

Ms. Christine Allen

**SUBJECT: NOTICE OF DENIAL OF AN APPLICATION TO TRANSFER
TRANSFERABLE SOUTH COAST REGION NEARSHORE FISHERY
PERMIT**

Dear Ms. Allen:

This letter is in response to your application to transfer a 2014-2015 Transferable South Coast Region Nearshore Fishery Permit (TSCRNFP), Permit Number NST033, from Mr. Thomas L. Ptak (L30798) to Mr. Brian Kiyohyara (L74934). You are the executor of Mr. Ptak's estate.

Authority-Nearshore Fishery Permit

Pursuant to Section 150(g)(1)(A), Title 14, of the California Code of Regulations (CCR), a transferable Nearshore Fishery Permit (NFP) may be transferred from one person to another. If the number of NFPs in a regional management area is greater than the capacity goal for the regional management area, one additional transferable NFP for the same regional management area must be surrendered to the Department of Fish and Wildlife (Department) for cancellation at the same time the application for transfer is submitted. The capacity goal for the South Coast Region is 18 permits. As of June 5, 2014, 43 SCRNFPS have been issued, therefore two TSCRNFPS must be surrendered.

Pursuant to Section 150(g)(3), Title 14, of the CCR, a transferable NFP may be transferred to the estate of a permittee who has died only for the purpose of transferring the NFP to another person.

Nearshore Fishery Permit Transfer Requirements

- The NFP(s) must be valid at the time of application for transfer.
- The transferee must have a valid California Commercial Fishing License.
- The transferee must have never been convicted of a violation of any provision of these regulations or the Fish and Game Code (FGC) pertaining to the commercial take of nearshore fish stocks.

Conserving California's Wildlife Since 1870

Required Documentation

- The request for the transfer must be submitted within one year of the date of death of the permit holder as listed on the death certificate.
- Transfer application in the form of a notarized letter which identifies the deceased permit holder, transferee, and transferable NFP for the regional management area.
- Copy of the permittee's death certificate.
- Copy of the permittee's California Commercial Fishing License and original NFP(s).
- Copy of the transferee's California Commercial Fishing License.
- Nonrefundable NFP transfer fee of \$500.

Documentation Submitted

- A notarized letter dated May 9, 2014, received May 23, 2014, from Ms. Christine Allen, Executor of the Estate of Thomas L. Ptak requesting to transfer Mr. Ptak's TSCRNFP and Transferable South Coast Region Nearshore Fishery Trap Endorsement (TSCRNFTE) to Mr. Kiyohara.
- A notarized letter dated May 9, 2014, received May 23, 2014, from Eric A. Kramer, requesting to transfer his TSCRNFP to Mr. Kiyohara.
- A notarized letter dated May 9, 2014, received May 23, 2014, from Brian Kiyohara, stating that one the TSCRNFPs will be retired to complete the transfer process.
- Copy of the Certificate of Death from County of San Diego, stating Mr. Ptak's date of death was on March 13, 2012.
- Copy of Letter of Testamentary filed January 31, 2014, for the estate of Thomas L. Ptak, appointing Christine Allen as executor.
- Mr. Ptak's original 2014-2015 TSCRNFP.
- Mr. Kramer's original 2014-2015 TSCRNFP.
- A copy of Mr. Kiyohara's 2014-2015 California Commercial Fishing License and Commercial General Trap Permit.
- Nonrefundable transfer fee \$500.

Department of Fish and Wildlife's Recommendation

The Department is denying your application to transfer Mr. Ptak's TSCRNFP, because the application must be submitted within one year of the date of death of the permit holder as listed on the death certificate. The application was received more than 26 months after the date of death listed on the death certificate.

Deadline to File an Appeal

You may appeal to the Department in writing describing the basis for the appeal. The appeal shall be reviewed and decided by the Department. The decision of the Department may be appealed in writing to the Commission at 1416 Ninth Street,

Ms. Christine Allen

July 3, 2014

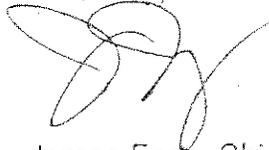

Page Three

Sacramento, California 95814. Pursuant to Section 150(m)(3), Title 14, of the CCR, your appeal of the Department's decision must be received within 60 days of this letter.

Your application to transfer a Transferable South Coast Region Nearshore Fishery Trap endorsement was addressed under separate cover.

If you have any questions or require further assistance, please contact Ms. Debbie Noriega of my staff, at the letterhead address, by telephone at (916) 928-5817, or e-mail Debbie.Noriega@wildlife.ca.gov.

Sincerely,

I, KURT WEISER, declare as follows:

1. I am an attorney duly licensed to practice law in the State of California. I am a partner in the law firm of Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys"), the attorneys-of-record for Christine Allen, Executor of the Estate of Thomas L. Ptak. I have personal knowledge to the following facts, except to those matters which I so indicate that are based on information and belief.

2. Thomas Leonard Ptak died on March 13, 2012. I was retained by Christine Allen immediately following Mr. Ptak's death. Christine Allen informed me that Mr. Ptak owned five (5) commercial fishing permits issued by the California Department of Fish and Wildlife.

3. I enlisted the assistance of commercial fisherman Ken Bates to contact the California Department of Fish and Wildlife on my behalf to notify the Department that Mr. Ptak died, confirm that Mr. Ptak owned five commercial fishing permits, obtain information on how Mr. Ptak's permits could be transferred, and obtain instructions on how Mr. Ptak's personal representative Christine Allen could apply for the transfer of Mr. Ptak's permits.

4. Ken Bates contacted Debbie Noriega at the California Department of Fish and Wildlife on March 19, 2012, only six (6) days following Mr. Ptak's death. Mr. Bates notified Ms. Noriega of Mr. Ptak's death and obtained information regarding the transferability of Mr. Ptak's permits. I spoke with Mr. Bates following his conversation with Ms. Noriega and Mr. Bates provided me with the notes he took during his conversation with Ms. Noriega. Based on my information and belief, Ms. Noriega never informed Mr. Bates that there was a time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit must be submitted to the California Department of Fish and Wildlife.

5. I personally spoke to Ms. Noriega two times within one year of Mr. Ptak's death to discuss the procedure for transferring Mr. Ptak's permits. I informed Ms. Noriega that Mr. Ptak's estate was subject to probate with the Superior Court of California, County of San Diego and that Mr. Ptak's commercial fishing permits were subject to the estate and like any estate assets could not be transferred to Eric Allen without closing the probate.

6. I explained to Ms. Noriega that Mr. Ptak's Probate Estate can not be closed until the creditors of the probate estate are paid. Ms. Noriega informed me that Mr. Ptak's commercial fishing permits could be retained in Mr. Ptak's Probate Estate and could be transferred once the probate was complete. I relied on this information provided by Ms.

Noriega. Ms. Noriega never informed me that there was a time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit must be submitted to the California Department of Fish and Wildlife.

7. As recently as April 28, 2014, Ms. Noriega informed me that an acceptable way to transfer Mr. Ptak's permits was to continue to hold the permits in Mr. Ptak's Probate Estate until the probate estate is complete. Ms. Noriega stated that I should wait to receive a court order for distribution of Mr. Ptak's probate assets issued by a Judge of the Superior Court and then submit the court order along with an application to transfer Mr. Ptak's permits to the California Department of Fish and Wildlife.

8. On or about April 28, 2014, Ms. Noriega informed me that one or more of Mr. Ptak's permits could be sold out of Mr. Ptak's Probate Estate in order to generate enough proceeds to pay off the estate's creditors so that the probate could be closed. In reliance on this information, I assisted Christine Allen, Executor of the Estate of Thomas Ptak in selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit to Brian Kiyohara. The California Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit to Brian Kiyohara and issued the permit in the name of Brian Kiyohara. The California Department of Fish and Wildlife then rescinded the transfer because the application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit was submitted more than one year after Mr. Ptak's death.

9. I spoke to Ms. Noriega on June 6, 2014 when I learned that the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit to Brian Kiyohara had been rescinded. Ms. Noriega stated that she felt terrible and was taken by surprise.

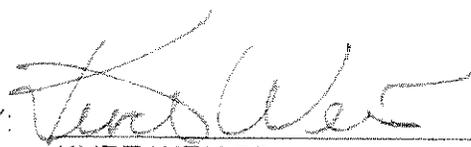

10. The probate of the Estate of Thomas L. Ptak is still ongoing as of the date of this declaration.

11. I have been in regular communication with Ms. Noriega, with initial assistance from Mr. Bates, since the date of Mr. Ptak's death. I followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit. It was my belief based on my conversations with Ms. Noriega that the time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit must be submitted to the California Department of Fish and Wildlife was tolled while Mr. Ptak's Estate was being probated.

I declare under penalty of perjury of the laws of the State of California that the foregoing is true and correct.

I, CHRISTOPHER SHOURDS, declare as follows:

1. I am an attorney duly licensed to practice law in the State of California. I am a associate attorney in the law firm of Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys"), the attorneys-of-record for Christine Allen, Executor of the Estate of Thomas L. Ptak. I have personal knowledge to the following facts, except to those matters which I so indicate that are based on information and belief.

2. My first communication with Debbie Noriega at the California Department of Fish and Wildlife was on December 16, 2013. I contacted Ms. Norriega to follow up to a letter attorney Weiser sent Ms. Norriega on October 7, 2013. Mr. Weiser's letter inquired as to whether Mr. Ptak's commercial fishing permits could be transferred to Eric Allen under

the theory that Mr. Ptak operated his commercial fishing operation as a general partnership entity. Under California law a general partnership is formed whenever two or more people join in a business for profit and share responsibility for management, profits, and liabilities for the debts of the general partners. Mr. Ptak shared profits with Mr. Allen by paying Mr. Allen a "crew share" that was a percentage of their net income. In addition to Mr. Ptak and Mr. Allen splitting profits, they each contributed to expenses, shared equally in the responsibility of maintaining the boat and the rest of the fishing operating, and had the ability to bind each other to contracts and other liabilities.

3. Ms. Noriega was cooperative in telling me she would attempt to have her supervisor prepare a written response to attorney Weiser's letter. No written response or definitive oral response to attorney Weiser's letter was ever received.

4. On December 30, 2014, Ms. Noriega informed me via telephone that one or more of Mr. Ptak's permits could be sold prior to the close of probate if the Department of Fish and Wildlife did not approve the transfer of Mr. Ptak's permits to Mr. Allen based on the theory that Mr. Ptak and Mr. Allen were operating as a general partnership.

5. In April of 2014 I began working to assist Christine Allen in the sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

6. On or about April 28, 2014, I participated in a telephone call with Ms. Noriega and attorney Weiser. Attorney Weiser informed Ms. Noriega that Christine Allen was selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Attorney Weiser also informed Ms. Noriega that the sale of these permits would generate enough income to pay off the

creditors of Mr. Ptak's Probate Estate so that the probate could be closed. Ms. Noriega stated that any unsold permits could remain in Mr. Ptak's Probate Estate and be transferred to Eric Allen at the close of probate by submitting a court order for distribution issued by a Judge of the Superior Court along with applications to transfer Mr. Ptak's remaining permits to Eric Allen to the Department of Fish and Wildlife.

7. The California Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara on June 5, 2014, and re-issued the permits in the name of transferee Brian Kiyohara.

8. I was notified on June 12, 2014 that the California Department of Fish and Wildlife was rescinding the successful transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara because more than one year had passed since Mr. Ptak's death.

9. My numerous conversation with Ms. Noriega between December 16, 2013 and June 12, 2014 and the information and analysis Ms. Noriega provided me regarding the transferability of Mr. Ptak's permits lead me to believe any time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit must be submitted to the California Department of Fish and Wildlife was tolled while Mr. Ptak's estate was being probated.

Dear Messrs. Shourds and Weiser and Ms. Allen:

At its meeting on December 3 in Van Nuys, the California Fish and Game Commission (Commission) considered your request for an extension of time to transfer Thomas L. Ptak's transferable Nearshore Fishery Permit and Nearshore Fishery Trap Endorsement for the South Coast Management Area.

The Commission approved an extension until December 15, 2015 to transfer Mr. Ptak's permit and endorsement. Please contact the California Department of Fish and Wildlife's License and Revenue Branch for more information about how to proceed.

If you have any questions about the Commission's action, please contact Melissa Miller-Henson of my staff at 916.653.6184 or Melissa.Miller-Henson@fgc.ca.gov.

Sincerely,

Sonke Mastrup
Executive Director

Messrs. Shourds and Weiser, Ms. Allen

**REQUEST FOR EXTENSION OF TIME TO TRANSFER THOMAS L. PTAK'S
TRANSFERRABLE SOUTH COAST REGION NEARSHORE FISHERY TRAP
ENDORSEMENT**

Dear Fish and Game Commission:

At its meeting on December 3, 2014, in Van Nuys, the California Fish and Game Commission (the "Commission") approved a request for extension of time to transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement. The Commission extended the time in which this trap endorsement could be transferred to December 15, 2015. This is a formal request to the Commission for an additional one year extension of time to transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement.

I.

Background

Thomas L. Ptak died on March 13, 2012. Christine Allen, Mr. Ptak's partner of 16 years immediately retained the law firm Greenman, Lacy, Klein, Hinds, Weiser & Heffron (hereinafter "Attorneys") to assist her in administering Mr. Ptak's affairs. This included getting Christine Allen appointed as Executor of Mr. Ptak's probate estate and communicating with the Department of Fish and Wildlife regarding Mr. Ptak's commercial fishing permits. The probate estate of Mr. Ptak is still open today and Christine Allen

remains the duly appointed Executor by order of the Superior Court of California, County of San Diego.

Attorneys began communication with the California Department of Fish and Wildlife upon Mr. Ptak's death regarding the procedure in which to transfer Mr. Ptak's commercial fishing permits, including the transferrable Nearshore South Coast Region Nearshore Fishery Trap Endorsement that is the subject of this request for additional time to transfer.

Attorneys stayed in regular communication with Ms. Debbie Noriega at the Department of Fish and Wildlife from the time Mr. Ptak died and relied on the information and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's permits. On June 5, 2014, the probate estate of Mr. Ptak followed transfer instructions provided by Ms. Noriega and sold Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement. The Department of Fish and Wildlife approved the transfer and issued the permit in the name of the buyer.

On June 22, 2014, Christine Allen, the buyer of the permit, and Attorneys were notified that the successful transfer of Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement was rescinded. Attorneys immediately contacted Ms. Noriega who informed Attorneys that the transfer was rescinded because more than one year had passed since Mr. Ptak's death. Ms. Noriega stated she "felt horrible and was as surprised as we were."

Attorneys filed an Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement with the Commission on August 22, 2014. The main grounds for the appeal was that Attorneys began communicating and working with Ms. Noriega within six (6) days of Mr. Ptak's death, were in regular communication with Ms. Noriega since March 13, 2012, and followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement.

A copy of the Appeal for Denial of Application to Transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement, including all exhibits filed with said appeal is attached to this Request for Extension of time as **Exhibit "A"** and incorporated herein.

On December 19, 2014, Attorneys and Executor Christine Allen received a letter from the Commission approving an extension of time until December 15, 2015 to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement. A copy of this letter from the Commission is attached to this Request for Extension of time as **Exhibit "B"** and incorporated herein.

II.

Estate of Thomas L. Ptak Puts Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement Up For Sale

Christine Allen, in her capacity as Executor of the probate estate of Thomas L. Ptak, began marketing Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement immediately after receiving the Commissions approval extending the time of transfer to December 15, 2015.

Christine Allen also continued to operate Mr. Ptak's commercial fishing business as an ongoing business concern of the Estate of Thomas L. Ptak as she had done since Mr. Ptak's death. The goal of continuing to operate the commercial fishing business was to attempt to generate sufficient income to pay of the creditor of the Estate of Thomas L. Ptak.

In order for Christine Allen to continue operating Mr. Ptak's commercial fishing business as an ongoing business concern of The Estate of Thomas L. Ptak, she continued to enlist the services of Eric Allen. Eric Allen is Mr. Ptak's long time crew member and an experienced commercial fisherman who has been involved in assisting the Estate of Thomas L. Ptak since Mr. Ptak died.

When Mr. Ptak died, the Superior Court of California, County of San Diego, appointed Eric Allen as the Special Administrator of the Estate of Thomas L. Ptak. Eric was appointed due to his familiarity of Mr. Ptak's commercial fishing business and due to his long history of working with Mr. Ptak. Eric Allen held the role of Special Administrator of the Estate of Thomas L. Ptak until the Court appointed Christine Allen Executor of the Estate of Thomas L. Ptak on September 18, 2012. At all times since, Christine Allen has enlisted the services of Eric Allen to operate Mr. Ptak's commercial fishing business as an ongoing business concern of the Estate of Thomas L. Ptak with the goal of generating sufficient income to pay off the creditors of the estate.

III.

Department of Fish and Wildlife Seizes Mr. Ptak's Commercial Fishing Permits

On March 18, 2015, Eric Allen was fishing on behalf of the probate Estate of Thomas L. Ptak aboard the vessel Donna Marie, a vessel that was an asset of probate estate. Mr. Allen was fishing using a General Gill/Trammel Net Permit that was current and issued in the name of Thomas L. Ptak. This permit is an asset of probate Estate of Thomas L. Ptak and has been listed and valued on an Inventory and Appraisal filed with the Superior Court of California, County of San Diego, on February 6, 2013.

It is important to know that on March 18, 2015, Eric Allen was not fishing with the transferrable South Coast Region Nearshore Fishery Permit or Transferrable South Coast

Region Nearshore Fishery Trap Endorsement in which the Commission granted the extension of time to transfer until December 15, 2015.

While fishing on March 18, 2015, Eric Allen was boarded by the Department of Fish and Game. The Department of Fish and Game escorted Eric Allen and the vessel Donna Marie back to the vessel's slip in Oceanside Harbor and issued Eric a citation for the following: No Commercial Fishing License; Permittee (Thomas L. Ptak) required to be on vessel; Department of Fish and Game Boat Registration Required; and Department of Fish and Game Boat Registration required aboard at all times.

Once at Oceanside Harbor Eric Allen went to his truck to obtain the following documents and permits, all of which were seized by the Department of Fish and Game: one transferrable South Coast Region Nearshore Fishery Permit issued in the name of Thomas Ptak; one transferrable South Coast Region Nearshore Trap Endorsement issued in the name of Thomas Ptak; one General Gill/Trammel Net Permit issued in the name of Thomas Ptak; one Lobster Operator Permit issued in the name of Thomas Ptak; one Southern Rock Crab Permit issued in the name of Thomas Ptak; the boat registration for the vessel Donna Marie; and one current Commercial Fishing License issued in the name of Thomas Ptak.

All permits seized were assets of the probate Estate of Thomas L. Ptak and were listed as such with the Superior Court of California, County of San Diego, and valued by a probate referee in an Inventory and Appraisal of assets owned by the probate Estate of Thomas L. Ptak filed with said Court on February 6, 2013.

Eric Allen being boarded by the Department of Fish and Game on March 18, 2015 resulted in two pending misdemeanor charges against Eric Allen. The first is for Fishing Without a Commercial License. The second is for Failure to Apply for Commercial Boat Registration.

The misdemeanor charges are not the subject of this request for extension of time. However, the events that have transpired are directly relevant to the reason the Estate of Thomas L. Ptak is requesting additional time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Report.

Christine Allen, as the Executor of the Estate of Thomas L. Ptak has not been able to market or sell Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement since March 18, 2015 because the Department of Fish and Game seized the permits on March 18, 2015 and the Department of Fish and Wildlife will not return the permit to Christine Allen or the Estate of Thomas L. Ptak.

The result is that Christine Allen was granted a one year extension of time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement but has been deprived of approximately nine (9) months of this one year extension because the permit has been held by the Department of Fish and Wildlife rather than being in the possession of Christine Allen.

IV.

Estate of Thomas L. Ptak Attempts To Regain Permits From Department of Fish and Wildlife

Attorneys, on behalf of Christine Allen, Executor of the Estate of Thomas L. Ptak, contacted David Kiene at the California Department of Fish and Wildlife, Office of the General Counsel on April 3, 2015. Attorneys discussed with Mr. Kiene the seizure of Mr. Ptak's permits that are assets of the probate Estate of Thomas L. Ptak. In particular, Attorneys requested that Mr. Ptak's transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement be returned to the Estate of Thomas L. Ptak so these permits could be marketed and sold by December 15, 2015, the time in which the Commission granted their extension for transfer.

Mr. Kiene stated that he would look into the matter but that the permits may not be able to be returned to the Estate of Thomas L. Ptak because they have potential evidentiary value for the citations issued against Eric Allen. Attorneys explained that The Estate of Thomas L. Ptak was no longer fishing, would not fish the permits if returned, and that the vessel Donna Marie (the fishing boat owned by the Estate of Thomas L. Ptak) was parked and listed for sale. Attorneys again requested return of Mr. Ptak's transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement so these permits could be sold before the extension of time granted by the Commission expired. Attorneys explained to Mr. Kiene that they did not understand how the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement had evidentiary value that was any different or more substantive than a copy of the permits would have.

Mr. Kiene informed Attorneys he would discuss the issue with his enforcement division and get back to Attorneys regarding Attorneys request for the return of the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement. Mr. Kiene never responded to Attorneys or to Christine Allen via telephone, letter, email, or any other form of communication.

Attorneys followed up with Mr. Kiene via telephone but never received a call back. To date, Attorneys and Christine Allen have received no communication, written or otherwise, from the Department of Fish and Wildlife since April 3, 2015.

V.

Why The Estate of Thomas L. Ptak Needs Additional Time to Transfer Permit

The probate Estate of Thomas L. Ptak has not been afforded sufficient opportunity to transfer the transferrable South Coast Region Nearshore Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement because these permits have been held by the Department of Fish and Wildlife since March 18, 2015.

VI.

Additional Pertinent Information

The Estate of Thomas L. Ptak sold the vessel Donna Marie and is no longer fishing. The Estate of Thomas L. Ptak has not fished since March 18, 2015 and has no plans to fish. The Estate of Thomas L. Ptak sold the vast majority of the commercial fishing equipment owned by the Estate of Thomas L. Ptak. Any remaining fishing equipment owned by the Estate of Thomas L. Ptak is for sale. The probate of the Estate of Thomas L. Ptak is still an open case with the Superior Court of California, County of San Diego. Christine Allen is still the duly appointed Executor of the Estate of Thomas L. Ptak.

In addition to Mr. Ptak's transferrable South Couth Coast Region Nearshore Fishery Permit and Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement, The California Department of Fish and Wildlife is holding the following permits that are assets of the Estate of Thomas L. Ptak: one General Gill/Trammel Net Permit; one Lobster Operator Permit; and one Southern Rock Crab Permit (collectively referred to hereafter as "The Five Permits"). All of The Five Permits were seized by the Department of Fish and Wildlife on March 18, 2015 and have not been returned to the Estate of Thomas L. Ptak, thus depriving the Estate of Thomas L. Ptak the ability to transfer these permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak.

VII.

Request for Additional Extension of time

Based on the information addressed in this Request For Extension of Time To Transfer Thomas L. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement, the Estate of Thomas L. Ptak respectfully requests from the Commission an additional one (1) year extension of time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Trap Endorsement.

VIII.

Request for Right to Renew Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to allow the Estate of Thomas L. Ptak to renew The Five Permits so The Five Permits will not expire and so the Estate of Thomas L. Ptak has the opportunity to transfer the permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak.

IX.

Request for Return of Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to return The Five Permits to the Estate of Thomas L. Ptak. Return of these permits is necessary because the Estate of Thomas L. Ptak cannot transfer the permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak unless the Estate of Thomas L. Ptak is in possession of these permits. The instruction should direct The Five Permits be returned to Christine Allen, Executor, The Estate of Thomas L. Ptak,

X.

Final Comments

Thank you for your time and consideration in reviewing the Estate of Thomas L. Ptak's requests contained in this document.

Very Truly Yours,

GREENMAN, LACY, KLEIN,
HINDS, WEISER & HEFFRON,

**APPEAL OF DENIAL OF APPLICATION TO TRANSFER THOMAS L. PTAK'S
TRANSFERABLE SOUTH COAST REGION NEARSHORE FISHERY TRAP
ENDORSEMENT**

Dear Fish and Game Commission:

This appeal is in response to the July 3, 2014 Notice of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Trap Endorsement addressed to Christine Allen as Executor of the Estate of Thomas L. Ptak. A copy of this Notice of Denial is attached to and incorporated herein as Exhibit A.

I.

Reason Given for Denial

The application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement was denied because the application was submitted more than one year after Mr. Ptak's date of Death.

II.

Basis for Appeal

Thomas Leonard Ptak died on March 13, 2012. A copy of his death certificate is attached to and incorporated herein as Exhibit B.

Christine Allen, Mr. Ptak's partner of 16 years, immediately retained the law firm Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys") to assist her in administering Mr. Ptak's affairs. This included communicating with the California Department of Fish and Wildlife regarding Mr. Ptak's commercial fishing permits and handling the Probate of Mr. Ptak's Estate.

Attorneys enlisted the assistance of commercial fisherman Ken Bates due to his understanding of the unique nature of the commercial fishing permits owned by Mr. Ptak. On behalf of Attorneys, Ken Bates first contacted Debbie Noriega at the Department of Fish and Wildlife on March 19, 2012 only six (6) days following Mr. Ptak's death. Ken Bates notified Ms. Noriega that Mr. Ptak died, confirmed that Mr. Ptak owned five commercial fishing permits, obtained information on how Mr. Ptak's permits could be transferred, and obtained instruction on how Mr. Ptak's personal representative Christine Allen could apply for the transfer of Mr. Ptak's commercial fishing permits. Ms. Noriega provided invaluable assistance and shared extensive knowledge regarding the permits owned by Mr. Ptak. However, at no time did Ms. Noriega explain to Mr. Bates that there was a time frame in which Mr. Ptak's permits must be transferred.

Attorney Kurt Weiser of the law firm Greenman, Lacy, Klein, O'Harra & Heffron spoke directly to Ms. Noriega two times within one year of Mr. Ptak's death. Attorney Weiser's first conversation with Ms. Noriega took place on or about May 16, 2012. His second conversation with Debbie Noriega took place on or about August 22, 2012. The purpose of these conversations was to discuss the procedure for transferring Mr. Ptak's commercial fishing permits.

Attorney Weiser explained that Mr. Ptak's estate was subject to Probate with the Superior Court of California, County of San Diego and therefore Mr. Ptak's commercial fishing permits would become probate assets. Under the California Probate Code assets, including the permits, can not transfer prior to the time the Probate Court's order to distribute estate assets is issued.

Attorney Weiser informed Ms. Noriega that the Probate of Mr. Ptak's estate would be a lengthy process because no probate can be completed until creditors of the estate are paid. Ms. Noriega informed Attorney Weiser that Mr. Ptak's commercial fishing permits could be retained in Mr. Ptak's probate estate and could be transferred once the probate was complete. Attorneys were appreciative of Ms. Noriega's analysis. However, Ms. Noriega analysis of the transfer of Mr. Ptak's permits never included reference to time frames in which applications to transfer Mr. Ptak's permits must be submitted to the Department of Fish and Wildlife. All of Mr. Ptak's commercial fishing permits are still assets of Mr. Ptak's Probate Estate as of the date of this appeal.

Attorney Weiser and Christine Allen relied on Ms. Noriega's instruction and expertise as a Department of Fish and Wildlife analyst. Attorney Weiser relied on Ms. Noriega's thorough analysis and advice (and lack of any mention of a time limitation). On that basis

Attorney Weiser understood that the time frames in which Mr. Ptak's permits could be transferred would be tolled during the probate. A declaration by Attorney Weiser is attached to and incorporated herein as Exhibit C.

III.

Summary of the Probate of The Estate of Thomas Ptak

Attorneys, on behalf of Petitioner Christine Allen, promptly filed a Petition for Probate of Mr. Ptak's Last Will and Testament and for Letters Testamentary with the Superior Court of California, County of San Diego, on June 1, 2012.

The Superior Court issued an order appointing Christine Allen as the Executor of Mr. Ptak's Will and issued Letters Testamentary to Christine Allen as the Executor of the Will of Mr. Ptak with full authority to administer Mr. Ptak's Probate Estate on September 18, 2012.

Multiple creditors filed creditor's claims against Mr. Ptak's Probate Estate. Claims by creditors of the decedent are very common in probates and occur when the decedent dies with legitimate debt. Attorneys and Christine Allen have worked diligently with these creditors to plan for the payoff of Mr. Ptak's debt so that Mr. Ptak's Probate Estate can generate enough income to pay off these creditors. Attorneys also maintained frequent communication with Ms. Noriega from Mr. Ptak's date of death until present day. These communications include Attorneys providing Ms. Noriega with frequent status updates on the probate of Mr. Ptak's estate. Ms. Noriega continued to provide Attorneys with advice and guidance.

Ms. Noriega advice to hold Mr. Ptak's permits in Mr. Ptak's Probate Estate until the close of probate never wavered. As recently as April 28, 2014, Ms. Noriega advised attorney Weiser that Mr. Ptak's commercial permits could be transferred once the probate of Mr. Ptak's estate is completed. Specifically, Ms. Noriega confirmed with attorney Weiser and attorney Christopher Shourds of Greenman, Lacy, Klein, O'Harra & Heffron that the best way to transfer Mr. Ptak's commercial permits was to continue to hold the permits in Mr. Ptak's probate estate until the probate is complete. Ms. Noriega stated that Attorneys should wait until they receive a court order for distribution of Mr. Ptak's probate assets issued by a Judge of the Superior Court and then submit the court order along with an application to transfer Mr. Ptak's permits to Eric Allen to the Department of Fish and Wildlife.

Further, Ms. Noriega stated that she had communicated with her supervisor and advised Attorneys that this process would result in the successful transfer of Mr. Ptak's permits to Eric Allen. A declaration by attorney Shourds is attached to and incorporated herein as Exhibit D.

IV.

Attorneys Sought Additional Ways to Transfer Permits to Eric Allen Prior to the Close of Mr. Ptak's Probate Estate

Attorney Weiser informed Ms. Noriega that Christine Allen desired to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Eric Allen, Mr. Ptak's long time deckhand and crew member, without the requirement that Eric Allen need to purchase any ancillary permits or endorsements. Ms. Noriega informed Attorney Weiser that this could not be accomplished because Eric Allen was not a blood relative of Mr. Ptak and because the owner of the permits was not a commercial entity in which Eric Allen possessed an ownership interest. Again, Ms. Noriega was cooperative and knowledgeable. Attorneys appreciate the assistance and insight she provided.

On October 7, 2013 attorney Weiser submitted a letter to Ms. Noriega asking the Department of Fish and Wildlife to consider allowing the transfer of Mr. Ptak's permits to Eric Allen, without the need for Eric Allen to acquire any ancillary permits, under the theory that Mr. Ptak and Eric Allen operated the fishing business as a general partnership entity. A general partnership can be legally recognized as a commercial entity in the state of California.

Attorney Weiser's letter informed Ms. Noriega that Eric Allen was paid a "crew share" for the past twelve years. It also explained that Mr. Ptak and Eric Allen split profits, each contributed to expenses, shared equally in the responsibility of maintaining the boat and the rest of the fishing operation, and had the ability to bind each other to contracts and other liabilities. Under these circumstances, attorney Weiser urged the Department of Fish and Wildlife that Mr. Ptak's Probate Estate should be able to transfer the permits to Eric Allen prior to the close of probate without the requirement that Eric Allen purchase any ancillary permits.

Attorneys never received a definitive response to attorney Weiser's October 7th letter despite placing numerous follow up calls to Ms. Noriega between December 16, 2013 and December 30, 2013. Ms. Noriega was supportive in trying to obtain a written response from her supervisors to attorney Weiser's letter. On December 30, 2013, attorney Shourds reached Ms. Noriega via telephone. Ms. Noriega still did not have a response to attorney Weiser's letter. However, Ms. Noriega stated that one or more of Mr. Ptak's permits could be sold prior to the close of probate if the Department of Fish and Wildlife did not approve the transfer of Mr. Ptak's permits to Eric Allen based on the theory that Mr. Ptak and Eric Allen were operating as a general partnership.

Attorneys relayed Ms. Noriega's comments to Christine Allen. Upon hearing Ms. Noriega's statement that one or more of Mr. Ptak's permits could be sold out of Mr. Ptak's Probate Estate, Christine Allen decided that the quickest way to generate income necessary to pay off creditors and close Mr. Ptak's Probate Estate would be to sell one or more of Mr. Ptak's permits.

Four months passed and Attorneys still did not receive a definitive response to their request to transfer Mr. Ptak's permits to Eric Allen based on the theory that Mr. Ptak and Eric Allen were operating as a general partnership. Attorney Weiser left a voicemail for Ms. Noriega on April 7, 2014 expressing Christine Allen's desire to sell Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Attorneys never received a response to this voicemail.

V.

Department of Fish and Wildlife's Approval of Transfer

On or about April 16, 2014 Christine Allen began working with a broker to sell Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Christine Allen was introduced to buyer Brian Kiyohara on or about April 21, 2014. On or about April 28, 2014, Attorneys Weiser and Shourds spoke to Ms. Noriega to inform her that Christine Allen was selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

Attorney Weiser informed Ms. Noriega that the sale of these permits would generate enough income to pay off the creditors of Mr. Ptak's Probate Estate so that the probate could be closed. Again, Ms. Noriega stated that any unsold permits could be held in Mr. Ptak's Probate Estate and transferred to Eric Allen at the close of probate by submitting a court order for distribution issued by a Judge of the Superior Court along with applications to transfer Mr. Ptak's remaining permits to Eric Allen to the Department of Fish and Wildlife.

Christine Allen relied on the information provided by Debbie Noriega and sold Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara.

The Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara on June 5, 2014 and re-issued the permits in the name of Brian Kiyohara. Copies of the Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement issued to Brian Kiyohara are attached to and incorporated herein as Exhibit E.

The sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement generated enough proceeds that Christine Allen was less than one week away from issuing payment in full to all creditors of Mr. Ptak's Probate Estate. Issuing these payments to creditors would have allowed Christine Allen to close Mr. Ptak's Probate Estate.

VI.

Department of Fish and Wildlife's Recission of Transfer

On June 12, 2014, Christine Allen, Brian Kiyohara, and Attorneys were notified that the successful transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement was rescinded by the Department of Fish and Wildlife even though transferee Brian Kiyohara was already in possession of newly issued permits.

Attorney Weiser immediately contacted Ms. Noriega who informed him that the transfer of the permits was rescinded because more than one year had passed since Mr. Ptak's death. Ms. Norriega stated that she "felt terrible and was surprised as we were."

Christine Allen had already deposited the proceeds from the sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement into the bank account for Mr. Ptak's Probate Estate and wrote checks to pay off the creditors of Mr. Ptak's Probate Estate. Fortunately, the checks to the creditors were not yet mailed and were able to be voided.

Christine Allen refunded transferee Brian Kiyohara the full amount that Mr. Kiyohara paid for Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

VII.

Additional Pertinent Information

The Probate of the Estate of Mr. Ptak is still ongoing as of the date of this Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Trap Endorsement.

Attorneys began communicating and working with Ms. Noriega within six (6) days of Mr. Ptak's death. Attorneys and Christine Allen have not delayed or neglected to attempt to transfer Mr. Ptak's commercial fishing permits. Attorneys have been in regular communication with Ms. Noriega since March 19, 2012 and have followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's permits.

The Estate of Mr. Ptak owns one Transferrable South Coast Region Nearshore Fishery Permit, one Transferrable South Coast Region Nearshore Fishery Trap Endorsement, one General Gill/Trammel Net Permit, one Lobster Operator Permit, and one Southern Rock Crab Trap Permit. All of these permits have exceeded the time frame for approval of transfer due to the probate of Mr. Ptak's estate and the same facts contained in this appeal.

Attorneys are hopeful the Fish and Game Commission will approve the request for extension of time (below) and apply it to all permits owned by the Estate of Mr. Ptak. Attorneys are prepared to apply for transfer of each permit owned by the Estate of Mr. Ptak and to appeal any denial to the maximum extent possible.

Attorneys are hopeful this situation can be resolved and the extension of time requested below can be granted without the need to appear at a hearing in front of the Fish and Game Commission.

Attorneys sincerely appreciate the time and resources the Fish and Game Commission put into reading and investigating this Appeal of Denial of Application to Transfer Thomas L. Ptak's Transferable South Coast Region Nearshore Fishery Permit.

VIII.

Request for Relief

Attorneys and Christine Allen, Executor of the Estate of Thomas L. Ptak, hereby request an extension of time to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Specifically, Attorneys and Christine Allen, Executor of the Estate of Thomas L. Ptak, formally request from the Fish and Game Commission a nine (9) month extension to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement with the extension beginning on the date that Attorneys and Christine Allen are notified by the Fish and Game Commission that the extension of time has been granted.

Christine Allen plans to use this extension of time to sell Mr. Ptak's Transferable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. This sale will generate enough proceeds that creditors of Mr. Ptak's Probate Estate can be paid off and Attorneys' can file a petition with the Superior Court to close the probate and distribute Mr. Ptak's remaining assets.

Christine Allen, at the time probate can be closed, plans to transfer all of Mr. Ptak's remaining permits to Eric Allen so the fishing business can be maintained. The inability to transfer Mr. Ptak's permits by selling one or more permit and transferring the remaining permits at the close of probate will irreparably harm Christine Allen and Eric Allen. Christine and Eric's main source of income comes from the operation of the fishing business Mr. Ptak spent his life developing with the help of Eric Allen as his crew member and deckhand. If the Fish and Game Commission does not grant an extension of time to allow Christine Allen to transfer Mr. Ptak's permits then the Allen family will likely lose everything, including but not limited to the house they live in and the income source they live off of. The extension of time requested above is the best foreseeable way to save the Allen family from financial hardship that would occur if Mr. Ptak's permits become non-transferrable due to the passage of time following Mr. Ptak's Death.

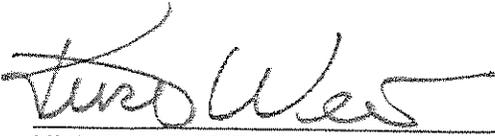

Respectfully Submitted,

GREENMAN, LACY, KLEIN,
O'HARRA & HEFFRON

Ms. Christine Allen

SUBJECT: NOTICE OF DENIAL TO TRANSFER TRANSFERABLE SOUTH COAST REGION NEARSHORE FISHERY TRAP ENDORSEMENT

Dear Ms. Allen:

This letter is in response to your application to transfer a 2014-2015 Transferable South Coast Region Nearshore Fishery Trap Endorsement (TSCRNFTE), Permit Number TST022, from Mr. Thomas L. Ptak (L30798). You are the executor of executor of the estate.

Authority- Nearshore Fishery Trap Endorsement

Pursuant to Section 150.03(d), Title 14, of the California Code of Regulations (CCR), a Nearshore Fishery Trap Endorsement (NFTE) may be transferred to another commercial fisherman if the transferee possesses a valid transferable Nearshore Fishery Permit (NFP) for the same regional management area.

Section 150.03(d), Title 14, of the CCR, states a nonrefundable transfer fee of \$75 is required.

Nearshore Fishery Trap Endorsement Requirements

- The NFTE must be valid at the time of application for transfer.
- The transferee must have a valid NFP and Commercial General Trap Permit.
- The transferee must have never been convicted of a violation of any provision of these regulations or the FGC pertaining to the commercial take of nearshore fish stocks.

Required Documentation

- The request for the transfer must be submitted within one year of the date of death of the permit holder as listed on the death certificate.
- Transfer application in the form of a notarized letter which identifies the current permit holder, transferee, and transferable NFTE for the regional management area.
- Copy of the permittee's death certificate.
- Copy of the permittee's valid NFP.
- The permittees' NFTE.
- Copy of the transferee's California Commercial Fishing License and Commercial General Trap Permit.
- Nonrefundable NFTE transfer fee of \$75.

Documentation Submitted

- A notarized letter dated May 9, 2014, received May 23, 2014, from Ms. Christine Allen, Executor of the Estate of Thomas L. Ptak requesting to transfer Mr. Ptak's TSCRNFP and Transferable South Coast Region Nearshore Fishery Trap Endorsement (TSCRNFTE) to Mr. Kiyohara.

Conserving California's Wildlife Since 1870

- Copy of the Certificate of Death from County of San Diego, stating Mr. Ptak's date of death was on March 13, 2012.
- Copy of Letter of Testamentary filed January 31, 2014, for the estate of Thomas L. Ptak, appointing Christine Allen as executor.
- Mr. Ptak's original 2014-2015 TSCRNFTE.
- A copy of Mr. Kiyohara's 2014-2015 California Commercial Fishing License and Commercial General Trap Permit.
- Nonrefundable transfer fee of \$75.

Department of Fish and Wildlife's Recommendation

The Department is denying your application to transfer Mr. Ptak's TSCRNFTE, because the application must be submitted within one year of the date of death of the permit holder as listed on the death certificate. The application was received more than 26 months after the date of death listed on the death certificate.

Deadline to File an Appeal

You may appeal to the Department in writing describing the basis for the appeal. The appeal shall be reviewed and decided by the Department. The decision of the Department may be appealed in writing to the Commission at 1416 Ninth Street, Sacramento, California 95814. Pursuant to Section 150(m)(3), Title 14, of the CCR, your appeal of the Department's decision must be received within 60 days of this letter.

If you have any questions or require further assistance, please contact Ms. Debbie Noriega, of my staff, at the letterhead address, by telephone at (916) 928-5817, or e-mail Debbie.Noriega@wildlife.ca.gov.

Sincerely,

James Fong, Chief
License and Revenue Branch

I, KURT WEISER, declare as follows:

1. I am an attorney duly licensed to practice law in the State of California. I am a partner in the law firm of Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys"), the attorneys-of-record for Christine Allen, Executor of the Estate of Thomas L. Ptak. I have personal knowledge to the following facts, except to those matters which I so indicate that are based on information and belief.

2. Thomas Leonard Ptak died on March 13, 2012. I was retained by Christine Allen immediately following Mr. Ptak's death. Christine Allen informed me that Mr. Ptak owned five (5) commercial fishing permits issued by the California Department of Fish and Wildlife.

3. I enlisted the assistance of commercial fisherman Ken Bates to contact the California Department of Fish and Wildlife on my behalf to notify the Department that Mr. Ptak died, confirm that Mr. Ptak owned five commercial fishing permits, obtain information on how Mr. Ptak's permits could be transferred, and obtain instructions on how Mr. Ptak's personal representative Christine Allen could apply for the transfer of Mr. Ptak's permits.

4. Ken Bates contacted Debbie Noriega at the California Department of Fish and Wildlife on March 19, 2012, only six (6) days following Mr. Ptak's death. Mr. Bates notified Ms. Noriega of Mr. Ptak's death and obtained information regarding the transferability of Mr. Ptak's permits. I spoke with Mr. Bates following his conversation with Ms. Norriega and Mr. Bates provided me with the notes he took during his conversation with Ms. Noriega. Based on my information and belief, Ms. Noriega never informed Mr. Bates that there was a time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement must be submitted to the California Department of Fish and Wildlife.

5. I personally spoke to Ms. Noriega two times within one year of Mr. Ptak's death to discuss the procedure for transferring Mr. Ptak's permits. I informed Ms. Noriega that Mr. Ptak's estate was subject to probate with the Superior Court of California, County of San Diego and that Mr. Ptak's commercial fishing permits were subject to the estate and like any estate assets could not be transferred to Eric Allen without closing the probate.

6. I explained to Ms. Noriega that Mr. Ptak's Probate Estate can not be closed until the creditors of the probate estate are paid. Ms. Noriega informed me that Mr. Ptak's commercial fishing permits could be retained in Mr. Ptak's Probate Estate and could be transferred once the probate was complete. I relied on this information provided by Ms.

Noriega. Ms. Noriega never informed me that there was a time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement must be submitted to the California Department of Fish and Wildlife.

7. As recently as April 28, 2014, Ms. Noriega informed me that an acceptable way to transfer Mr. Ptak's permits was to continue to hold the permits in Mr. Ptak's Probate Estate until the probate estate is complete. Ms. Noriega stated that I should wait to receive a court order for distribution of Mr. Ptak's probate assets issued by a Judge of the Superior Court and then submit the court order along with an application to transfer Mr. Ptak's permits to the California Department of Fish and Wildlife.

8. On or about April 28, 2014, Ms. Noriega informed me that one or more of Mr. Ptak's permits could be sold out of Mr. Ptak's Probate Estate in order to generate enough proceeds to pay off the estate's creditors so that the probate could be closed. In reliance on this information, I assisted Christine Allen, Executor of the Estate of Thomas Ptak in selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara. The California Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara and issued the permit in the name of Brian Kiyohara. The California Department of Fish and Wildlife then rescinded the transfer because the application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement was submitted more than one year after Mr. Ptak's death.

9. I spoke to Ms. Noriega on June 6, 2014 when I learned that the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara had been rescinded. Ms. Noriega stated that she felt terrible and was taken by

surprise.

10. The probate of the Estate of Thomas L. Ptak is still ongoing as of the date of this declaration.

11. I have been in regular communication with Ms. Noriega, with initial assistance from Mr. Bates, since the date of Mr. Ptak's death. I followed the advice and instruction Ms. Noriega provided regarding the transferability of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement. It was my belief based on my conversations with Ms. Noriega that the time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement must be submitted to the California Department of Fish and Wildlife was tolled while Mr. Ptak's Estate was being probated.

I declare under penalty of perjury of the laws of the State of California that the foregoing is true and correct.

I, CHRISTOPHER SHOURDS, declare as follows:

1. I am an attorney duly licensed to practice law in the State of California. I am a associate attorney in the law firm of Greenman, Lacy, Klein, O'Harra & Heffron (hereinafter "Attorneys"), the attorneys-of-record for Christine Allen, Executor of the Estate of Thomas L. Ptak. I have personal knowledge to the following facts, except to those matters which I so indicate that are based on information and belief.

2. My first communication with Debbie Noriega at the California Department of Fish and Wildlife was on December 16, 2013. I contacted Ms. Norriega to follow up to a letter attorney Weiser sent Ms. Noriega on October 7, 2013. Mr. Weiser's letter inquired as to whether Mr. Ptak's commercial fishing permits could be transferred to Eric Allen under

the theory that Mr. Ptak operated his commercial fishing operation as a general partnership entity. Under California law a general partnership is formed whenever two or more people join in a business for profit and share responsibility for management, profits, and liabilities for the debts of the general partners. Mr. Ptak shared profits with Mr. Allen by paying Mr. Allen a "crew share" that was a percentage of their net income. In addition to Mr. Ptak and Mr. Allen splitting profits, they each contributed to expenses, shared equally in the responsibility of maintaining the boat and the rest of the fishing operating, and had the ability to bind each other to contracts and other liabilities.

3. Ms. Noriega was cooperative in telling me she would attempt to have her supervisor prepare a written response to attorney Weiser's letter. No written response or definitive oral response to attorney Weiser's letter was ever received.

4. On December 30, 2014, Ms. Noriega informed me via telephone that one or more of Mr. Ptak's permits could be sold prior to the close of probate if the Department of Fish and Wildlife did not approve the transfer of Mr. Ptak's permits to Mr. Allen based on the theory that Mr. Ptak and Mr. Allen were operating as a general partnership.

5. In April of 2014 I began working to assist Christine Allen in the sale of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement.

6. On or about April 28, 2014, I participated in a telephone call with Ms. Noriega and attorney Weiser. Attorney Weiser informed Ms. Noriega that Christine Allen was selling Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement. Attorney Weiser also informed Ms. Noriega that the sale of these permits would generate enough income to pay off the

creditors of Mr. Ptak's Probate Estate so that the probate could be closed. Ms. Noriega stated that any unsold permits could remain in Mr. Ptak's Probate Estate and be transferred to Eric Allen at the close of probate by submitting a court order for distribution issued by a Judge of the Superior Court along with applications to transfer Mr. Ptak's remaining permits to Eric Allen to the Department of Fish and Wildlife.

7. The California Department of Fish and Wildlife approved the transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara on June 5, 2014, and re-issued the permits in the name of transferee Brian Kiyohara.

8. I was notified on June 12, 2014 that the California Department of Fish and Wildlife was rescinding the successful transfer of Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Permit and Transferrable South Coast Region Nearshore Fishery Trap Endorsement to Brian Kiyohara because more than one year had passed since Mr. Ptak's death.

9. My numerous conversation with Ms. Noriega between December 16, 2013 and June 12, 2014 and the information and analysis Ms. Noriega provided me regarding the transferability of Mr. Ptak's permits lead me to believe any time frame in which an application to transfer Mr. Ptak's Transferrable South Coast Region Nearshore Fishery Trap Endorsement must be submitted to the California Department of Fish and Wildlife was tolled while Mr. Ptak's estate was being probated.

Ms. Christine Allen, Executor
Estate of Thomas L. Ptak

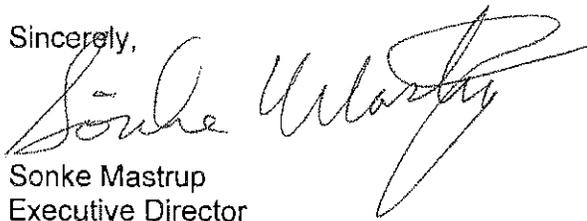

Dear Messrs. Shourds and Weiser and Ms. Allen:

At its meeting on December 3 in Van Nuys, the California Fish and Game Commission (Commission) considered your request for an extension of time to transfer Thomas L. Ptak's transferable Nearshore Fishery Permit and Nearshore Fishery Trap Endorsement for the South Coast Management Area.

The Commission approved an extension until December 15, 2015 to transfer Mr. Ptak's permit and endorsement. Please contact the California Department of Fish and Wildlife's License and Revenue Branch for more information about how to proceed.

If you have any questions about the Commission's action, please contact Melissa Miller-Henson of my staff at 916.653.6184 or Melissa.Miller-Henson@fgc.ca.gov.

Sincerely,

Sonke Mastrup
Executive Director

Subject: Thomas Ptak Estate's requests

Dear Commissioners:

This letter is in regards to a letter by Chris Shourds dated November 11, 2015 ("Letter"), written on behalf of the Estate of Thomas Ptak ("Estate"), to the Fish and Game Commission ("Commission"), in which the Estate asks the Commission to waive deadlines in regulations and the Fish and Game Code ("Waiver Requests"). These deadlines pertain to the transfer of a nearshore fishery permit (South Coast Region) and nearshore trap endorsement (South Coast Region), and renewal of a southern rock crab trap permit, lobster operator permit, general gill/trammel net permit, nearshore fishery permit, and nearshore trap endorsement that Mr. Ptak had owned (collectively, "Permits"). The Estate is also asking the Department to return the Permits, which it seized earlier this year because of fishing violations committed by a representative of the Estate. Because there is no authority to waive these deadlines, and because the Estate has used the Permits after Mr. Ptak's death to illegally catch over \$135,000 worth of lobsters and crabs, the Department of Wildlife ("Department") objects to the Waiver Requests and request to return the Permits, and asks that the Commission remove these requests as an agenda item.

I. Background

Mr. Ptak possessed a southern rock crab trap permit, lobster operator permit, general gill/trammel net permit, nearshore fishery permit (South Coast Region), and nearshore trap endorsement (South Coast Region). Mr. Ptak died on March 13, 2012. As explained below, each permit has rules and deadlines applying to its transfer after the death of a permittee. Furthermore, each permit could only be used by Mr. Ptak unless they were lawfully transferred after his death: none have been transferred.

With respect to southern rock crab trap permits, California Code of Regulations, title 14 ("Title 14"), section 125, subdivision (a) ("Section 125(a)") states in part that "any person using traps to take, possess aboard a vessel, use as bait, or land rock crab...for commercial purposes shall have a valid general trap permit issued pursuant to Fish and Game Code Section 9001 and either a northern or southern rock crab trap permit..." Upon death of a permittee, an estate "may renew the permit, for the purpose of maintaining its validity, for a period of two (2) years from

the date of death of the permit holder as stated on the death certificate.” (Section 125, subd. (f)(5).) This authorization does not allow anyone to fish for crabs until the transfer is complete. Accordingly, the Estate could not renew the southern rock crab trap permit after March 13, 2014, although it did so on March 28, 2014 and March 12, 2015.¹ (Exhibit A, which is a list printed from the Department’s Automated License Data System showing all of the Permits and the dates that they have been renewed.) The Estate has never submitted an application to transfer the southern rock crab trap permit.

Lobster operator permits have similar restrictions. When taking lobsters, each “operator and crewmember permittee shall have his/her permit in possession.” (Title 14, Section 122 (“Section 122”), subdivision(b).) Upon a permittee’s death, the estate of a lobster operator “may renew that permit as provided for in these regulations if needed to keep it valid” for up to one year, but may not fish with it. (Section 122, subdivision (r)(2).) Thus, the Estate could not renew the lobster operator permit after March 13, 2013, although it did so on March 28, 2014 and March 12, 2015. (Exhibit A.) The Estate has never submitted an application to transfer the lobster operator permit.

Likewise, for a general gill/trammel net permit transfer, “The application for transfer by that person's estate shall be received by the department...within one year of the date of death of the permitholder.” (Fish & G. Code, § 8681.5, subd. (d) (“Section 8681.5(d)”.) An estate may renew a permit only once. If no transfer application is submitted within one year of the death of the permittee, “the permit shall revert to the department for disposition pursuant to Section 8681.” (Section 8681.5(d).) Therefore, the Estate could not renew the gill/trammel net permit after March 13, 2013. Nonetheless, the Estate renewed Mr. Ptak’s general gill/trammel net permit on March 28, 2014 and March 12, 2015. (Exhibit A.) The Estate has never submitted an application to transfer this permit.

Title 14, section 150, subdivision (g)(3) (“Section 150”), which addresses the transfer of a nearshore fishery permit and nearshore fishery endorsement after the death of a permittee, states in part:

A transferable Nearshore Fishery Permit issued pursuant to this section may be transferred to the estate of a permittee who has died only for the purpose of transferring the Nearshore Fishery Permit to another person.

¹ Mr. Ptak’s commercial fishing license was also illegally renewed after his death on these dates and on March 26, 2012.

(A) Such transfer may be considered if the estate makes application, in the form of a notarized letter, for the transfer within one year of the date of death as listed on the death certificate.

...

Since Mr. Ptak's death occurred on March 13, 2012, the Estate was required to submit an application by March 13, 2013.

According to the Estate, Eric Allen, a commercial fisherman and former crewmember of Mr. Ptak, was enlisted by the Executor of the Estate, Christine Allen, "to continue operating Mr. Ptak's commercial fishing business," which was "an ongoing business concern of The Estate of Thomas L. Ptak." (Letter, p. 3.) Mr. Allen has assisted the Estate with Mr. Ptak's fishing business since Mr. Ptak's death. Furthermore, Mr. Allen was formally recognized by the Superior Court of California, County of San Diego, as the Special Administrator of the Estate of Thomas L. Ptak, a title which he held until September 18, 2012. Since that time, according to the Estate, "Christine Allen has enlisted the services of Eric Allen to operate Mr. Ptak's commercial fishing business as an on ongoing business concern of the Estate of Thomas L. Ptak with the goal of generating sufficient income to pay off the creditors of the estate." (Letter, p. 3.)

On May 23, 2014, over two years after Mr. Ptak's death, and over a year after the deadline, the Estate submitted documents to transfer the nearshore fishery permit and nearshore trap endorsement. Because the deadline had passed, the Department denied the transfer application on July 3, 2014. (Exhibit B.)

On August 22, 2014, the Estate submitted a request to the Commission to appeal the Department's denial, and waive Section 150, subdivision (g)(3)(A)'s one-year deadline by extending the deadline by nine months. In support of the Estate's appeal request, attorneys for the Estate, Kurt Weiser and Mr. Shourds, each submitted a declaration, attached to the Letter, claiming that Governmental Program Analyst Debbie Noriega, who has no knowledge or training regarding probate matters, advised them on various probate issues.² They also allege

² Mr. Weiser and Mr. Shourds claim Ms. Noriega told them: "Mr. Ptak's commercial fishing permits could be retained in Mr. Ptak's Probate Estate and could be transferred once the probate was complete." (Weiser Dec., paragraph 6, p. 2); "...one or more of Mr. Ptak's permits could be sold out of Mr. Ptak's Probate Estate in order to generate enough proceeds to pay off the estate's creditors so that the probate could be closed." (Weiser Dec., paragraph 8, p. 3); "...one or more of Mr. Ptak's permits could be sold prior to the close of probate if the Department of Fish and Wildlife did not approve the transfer of Mr. Ptak's permits to Mr. Allen based on the theory that Mr. Ptak and Mr. Allen were operating as a general partnership." (Shourds Dec., paragraph 4, p. 2); and "...any unsold permits could remain in Mr. Ptak's Probate Estate and be transferred to Eric Allen at the close of probate by

that she failed to advise them of a deadline to submit a transfer application, although neither attorney asked her about deadlines, and the transfer deadlines are clearly stated in the regulations. Ms. Noriega vigorously denies making such statements regarding probate, and does not recall discussing any probate matter with them. Even though their law firm, Greenman, Lacy, Klein, Hinds, Weiser & Heffron, has, according to its website, “attorneys specializing in the following practice areas: family law, probate, estate planning, . . .” they maintain that they relied on Ms. Noriega for advice on probate issues.

In lieu of an appeal hearing, on December 3, 2014, the Commission granted the Estate a twelve month extension to complete the transfer—i.e., until December 15, 2015. Since Mr. Ptak died on March 13, 2012, and the deadline to apply for a transfer had already passed on March 13, 2013, this waiver actually extended the deadline from 12 to 45 months. These latest Waiver Requests would again extend the deadlines to submit transfer applications, and renew the Permits, by another twelve months to December, 2016—57 months after Mr. Ptak’s death. Specifically, the deadlines would be extended as follows:

- Southern rock crab trap permit renewal deadline: from March 13, 2014 to December 15, 2016 (33 month extension).
- Lobster operator permit renewal deadline: from March 13, 2013 to December 15, 2016 (45 month extension).
- General gill/trammel net permit renewal deadline: from March 13, 2013 to December 15, 2016 (45 month extension).
- Nearshore fishery permit and nearshore trap endorsement renewal and transfer submission deadlines: from March 13, 2013 to December 15, 2016 (45 month extension).

II. Argument

A. No Authority Exists to Grant the Extension.

There is no authority in the Fish and Game Code or regulations adopted pursuant to the Fish and Game Code allowing the Commission to waive the deadlines for renewing or transferring the Permits. Moreover, the Commission does not have any obligation to even consider the Waiver Requests.

submitting a court order for distribution issued by a Judge of the Superior Court along with applications to transfer Mr. Ptak’s remaining permits to Eric Allen to the Department of Fish and Wildlife.” (Shourds Dec., paragraph 6, pp. 2-3).

B. The Estate Has Received \$135,000 from Illegal Fishing.

Even if the Commission considers the Waiver Requests, the Estate does not deserve any waivers of the rules because it has continually engaged in illegal fishing since Mr. Ptak's death, including illegally fishing for three months after the Commission granted that waiver. The Estate also repeatedly renewed the southern rock crab trap permit, lobster operator permit, and general gill/trammel net permits in violation of Sections 122, subdivision (r)(2), 125 (f)(5), and 8681.5(d), despite an instruction not to do so.

For three years after Mr. Ptak's death, from March 27, 2012 through March 18, 2015, Mr. Allen fished on behalf of the Estate "to continue operating Mr. Ptak's commercial fishing business." (Letter, p. 3.) During that time, Mr. Allen made over 200 landings and caught 5,772.7 pounds of lobsters and 2,211 pounds of southern rock crabs, totaling over **17,000 pounds**, and valued at **\$135,136.52**. Exhibit C is a spreadsheet showing lobster and southern rock crab landings that were made after Mr. Ptak's death while using his southern rock crab trap and lobster operator permits. As explained above, since the lobster operator and southern rock crab trap permits were not transferred, they may not be used. Thus, **all of this fishing was conducted illegally**. Exhibit D is a receipt dated January 27, 2014, that is an example of a landing Mr. Allen made after Mr. Ptak's death while using Mr. Ptak's commercial fishing license (L30798) and lobster permit. In other instances, a fisherman forged Mr. Ptak's signature. Exhibit E is a landing receipt from January 17, 2014, supposedly signed by "TP" even though Thomas Ptak had died nearly two years earlier.

The illegal fishing continued until March 18, 2015, when Department enforcement personnel contacted Mr. Allen while he was fishing and seized the Permits as evidence. There is currently a criminal case pending against Mr. Allen in the Superior Court of San Diego County. As explained previously, the southern rock crab trap permit could not be renewed after March 13, 2014 and the general gill/trammel net and lobster operator permits could not be legally renewed after March 13, 2013. Thus, the Estate lost all interest in them several years ago.

Moreover, on February 18, 2015, the Department warned the Estate in an e-mail that "because Thomas Ptak is deceased, the Estate cannot renew the lobster operator, gill trammel and rock crab permits (although the Estate might have already received renewal applications for these permits)." On March 12, 2015, the Estate renewed all of these Permits anyway. (Exhibit F.)

III. Conclusion

There is no authority in the Fish and Game Code or regulations that allows the Commission to waive the transfer or renewal deadlines, nor is there any legal obligation for the Commission to even consider any of the Estates' requests. And certainly, there is no equitable reason to extend the deadlines another 12 months, from 12 or 24 months to 57 months, since the Estate continued to illegally fish even after the Commission extended the nearshore fishery permit and nearshore fishery endorsement transfer deadline last December. The Estate has already received an enormous benefit--\$135,000--from illegally using the Permits. The Estate's rampant illegal fishing should not be further rewarded by bending the rules to allow it to transfer them.

For these reasons, the Department objects to the Waiver Requests and respectfully requests that the Commission completely remove the Estates various requests as an agenda item.

Sincerely,

DAVID KIENE
Senior Staff Counsel

July 3, 2014

Ms. Christine Allen

**SUBJECT: NOTICE OF DENIAL OF AN APPLICATION TO TRANSFER
TRANSFERABLE SOUTH COAST REGION NEARSHORE FISHERY
PERMIT**

Dear Ms. Allen:

This letter is in response to your application to transfer a 2014-2015 Transferable South Coast Region Nearshore Fishery Permit (TSCRNFP), Permit Number NST093 from Mr. Thomas L. Ptak (L30798) to Mr. Brian Kiyohyara (L74934). You are the executor of Mr. Ptak's estate.

Authority-Nearshore Fishery Permit

Pursuant to Section 150(g)(1)(A), Title 14, of the California Code of Regulations (CCR), a transferable Nearshore Fishery Permit (NFP) may be transferred from one person to another. If the number of NFPs in a regional management area is greater than the capacity goal for the regional management area, one additional transferable NFP for the same regional management area must be surrendered to the Department of Fish and Wildlife (Department) for cancellation at the same time the application for transfer is submitted. The capacity goal for the South Coast Region is 18 permits. As of June 5, 2014, 43 SCRNFPS have been issued, therefore two TSCRNFPS must be surrendered.

Pursuant to Section 150(g)(3), Title 14, of the CCR, a transferable NFP may be transferred to the estate of a permittee who has died only for the purpose of transferring the NFP to another person.

Nearshore Fishery Permit Transfer Requirements

- The NFP(s) must be valid at the time of application for transfer.
- The transferee must have a valid California Commercial Fishing License.
- The transferee must have never been convicted of a violation of any provision of these regulations or the Fish and Game Code (FGC) pertaining to the commercial take of nearshore fish stocks.

Conserving California's Wildlife Since 1870

Required Documentation

- The request for the transfer must be submitted within one year of the date of death of the permit holder as listed on the death certificate.
- Transfer application in the form of a notarized letter which identifies the deceased permit holder, transferee, and transferable NFP for the regional management area.
- Copy of the permittee's death certificate.
- Copy of the permittee's California Commercial Fishing License and original NFP(s).
- Copy of the transferee's California Commercial Fishing License.
- Nonrefundable NFP transfer fee of \$500.

Documentation Submitted

- A notarized letter dated May 9, 2014, received May 23, 2014, from Ms. Christine Allen, Executor of the Estate of Thomas L. Ptak requesting to transfer Mr. Ptak's TSCRNFP and Transferable South Coast Region Nearshore Fishery Trap Endorsement (TSCRNFTE) to Mr. Kiyohara.
- A notarized letter dated May 9, 2014, received May 23, 2014, from Eric A. Kramer requesting to transfer his TSCRNFP to Mr. Kiyohara.
- A notarized letter dated May 9, 2014, received May 23, 2014, from Brian Kiyohara, stating that one of the TSCRNFs will be retired to complete the transfer process.
- Copy of the Certificate of Death from County of San Diego, stating Mr. Ptak's date of death was on March 13, 2012.
- Copy of Letter of Testamentary filed January 31, 2014, for the estate of Thomas L. Ptak, appointing Christine Allen as executor.
- Mr. Ptak's original 2014-2015 TSCRNFP.
- Mr. Kramer's original 2014-2015 TSCRNFP.
- A copy of Mr. Kiyohara's 2014-2015 California Commercial Fishing License and Commercial General Trap Permit.
- Nonrefundable transfer fee \$500.

Department of Fish and Wildlife's Recommendation

The Department is denying your application to transfer Mr. Ptak's TSCRNFP, because the application must be submitted within one year of the date of death of the permit holder as listed on the death certificate. The application was received more than 26 months after the date of death listed on the death certificate.

Deadline to File an Appeal

You may appeal to the Department in writing describing the basis for the appeal. The appeal shall be reviewed and decided by the Department. The decision of the Department may be appealed in writing to the Commission at 1416 Ninth Street,

Ms. Christine Allen
July 3, 2014
Page Three

Sacramento, California 95814 Pursuant to Section 150(m)(3), Title 14, of the CCR, your appeal of the Department's decision must be received within 60 days of this letter.

Your application to transfer a Transferable South Coast Region Nearshore Fishery Trap endorsement was addressed under separate cover.

If you have any questions or require further assistance, please contact Ms. Debbie Noriega of my staff, at the letterhead address, by telephone at (916) 928-5817, or e-mail Debbie.Noriega@wildlife.ca.gov.

Sincerely,

James Fort, Chief

To: 'Chris Shourds'
Subject: RE: Estate of Thomas Ptak Transfer of Nearshore Permit and Trap Endorsement.

Chris,

Below are answers to several questions you have asked.

1. Can the two for one to the buyer be accomplished considering both sellers have and will be surrendering full Nearshore Fishery Permits and Nearshore Trap Endorsements?
A: **Yes.** The second trap endorsement will become null and void once the second Nearshore Fishery Permit is transferred. If the second permit holder would like to transfer his/her endorsement to another party, the second permit holder should submit a request to transfer his/her endorsement at the same time the transfer request for the Nearshore Fishery Permits is submitted.
2. Can the Estate sell its Nearshore Fishery Permit to the buyer now, and the other seller sell his/her Nearshore Fishery Permit later (with the understanding that the transfer would not be effective until the second sale occurs)?
A: **No.** The Department cannot review a transfer request unless two permits are surrendered by the transferors at the same time. The request must include two Transferable Nearshore Fishery Permits for the same regional management area.
3. With respect to the lobster operator, gill trammel and rock crab permits:
 - Does the Estate need to pay transfer application fees before the Department can review transfer applications for these permits?
A: **Yes.** The transfer fees are as follows:
Lobster Operator Permit nonrefundable transfer fee is \$500.
General Gill Net /Trammel Net Permit nonrefundable transfer fee is \$100.
Southern Rock Crab Trap Permit nonrefundable transfer is \$1,000.
 - Assuming the transfer requests are denied, the Estate appeals the denials to the Commission, and the Estate prevails, can these transfer application fees apply to future transfer application fees for these permits?
A: **Yes.** In fact, under this scenario, the Estate would not have to pay additional transfer application fees later as long as the proposed permittees are the same.

Please keep in mind that because Thomas Ptak is deceased, the Estate cannot renew the lobster operator, gill trammel and rock crab permits (although the Estate might have already received renewal applications for these permits).

Subject: RE: Estate of Thomas Ptak Transfer of Nearshore Permit and Trap Endorsement.

Dear David,

Do you have any answer as to whether we can transfer our Southern Region Nearshore Permit and Trap Endorsement to the buyer now and then put the burden on the buyer to obtain the other Nearshore Permit before the buyer can fish the permit?

Also, do you have an answer as to whether we can do the two-for-one transfer if both sellers have a full Southern Region Nearshore Permit and Trap Endorsement (instead of the normal deal where we transfer our permit and trap endorsement to the buyer and the second seller transfers only a Nearshore Permit)?

Any info would be much appreciated as we have a buyer who still seems interested but is a little concerned that our permits are owned and being transferred out of a probate estate.

We want to make sure everything is done proper when we enter negotiations with the buyer so that the transaction will be smooth and not voided this time.

Thanks in advance. I look forward to hearing from you.

Sincerely,

Chris Shourds

Subject: Estate of Thomas Ptak Transfer of Nearshore Permit and Trap Endorsement.

Dear Mr. Kiene,

Thank you for reaching out to me last week to discuss some of the issues surrounding the transfer of Thomas Ptak's permits. I am dropping you this quick line so you have all of my contact info (below in my signature).

It looks like we have a buyer for Mr. Ptak's Southern Region Nearshore Fishery Permit and Nearshore Fishery Trap Endorsement. In addition to the Mr. Ptak's Estate and the buyer there is another seller involved so the two for one can be accomplished. The other seller also has a Nearshore Fishery Permit and Nearshore Trap Endorsement.

Can the two for one to the buyer be accomplished considering both sellers have and will be surrendering full Nearshore Fishery Permits and Nearshore Trap Endorsements?

We are hoping to move forward with the transaction as soon as we hear from you regarding this issue and the other questions we discussed on the telephone last week.

Again, I thank you for your time. I look forward to hearing from you.

Sincerely,

Chris Shourds

**Re: The Estate of Thomas L. Ptak
Response to California Department of Fish and Wildlife's Letter dated
November 20, 2015**

Dear Fish and Game Commission:

This serves as the response to the letter the California Department of Fish and Wildlife (the "Department") wrote to the California Fish and Game Commission (the "Commission") dated November 20, 2015 (the "Department's Letter").

The Department's Letter is creative, yet it is misplaced. The Estate of Thomas L. Ptak has not conducted any illegal fishing. Thomas Ptak died. Christine Allen was duly appointed the Executor of the Estate of Thomas L. Ptak by the Superior Court of California, County of San Diego. The California Probate Code grants Christine Allen the right to continue to operate the decedent's business. In continuing to operate the decedent's business, she has the right to enlist an agent who has the knowledge and expertise necessary to properly carry out the business operations.

Christine Allen's operation of Mr. Ptak's fishing business is legal under the probate code. The Estate of Thomas L. Ptak never tried to take advantage of Department regulations and has never tried to hide information or activity from the Department. Rather, the Estate has been open and transparent with the Department beginning in 2012, only six days following Thomas' death.

In 2014, the Department admitted to Attorneys that the Department really needs to update their permit transfer regulations to account for the death of permit holders whose affairs end up in the probate court system. If this hearing were being held in a court of law, the Department would likely argue this statement is hearsay. However, this statement falls under an exception to the rules of hearsay because it is an admission that the Department's permit transfer regulations are broken and do not provide a fair opportunity for the probate estate of a decedent to transfer the decedent's permits. An admission such as the one made by the Department is not made inadmissible by California hearsay rules. Attorneys understand and respect that the December 9, 2015 Commission meeting is not a hearing in the court of law. However, Attorneys ask the Commission to carefully consider the issue of the transfer of a decedent's permits when the death of a permit holder's affairs find their way into the probate court system.

The Estate of Thomas L. Ptak is on the Commission's agenda for December 9, 2015 because the Estate has not been afforded a fair opportunity to transfer the permits owned by Mr. Ptak. Depriving the Estate of a fair opportunity to transfer Mr. Ptak's permits is inequitable in that it harms the beneficiaries of his Estate. It is unclear to Attorneys and Christine Allen why the Department would desire to harm beneficiaries of the Estate of an individual who dedicated his life to the business of commercial fishing, especially when this deceased individual's estate is being formally conducted as probate in the Superior Court of California, County of San Diego. Depriving the Estate the ability to transfer Mr. Ptak's permits will leave the beneficiaries of his estate in financial hardship.

I.

Clarifications Regarding Background

The Department's Letter states the law firm Greenman, Lacy, Klein, Hinds, Weiser, & Heffron (the "Attorneys") relied on Ms. Noriega for advice on probate issues. The Department's incorrect characterization of Attorneys regular communications with Ms. Noriega lead one to believe Attorneys relied on Ms. Noriega help carry out the probate of the Estate of Thomas L. Ptak. This is not correct. Attorneys never sought advice on probate issues from Ms. Noriega.

Rather, Attorneys did consult with Ms. Noriega on a regular basis regarding the steps required to transfer the Permits. Ms. Noriega provided interpretation of the Department's rules and regulations that apply to the permits owned by the Estate. Attorney also consulted with David Kiene regarding the same. This can be seen in Exhibit F to the Departments Letter. Exhibit F shows open communication between Attorneys and the Department. The email exchange shown is Exhibit F to the Department's Letter clearly show Attorneys were not soliciting probate advice from the Department but openly communicating with the Department regarding the transferability of Mr. Ptak's permits.

The permits are a valuable asset of the Estate. Accordingly, Attorneys sought guidance from the Department on their rules and regulations. This is a prudent and professional

thing to do. Attorneys could not have predicted that relying on the Department's guidance would lead to such peril.

II.

Legal Authority Does Exist To Grant The Extensions

The Department's statement that "No Authority Exists to Grant the Extension" is incorrect and therefore misleading. Attorneys did receive an extension of time from the Commission on December 3, 2014. This shows that authority does exist to grant the extensions requested and that the Commission possesses this authority.

Further, legal authority in the following widely accepted equitable doctrines of law apply.

1) Promissory Estoppel:

Promissory Estoppel, also known as Detrimental Reliance, is an equitable doctrine that states that once a party makes a promise significant enough to cause another party to act on it to their own detriment, relief can only come in the form of the promisor fulfilling the promise.

Here, Attorneys began communicating with the Department within six (6) days of Mr. Ptak's death. At that time Attorneys received detailed instructions from Ms. Noriega on how the estate could transfer the permits. Attorneys relied on Ms. Noriega's instructions and complied with them. Thereafter, attorneys maintained regular communication with the Department. The Department was aware of Mr. Ptak's death and aware that a probate was being conducted for the Estate of Thomas L. Ptak. The Department was aware that Christine Allen was the court appointed Executor of the Probate Estate and that Attorneys represented Christine Allen in her capacity as Executor of the Estate of Thomas L. Ptak.

Each year, from 2013 through 2015, the Department mailed applications to Christine Allen's address of record for the renewal of Mr. Ptak's permits. Each year Christine Allen completed these renewal applications, paid the required renewal fees to the Department, and renewed Mr. Ptak's permits so she could continue to operate the business of the Decedent (discussed above) for the purposes of generating income to pay off the creditors of the probate estate.

The Department had actual knowledge of Mr. Ptak's death and actual knowledge that Mr. Ptak's permits were being fished by his Estate. The Department admits their actual knowledge in their Letter by discussing Landing Receipts for the years 2012 through 2015 and actually submitting these landing receipts as Exhibit C to their Letter.

In addition, the Department's actual knowledge that Mr. Ptak's permits were renewed and up to date is shown by the fact that Ms. Noriega worked with Attorneys to successfully transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit and Trap

Endorsement on June 5, 2014. After consulting with Ms. Noriega from Mr. Ptak's date of death until June 5, 2014 and following Ms. Noriega's exact instructions on transferring Mr. Ptak's permits, the Department then rescinded the transfer by stating too much time had passed since Mr. Ptak's death.

Attorneys appealed the rescission of the successful transfer of Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit and Trap Endorsement and were granted an extension of time by the Commission until December 15, 2015. David Kiene improperly attempted to prevent the estate from renewing the permits prior to their 2015 renewal date and the Department then improperly seized all of Mr. Ptak's permits on March 18, 2015. The Department has been holding all Mr. Ptak's permits since March 18, 2015 including the permits the Commission granted the estate an extension to transfer until December 15, 2015. This is why the Estate now needs an additional extension of time.

Prior to the rescission of the successful transfer on June 5, 2015, the Department, Ms. Noriega, and Mr. Kiene were open and willing to communicate with Attorneys. Since Attorneys were successful in their appeal and granted an extension by the Commission on December 3, 2014, the Department has retaliated by thwarting all attempts by Attorneys to transfer Mr. Ptak's permits.

By sending renewal applications for Mr. Ptak's permits, accepting payments for renewal, and continuing to renew the permits, the Department was clearly making a promise to Christine Allen and the Estate of Thomas L. Ptak that permits would remain valid and be transferrable by sale or at the close of probate. Christine Allen and the Estate of Thomas L. Ptak relied on this promise by continuing to make renewal payments to the Department. This reliance worked to the detriment of Christine Allen and the Estate of Thomas L. Ptak because the Department is now stating that the permits should not have been renewed and should not be transferred, contrary to the advice Christine Allen and Attorneys received from Ms. Noriega when communicating with Ms. Noriega about the transferability of the permits.

It is patently unfair to the Estate of Thomas L. Ptak not to grant an extension on all permits after the Estate relied to its detriment on each annual renewal and the advice the Department provided as to the transferability of the permits.

2) Waiver:

Waiver is an equitable doctrine that states that an act of a person or entity voluntarily giving up a legal right, either by an express statement or by conduct such as not enforcing that right, waives their ability to enforce that legal right.

Attorneys began communicating with the Department within six (6) days of Mr. Ptak's death. At that time Attorneys received detailed instructions from Ms. Noriega on how the estate could transfer the permits. Thereafter, attorneys maintained regular communication with the Department. The Department was aware of Mr. Ptak's death and aware that a probate was being conducted for the Estate of Thomas L. Ptak. The Department was

aware that aware that Christine Allen was the court appointed Executor of the Probate Estate and that Attorneys represented Christine Allen in her capacity as Executor of the Estate of Thomas L. Ptak.

Each year, from 2013 through 2015, the Department mailed applications to Christine Allen's address of record for the renewal of Mr. Ptak's permits. Each year Christine Allen completed these renewal applications, paid the required renewal fees to the Department, and renewed Mr. Ptak's permits so she could continue to operate the business of the Decedent (discussed above) for the purposes of generating income to pay off the creditors of the probate estate.

In her efforts as Executor continuing to operate the business of Mr. Ptak pursuant to the California Probate Code, Christine Allen completed all the proper renewal paperwork for the permits, paid all renewal fees for the permits, and ensured the agent she enlisted to assist in the operation of the business submitted Landing Receipts to the Department.

The Department had actual knowledge that the Estate of Thomas L. Ptak had current permits and was fishing these permits because of the renewal fees, the issuance of current permits annually, and the landing receipts being submitted by Eric Allen to the Department on behalf of the Estate.

The Department had direct contact information for Attorneys and for Christine Allen. Yet, the Department never told Attorneys or Christine Allen that the Estate needed to stop fishing the permits or stop renewing the permits with the exception of one sentence buried in the bottom of an email from David Kiene to Attorneys in 2015. The Department now hinges a major portion of its argument for non-renewal on this one sentence that is likely the only communication that contradicts the actions the Department has taken since 2012, the advice the Department provided regarding the transferability of the permits since 2012, the sending of renewal applications to Christine Allen since 2013, and the collecting of renewal fees since 2013.

Even more egregious, the Department hinges one of its main arguments for non-renewal of the permits on this one sentence. This appears retaliatory. The Commission granted an extension to transfer two permits until December 15, 2015. The Department gladly accepted renewal payments from the Estate for all Mr. Ptak's permits in March of 2015, and issued current permits in March of 2015. It is not logical that the Commission grant an extension to transfer the permits only to have the Department deny the Estate's ability to renew them.

The Department could have contacted Attorneys or Christine Allen at any time. Instead of doing so to discuss the issue of Mr. Ptak's permits, the Department sent a vessel containing armed officers to board the Donna Marie (as asset of the Estate) on the water, arrest Eric Allen, escort Eric Allen to Oceanside Harbor, and then seized all of Mr. Ptak's permits. This all occurred as retaliation after the Commission granted an extension of time on December 3, 2014. This was unnecessary. The Department could have simply called

Attorneys to discuss the permits. By seizing and then keeping the permits, the Department further hampered Christine Allen's ability to facilitate their transfer.

The Department claims the permits should not be renewed because too much time has passed. However, the Department's actions tell a completely different story. The Department sent an application for renewal in 2015, collected renewal fees in 2015, and issued current permits in 2015. The department failed to enforce its right to not issue permits in 2015, continued to tell Attorneys the permits were transferrable and even allowed the Estate to transfer two permits in 2014 before rescinding the transfer by saying too much time had passed.

Based on the Department's actions, they have waived their right to interfere with our extension request.

III.

Additional Pertinent Information

The Department refers to \$135,136.52 worth of landing receipts as if they are ill-gotten earned by Christine Allen and the Estate of Thomas L. Ptak. This dollar amount constitutes nothing more than an estimate of gross receipts. As stated above, the Estate has the right under the probate code to generate sufficient funds necessary to pay off legitimate creditors of the probate. Christine Allen and the beneficiaries of the estate did not walk away with these funds.

These funds first went to pay expenses necessary for the operation of the business including but not limited to fuel, boat repair and maintenance, license renewal, slip rental, bait, and taxes. The net funds after these expenses were deposited into the probate estate bank account to be saved and to pay costs associated with the probate such as court filing fees. Please note that Christine Allen, the beneficiaries of the Estate of Thomas L. Ptak, and Attorneys have not been paid out of these funds. The Department's labeling this an illegal fishing operation is incorrect and prejudicial.

The Department's new allegations that the Estate has been rewarded by rampant illegal fishing and should not be rewarded by bending the rules to allow the Estate to transfer permits is appalling and should be disregarded by the Commission because the Department had knowledge of the Estate's fishing activities, willingly renewed the permits each year, gladly accepted payment for the renewal of the permits, and advised Attorneys on the procedure to transfer the permits beginning six (6) days following Mr. Ptak's death.

//

//

//

V.

Prayer for Relief

1) Request for Additional Extension of Time

The Estate of Thomas L. Ptak respectfully requests from the Commission an additional one (1) year extension of time to transfer Mr. Ptak's transferrable South Coast Region Nearshore Fishery Permit and transferrable South Coast Region Nearshore Fishery Trap Endorsement.

2) Request for Right to Renew Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to allow the Estate of Thomas L. Ptak to renew Mr. Ptak's transferrable South Couth Coast Region Nearshore Fishery Permit, transferrable South Coast Region Nearshore Fishery Trap Endorsement, General Gill/Trammel Net Permit, Lobster Operator Permit, and Southern Rock Crab Permit (collectively referred to hereafter as "The Five Permits").

3) Request for Return of Permits

The Estate of Thomas L. Ptak requests the Commission issue an instruction to the Department of Fish and Wildlife to return The Five Permits to the Estate of Thomas L. Ptak. Return of these permits is necessary because the Estate of Thomas L. Ptak cannot transfer the permits by following the advice and instruction Ms. Noriega provided Attorneys and the Estate of Thomas L. Ptak beginning six (6) days following the death of Mr. Ptak unless the Estate of Thomas L. Ptak is in possession of these permits. The Estate of Thomas L. Ptak requests the instruction should direct The Five Permits be returned to Christine Allen, Executor, The Estate of Thomas L. Ptak, California,

V.

Final Comments

Thank you for your time and consideration in reviewing the Estate of Thomas L. Ptak's requests contained in this document.

Very Truly Yours,

GREENMAN, LACY, KLEIN, HINDS, WEISER & HEFFRON

CHRIS SHOURDS, ESQ
Attorney for The Estate of Thomas L. Ptak
and Christine Allen, Executor

RENEWAL OF LEASE

Made this 3rd day of November, 2005 at Santa Barbara, California by and between the State of California, acting by and through its Department of Fish and Game, hereinafter referred to as "Lessor" and Santa Barbara Mariculture Company, hereinafter referred to as "Lessee."

WITNESSETH:

WHEREAS, Lessee failed to exercise an option to extend a prior lease agreement (also M-653-02) and said lease terminated on October 31, 1999, and

WHEREAS, Lessee did on January 1, 2001 enter into Lease M-653-02, for the purpose of cultivating rock scallops, and

WHEREAS, Lessee requested that title to Lease Agreement (No. M-653-02) be transferred to Santa Barbara Mariculture Company, and the Fish and Game Commission at its meeting on November 3, 2005, authorized the transfer of title of State Water Bottoms Lease M-653-02, from Pacific Seafood Industries, and

WHEREAS, Lessee indicated an interest in renewing a prior lease agreement and exercised that option by requesting Fish and Game Commission consideration of the request in correspondence dated March 29, 2005, and

WHEREAS, Lessee is presently a registered aquaculturist authorized to grow marine life for profit in the waters of the State of California as provided in Section 15101 of the Fish and Game Code, and

WHEREAS, Lessee expressed support for the Lessor's recommended approval of the requested lease renewal for the stipulated 5-year period at a lease rate of five (\$5.00) dollars per acre, and.

WHEREAS, the Fish and Game Commission determined that a lease renewal was in the best interest of the State of California at the November 3, 2005, meeting in Santa Barbara, California and approved the renewal based on the renegotiated lease terms recommended by the Department of Fish and Game.

NOW, THEREFORE, THIS INDENTURE WITNESSETH:

That, in consideration of payment of the monies hereinafter stated in accordance with the renegotiated terms recommended by the Lessor and accepted at a duly called and noticed hearing of the Fish and Game Commission of the State of California, pursuant to law and in consideration of the covenants contained herein on the part of the Lessee, Lessor does hereby grant to Lessee the exclusive privilege to cultivate

approved shellfish hereon and in those certain waters of the State of California described as follows, to wit:

All that area lying within the Santa Barbara Channel, Santa Barbara County, State of California, starting from the Santa Barbara light located at 34°23'08" North, 119°43'03" West on the Santa Barbara quadrangle, California, Santa Barbara County, 7.5 minute series, topographic, U.S. Department of the Interior, Geological Survey; southwesterly on a bearing of 256° true, 9,000 feet to the point of beginning located at coordinates 34°23'20" North, 119°45'01" West on the Goleta quadrangle, California, Santa Barbara County 7.5 minute series, topographic, U.S. Department of the Interior, Geological Survey then east 1,250 feet; then south 1,250 feet; west 2,500 feet; then north 1,250 feet; then 1,250 feet to the point of beginning.

The area described hereinbefore, containing an area of 71.74 acres more or less, comprises Aquaculture Lease M-653-02 (Appendix 1).

This lease, in accordance with provisions of Section 15400 of the Fish and Game Code, as may from time to time be amended or changed by the State Legislature, is for the sole purpose of cultivating rock scallops (*Crassadoma gigantea*, formerly *Hinnites multirugosus*), speckled scallop (*Argopectin aequisulcatus*), Japanese bay scallop (*Patinopectin yessoensis*), Pacific oyster (*Crassostrea gigas*), Kumamoto oyster (*Crassostrea sikamea*), Manila clam (*Venerupis philippinarum*), and Mediterranean mussel (*Mytilus galloprovincialis*) in the previously designated area.

The cultivation of additional species of aquatic plants and animals requires the approval of the Fish and Game Commission. Seed stock, other than those obtained from State waters, must be inspected and certified before planting in compliance with Section 15201 of the Fish and Game Code, and must be planted by Lessee in a manner and at a size approved by the Lessor. A request for certification of seed stock will be submitted by Lessee to the Lessor at least ten (10) days prior to the proposed date of inspection.

All scallops, oysters, clams, and mussels shall be cultured on buoyed submerged longlines, anchored to the bottom within the lease area. No other mode of operation or culture method is authorized unless Lessee shall first obtain approval thereof from the Fish and Game Commission. Only the designated species planted in the specified lease area may be taken.

The notice of intent to plant scallops, oysters, clams or mussels on the lease area shall be given to the Department of Fish and Game's, Marine Region aquaculture coordinator, P.O. Box 1560, Bodega Bay, California, 94923, telephone (707) 875-4261, or at such other place as Lessor may from time to time designate. In addition to the required ten (10) day notice, at least a 24-hour notice shall be given to the aquaculture coordinator or their designee, giving the details on where an observer can meet the

Lessee prior to planting.

This lease renewal is authorized for a term of five (5) years commencing on the 3rd day of November, 2005, and ending on the 2nd day of November, 2010, for the total rental of three hundred and fifty dollars and seventy cents (\$358.70) per year, and a privilege tax on all products harvested as provided by Fish and Game Code Sections 8051, 18406.5, and 15406.7. Beginning January 1, 2006, said annual rental fee will be payable to Lessor on a calendar year basis, January 1 – December 31. If said annual rental fee is not paid within sixty (60) days after the close of the month in which it is due, an additional 10 percent penalty shall be paid. Lessor, at its option, may declare the lease abandoned for failure to pay such rental fees within 90 days from the beginning of the rental period; although such abandonment shall not relieve Lessee of its obligation to pay such rental and penalty which are due and owing. Lessee agrees to pay Lessor reasonable attorney fees and costs incurred in collecting any amounts and/or penalties due and owing from Lessee under the provisions of this lease. Lessee agrees to pay said fee(s) to Lessor at its office in the City of Sacramento, State of California, or at such other place as Lessor may, from time to time, designate.

Lessee expressly recognizes and acknowledges that any payments by Lessee as provided for herein are subject to the provisions of Section 15410 which states "All leases shall be subject to the power of the Legislature to increase or decrease the rents, fees, taxes, and other charges relating to the lease, but no increase in rent shall be applicable to an existing lease until it is renewed."

In accordance with actions taken by the Fish and Game Commission of the State of California, pursuant to Fish and Game Code Section 15400, Lessor does hereby renew said lease for such consideration, specific purposes and subject to covenants, terms, conditions, reservation, restrictions and limitation as are set forth herein.

This lease is made upon the following additional terms, conditions, and covenants, to wit:

- A. This lease may, at the option of Lessee, be renewed for additional periods not to exceed 25 years each. If the Lessee desires to enter into a new lease for a period commencing after expiration of the initial 5-year term, Lessee shall give notice to Lessor one (1) year prior to termination of the lease. The lease may be renewed if, during the notification period, terms for a new lease are agreed upon by Lessee and the Commission. Lessor retains the right to renegotiate terms of the lease, including annual rental rates, subject to adjustment considering changes in the Consumer Price Index and current lease rates, at the Fish and Game Commission's discretion, no more often than every five (5) years during the current renewal period.
- B. Lessee shall keep records as required in accordance with Fish and Game Code Section 15414 on forms to be supplied by Lessor, and shall maintain adequate

accounting records sufficient to determine monies due to Lessor by the 10th day of each month for all shellfish harvested during the preceding calendar month. Lessor reserves the right to inspect Lessee's premises, equipment and all books at any time, and Lessee's records pertaining to its cultivation on the leased premises and all shellfish taken from the leased premises.

- C. The lease shall be improved at no less than the minimum rate established by Commission regulations (Section 237(i)(A) - (C), Title 14, CCR). A minimum rate of planting for shellfish other than oysters shall be negotiated for option periods. A record of seed catching activity for rock scallops and mussels will be reported in the annual proof of use statement required by Section J. Planting credit will be given for catching naturally produced seed on the lease. Off-bottom improvement rate for single seed oysters is 5,000 single seed per acre per year over the allotted acreage. The annual harvest rate for oysters shall be an average of 2,000 oysters (over one year of age) over the allotted acreage effective three years after effective date of lease. Lessor may declare this lease terminated if Lessee fails to meet these specified requirements, and if Lessee at any time, is proven to be failing in good faith, to pursue the purpose of this lease.
- D. The lease shall be clearly marked at all times. Minimum marking of the lease shall include: One (1) buoy anchored on each corner of the four corners of the lease, and one (1) buoy possessing radar-reflecting capability, anchored in the center of the lease. All buoys used to define the boundaries of the lease shall be marked in conformance with the International Association of Lighthouse Authorities Maritime Buoyage System Regulations (33 CFR Section 62.33 and 66.01-10). All buoys shall bear the aquaculture lease number M-653-02. Buoys marking the boundaries of the lease shall be maintained at all times. If buoys are lost, displaced, or are otherwise removed from the lease, they must be replaced within a two-week period, weather conditions permitting, or the lease may be subject to termination.
- E. If, at any time subsequent to the beginning date of this lease the use of long lines authorized herein shall fall into a state of disrepair or otherwise become an environmental or aesthetic degradation, as determined by Lessor, then upon written notice by Lessor, Lessee shall have sixty (60) days to repair and correct conditions cited by Lessor. Failure to comply with the written notice shall be grounds for termination of this lease and Lessee shall, at the option of Lessor, remove all improvements located on lands covered by this lease.

As a financial guarantee of growing structure removal and/or clean-up expense in the event the lease is abandoned or otherwise terminated, Lessee shall place on deposit, pursuant to the "Escrow Agreement for Clean-up of Aquaculture Lease M-653-02, Santa Barbara Channel, California", the sum of one thousand (\$1,000) dollars. Such money shall be deposited over a two-year-period, payable one-half upon entering upon the lease, and one-half upon the first anniversary of such

inception date. The escrow account shall be increased if the Fish and Game Commission determines that, if abandoned, the culture operation is likely to be more expensive to remove. The escrow account may be reduced by the Commission upon demonstration that the probable cost of removal of all improvements would be less than the deposit previously required. In its annual Proof-of Use Report, the Lessor shall advise the Commission of its best estimate of the probable cost of removal the lease operation. The escrow agreement, escrow holder, and escrow depository shall be agreed upon by the Executive Director of the Fish and Game Commission and the Lessor.

If Lessee abandons this lease without removing growing structures therefrom, the escrow deposit shall be expended to remove growing structures or otherwise clean up the lease.

In order to assure compliance with the escrow provisions of this lease, Lessee shall dedicate to the agreed upon escrow account specified in the "Escrow Agreement for Clean-up of Aquaculture Lease M-653-02, Santa Barbara Channel, California (Addendum 2)", hereby attached to and made part of this agreement, a total of five hundred dollars (\$500). This amount equals one-half of the total amount, one thousand dollars (\$1,000), to be deposited in the "Lease M-653-02, Santa Barbara Channel, California Escrow Account".

- F. Lessee shall observe and comply with all rules and regulations now or hereinafter promulgated by any governmental agency having authority by law, including but not limited to State Water Resources Control Board, State Coastal Commission, State Lands Commission, and U.S. Army Corps of Engineers. Any other permits or licenses required by such agencies will be obtained by Lessee at his own sole cost and expense.
- G. Lessee recognizes and understands in accepting this lease that his interest therein may be subject to a possible possessory interest tax that the county may impose on such interest, and that such tax payment shall not reduce any rent or royalty due the Lessor hereunder and any such tax shall be the liability of and be paid by Lessee.
- H. Any modification of natural or existing features of the real property described in this lease, which are not consistent with the authorized uses under this lease are expressly prohibited without prior written consent of the Lessor.
- I. As evidence of progress in aquaculture, Lessee shall submit each year to the State at the Marine Region office, P.O. Box 1560, Bodega Bay, California 94923, a written declaration under penalty of perjury, showing the date and amount of each type of aquaculture development and date and amount of designated species comprising each planting, including a diagram (map) showing area, amounts, and dates planted. Such annual proof-of-use shall be submitted on or

before February 1 of each year for the previous year, January 1 -- December 31, inclusive.

- J. This lease shall be canceled at any time Lessee fails to possess a valid aquaculture registration issued pursuant to Section 15101 of the Fish and Game Code. Lessee agrees not to commit, suffer, or permit any waste on said premises or any act to be done thereon in violation of any laws or ordinances. This lease shall be subject to termination by Lessee at any time during the term hereof, by giving Lessor notice in writing at least ninety (90) days prior to the date when such termination shall become effective. In the event of such termination by Lessee, any unearned rental shall be forfeited to the Lessor.
- K. This lease of State water bottoms only grants Lessee the exclusive right to cultivate marine life as described in the lease. The lease does not imply that any guarantee is given that shellfish may be grown or harvested for human consumption. The Lessor only has the statutory authority to enter into aquaculture leases (Fish and Game Code Section 15400 et. seq.). The California Department of Health Services has the authority (Health and Safety Code Section 109875 et. seq. and 112150 et. seq.) to certify and regulate sanitary procedures followed in the harvesting, handling, processing, storage, and distribution of bivalve mollusk shellfish intended for human consumption.
- Lessee must recognize that compliance by certified shellfish harvesters with the conditions and procedures set forth in the Department of Health Service's current "Management Plan for Santa Barbara Lease M-653-02, Santa Barbara Channel, California" and in the current "Contingency Plan for Marine Biotoxins in California Shellfish" is mandatory. These conditions and procedures establish classifications for certification to harvest shellfish (oysters, mussels and clams) and establish rainfall closures which may delay or prevent harvesting of cultured organisms from this lease and are a condition of the Shellfish Growing Area Certificate.
- L. In addition to the conditions and restrictions herein provided for in this lease, and any right or privilege granted, conveyed or leased hereunder, shall be subject to, and Lessee agrees to comply with all applicable provisions of the California Fish and Game Code, and regulation of the Fish and Game Commission, in particular Sections 15400 - 15415, inclusive, of the Fish and Game Code, and expressly recognizes the right of the Legislature and the Fish and Game Commission to enact new laws and regulations. In the event of any conflict between the provisions of this lease and any law or regulation, the latter will control. This lease shall be deemed amended automatically upon the effective date of such conflicting law or regulation.
- M. This lease is personal to the Lessee and shall not be transferred, assigned,

- Q. Lessee hereby indemnifies and holds harmless the Lessor, its officers, agents and employees against any and all claims and demands of every kind and nature whatsoever arising out of or in any way connected with the use by the Lessee of said lease or the exercise of the privilege granted herein.
- Q. The terms, provisions, and conditions hereof shall be binding upon and inure to the benefit of the parties and the successors, and assigns of the parties hereto.
- R. The attached Nondiscrimination Clause (OCP-1) Is hereby made a part of this agreement.

Except as herein amended, all other terms of said lease agreement shall remain unchanged and in full force and effect.

IN WITNESS THEREOF, the parties hereto have caused this lease to be duly executed as of the day and year first above written.

Fish and Game Commission

1416 Ninth St.

Sacramento, CA 95814

Dear Fish and Game Commission:

I would like to thank you for approving a one year extension of my existing Santa Barbara Mariculture Company aquaculture lease M-653-02 at the December 3, 2014 Commission meeting in Van Nuys. I would like to complete the lease approval process for this lease, and enter into a longer term lease contract with the Commission.

I would like to amend the shape of the original lease as proposed in exhibit A1. In addition, I would like to request a new lease. Exhibit A2 which will consist of 26 acres and be adjacent to lease no. 1.

The description of both lease no. 1 and lease no. 2 are attached. See exhibit A1, A2, and B.

I would like both of these leases to reflect my current aquaculture registration (number 0969) in allowing me to grow *Mytilus galloprovincialis* (Mediterranean mussel), *Crassostrea gigas* (Pacific oyster), and *Crassadoma gigantean* (Rock scallop).

Santa Barbara Mariculture Company is the leading offshore shellfish production company on the West Coast both in the number of years practicing offshore shellfish culture and quantities of shellfish produced. Both these leases will be used for research, development, and production of shellfish. The existing and proposed operation will use submerged longlines as the structure from which shellfish will be grown. The existing lease already has a conditionally approved classification from the California Department of Public Health.

Santa Barbara Mariculture Company has worked with the Department of Fish and Wildlife and the California Fish and Game Commission to further the research and development of offshore shellfish culture and wishes to continue a productive relationship with the State of California.

Sincerely,

A handwritten signature in cursive script, appearing to read "Bernard Friedman". The signature is written in dark ink on a white background.

Bernard Friedman

President of Santa Barbara Mariculture Co.

FORM A
State Of California Department Of Fish And Game Application For Lease Of
State Water Bottoms For Aquaculture

Applicant Name: Santa Barbara Mariculture Co. Phone No. (805) 886-1283
Address: 4365 Cuna Dr., Santa Barbara, CA 93110
Aquaculture Registration No 0969 Expiration Date 12/31/15

Species of plant or animals to be cultured:

Mytilus galloprovincialis
Crassostrea gigas
Crassadoma gigantea

Application is hereby made to the Fish and Game Commission of the State of California for a lease of State water bottoms in the area described in the attached exhibit entitled "Exhibit A-Legal Description", and as shown on the map attached hereto marked "Exhibit B". Each exhibit bears the name of this applicant. Such lease will be for the purpose of aquaculture involving the species designated above. In support of this application, the applicant hereby submits the following explanation of the type of operation and cultural practices to be employed:

- A. Purpose of operation - research and development or production
- B. Plan of development and proposed production schedule - 5 year plan
- C. Type of cultural method(s) to be employed: bottom, long line, buoyed habitats, etc.
- D. Department of Health Services growing water classification: approved, conditionally approved, prohibited, restricted or unclassified

(Attach additional sheets for detailed explanation)

Date: 4/15/15 Signed: B. Friedman

Print Name: Bernard Friedman

Five Year Work Plan

Currently there are 12 longlines on two-thirds of the Eastern portion of lease 1. Each longline grows 10,000 lbs. of Mediterranean mussels per year. Together, the 12 longlines produce 120,000 lbs. annually.

At the end of year five, lease 1 will hold 24 longlines which are 700 feet long from anchor to anchor. They will be installed in 3 rows of 8 parallel to the shore. The lines will be spaced 100 feet apart and each grow 10,000 lbs. of mussels per year. The projected harvest from lease 1 will be 240,000 lbs. per year.

Also at the end of year five, lease 2 will hold 16 longlines which are 700 feet long anchor to anchor. They will be installed in 2 rows of 8 parallel to shore. The lines will be spaced 100 feet apart and each grow 10,000 lbs. per year for an annual yield of 160,000 lbs..

The combined annual yield for both leases is projected to be 400,000 lbs. at the end of year 5.

During the development of the leases, in year 1, 16 longlines in lease 2 will be established as well as 8 longlines in the Western half of lease 1. The installation of these 24 longlines will take less than a week to install and consist of putting 32 screw anchors in the seafloor and joining them with 1 ¼ inch tensioned rope. The harvest from the current 12 longlines will continue at 120,000 lbs. in year 1.

Year 2 will see an increase in yield with 8 more longlines incorporated into production with an increased yield of 200,000 lbs..

Year 3 will see an increase of 12 more longlines put into production while the original 12 longlines in the Easter half will be removed and replaced with new rope and screw anchors. Yield is expected to stay the same at 200,000 lbs. Construction of a second boat and equipment is expected to begin and be completed by the beginning of year 4.

Year 4 will see an increase in production as the new boat comes on line with a total of 30 longlines used for production of 300,000 lbs. of mussels.

Year 5 will be in full production of all 40 longlines with two boats working the farm. Yields for each longline will also steadily increase with each longline steadily increasing to an annual yield of 20,000 lbs.

Production by year 10 could be upward of 800,000 lbs. of mussels with steady and managed growth.

If there is a production failure in any given year, the Pacific oyster will be cultivated to offset losses and create income until mussel production comes back on line.

Similarly, SBMC would like to diversify with the Purple hinged rock scallop and is looking for opportunities to develop commercial production of this species.

SBMC will be investigating production techniques of other species as the opportunities become available. Integrated multi-trophic mariculture systems may be the future for California, and SBMC will alter its work plan accordingly to create a sustainable future for the long term.

Mr. Bernard Friedman
Santa Barbara Mariculture Company
4365 Cuna Dr.
Santa Barbara, CA 93110

Dear Mr. Friedman:

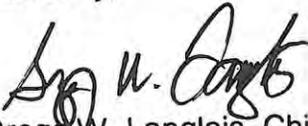

SHELLFISH GROWING AREA CERTIFICATE

Your application for a Shellfish Growing Area Certificate to harvest shellfish from aquaculture Lease M-653-02 in the Santa Barbara Channel has been reviewed and approved. The following Shellfish Growing Area Certificate Number has been assigned to the Santa Barbara Mariculture Company: SGA15-614 (Lease M-653-02).

This growing area is classified as **Conditionally Approved**. Based on our review, your shellfishing operation at this growing area is currently in compliance with the requirements of Title 17, California Code of Regulations, Sections 7706 to 7733, and Section 112150 et seq. of the California Health and Safety Code, pertaining to the culture and harvesting of shellfish for human consumption.

The enclosed Shellfish Growing Area Certificate contains the terms and conditions for maintaining compliance with regulatory requirements for your shellfish operation at this lease and certification of this growing area. If you have any questions, please call me at (510) 412-4635.

Sincerely,

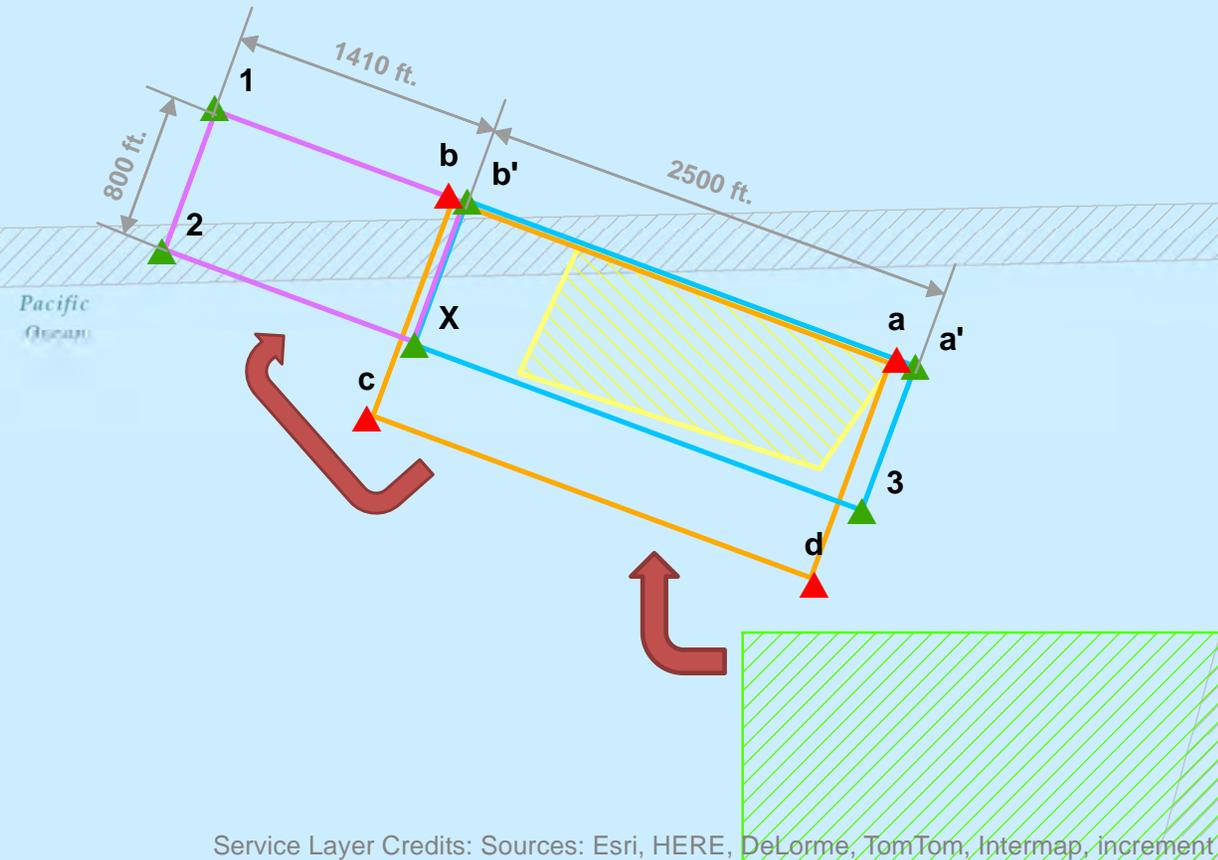

Gregg W. Langlois, Chief
Preharvest Shellfish Unit
Environmental Management Branch

Memorandum

Date: November 30, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Request for One-Year Extension of Santa Barbara Mariculture State Water Bottom Lease (M-653-02)**

The Department of Fish and Wildlife (Department) requests an one-year extension of Santa Barbara Mariculture's state water bottom lease #M-653-02, which will expire January 27, 2016.

Work by the applicant, and Department and Commission staffs involving CEQA and administrative reviews of a reconfigured lease shape are in progress, and will require additional time to allow for other responsible agencies' input as well as public comment prior to the Commission considering certification of the CEQA documents and its subsequent determination regarding the lease reconfiguration. An extension of the existing lease will allow the leaseholder to continue its mussel farming operations while work is completed on separate but parallel CEQA and administrative reviews of both this existing lease and a new lease parcel needed to complete the shape transformation. It is anticipated that these reviews will be completed well before the one-year extension period is complete, so that the Commission may fully resolve this reconfiguration without further extensions needed.

Background:

Department and Commission staffs are in the middle of a complex process responding to a request to re-shape the existing lease that includes a number of steps:

1. The reconciliation of an error that existed between the previous legal (narrative) description of the lease and the actual location of gear placement in the water based on the previous leaseholder's reckoning. This reconciliation has been approved by the Commission (Dec 2014), and the lease is now described by GPS coordinates, with a precision of 0.001 seconds.

2. Santa Barbara Mariculture's request to reconfigure the shape of its lease seeks to transform the existing broad, rectangular shape that has not been fully utilized (approx. 28 acres in cultivation out of 72 acres leased), into a long, linear-shape that is parallel with the coast. This reshaping of the lease would allow the operator to expand culture gear to the full extent of the lease for which he's paying, in a fashion that is more compatible with both the operator's long-line culture methods, the navigation of local boat traffic, and perhaps other environmental factors. These factors are being considered through the CEQA environmental review process currently underway.
3. The Department has determined that such a reconfiguration of the lease requires a two-step process that includes:
 - a) the creation of a "new" 26-acre lease parcel that would provide sufficient additional length when adjoined next to the existing lease, without widening the culture gear footprint further into Santa Barbara Channel;
 - b) An area of the existing lease equivalent to the "new" lease (26 acres) would be surrendered by the leaseholder, so that the net resulting acreage between the two parcels would remain at a total of 72 acres (see Figure 1).
4. The new lease parcel represents area upon which Mariculture activities have not yet taken place; CEQA review for this new parcel is well underway. Also in progress are the administrative reviews that include financial surety valuations and lease rate adjustments for offshore parcels like this and others anticipated in the near future.

The existing lease renewal is also subject to CEQA review, but separately from the new parcel. However, it is the Department's recommendation that sufficient time be allowed through this extension so that the aforementioned administrative and CEQA reviews can be completed in a parallel, efficient, and comprehensive manner.

The Department recommends the Commission approve a one-year extension of lease #M-653-02 with Santa Barbara Mariculture under its current terms and conditions.

Sonke Mastrup, Executive Director
Fish and Game Commission

Overview

- Background
- Regulations
- Pilot Program
- Future Plans

Background

- * Interest in electronic reporting
- * Marine Log System database
- * Commercial Passenger Fishing Vessel electronic log
- * Benefits: improved data quality, reduced cost, improved timeliness of data, saves time & effort for captains

Logbook Regulations

- * Commercial fishers are required to use logbooks for specific fisheries
- * Currently CDFW has 15 logbooks
- * Each logbook is unique
