Pilot Program for CPFV electronic log

- * Collaboration with the Sportfishing Association of California - June 2014
- * Beta testing from Feb – Mar 2015
- * Accounts added though Sep 2015
- * 150 vessels in southern CA submitting electronic logs

Future Plans

- * Complete the Marine Log System database - TBD
- * Complete evaluation of logbooks – May 2016
- * Complete regulatory package that allows option of electronic reporting for logbooks – April 2016

Acknowledgements

- * **Marine Region:** J. Eres, J. Robertson, O. Horning
- * **Data and Technology Division:** T. Lupo, C. McClanahan, M. Billingsley, A. Del Monte, V. Hardge, J. Thomas, E. Miller, D. Hampton, A. Miller, R. Dubey.
- * **Law Enforcement Division:** R. Puccinelli, M. Stefanak
- * **SAC:** Ken Franke, Alayna Siddall, Derek Southern, and all the owners & operators participating in the pilot program
- * **PSMFC:** Steve Williams

Summary

- * Department is making good progress on the Marine Log System database
- * Successful pilot program for CPFV electronic logs
- * Foundation has been built for future electronic logs

Thank You * Questions

Draft Regulatory Language

December 2, 2015

Section 665, Title 14, CCR, is amended to read:

665. Meeting Procedures

~~(a) Time limits for speakers at commission meetings.~~

~~(1) The time allotted for each speaker wishing to address an agenda item shall be set by the presiding commissioner.~~

(a) Commission quorum, agendas, and meeting procedures.

- (1) Quorum. Commission and committee meetings may not be conducted without a quorum present.
 - (A) Commission meetings require a quorum of at least three commissioners be present to conduct a meeting. A commission meeting must be immediately recessed or adjourned if at least three commissioners are no longer present.
 - (B) Committee meetings require a quorum of at least one appointed member be present to conduct a meeting. A committee meeting must be immediately recessed or adjourned if at least one appointed member is no longer present.
- (2) Commissioner participation at committee meeting.
 - (A) No more than two commissioners may attend a committee meeting.
- (3) Meeting agendas.
 - (A) Public requests for items to be added to an agenda must be received no later than the commission meeting immediately prior to the desired meeting.
 - (B) Contents of meeting agendas.
 1. Except for emergency meetings of the commission, contents of commission and committee meeting agendas are established by a majority vote of the commission.
 2. Contents of agendas for emergency meetings of the commission are established by the president or the president's designee.
 3. Committee agendas may not contain items that have been placed on commission meeting agendas, unless otherwise directed by a majority vote of the commission.
 4. Notwithstanding subsection (a)(3)(B)1., the president or the president's designee may add an item to the agenda.
 - (C) Agenda distribution.
 1. Except for emergency meetings of the commission, commission and committee meeting agendas shall be distributed and posted to the commission website at least 10 days prior to the first day of the meeting.
 2. Agendas for emergency meetings of the commission shall be distributed and posted to the commission website

pursuant to the provisions of the Bagley-Keene Open Meeting Act (Government Code Sections 11120-11132).

- (4) Committee recommendations. Pursuant to Sections 105 and 106 of the Fish and Game Code, the marine resources committee and wildlife resources committee shall report on their activities from time to time and make recommendations on resource matters before the commission.
 - (A) Committees may meet to make recommendations no later than 15 days prior to the first day of the commission meeting at which the commission may consider taking action on the subject of the recommendation.
 - (B) Committee recommendations shall be posted to the commission website at least five days prior to the first day of the meeting.
- (5) Commission Meeting Voting
 - (A) A motion shall pass or fail only upon a majority vote of the membership.
 - 1. The commission may make and vote on more than one motion related to an agenda item. If no motion receives a majority vote of the membership, the agenda item shall be continued to a subsequent commission meeting.

(b) Public participation. Except for the department, every person or agency participating in commission and/or committee meetings is subject to the provisions in this subsection.

- (1) Public comment on agenda items. The public may comment on an agenda item before any decision is made regarding the agenda topic.
 - (A) Public requests to provide comments on a commission agenda item must be submitted to commission staff prior to when the agenda item is announced.
 - 1. A person may voluntarily complete a speaker card furnished by commission staff.
 - 2. A person not completing a speaker card must inform commission staff, orally or in writing, of their desire to comment on the item.
 - (B) A person may request to provide comments on a committee agenda item by raising his hand during the discussion of that item.
- (2) Public forum. During the public forum agenda item, any member of the public may address the commission or committee regarding commission policies or any other matter within the commission's jurisdiction so long as the subject is not related to any other item on the current agenda.
- (3) Allotted time for comments and presentations at commission meetings.
 - (A) The time allotted for each person wishing to address an agenda item shall be set by the presiding commissioner at between one and three minutes per person per agenda item, except as provided in subsections (b)(3)(A)1., (b)(3)(A)2. and (b)(3)(A)3.
 - 1. Ceding time. The presiding commissioner may allot up to five minutes for a person to comment on an agenda item if at least three other persons are present when the agenda item

- is called and forgo their opportunity to speak to that agenda item.
2. Advanced approval for extended time. The public may request extended time to comment longer than three minutes. The president or designee of the president shall approve or deny the requested time based on relevance to the agenda topic and time available.
 - a. Except for emergency meetings of the commission, requests for extended time must be received in writing no later than 12:00 noon five days prior to the first day of the meeting and must be sent by email to fgc@fgc.ca.gov or by mail/courier to California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814. Only one method of delivery is necessary.
 - i. The president or designee shall approve or deny the request no later than 5:00 p.m. two days prior to the first day of the meeting.
 - b. Requests for extended time for an emergency meeting of the commission must be received prior to the start of the meeting and must be sent by email to fgc@fgc.ca.gov or delivered in person at the meeting.
 - i. The president or designee shall approve or deny the request prior to the start of the meeting.
 3. At the request of any commissioner, a person may receive additional time to comment on an agenda item.
- (B) The total amount of time allocated for public comments on a particular issue may be limited by publishing the time limit on the meeting agenda.
- (4) Allotted time for comments at committee meetings. The time allotted for each person wishing to address an agenda item shall be at the discretion of the committee chair(s).
 - (5) Written comments. All written comments are available to commissioners upon request.
 - (A) Except for an emergency meeting of the commission, written comments intended for a commission or committee meeting must be delivered to the commission office via email or mail/courier no later than 12:00 noon five days prior to the first day of the meeting, or in person at the meeting.
 1. Written comments received by 5:00 p.m. 13 days prior to the first day of the meeting may be posted to the commission website and may be included in the meeting materials provided to commissioners prior to the first day of the meeting.

2. Written comments received after 5:00 p.m. 13 days prior to the first day of the meeting and before 12:00 noon 5 days prior to the first day of the meeting may be made available to commissioners at the meeting, but are not posted to the commission's website for that meeting.
3. Written comments received in the commission office after 12:00 noon five days prior to the first day of the meeting are only delivered to the meeting if required by the Administrative Procedure Act, Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code, and are not posted to the commission's website for that meeting.
4. Written comments received in the commission office after 12:00 noon five days prior to the first day of the meeting that are not required to be delivered to the meeting pursuant to the Administrative Procedure Act are held for a future meeting if related to a future agenda item.
5. Number of copies of written comments delivered in person at a meeting.
 - a. Ten copies of written comments are requested if delivered in person at a commission meeting, except two copies of written comments are requested if delivered in person at a teleconference meeting.
 - b. Five copies of written comments are requested if delivered in person at a committee meeting.
6. Any writings, when distributed to all, or a majority of all, commissioners in connection with a matter subject to discussion or consideration at a meeting shall be made available to the public upon request without delay. However, this subsection does not apply to any writing exempt from public disclosure under Section 6253.5, 6254, or 6254.7 of the Government Code.
7. Writings that are public records under subsection (b)(5)(A)6., and that are distributed to members of the commission prior to a meeting, pertaining to any item to be considered during the meeting, shall be made available for public inspection at the meeting.
8. Writings that are public records under subsection (b)(5)(A)6., and that are distributed to members of the commission during a meeting, pertaining to any item to be considered during the meeting shall be made available for public inspection at the meeting if prepared by department or commission staff, or after the meeting if prepared by some other person.

- (B) Written comments intended for an emergency meeting of the commission must be received prior to the start of the meeting or in person at the meeting.
- (C) In the event multiple written comments expressing similar views are received, an example or a summary of the comments may be posted to the commission website and/or included in the meeting materials for commissioners.
- (D) Written comments delivered to the commission office must be submitted via email to fgc@fgc.ca.gov or mail/courier to California Fish and Game Commission, 1416 Ninth Street, Suite 1320, Sacramento, CA 95814. Only one copy and only one method of delivery are necessary.
- (E) Written comments are not accepted if sent to the meeting facility.
- (6) Audio or visual materials for commission and committee presentations must be approved by the executive director.
 - (A) Except for emergency meetings of the commission, consideration for approval requires that materials be submitted no later than 12:00 noon five days prior to the first day of the meeting.
 - (B) For emergency meetings of the commission, consideration for approval requires that materials be submitted prior to the start of the meeting.
 - (C) A request for an audio or visual presentation for a commission or committee meeting may be denied if the material is deemed not relevant to the agenda item, contains inappropriate material, or contains unauthorized copyrighted materials.
 - (D) A request for an audio or visual presentation for Commission meetings may be denied if the material cannot be presented in three minutes or less.
 - (E) Audio or visual materials for presentations must be submitted via email to fgc@fgc.ca.gov.
 - (F) All electronic formats must be Windows PC compatible.
- (7) Prohibited behavior. A person willfully disrupting the orderly conduct of the meeting may be removed from the meeting.
- (c) Concurrence with Government Code Sections 6707 and 6800. The deadlines and due dates in this Section shall conform to Sections 6707 and 6708 of the Government Code pertaining to deadlines that fall on Saturdays or holidays.

Note: Authority cited: Section 108, Fish and Game Code. Reference: Section 108, Fish and Game Code; Section 11125.7 Government Code.

Summary of Public Recommendations for Commission and Committee Procedures

12/2/2015

Source	Recommendation	Staff Response	Notes
Commission Votes			
6/30/15 Eric Mills	If only three of the five commissioners are present, any issue on the agenda should be required to receive a 3:0 vote for passage. [Majority of the entire membership]	Some Commissioners have expressed an interest in including this provision, if not as a regulation, then perhaps as a policy.	The Bagley-Keene Open Meeting Act only requires that a majority of the members of a state body meet to establish a quorum for a meeting; it does not require a majority vote of the membership for a vote to pass. The general standard for passage of an item requires the majority of those present and voting for an item to pass.
Public Forum			
6/30/15 Eric Mills	There should be public forum at the beginning and end of each day of each meeting.	Reject: The Commission has already determined that it will include public forum at the beginning or end of each meeting day, but not both; to date public comment has supported public forum at the beginning of the day and the Commission has chosen to accommodate that preference.	The Bagley-Keene Open Meeting Act provides that at any meeting the body can elect to consider comments from the public on any matter under the body's jurisdiction. (§11125.7, Government Code)
Committees are Subject to the Bagley-Keene Open Meeting Act			
4/14/14 Michel & Associates	Because the Wildlife Resources Committee (WRC) was created by statute and because it includes more than one member, it is subject to the Bagley-Keene Open Meeting Act.	Accept: The proposed regulation recognizes that Commission committees are subject to the Bagley-Keene Open Meeting Act.	

Source	Recommendation	Staff Response	Notes
7/18/14 Bell, McAndrews & Hiltachk	The WRC is created by statute, and therefore is subject to the Bagley-Keene Open Meeting Act, regardless of whether it is a decision-making or advisory body.	Accept: The proposed regulation recognizes that Commission committees are subject to the Bagley-Keene Open Meeting Act.	
7/14/14 Safari Club International	The WRC must publish its plan to meet.	Accept: The proposed regulation provides that committee meeting agendas are published at least 10 days prior to the meeting.	The Commission must announce its meetings for the year by January 1 of that year, or sixty days prior to the first meeting, whichever is sooner. (§206, Fish and Game Code)
7/14/14 Safari Club International	Upon obtaining suggested presentations from the public, the WRC should publish its proposed agenda.	Reject: The public may request, but does not assign WRC agenda items. The Commission, not the WRC, determines the WRC agenda. The proposed regulation provides that committee meeting agendas will be approved at the Commission meeting immediately prior to the committee meeting and may be amended by the president or his designee. Consistent with the Bagley-Keene Open Meeting Act, the proposed regulation provides that Commission and committee meeting agendas will be distributed and posted to the Commission website at least ten days prior to the first day of a meeting.	

Source	Recommendation	Staff Response	Notes
7/14/14 Safari Club International	The WRC should give the public adequate opportunity to prepare responses to agenda items and to submit requests to be heard on agenda items.	Accept: Consistent with current practice, the proposed regulation provides rules for submitting written comments and presentations on an agenda item, and rules for making oral comments or presentations at a meeting.	The Bagley-Keene Open Meeting Act provides that a member of the public must be expressly afforded an opportunity to speak at meetings of a body either before or during the consideration of any agenda item (§11125.7, Government Code).
7/28/14 Michel & Associates	A committee meeting is subject to the Bagley-Keene Open Meeting Act if (a) any portion of the meeting relates to one or more matters within the Commission's jurisdiction, and (b) the meeting is attended (whether in person or otherwise) by all of the following: at least one WRC member, and least one Department employee, and at least one person who is neither a member of the Department nor affiliated with the Commission (e.g., non-committee member Commissioners or Commission staff)	Reject	The Bagley-Keene Open Meeting Act defines a meeting as any congregation of a majority of the members of a state body at the same time and place to hear, discuss, or deliberate upon any item that is within the subject matter jurisdiction of the state body to which it pertains. (§11122.5, Government Code)
9/24/15 Michel & Associates	What is the process for arranging a WRC meeting? Who decides the date, and location?	The dates and locations of committee meetings are established annually by the Commission.	The Commission must announce its meetings for the year by January 1 of that year, or sixty days prior to the first meeting, whichever is sooner. (§206, Fish and Game Code)

Source	Recommendation	Staff Response	Notes
9/24/15 Michel & Associates	Who dictates what items will be discussed at the WRC? How are issues decided to be placed on the agenda for any given meeting? Is there a process for the public to suggest items for consideration by the WRC.	<p>The proposed regulation provides that the Commission will approve committee meeting agenda topics at the Commission meeting immediately prior to the committee meeting.</p> <p>The public may suggest items for consideration by the WRC by presenting the request to the Commission.</p>	
9/24/15 Michel & Associates	Does the WRC comply with the Bagley-Keene Act as it must? If so, does it have established procedures to maintain compliance? Who created those procedures?	<p>The proposed regulation recognizes that Commission committees are subject to the Bagley-Keene Open Meeting Act.</p> <p>The WRC currently complies with the requirements of the Bagley-Keene Open Meeting Act. The proposed regulations will codify procedures not duplicative of current laws and regulations. The proposed regulations are being developed by Commission staff as directed by the Commission.</p>	

Source	Recommendation	Staff Response	Notes
9/24/15 Michel & Associates	Until our questions are answered and the lack of transparency for what the WRC is doing is addressed, it is inappropriate for the WRC to engage in any more activity related to the Commission's policy making.	WRC meetings are publicly noticed and open to the public. WRC does not make policy decisions on behalf of the Commission, but is directed by statute to make recommendations to the Commission.	The WRC shall report to the commission from time to time on its activities and shall make recommendations on all nonmarine resource matters considered by the commission. (§106, Fish and Game Code)
Appointments to WRC			
4/14/14 Michel & Associates	The WRC should have at least two members.	Reject	WRC is required to have only one member (§106, Fish and Game Code)
7/14/14 Safari Club International	The membership of the WRC should be two Commissioners	Reject	IBID
4/14/14 Michel & Associates	When the Commission makes its yearly appointment to the WRC, it should, to the extent practicable, appoint two WRC members who have different backgrounds (e.g., a hunter and a member with non-hunting interests).	Reject: Committee appointments are dependent upon the background and interest of commissioners.	Commissioners are appointed by the Governor (Article 4, Section 20, California Constitution) and IBID.
7/28/14 Michel & Associates	To the extent feasible, the Commission shall place at least one Commissioner with substantial hunting experience on the WRC.	Reject: Committee appointments are dependent upon the background and interest of commissioners.	Commissioners are appointed by the Governor (Article 4, Section 20, California Constitution)

Source	Recommendation	Staff Response	Notes
7/28/14 Michel & Associates	If the WRC has a designee, the name of that designee should be announced at a Commission meeting prior to that designee acting as the designee of the WRC.	Reject: It is impracticable to have a regulation requiring that the name of a designee be announced at a Commission meeting prior to a meeting that may not yet have been scheduled. Generally, the designee would be the wildlife advisor or executive director.	The WRC or its designee shall, to the extent practicable, attend meetings of the department staff, including meetings of the department staff with interested parties, in which significant wildlife resource management documents are being developed. (§106, Fish and Game Code)
Committee Quorum			
7/11/14 Michel & Associates	By law, the WRC is only required to have one member, so the claim that two members are needed for WRC meetings is inaccurate.	Accept: The proposed regulation provides that a committee quorum is one appointed member.	
7/28/14 Michel & Associates	WRC meetings will be run by at least one of the WRC members or the designee	Accept in part: The proposed regulation provides that a quorum is one appointed member.	Statute does not provide that a designee may run a WRC meeting (§106, Fish and Game Code).
Non-committee Members' Participation in Committee Meetings			
4/14/14 Michel & Associates	Three Commissioners should never participate in any WRC meeting.	Accept: The proposed regulation provides that no more than two Commissioners may attend a Committee meeting.	The prohibitions of the Bagley-Keene Open Meeting Act do not apply to the attendance of a majority of the members of a state body at an open and noticed meeting of a standing committee of that body, provided that the members of the state body who are not members of the standing committee attend only as observers. (§11122.5 (c)(6),
7/14/14 Safari Club International	Non-committee Commissioners should resist the temptation of attending WRC meetings in any capacity.	Reject: The proposed regulation provides that no more than two Commissioners may attend a Committee meeting.	

Source	Recommendation	Staff Response	Notes
7/28/14 Michel & Associates	Non-committee Commissioners may attend a WRC meeting but should be expressly prohibited from participating in anything other than an observational capacity. Non-member commissioners should not make any comment, either directly or indirectly, during a WRC meeting.	Reject: The proposed regulation provides that no more than two Commissioners may attend a Committee meeting.	Government Code)
Committee Recommendations			
4/14/14 Michel & Associates	Because WRC is required to make recommendations, final decisions will need to be made, which could be problematic if there are two Commissioners sitting on the WRC (e.g., a tie). The regulations should address how any disputes between WRC members shall be resolved.	Reject: Committees are not decision making bodies. They are required to make recommendations on matters before the Commission. In addition, the public has an opportunity per the Bagley-Keene Open Meeting Act to request that the Commission consider actions not recommended by a Committee.	
7/28/14 Michel & Associates	If the WRC has two members, any finding or recommendation it makes must be unanimous.	Reject: Committees are not required to have agreement between the members and may forward to the Commission differing recommendations.	

Source	Recommendation	Staff Response	Notes
7/18/14 Bell, McAndrews & Hiltachk	If the WRC members are to operate within their statutory authority as a strictly advisory body, the Commission must provide significant intervening substantive review for all recommendations made by the WRC, and must do so where the deliberations and determinations are open to the public – the Commission cannot simply rubberstamp a recommendation made by WRC. Furthermore, in considering recommendations from the WRC, the Commission must adhere to the Administrative Procedure Act and Bagley-Keene Open Meeting Act.	Accept: The proposed regulation provides that the Marine Resources Committee (MRC) and WRC may meet to make recommendations no later than 15 days prior to the Commission meeting at which the Commission may consider taking action on the subject of the recommendation; Committee recommendations shall be posted to the Commission website at least five days prior to the first day of the meeting; and the public may comment on an agenda item before any decision is made regarding the item.	
9/24/15 Michel & Associates	Who decides (or what is the process for deciding) what actions WRC will take, i.e., whether a recommendation will be made to the full Commission?	Committees are not decision making bodies; they are required to make recommendations on matters before the Commission.	The WRC shall report to the commission from time to time on its activities and shall make recommendations on all nonmarine resource matters considered by the commission. (§106, Fish and Game Code)

Source	Recommendation	Staff Response	Notes
9/24/15 Michel & Associates	What happens if one Commissioner disagrees with a recommendation? Is there a record kept of that? Is the Commission or the public informed of the disagreement?	<p>Committees are not required to have agreement between the appointed members and may forward to the Commission differing recommendations.</p> <p>Committee meetings are currently audio-recorded and Commission meetings are audio- or video-recorded. Commission staff maintains Commission voting records.</p>	
9/24/15 Michel & Associates	What form does a recommendation take? Who prepared it?	<p>The proposed regulation provides that MRC and WRC may meet to make recommendations no later than 15 days prior to the Commission meeting at which the Commission may consider taking action on the subject of the recommendation; Committee recommendations shall be posted to the Commission website at least five days prior to the first day of the Commission meeting at which the recommendations will be considered.</p> <p>Recommendations are generally developed by Commission staff under direction of the Committees.</p>	

Source	Recommendation	Staff Response	Notes
Public Participation in Committee Meetings – Written Comments and Presentations			
7/11/14 Michel & Associates	If the purpose of the WRC is to have the most enlightened discussion possible...then stakeholders and the public should not be surprised by new information presented for the first time at WRC meetings when there is no opportunity to prepare a rebuttal. If the Executive Director receives a copy of presentation materials a few weeks prior to the WRC meeting, why can't that information be circulated publicly beforehand?	<p>Accept in Part: The proposed regulation provides that written comments received at least 13 days prior to the meeting may be posted to the Commission's website at the same time Commissioners receive them.</p> <p>All writings are made available to the public when distributed to all or a majority of Commissioners.</p> <p>Members of the public who plan to submit information at a meeting are not required to share that information prior to a meeting; the exception in this regulation is for audio or visual presentations, which must be submitted to the executive director by noon five days prior to the day of the meeting.</p>	The Bagley-Keene Open Meeting Act provides that "...writings, when distributed to all, or a majority of all, of the members of a state body...shall be made available upon request without delay" (§11125.1, Government Code). The act also provides that a member of the public must be expressly afforded an opportunity to speak at meetings of a body either before or during the consideration of any agenda item (§11125.7, Government Code), which necessarily suggests that new information may be provided at a meeting without advance notice.
7/11/14 Michel & Associates	If a deadline is applicable to all, it should be publicized.	Accept: The proposed regulation includes deadlines for receipt of written comments and audio/visual presentations.	
7/14/14 Safari Club International	The WRC must solicit proposed presentations for a meeting from the public generally, and not just from a limited group.	Reject: The proposed regulation provides rules for submitting written comments and presentations on Commission and committee meeting agenda items, with no limitations on who may submit such materials. However,	

Source	Recommendation	Staff Response	Notes
		<p>the Commission and committees may ask a certain individual(s) or group(s) to provide information relevant to an agenda item or to work together to develop a collaborative proposal; this would not preclude others from participating in Commission and committee processes.</p> <p>The proposed regulation also provides that members of the public may comment on an agenda item before any decision is made regarding the item.</p>	
7/14/14 Safari Club International	The WRC should require presentations to be submitted well in advance of the meeting and should share those presentation materials with the public to give the public the opportunity to prepare comments on those presentations.	Accept in Part: The proposed regulation includes a deadline of noon five days prior to the first day of a meeting for receipt of written comments and audio/visual presentations. All writings and presentations are available to the public when distributed to all, or a majority of all, Commissioners.	
7/18/14 Bell, McAndrews & Hiltachk	All members of the public must be given the opportunity to comment and participate in meetings of the WRC.	Accept: The proposed regulation provides that Commission committees are subject to the Bagley-Keene Open Meeting Act and provides rules for written and verbal participation.	

Source	Recommendation	Staff Response	Notes
Public Participation in Committee Meetings Should not Preclude Public Participation during Commission Meetings			
7/11/14 Michel & Associates	Clarification is needed whether the WRC is going to be the only opportunity for public comment on issues raised at WRC meetings, or if the public will have an opportunity to comment on all issues agendized for Commission meetings, even if that issue was already discussed (or not) at a WRC meeting.	Accept: The proposed regulation provides that the public may comment on an agenda item before any decision is made regarding the item.	The Bagley-Keene Open Meeting Act includes an allowance to not take testimony on items discussed in committee, but it is not included in our proposed regulation. “...the state body shall provide an opportunity for members of the public to directly address the state body on each agenda item before or during the state body’s discussion or consideration of the item. This section is not applicable if the agenda item has already been considered by a committee composed exclusively of members of the state body at a public meeting where interested members of the public were afforded the opportunity to address the committee on the item, before or during the committee’s consideration of the item, unless the item has been substantially changed since the committee heard the item, as determined by the state body.” (§11125.7, Government Code)
7/14/14 Safari Club International	Need to clarify how the Commission and WRC will work together and, in particular, whether a discussion on the WRC agenda will provide the only opportunity for the public to comment on matters that result in WRC recommendations to the Commission.	Accept: The proposed regulation provides that the public may comment on an agenda item before any decision is made regarding the item.	
7/28/14 Michel & Associates	The ability to speak at a WRC meeting on a particular item should not preclude a member of the public from attending a later Commission meeting and commenting on that item, or a related item, during the Commission meeting but prior to the Commission taking action.	Accept: The proposed regulation provides that the public may comment on an agenda before any decision is made regarding the item.	
Subcommittees			
4/14/14 Michel & Associates	WRC needs rules to explain exactly how and when subcommittees will be formed.	Reject: If the Commission desires to move forward with this proposal, staff recommends doing so in a separate rulemaking.	

Source	Recommendation	Staff Response	Notes
7/28/14 Michel & Associates	WRC should not create any sub-committee or other entity without express approval by the full Commission after the Commission has taken public comment on the issue.	Reject: If the Commission desires to move forward with this proposal, staff recommends doing so in a separate rulemaking.	
7/28/14 Michel & Associates	Any subcommittee or other entity created by the WRC should only meet as part of a WRC meeting.	Reject: It is impracticable to have a regulation requiring that meetings of a subcommittee only take place as part of a committee meeting, which defeats the purpose of creating such a group.	
7/28/14 Michel & Associates	All communications between members of any subcommittee or other entity created by WRC should be treated as public records.	Reject: The Public Records Act dictates the extent to which communications between members of any entity created by WRC are treated as public records.	
9/25/15 Michel & Associates	What is the source of authority to create the Predator Working Group (PWG)? Assuming there is such authority, why is it not subject to the official rulemaking process? Would the Commission be able to create a workgroup itself without going through the formal rulemaking process?	Nothing prohibits a deliberative body from engaging the public to help it resolve issues before it. Nothing in the proposed regulations, or in practice, gives workgroups any authority; guidance and information provided by a workgroup is just that.	If the Commission determines it is appropriate to adopt a regulation regarding creation of a working group, staff recommends doing so in a separate rulemaking.
9/25/15 Michel & Associates	Who has authority to dictate the criteria or process for nominating PWG members? Are such nominations subject to the official rulemaking process?	The Commission approved a proposal by public vote to establish a predator policy workgroup. It included criteria and a process for nominating members to the workgroup.	

Source	Recommendation	Staff Response	Notes
9/25/15 Michel & Associates	Assuming authority exists to establish the PWG, does such authority reside with the Commission or the WRC?	The WRC serves at the pleasure of the Commission and the Commission directs all work of the committees.	
9/25/15 Michel & Associates	Will the public have an opportunity to weigh in on the criteria for nominating PWG members?	The public had an opportunity to provide comment at the August, 2015 meeting when the proposal was discussed.	
Minutes, Webcasting and Video Recording Committee Meetings			
4/14/14 Michel & Associates	WRC meetings should be video recorded and posted on the internet.	Reject: Though it may be desirable to video record and/or webcast committee meetings, for the foreseeable future the Commission does not have the necessary resources, making a regulation impracticable. WRC meetings are currently audio-recorded and posted on the Commission website.	This recommendation exceeds the requirements of the Bagley-Keene Open Meeting Act.
7/28/14 Michel & Associates	WRC meetings should be audio recorded. WRC meetings should be video recorded and broadcast on the internet unless the Commission makes a finding that as to a specific year, funding is not reasonably available for video recording.		
9/24/15 Michel & Associates	Are any meeting minutes or notes of proposed actions prepared? If so, by whom? Are any meeting minutes or notes kept? If so, are they made available?	Committee meetings are currently audio-recorded and the recordings are posted to the Commission website.	

Source	Recommendation	Staff Response	Notes
Purpose/Function of Committee Meetings			
7/11/14 Michel & Associates	If the WRC meeting will provide for a longer format pre-discussion of a discussion that will take place again before the full Commission, then no binding action (other than perhaps a recommendation to the Commission action) takes place at a WRC meeting. If that is the case, then the Commission should say so unequivocally.	Reject: WRC is established by statute that does not authorize WRC to take binding action on behalf of the Commission.	“The commission shall form a wildlife resources committee from its membership consisting of at least one commissioner. The committee shall report to the commission from time to time on its activities and shall make recommendations on all nonmarine resource matters considered by the commission. The committee or its designee shall, to the extent practicable, attend meetings of the department staff, including meetings of the department staff with interested parties, in which significant wildlife resource management documents are being developed.” (§106, Fish and Game Code)
7/14/14 Safari Club International	Asks for clarification regarding statements made that suggested that WRC meetings can operate as official Commission meetings.	Reject: Membership and meetings of committees and the Commission are not interchangeable pursuant to the various requirements of the Bagley-Keene Open Meeting Act.	
7/28/14 Michel & Associates	Unless specific situations dictate otherwise, WRC meetings should be structured to provide participants opportunities to engage in detailed discussions with Commission staff, Department staff, the presenter (if	Reject: It is not necessary to codify this in regulation. The proposed regulation requires sufficiently less structure and rules for committee meetings than Commission meetings to allow for greater flexibility and less	

Source	Recommendation	Staff Response	Notes
	applicable), and stakeholders. The WRC should strive to provide an informal setting at its meetings where all participants will have an opportunity to provide input into the conversation. However, if required, WRC should retain the option to apply a more structured setting.	formality.	
9/24/15 Michel & Associates	Who decides the format of a WRC meeting?	The format of committee meetings is the discretion of the committee chairs.	
Miscellaneous WRC Procedures/Practices			
4/14/14 Michel & Associates	Fish and Game Code §106 does not actually authorize or suggest the WRC is to perform its own meetings; the Commission should explain to the public why the Commission is going beyond its statutory mandate.	Reject: It is not necessary to codify this in regulation. WRC is required to report from time to time on its activities and shall make recommendations on all non-marine resource matters before the Commission (§106, Fish and Game Code); the only logical mechanism for these to occur, per the Bagley-Keene Open Meeting Act, is through public meetings.	
4/14/14 Michel & Associates	The WRC is, to the extent practicable, to attend meetings of DFW staff, including meetings of DFW staff with interested parties, in which significant wildlife resource management documents are being developed. Are these meetings all going to be open to the public and publicly noticed? Is	Reject: The recommendation would be duplicative. The Bagley-Keene Open Meeting Act defines public meetings.	

Source	Recommendation	Staff Response	Notes
	there going to be a public record of these meetings occurring?		
7/28/14 Michel & Associates	The WRC should strive to adhere to an “equal time” model to the extent practicable, to prevent an unreasonable disparity of non-public WRC meetings being granted to specific parties holding disparate viewpoints.	Reject: This recommendation does not pertain to meeting procedures but to one-on-one meetings between a WRC member and a member of the public.	
7/28/14 Michel & Associates	A log should be kept of all WRC-related meetings attended by WRC members or the WRC-designee.	Reject: This recommendation is excessive. If questions arise about a specific meeting or document, members of the public have recourse through the Public Records Act.	
Communication Should be Made on Government-Issued Devices			
6/5/15 Michel & Associates	<p>The Commission should mandate that all electronic correspondence concerning official Commission matters be conducted through government issued e-mail accounts that are stored on government owned servers or other electronic data storage mechanism.</p> <p>The use of personal email accounts for transmitting communications relating to any government business should be prohibited.</p> <p>The use of text messaging and other technologies that don't</p>	Reject: Inappropriate for meeting procedures. If the Commission desires to move forward with a regulation regarding communication methods, staff recommends doing so in a separate rulemaking.	At its October 2015 meeting, FGC referred this recommendation to legal counsel for evaluation.

Source	Recommendation	Staff Response	Notes
	create a record should be prohibited or discouraged.		
7/8/15 National Shooting Sports Foundation	<p>The use of personal email, personal cell phones, or any other personal device used for sending or receiving official government communications or business should be strictly prohibited or highly discouraged.</p> <p>The Commission should require all business communications be conducted via government issued technology and stored on government servers/databases, etc.</p>	Reject: Inappropriate for meeting procedures. If the Commission desires to move forward with a regulation regarding communication methods, staff recommends doing so in a separate rulemaking.	At its October 2015 meeting, FGC referred this recommendation to legal counsel for evaluation.

**Re: Comments on Proposed Regulations and Notice of Improper Wildlife
Resources Committee Procedures**

Dear Mr. Mastrup:

We write on behalf of our client, the National Rifle Association of America, to comment on proposed policies and to notify you of apparent improprieties in the proposed adoption of policy and procedures related to the Wildlife and Marine Resources Committee (respectively "WRC" and "MRC").

The agenda for the Fish & Game Commission ("Commission") meeting of February 5, 2014, includes the following agenda item: "DISCUSSION OF DRAFT POLICY AND PROCEDURES FOR WILDLIFE AND MARINE RESOURCES COMMITTEES" (the "Draft") A copy of the Draft is available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

The Draft, as written, is a "regulation¹" under state law. So the Commission appears to be

¹ Government Code section 11342.600 states, in its entirety,

'[r]egulation' means every rule, regulation, order, or standard of general application or the amendment, supplement, or revision of any rule, regulation, order, or standard adopted by any state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure.

Further, as used in section 11342.600, the term "state agency" includes every state commission. Gov't

improperly attempting to create “underground regulations[.]” i.e., regulations that are not valid because they were not adopted in accordance with the proper procedural guidelines.

I. The Proposed Procedures Must Be Properly Enacted Before They Can Be Implemented

California law is clear about the prohibition on the issuance or use of underground regulations:

No state agency shall issue, utilize, enforce, or attempt to enforce any guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule, which is a regulation as defined in Section 11342.600, unless the guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule has been adopted as a regulation and filed with the Secretary of State pursuant to this chapter.

Gov’t Code § 11340.5(a).

Case law confirms that the proposed rules in the Draft would be improper “underground regulations” if they arose as part of the implementation of the duties created by Fish and Game Code section 105 and 106, which, respectively, created the MRC and WRC. *See Engelmann v. State Bd. of Educ.*, 2 Cal. App. 4th 47, 62 (1991) (holding Board of Education was required to go through rule making process found in the Administrative Procedures Act when creating the guidelines and manuals for the mutli-level review process used for selecting the textbooks that could be used in public schools).

Accordingly, the Commission should follow normal regulatory standards (e.g., a series of three properly noticed Commission meetings used to introduce, discuss, and vote on a proposed regulation that was noticed via publication in the state’s Regulatory Notice Register) to move forward with the creation of the proposed policies/regulations. Once the proper process has been complied with and the regulations have been filed with the Secretary of State, only then can the regulations be relied upon by the WRC.

II. Substantive Comments Regarding the Proposed Regulations

1. Based on the lack of notice regarding the formation and dissolution of the Predatory Policy subcommittee, it is clear the WRC needs rules to explain exactly how and when subcommittees will be formed. The Draft should be revised accordingly.
2. Fish & Game Code section 106 does not actually authorize or suggest the WRC is to perform its *own* meetings; the Commission should explain to the public why the Commission is going beyond its statutory mandate.
3. The WRC should have at least two members; there appears to be no difference between

Code § 11000. Thus, the Commission is clearly a state agency for the purposes of section 11342.600.

a Commissioner's own abilities and a one-person WRC, and having two members will decrease the possibility of hasty or unfairly biased decision making.

4. The Draft should include a provision that, when the Commission makes its yearly appointment to the Committee, it should, to the extent practicable, appoint two WRC members who have differing backgrounds (e.g., a hunter and a member with non-hunting interests) to help ensure that recommendations have been "vetted" as much as possible before they get to the Commission.
5. Because the WRC is required to make recommendations (i.e., take "action[,]") as that term is defined in Government Code section 11122), that means final decisions will need to be made, which could be problematic if there are two Commissioners sitting on the WRC (e.g., a "tie"). The proposed regulations should address how any disputes between WRC members shall be resolved.
6. The WRC is, "to the extent practicable," to "attend meetings of the department staff, including meetings of the department staff with interested parties, in which significant wildlife resource management documents are being developed." Fish & Game Code § 106. Are these meetings all going to be open to the public and publicly noticed? Is there going to be a public record of these meetings occurring? If they are not, and further assuming the department has discretion as to who it meets with in private concerning the development of "significant wildlife resource management documents[,]," there are real transparency and equal access problems here.
7. Because the WRC was created by statute and because it includes more than one member, it is subject to the requirements of the Bagley-Keene Act. Gov't Code §§ 11121, 11123. Regardless, if it is the Commission's position is that the WRC, or any "subcommittees" it produces, will not be treated as if subject to the Bagley-Keene Act, the Commission should explain to the public the considerations that the Commission has found to outweigh the public's interest in open government.
8. Three Commissioners should never participate in any WRC meeting. The Draft obscures, at the least, the limits of Government Code section 11122.5(c)(2)(6). That section states:

[a] majority of the members of a state body [e.g., the Commission] shall not, outside of a meeting authorized by this chapter, use a series of communications of any kind, directly or through intermediaries, to discuss, deliberate, or take action on any item of business that is within the subject matter of the state body The prohibitions of this article do not apply to . . . attendance of a majority of the members of a state body at an open and noticed meeting of a standing committee of that body, *if* the members of the state body who are not members of the standing committee attend only as observers.

(Emphasis added).

It seems, however, that someone within the Commission or related staff wants to blur the lines about non-committee member Commissioners attending committee meetings. This can be seen via a comparison of the Draft and the prior “approved” MRC rules previously posted on the Commission’s website.

Compare the following.

- In the event that another Commissioner wishes to attend a meeting of the MRC, and there are two members of the MRC present at the meeting, that Commissioner may attend the meeting but must recuse himself or herself from any discussions related to Commission business. [2]
- Non-chair Commissioner [sic] may attend committee meetings.[3]

There is no legitimate reason to make this language *less* clear than it was in the prior draft. Further, it is debatable if the passage, as originally stated, is an accurate representation of the limitation stated in section 11122.5(c)(2)(6). Having three Commissioners on the dias during a committee meeting is inappropriate. If the Commission is going to have a meeting, it should be clearly noticed as a *Commission* meeting. History has show that non-committee Commissioners are likely going to speak at committee meetings even though doing so is patently inappropriate, and the rules should be absolutely clear to everyone, *including Commissioners and staff*, that non-committee Commissioners cannot legally speak at committee meetings.

9. WRC meetings should not be video recorded and posted on the internet. It was mentioned at the last WRC meeting that the cost of such service would be a problem. Though no actual cost information was provided, with the availability of YouTube and inexpensive digital cameras (perhaps even state-owned cellular phones), that statement is difficult to accept. Indeed, if the Commissioners and staff are all having travel costs reimbursed, it seems that the cost of video, which would *guarantee public access*, is likely much less than that which is already expended.

During the meeting of February 5, 2014, the Commission discussed the possibility of live-streaming WRC meetings. During that discussion, you mentioned that live-streaming meetings costs approximately six to eight thousand dollars per meeting, and the it was unclear if the Department of Fish and Wildlife had the money in its budget needed to live-stream the meetings. Because of the importance of public participation,

² <http://www.fgc.ca.gov/meetings/committees/MRCrulesandprocedures052213.pdf>.

³ http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

Mr. Sonke Mastrup
April 14, 2014
Page 5 of 5

live streaming and later web access should be considered a priority.

10. To the extent that the Draft states committee meetings “may be taped and broadcast on the internet at the discretion of the Commission[,]” this provision should be clarified, as it can reasonably be interpreted as a prohibition on the public recording committee meetings, subject only to express permission of the Commission. *See* Gov’t Code § 11124.1 (members of the public have the right to use a video recording device to record meetings of state bodies).

III. Conclusion

In summary, the Commission should incorporate all of the above comments into a new draft set of regulations that can be considered and adopted through the appropriate procedural mechanisms.

Sincerely,
Michel & Associates, P.C.

**Re: Request Wildlife Resources Committee Procedure and Meeting Protocols
Be Put In Place *Before* That Committee Makes Any Recommendations to
the Fish & Game Commission**

Honorable Commissioners:

We write on behalf of our client the National Rifle Association.

Recently while conducting meetings, the Commission and the WRC have blurred the lines between a true Commission hearing, where policy decisions can legally be made and official actions can be taken, and WRC meetings where apparently the only action possible is the WRC making a recommendation for the Commission to consider. This letter is a formal request that the Fish & Game Commission (Commission) require the Wildlife Resources Committee (WRC) to establish and publicize rules and procedures under which it will operate before the WRC takes any further substantive action, and that such procedural rules be vetted through the normal regulatory approval process before they become effective.

1. The Commission is Sending Mixed Signals About the Authority of the WRC

There is confusion about the role and authority of the WRC because at Commission and WRC meetings, the Executive Director, as well as Commissioners Sutton and Baylis, have inaccurately stated that WRC meetings are a form of, or can operate as, official Commission meetings. The Commissioners and Commission staff have also made numerous other confusing and conflicting comments about the role, limitations, and procedural rules of the WRC. Commissioner Sutton said that the WRC meetings are of an "informal nature." But there has been no clarification about whether

the WRC is going to be the only opportunity for public comment on issues raised at WRC meetings, or if the public will have opportunity to comment on all issues agendaized for Commission meetings, even if that issue was already discussed (or not) at a WRC meeting. This is compounded by the fact that WRC meeting videos are not available online, notwithstanding multiple requests from various segments of the stakeholder community for that type of access.

If the WRC meeting will provide for a longer format pre-discussion of a discussion that will take place again before the full Commission, then no binding action (other than perhaps a recommendation to the Commission action) takes place at a WRC meeting. If that is the case, then the Commission should say so unequivocally. This clarification would drastically reduce the amount of confusion being created by the uncertain state of the WRC's procedures and its authority.

2. *The Commission Must Establish Procedural Rules for the WRC Before It Allows the WRC to Address Substantive Issues*

Based on the recently released agenda for the July 28, 2014, WRC meeting, it appears that the Commission is moving forward with potentially substantive decision making at the upcoming next WRC meeting, even though the procedures for how the WRC will operate, and significantly, how the public can participate in WRC meetings, have not been publicized and apparently do not exist. Because there is no system or procedures in place, our clients, other stakeholders, and the interested public are unable to effectively participate in the rule and policy making process.

This office sent the Executive Director of the Commission a letter on April 14, 2014, raising concerns that the previously proposed WRC rules would be improper as "underground regulations." That letter also outlined nine other specific issues that are confusing or otherwise unclear as to plans for the future operation of the WRC. A copy of the letter is attached.

Our office recently followed up with the Executive Director about that letter. We were informed that the Commission has addressed the concerns raised our letter of April 14, 2014. We respectfully disagree. No new proposed procedural rules have been published, nor have we received a response letter addressing the issues noted in the letter of April 14, 2014.

So we now ask the Commission to please tell us; how have our client's concerns as recited in our April 14, 2014 letter, been addressed?

3. *The Commission Seems Biased, Favoring Participation by Anti-Hunting Groups Over Pro-Hunting Groups*

Holding WRC meetings without established procedures facilitates the impression that different rules apply to different stakeholders. Certain stakeholders appear to have more access and to information about WRC activities and plans. This not only creates an appearance of impropriety and fosters an antagonistic situation, it will result in increased investigations by watchdog associations suspecting bias in the way the Department and Commission are conducting their affairs.

If published rules are put in place, it would not only provide some clarity, it would also help limit unfair treatment, reduce the appearance of bias or conflicts of interest, alleviate concerns of bias,

and facilitate a more productive regulatory process.

4. Stakeholder Presentation Materials Should Be Made Publicly Available Well Before WRC Meetings

Furthermore, it was only because this office asked the Executive Director that we found out that the deadline for making a request to make a presentation at the July 28, 2014, WRC meeting was July 7, 2014. Assuming this was a deadline that was applicable to all who wanted to make a presentation to the WRC, shouldn't it have been publicized? And if that deadline did not apply to every group that wanted to make a presentation, our clients object to any content-based scheduling advantage that is being granted to other stakeholders.

If the purpose of the WRC is to have the most enlightened discussion possible concerning issues headed to the full Commission for consideration, then stakeholders and the public should not be surprised by new information presented for the first time at WRC meetings when there is no opportunity to prepare a rebuttal.

It is our understanding that there is a currently unwritten rule that presenters at WRC meetings are required to give the Executive Director a copy of presentation materials a few weeks prior to the WRC meeting. Though our clients don't necessarily agree with such a rule, if it is going to be enforced, why couldn't that information be circulated publicly beforehand?

5. The Commission's Attempt to Create an "Alternate" WRC Member Is Disconcerting

Another unsettled and troubling issue related to the WRC is the attempt (foiled by a loss of quorum at the June 4, 2014, meeting of the Commission) to create an "alternate" WRC "member" position. By law, the WRC is only required to have one member, so the claim that two members are need for meetings is inaccurate. Fish & Game Code § 106 ("The commission shall form a wildlife resources committee from its membership consisting of at least one commissioner.").

The WRC has *two* committee "members," Commissioners Kellogg and Baylis. If only one of committee "members" is unable to attend a WRC meeting, there is still no quorum or other procedural limitation that prevents a single WRC committee member from going forward with a WRC meeting.

The fact that some Commissioners are pushing very hard to have a third Commissioner appointed as a "member" to the WRC, even though there is no need to do so, raises concerns that by having three Commissioners at WRC meetings, those Commissioners would then attempt to act as the Commission and take a binding vote on Commission business.

At the January 15, 2014, WRC meeting, both the Executive Director and Commissioner Baylis indicated that had the three Commissioners present at that meeting wanted to, they could have acted as the Commission (an assertion we vigorously disagree with). Though the January 15, 2014, meeting was technically a Commission meeting, it was also an illegal meeting because it was not properly noticed as a Commission meeting.

If the Commission tries to use a noticed WRC meeting as an opportunity to take a Commission

Honorable Commissioners
July 11, 2014
Page 4 of 4

vote on a controversial topic, that will result in litigation.

The Commission should consider the implications of the WRC's current methods of operation, and should draft a new set of proposed procedures for the WRC. In doing so, the "alternate" issue should be resolved.

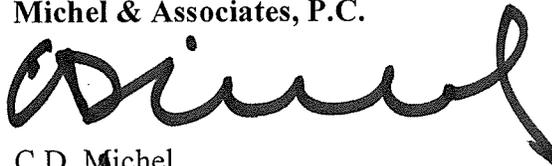

6. *Reservation of Rights*

Because it is not clear to us what the limitations are about making comments at the upcoming WRC and at later, related Commission meetings, our clients expressly reserve all rights to make a comment/presentation and at the July 28, 2014, WRC meeting and the August 6, 2014 Commission meeting, regardless of whether our client participates in one or both of these meetings.

7. *Conclusion*

The next WRC meeting should be used to formalize a set of proposed procedural rules that can be reviewed and approved by the Commission through its normal regulatory process. Otherwise the WRC's actions will continue to cause stakeholders and the public to believe that the Commission has lost its objectivity, and that it is now a biased politicized body. This directly conflicts with the reason the Commission was created in the first place. See *Young v. Dep't of Fish & Game*, 124 Cal. App. 3d 257, 273 (1981) (noting that the constitutional amendment that resulted in the Commission being a constitutional body "was to remove the old Fish and Game Commission from political influence").

Sincerely,
Michel & Associates, P.C.

RE: Wildlife Resources Committee

Dear Commissioners and Mr. Mastrup:

Our firm represents the National Shooting Sports Foundation ("NSSF"). NSSF is the trade association for America's firearms, ammunition, hunting and recreational shooting sports industry. NSSF's more than 10,000 members are comprised of manufacturers, distributors, retailers, shooting ranges, sportsmen's organizations and publishers, including many based in California. NSSF's mission is to promote, protect and preserve hunting and shooting sports.

The purpose of this letter is to address concerns of the NSSF regarding the transparency of the Wildlife Resources Committee ("WRC"). The policies and decisions of the California Fish and Game Commission ("Commission"), and the actions of the WRC have a direct and substantial, material impact on businesses of a significant number of our members, including those based in California.

Effective January 1, 2014, the California Fish and Game Code was amended by the Legislature to require the Commission to form a wildlife resources committee to make recommendations on all nonmarine resource matters considered by the Commission. (Fish and Game Code §106.) However, the Commission has not adopted rules of order and procedures for the WRC, and does not appear to adhere to existing statutory requirements.

Although the Commission apparently views the WRC as an “informal” committee, the Bagley-Keene Open Meeting Act (“the Bagley-Keene Act”) covers all state bodies. (Gov. Code §§ 11120-111321.) If a body is created by statute, such as by a statute added to the Fish and Game Code, it is subject to the Bagley-Keene Act regardless of whether it is decision-making or advisory. (Gov. Code §11121(a); see also subdivision (c) which explicitly applies to certain advisory committees.) This requires the WRC to adhere to basic requirements involving notice, access to records, and the opportunity for public comment. This is to ensure transparency and accountability in the governmental process.

Pursuant to the Bagley-Keene Act, at least ten days prior to the WRC meetings, the WRC must prepare an agenda of all items to be discussed or acted upon at the meeting. (Gov. Code § 11125(b).) The notice must also state the time and the place of the meeting and give the name, phone number and address of a contact person who can answer questions about the meeting and the agenda. (Gov. Code § 11125(a).) Not only agendas, but also all other materials distributed to a majority of the WRC members, must be made available to the public without delay. (Gov. Code § 11125.1.) This includes all members of the public, and not just those that support the WRC’s views on a recommendation. Further, all members of the public must be given the opportunity to comment and participate in the meetings of the WRC. (Gov. Code §11125.7.) NSSF respectfully requests that these requirements be strictly followed by the WRC.

As a separate issue, the WRC must ensure that it is working within the confines of its statutory authority. The Fish and Game Code provides that the WRC is only to make recommendations to the Commission. (Fish and Game Code §106.) A committee does not possess decision-making authority and is considered strictly advisory in nature if it is formed for the sole purpose of researching a topic and preparing a recommendation for submission to another governmental body that has final decision-making authority. (2 CCR § 18701.)

However, a committee is no longer considered to be strictly advisory if the committee members advise or make recommendations to the decionmaker either directly or without significant intervening substantive review by: (1) conducting research or making any investigation which requires the exercise of judgment on the part of the committee member for the purpose of influencing a governmental decision; or, (2) preparing or presenting any report, analysis, or opinion, orally, or in writing, which requires the exercise of judgment on the part of the committee member for the purpose of influencing a governmental decision. (2 CCR § 18702.2.) If the WRC members are to operate within their statutory authority as a strictly advisory body, the Commission must provide significant intervening substantive review for all recommendations made by the WRC, and must do so where the deliberations and determinations are open to the public – the Commission cannot simply rubberstamp a recommendation made by the WRC. Furthermore, in considering recommendations from the WRC, the Commission must adhere to the Administrative Procedures Act and Bagley-Keene Act.

NSSF has recently raised a series of concerns related to the impartiality and transparency of the Commission. The operation of the Wildlife Resources Committee reinforces NSSF's concerns about the ability of the current Commission to fairly and openly manage California's treasured wildlife. NSSF exhorts the Commission to examine its operational policies and its accessibility to all stakeholders.

Very truly yours,

Ashlee Titus

Re: Request for Transparency, Structure and Fairness in the Operations of the California Wildlife Resources Committee

Dear Sirs and Madam:

On behalf of the California chapters of Safari Club International (SCI California), we are submitting this letter to request major changes in the manner in which the California Wildlife Resources Committee (WRC) conducts its business. In the past several months and continuing into the present, the WRC has operated without formal procedural constraints. As a result, the WRC and by implication the entire Fish and Game Commission (Commission) have created the appearance that they are bodies that make decisions without fairness and based on the agendas of certain interest groups who have special access to the WRC and the Commission. Without procedural rules that require that all interest groups be given equal access to the WRC's decision-making processes, all recommendations made by the WRC and all determinations that the Commission makes based on WRC recommendations violate the law and potentially harm the resources that the Commission is obligated to protect.

Safari Club International Chapters in California

There are thirteen California Chapters of Safari Club International, collectively representing over 5,000 members and 30,000 California affiliates who hunt and participate in sustainable wildlife conservation. SCI chapters and their members participate in numerous conservation projects throughout the state. SCI California Chapters attend WRC and Commission meetings and make every effort to play active roles in the state's decision-making concerning

wildlife conservation and management. The activities of the WRC have deprived SCI California Chapters and their members of fair and equal access to these important decisions.

The WRC and Commission Have Created the Impression That Only Certain Interest Groups Have Access to Their Decision-Making Processes

The July 28, 2014 meeting agenda for the WRC includes “Discussion of Options to Implement Non-lead Ammunition Requirements” and identifies a presentation on this topic by Audubon California, Defenders of California and the Humane Society of the United States. To SCI California’s knowledge, no organization or individual representing the hunting community was offered the opportunity to make a presentation on this issue. Similarly, on the agenda for the January 15, 2014 meeting included a “Discussion and Update of Predator Management Subcommittee’s Recommendations for Changes to Predator Management Policies/Regulations.” The recommendations reviewed by the WRC for this discussion were submitted by only two entities, HSUS and Project Coyote. To SCI California’s knowledge, no organization or individual representing the hunting community was asked to participate on the Predator Management Subcommittee or to engage in the development of the recommendations for changes to the Predator Management Policies/Regulations.

The WRC is patently offering access to only certain interest groups for development of its recommendations and presentations. If the WRC, and by implication the Commission, wants to avoid the appearance, taint and potential invalidity of its decisions due to inappropriate bias, it should take immediate action to create procedures and regulations that impose measures to prevent such bias.

The Commission Must Establish and Publish Procedural Rules for the WRC Before the WRC Makes Any Further Recommendations or Takes Any Further Actions

Currently, the WRC is operating without formally adopted or publicized procedures for its decision-making process. Nevertheless, the WRC has already held a meeting on January 15, 2014 and plans another meeting for July 28, 2014. Without such established procedures, all WRC recommendations are potentially invalid and will have a similar impact on the decisions that the Commission makes that are based upon these recommendations. In the absence of such procedures, the public, and in particular members of SCI California Chapters, cannot actively participate in the WRC meetings and recommendations in a meaningful and significant way.

In a July 8, 2014 e-mail from Executive Director Sonke Mastrup to Kathy Lynch, Mr. Mastrup admitted that the WRC has no formal procedures established for their meetings and referred to the WRC meeting scheduled for July 28, 2014 as a “workshop.” Unfortunately, the labeling of the meeting as a “workshop” offers little to the public in terms of how to offer meaningful participation in the WRC’s work. The “workshop” label does nothing to remedy the imbalances in the access gained by certain interest groups and does not appear to have any impact on the Commission’s use of and reaction to the WRC’s recommendations. Informality does not excuse bias or illegality. Consequently, SCI California Chapters strongly recommend that the WRC July 28, 2014 “workshop” be cancelled (as was the May

2014 WRC meeting) and that no future meetings be scheduled until fair and predictable procedures can be adopted. In addition, the public should be permitted to play a role in establishing such procedures, to make certain that the WRC's agenda and its subcommittees are fairly represented by all or at least a balanced share of the constituencies interested in the WRC's and Commission's responsibilities.

The Commission Must Clarify Its Relationship With the WRC As Well as The Extent of the WRC's Authority

SCI California Chapters are very concerned that the lines between the WRC and the Commission have been blurred. According to the information on the Commission's own website, the WRC cannot operate instead or on behalf of the Commission. "It is important to note that the committee chairs cannot take action independent of the full Commission. Instead, the chairs make recommendations to the full Commission at regularly scheduled meetings." Consequently, SCI California Chapters are concerned about statements made by Executive Director Mastrup and Commissioners Sutton and Baylis that have suggested that WRC meetings can operate as official Commission meetings. SCI California Chapters need better clarification about how the Commission and WRC will work together, and in particular whether a discussion on the WRC agenda will provide the only opportunity for the public to comment on matters that result in WRC recommendations to the Commission.

The WRC's Membership Should Not Be Increased With an "Alternate" WRC Member

SCI California Chapters are aware of recommendations that the Commission appoint a third "alternate" Commissioner to the WRC. If a third Commissioner was added to the WRC's Membership as an alternate, the WRC would run the risk of turning all of its meetings into unpublicized Commission meetings. Such attempt to bypass the statutory limitations and requirements for Commission meetings could taint the recommendations of the WRC meetings, as well as the decisions made by the Commission at such meetings, or based on the recommendations made at these meetings. SCI strongly recommends that the membership of the WRC remain at two Commissioners only and that the remaining Commissioners resist the temptation of attending WRC meetings in any capacity.

WRC Meeting Must Give the Public a Meaningful Opportunity to Participate

As indicated above, the actions of the WRC up until this date have given the appearance that only certain interest groups have access to the WRC agenda, to offer presentations at WRC meetings and to influence the WRC decision-making processes. These practices must be immediately reversed. At the outset, the WRC must publish notice of its plan to meet and must solicit proposed presentations for the meeting from the public generally, and not just from a limited group. Upon obtaining suggested presentations, the WRC should publish its proposed agenda and give the public adequate opportunity to prepare responses and to submit requests to be heard on agenda items. The WRC should require presentations to be submitted well in advance of the meeting and should share those presentation materials with the public to give the public the opportunity to prepare comments on those presentations.

The only way that the WRC can make meaningful recommendations to the Commission is to make certain that it solicits data from all perspectives. Unless the WRC immediately develops a process to give the public an opportunity to participate in its decision-making, the

WRC's recommendations will be useless and will make the Commission's decisions vulnerable to challenge.

Participation in the July 28, 2014 WRC Meeting

In the absence of any established procedures for the upcoming WRC meeting, and future meetings, SCI California Chapters expressly reserve all rights to make comments/presentations at these meetings and at the August 6, 2014 Commission meeting.

Thank you for the opportunity to present these concerns. Should you have any question concerning this letter or concerning the intent of the SCI California Chapters to participate in the July 28, 2014 WRC Meeting and/or the August 6, 2014 Commission meeting, please contact Anna M. Seidman, Director of Litigation, Safari Club International, 202-543-8733 or aseidman@safariclub.org.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Dennis Anderson". The signature is fluid and cursive, with a large initial "D" and "A".

RECEIVED
CALIFORNIA
FISH AND GAME
COMMISSION
2014 JUL 31 PM 4:51

**Re: Petition for Rule Making by the Fish & Game Commission Regarding the
Need for Formal Procedures and Rules for the Proper and Fair Operation
of the Wildlife Resources Committee**

Dear Mr. Mastrup:

This Petition, submitted by the National Rifle Association of America ("NRA") pursuant to Government Code sections 11340.6 and 11340.7, requests that the California Fish & Game Commission (the "Commission") enact regulations to ensure public participation and fair debate vis-à-vis the Wildlife Resource Committee (the "WRC").

I. STANDING OF PETITIONERS

Petitioner NRA is an Internal Revenue Code § 501(c)(4) nonprofit corporation, incorporated in the State of New York in 1871, with principal offices and place of business in Fairfax, Virginia. NRA has approximately five million members, and hundreds of thousands of members in California.

The founders of NRA desired to create an organization dedicated to marksmanship, or, in the parlance of the time, to "promote and encourage rifle shooting on a scientific basis." NRA's bylaws, at Article II, Section 5, state that one of the purposes of NRA is "[t]o promote hunter safety, and to promote and to defend hunting as a shooting sport and as a viable and necessary method of fostering the propagation, growth, conservation, and wise use of our renewable wildlife resources."

NRA has been a party to or supported multiple lawsuits throughout the nation supporting and

defending the right to keep and bear firearms for hunting, sport shooting, and self-defense. Indeed, one of NRA's key functions is to preserve the tradition of hunting, by protecting it from unreasonable and unnecessary restrictions.

NRA has an established record of advocating against restrictions on hunting based on scientifically unsupported claims of alleged environmental harm.

Petitioner David Halbrook resides in Victorville, California, and has been a hunter for basically his entire life. Mr. Halbrook has hunted various big and small game in California in the past, and he intends to hunt in California in the future. Mr. Halbrook is a member of NRA and is the executive director of the Hunt For Truth Association.

Based on the foregoing, the petitioners have standing to make the requested regulatory changes.

II. REQUESTED REGULATORY CHANGES

Petitioners hereby seek the amendment of California Code of Regulations ("CCR"), title 14, via the addition of a new section dedicated to the procedural aspects of the operation of the WRC, including, but not limited to, public meetings held by the WRC.

The following provisions, based on draft language created by the Commission, should be included in the new section.

- (A) Section 108 of the Fish and Game Code requires the commission to adopt rules to govern the business practices and processes of the Commission. Sections ~~105 and~~¹ 106 of the Fish and Game Code require the commission to establish ~~a minimum of two committees, the Marine Resources Committee and~~² the Wildlife Resources Committee; ~~respectively.~~
- (B) A minimum of one, but no more than two members of the Commission will be appointed to the Wildlife Resources Committees at the first Commission meeting of each calendar year. To the extent feasible, the Commission shall place at least one Commissioner with substantial hunting experience on the Wildlife Resources Committee.
- (C) All public are welcome to attend and participate meetings as defined in subsection (a).
- (D) The Commission will establish the meeting schedule for the WRC committees each year

¹ ~~Strikeout~~ and underline are used herein to reflect deletions and additions, respectively, that Petitioner proposes be made regarding language previously put forth by the Commission in the Draft.

² Petitioner is not taking any position on what regulations should or should not be adopted for the operation of the Marine Resources Committee, but reference thereto is omitted herein because this Petition does not concern the operation of the Marine Resources Committee.

as part of the annual rulemaking calendar the prior November and may schedule additional meetings as needed.

- (E) Agenda will be approved at the Commission meeting before the committee meeting. Agendas will be developed by staff and will be comprised of standing items and topics requested by: ~~referred by the Commission, topics requested by the Department, and/or state agencies, and federal agencies, and standing items.~~ Public requests for agenda items must be made to the Commission and subsequently referred to the ~~appropriate committee~~ Wildlife Resources Committee.

Agenda items to be considered for the year will be adjusted based on urgency, need, and interest as determined by the Commission. Findings and recommendations will be made to the Commission for possible action by the ~~two chairs~~ Wildlife Resources Committee. If the Wildlife Resources Committee has two members, any finding or recommendation it makes must be unanimous.

- (F) All Wildlife Resources Committee meetings ~~of committees~~ shall be noticed at least 10 days prior to the meetings. Meeting agendas will be noticed on the Commission's website and distributed electronically.
- (G) Commission staff will secure appropriate meeting venues for Wildlife Resources Committee meetings with preference given to those that are provided free of charge. Meetings will be run by at least one of the Wildlife Resources Committee members or the designee, ~~two chairs~~ and facilitated by Commission staff.
- (H) ~~In general~~ Unless specific conditions dictate otherwise, meetings will be structured to provide participants opportunities to engage in detailed discussions with Commission staff, Department staff, the presenter (if applicable), and stakeholders. ~~Meetings~~ The Wildlife Resources Committee will strive to provide an informal setting at its meetings, where all participants will have an opportunity to provide input into the conversation. However, if required, the ~~chairs~~ Wildlife Resource Committee retains the option to apply a more structured setting where by discussion and public comment are governed by speaker cards and time limits.
- (I) ~~Non-chair member~~ Commissioners may attend Wildlife Resource Committee meetings, however, they are expressly prohibited from participating in anything other than an observational capacity. Non-member Commissioners shall not make any comment, either directly or indirectly, during a Wildlife Resources Committee meeting.
- (J) Commission staff shall prepare a ~~M~~meeting ~~S~~summary following each Wildlife Resources Committee meeting that summarizes the main discussion points and any recommendations developed by the Wildlife Resources Committee ~~committee chairs.~~ Draft meeting summaries shall be provided to the Department and Wildlife Resources Committee ~~committee chairs~~ prior to finalization for review and comment. The final meeting summary shall be posted on the Commission's website and serve as the formal record of the meeting. Any recommendations developed by a committee shall be clearly

identified in the meeting summary and presented to the Commission for consideration at a future Commission meeting.

- (K) Wildlife Resources Committee meetings shall be audio recorded. Wildlife Resource Commission meetings may shall be taped video recorded and broadcast on the internet at the discretion of unless the Commission and available makes a specific finding that, as to a specific fiscal year, funding is not reasonably available for video recording. This provision does not in any way inhibit any right that members of the public have concerning the use of a recording device to record public meetings of a state body.

Furthermore, the following provisions, drafted by the Petitioner, should also be included in the new section requested hereby.

- (L) A meeting is subject to the Bagley-Keene Act if (a) any portion of the meeting relates to one or more matter within the Commission's jurisdiction, and (b) the meeting is attended (whether in person or otherwise) by all of the following: at least one Wildlife Resources Committee member (or a Wildlife Resources Committee designee), at least one Department of Fish & Wildlife (the "Department") employee, and at least one person who is neither a member of the Department nor affiliated with the Commission (e.g., non-committee member Commissioners or Commission Staff). This provision only applies to meetings that concern, at least in part, nonmarine wildlife resource issues.
- (M) The ability of the public to speak at a Wildlife Resources Committee meeting on a particular item does not preclude a member of the public from attending a later Commission meeting and commenting on that item, or a related item, during the Commission meeting but prior to the Commission taking action on the relevant item.
- (N) If the Wildlife Resources Committee has a designee, the name of that designee shall be announced at a Commission meeting prior to that designee acting as the designee of the Wildlife Resources Committee.
- (O) The WRC shall strive to adhere to an "equal time" model to the extent practicable, to prevent an unreasonable disparity of non-public Wildlife Resources Committee meetings being granted to specific parties holding disparate viewpoints.
- (P) The Wildlife Resources Committee shall not create any sub-committee or other entity without express approval by the full Commission after the Commission has taken public comment on the issue. All subcommittees or similar entities created by Wildlife Resources Committee with Commission approval shall meet only as a part of Wildlife Resources Committee meetings, and all communications between members of these entities shall be treated as public records.
- (Q) A log should be kept of all Wildlife Resources Committee-related meetings attended by Wildlife Resources Committee members or the Wildlife Resources Committee designee.

III. JUSTIFICATION FOR THE REQUESTED REGULATORY CHANGES

A. Any Rules Used by and for the WRC Are Regulations, Thus They Must Be Approved through the Proper Regulatory Process

The agenda for the Fish & Game Commission (“Commission”) meeting of February 5, 2014, included the following agenda item: “DISCUSSION OF DRAFT POLICY AND PROCEDURES FOR WILDLIFE AND MARINE RESOURCES COMMITTEES” (the “Draft”). A copy of the Draft is available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

The Draft, as written, is a “regulation” under state law. Government Code section 11342.600 states, in its entirety,

‘[r]egulation’ means every rule, regulation, order, or standard of general application or the amendment, supplement, or revision of any rule, regulation, order, or standard adopted by any state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure.

As used in section 11342.600, the term “state agency” includes every state commission. Gov’t Code § 11000. Thus, the Commission is clearly a state agency for the purposes of section 11342.600. Section 11342.600 is in accord with Fish & Game Code section 108, which “requires the commission to adopt rules to govern the business practices and processes of the Commission.”³

Should the Commission attempt to utilize any rules regarding the operation of the Wildlife Resources Committee without having them adopted via proper regulatory rulemaking, that would violate Government Code section 11340.5(a). That section states:

No state agency shall issue, utilize, enforce, or attempt to enforce any guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule, which is a regulation as defined in Section 11342.600, unless the guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule has been adopted as a regulation and filed with the Secretary of State pursuant to this chapter.

Case law confirms that the Wildlife Resources Committee would be using illegal “underground regulations” if the Commission allowed the Wildlife Resources Committee to operate by a set of rules that were not properly enacted. *See Engelmann v. State Bd. of Educ.*, 2 Cal. App. 4th 47, 62 (1991) (holding Board of Education was required to go through rule making process found in the Administrative Procedures Act when creating guidelines and manuals for a multi-level review process used for selecting textbooks that could be used in public schools).

³ See the Draft, available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf

Executive Director Sonke Mastrup
July 28, 2014
Page 6 of 6

B. Equal Access and Transparency Interests Will Be Served if the Petition Is Granted

The Petitioner sent a letter to the Commission on April 14, 2014, outlining why the Wildlife Resources Committee needed rules adopted pursuant to the proper regulatory process. A copy of that letter is attached and incorporated by reference. Put simply, that letter outlined the various potential pitfalls related to the draft rules that the Commission circulated earlier this year, rules that, it seemed, the Commission wanted to adopt without adhering to the proper regulatory process. Because three months have passed since that letter and the July 28, 2014, meeting of the Wildlife Resources Committee is being held without any binding rules or regulations, the Petitioner is now forced to make this formal demand that the lack of regulations be addressed.

Indeed, to prevent any possible argument that a Commission decision was made as the result of a fault in the undefined Wildlife Resources Committee public comment process in place as of July 28, 2014, the Petitioner strongly suggests that the Wildlife Resources Committee not make any final decisions or recommendations at that meeting.

IV. THE COMMISSION HAS THE LEGAL AUTHORITY TO ADOPT THE REQUESTED REGULATORY CHANGES

Section 108 of the Fish and Game Code requires the commission to adopt rules to govern the business practices and processes of the Commission. Thus, the regulations sought hereby are clearly within the Commission's regulatory authority. *See also* Gov't Code § 11340.6 ("any interested person may petition a state agency requesting the adoption, amendment, or repeal of a regulation").

V. CONCLUSION

For the reasons stated herein, this Petition should be granted.

Sincerely,
Michel & Associates, P.C.

C.D. Michel

Subject: Re: Commission Bylaws

June 30, 2015

Dear Sonke:

So am I to understand that there are NO official bylaws for the Commission?

Specific recommendations, you ask?

Indeed. See my original inquiry. Here are two:

I'm of the opinion that, if only three of the five commissioners are present, any issue on the agenda should be required to receive a 3:0 vote for passage. A 2:1 or 2:0 margin shouldn't be allowed to decide such issues. (Case in point: the recent failure of Endangered Status for the tri-colored blackbird.)

And this: As you know, the Commission recently put Public Forum back first-thing on the agenda, where it belongs. You might consider adding a Public Forum to the tail-end of each day's meeting, too, as a "public friendly" service.

Thoughts?

Cheers,

Eric Mills, coordinator

Hi Eric,

The Commission generally follows Robert's Rules of Order and strictly adheres to the Bagley-Keene Open Meeting Act. As you know, we have been working on adopting additional regulations that will govern the operations of the Commission. If you have any specific recommendations, please don't hesitate to share them with us.

P.O. Box 944209
Sacramento, CA 94244-2090

VIA ELECTRONIC MAIL: fgc@fgc.ca.gov

**Re: Petition for the Adoption of a Regulation Requiring Correspondence About
Official Fish & Game Commission Matters to Be Conducted Via
Government Issued Means**

Mr. Mastrup:

This Petition is submitted on behalf of our clients, the National Rifle Association of America ("NRA") and California Rifle and Pistol Association ("CRPA") pursuant to Government Code sections 11340.6 and 11340.7.

I. REQUESTED ACTION

The Petitioners hereby request that the California Fish and Game Commission ("FGC") propose and adopt regulations requiring Department of Fish & Wildlife ("FWD") personnel, FGC Commissioners, and the staffers, agents, employees, and others assisting them with official Commission business, to conduct all government business in a way that maximizes public transparency and discourages the exclusion of any stakeholder group from being fully informed about the regulatory process. Toward this end, the FGC should mandate that all electronic correspondence concerning official Commission matters be conducted through government issued electronic-mail (i.e., e-mail) accounts that are stored on government owned servers, cloud data networks, or other electronic data storage mechanisms.

Use of personal email accounts for transmitting communications relating to any government business should be prohibited. The use of text messaging and other technologies that don't create a record should also be prohibited or discouraged.

Alternatively, should the FGC not wish to adopt this measure as a regulation, Petitioners request that FGC nevertheless adopt it as official policy of the Commission.

II. STANDING OF PETITIONERS

Petitioner NRA is an Internal Revenue Code § 501(c)(4) nonprofit corporation, incorporated in the State of New York in 1871, with principal offices and place of business in Fairfax, Virginia. NRA has approximately five million members, including hundreds of thousands of members who reside in California.

The founders of NRA desired to create an organization dedicated to marksmanship, or, in the parlance of the time, to "promote and encourage rifle shooting on a scientific basis." NRA's bylaws, at Article II, Section 5, state that one of the purposes of NRA is "[t]o promote hunter safety, and to promote and to defend hunting as a shooting sport and as a viable and necessary method of fostering the propagation, growth, conservation, and wise use of our renewable wildlife resources."

Petitioner CRPA is a nonprofit membership organization classified under section 501(c)(4) of the Internal Revenue Code and incorporated under the laws of California, with headquarters in Fullerton, California. Founded in 1875, the CRPA works to preserve the constitutional and statutory rights of gun ownership for its members, including the right to hunt. CRPA regularly participates in Fish and Game Commission matters on behalf of its tens of thousands of California resident members.

Based on the foregoing, the petitioners have standing to make the requested regulatory changes.

III. JUSTIFICATION FOR REQUESTED ACTION

a. **The Commission Should Establish a Regulation Governing Communications of Official Matters that Promotes Government Transparency and Accountability**

The California Constitution provides that "[t]he people have the right of access to information concerning the conduct of the people's business, and, therefore, the meetings of public bodies and *the writings of public officials and agencies shall be open to public scrutiny.*" (Cal. Const., art. I, § 3(b)(1).)¹ Current law, however, does not specifically address the propriety of FGC Commissioners using their personal communications technologies means, such as e-mails, texts, and servers, to conduct public business.

A regulation prohibiting Commissioners and their employees and agents from conducting public business via private or secret or non-public means is necessary to optimally provide transparency, open-government access, and accountability to facilitate CPRA requests, and to promote public understanding, participation, and confidence in the FGC and in its practices and procedures in matters deserving of public review.

¹The California Public Records Act (Gov. Code, § 6250 et seq.) ("CPRA") provides that "public records" include any writing containing information relating to the conduct of the public's business prepared, owned, used, or retained by any state or local agency regardless of physical form or characteristics." (Gov. Code, § 6252(e).)

Such a regulation also furthers the principles articulated in Fish and Game Code section 107 that the FGC is legally obligated to adhere to. Relevant here are subdivisions: (b) stating "the commissioner shall conduct his or her affairs in the public's best interest;" (c) stating the "commissioner shall conduct his or her affairs in an open, objective, and impartial manner, free of undue influence, and the abuse of power and authority;" (d) stating FGC's programs "require public awareness, understanding, and support of, and participation and confidence in, the commission and its practices and procedures;" and (e) stating "the commissioner shall preserve the public's welfare and the integrity of the commission, and act to maintain the public's trust in the commission and the implementation of its regulations and policies."

With the public's increased and increasing skepticism of government officials who are using none traceable technologies and private e-mail accounts, the appearance of a conflict of interest that this creates, the distrust in government that these practices encourage, the diversity of views stakeholders the FGC should take all steps available to show by its actions and regulations that it is dedicated to being transparent beyond what current statutory law requires. This is especially critical for a body like the FGC whose actions directly and significantly impact stakeholders with a large diversity of views. Adoption of the proposed regulation is a small but significant step towards achieving just that.

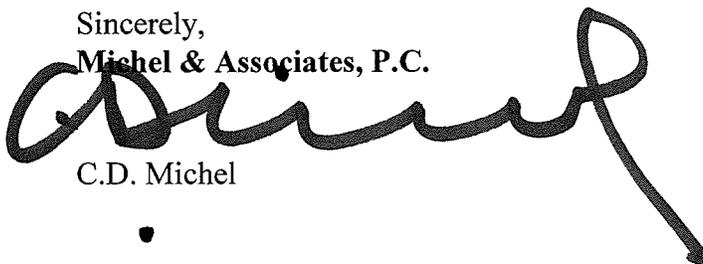

IV. THE COMMISSION HAS THE LEGAL AUTHORITY TO TAKE THE REQUESTED ACTION

Pursuant to section 108 of the California Fish and Game Code, the FGC must "adopt rules to govern the business practices and processes" of the FGC. Further, as discussed above, section 107 requires that the Commission maintain the public trust in implementing its regulations and policies. Thus, the regulation Petitioners propose is clearly within the FGC's regulatory authority.

V. CONCLUSION

For the above stated reasons, the FGC should accept this Petition and open the rulemaking process for a regulations that require electronic correspondence by Commissioners or their agents or employee about any official Commission matter to be conducted through government issued electronic-mail accounts that are hosted on government owned servers and that discourages the adoption or use of any technology or practice that serves to avoid creating a record that can be viewed by the public. Alternatively, the FGC should adopt this as an official policy, if not a regulation. Either way, this should be the standard operating procedure for the FGC.

Sincerely,
Michel & Associates, P.C.

C.D. Michel

Re: Petitions for the Adoption of a Regulation Requiring Correspondence About Official Fish & Game Commission Matters to be Conducted Via Government Issued Means

Dear Mr. Mastrup:

On behalf of the National Shooting Sports Foundation, I write to you today to express our support for the petition submitted on behalf of the National Rifle Association (“NRA”) and California Rifle and Pistol Association (“CRPA”) on June 5, 2015. The petition submitted on behalf of the NRA and CRPA “request(s) that the California Fish and Game Commission (“FGC”) propose and adopt regulations requiring Department of Fish & Wildlife (“DFW”) personnel, FGC Commissioners, and staffers, agents, employees, and others assisting them with official Commission business, to conduct all government business in a way that maximizes public transparency and discourages the exclusion of any stakeholder group from being fully informed about the regulatory process.”

As the trade association for America's firearms, ammunition, hunting, and recreational shooting sports industry, the National Shooting Sports Foundation (“NSSF”) seeks to promote, protect, and preserve hunting and the shooting sports. NSSF has a membership of nearly 13,000 manufacturers, distributors, firearms retailers, shooting ranges, and sportsmen's organizations. Our manufacturer members make the firearms used by law-abiding California sportsmen, the U.S. military and law enforcement agencies throughout the state.

The view of the NSSF follows that of the NRA and CRPA in that the use of personal email, personal cell phones, or any other personal device used for sending or receiving official government communications or business should be strictly prohibited or highly discouraged. When conducting business funded by tax-payers, the ultimate goal of the FGC and FWD should be complete transparency. Like the NRA and CRPA, the NSSF would respectfully request the FGC and DFW adopt a regulation, or official policy, requiring all business communications be conducted via government issued technology and stored on government servers, cloud-based databases, etc.

In closing, the National Shooting Sports Foundation strongly supports and would respectfully request that you move forward with the petition submitted on behalf of the NRA and the CRPA, and adopt regulations, or official policy, requiring all correspondence regarding official Fish & Game Commission matters be conducted through government issued means.

Sincerely,

Trevor W. Santos
Manager of Government Relations – State Affairs

Re: Comments on Wildlife Resources Committee Procedures

Dear Mr. Mastrup:

We again write on behalf of our client the National Rifle Association of America to comment on the Wildlife Resources Committee's lack of established procedure and governing rules. Our office sent the Commission's Executive Director a letter on April 14, 2014, raising concerns that the originally proposed rules for the WRC would be improper as "underground regulations" because they had not been adopted pursuant to the proper rulemaking process. That letter also outlined nine other specific issues that are confusing or otherwise unclear as to plans for the future operation of the WRC.¹

Our office followed up with the Executive Director about that letter. We were informed that the Commission had since addressed our client's concerns. Not seeing any evidence of that, on July 11, 2014, we sent a formal request that this Commission require that rules and procedures be established for the WRC through the normal regulatory approval process before the WRC takes any further

¹ A copy of the letter is attached as Exhibit 1.

Mr. Sonke Mastrup
September 24, 2015
Page 2 of 4

action.² Around the same time Safari Club International submitted a letter raising similar concerns, and NSSF attorneys also submitted a letter correctly explaining the legal shortcomings for how the WRC is operated. Due to a lack of response to these correspondence, our office then followed up with an official petition on July 28, 2014, which the Commission accepted and referred it to staff for evaluation and recommendation.³

Despite all these efforts, our client's concerns have not been addressed *over a year later*. To date no official procedures for the WRC have been adopted. To the contrary, it seems like how the WRC runs is ever-changing, leaving stakeholders cynical about the process and with many questions that need to be answered, including:

What is the process for arranging a WRC meeting? Who decides the date, location, and format?

Who dictates what items will be discussed at the WRC? How are issues decided to be placed on the agenda for any given meeting? Is there a process for the public to suggest items for consideration by the WRC?

Who decides (or what is the process for deciding) what actions the WRC will take, i.e., whether a recommendation will be made to the full Commission? What happens if one Commissioner disagrees with a recommendation? Is there a record kept of that? Is the Commission or the public informed of the disagreement?

What form does a recommendation take? Who prepared it?

Are any meeting minutes or notes of proposed actions prepared? If so, by whom? Are any meeting minutes or notes kept? If so, are they made available?

Does the WRC comply with the Bagley-Keene Act as it must? If so, does it have established procedures to maintain compliance? Who created those procedures?

Until these (and other) questions are answered and the lack of transparency for what the WRC is doing is addressed, it is inappropriate for the WRC to engage in any more activity related to the Commission's policy making. Yet, the exact opposite seems to be occurring.

² A copy of the letter is attached as Exhibit 2.

³ A copy of the petition is attached. as Exhibit 3

Mr. Sonke Mastrup
September 24, 2015
Page 3 of 4

Not only does the WRC continue to operate without any formal governing procedures in place, but it is *expanding* its operation. The October Commission meeting agenda includes, among other items, "Appointments to predator workgroup." While not entirely clear (which is an additional issue that needs to be addressed), it appears this item means the Commission will be discussing nominations and appointments to the WRC's so-called Predator Policy Workgroup ("PWG"). The propriety of such an expansion is dubious standing alone, but with so many questions remaining about the proper procedure and structure for the WRC itself, doing so is beyond the pale for a public entity.

Moreover, it is unclear whether it is even legal to form the PWG. Nothing in the statute creating the WRC provides for it.⁴ Assuming it is legal, it remains unclear whether the Commission or the WRC would be the body responsible for creating it and regulating it. Accordingly, before the WRC expands with subcommittees like the PWG, the following questions should be answered:

What is the source of authority to create the PWG? Assuming there is such authority, why is its creation not subject to the official rulemaking process? Would the Commission be able to create a workgroup under itself without going through the formal rulemaking process?

Who has authority to dictate the criteria or process for nominating PWG members? Are such nominations subject to the official rulemaking process?

Assuming such authority exists in either case, does it reside in the Commission or the WRC?

Will the public have an opportunity to weigh in on the criteria for nominating PWG members?

Of course, the same queries regarding the lack of procedure for the WRC generally apply to the PWG, but addressing those now would be to put the cart before the horse. Our client is not alone in its concerns here. Even WRC staff recently recommended "[t]hat structure, function, and specific tasks for the predator workgroup be clearly identified."⁵

Needless to say, established rules and procedures are needed for the WRC now. Important matters are currently being addressed while many stakeholders remain uncertain about how to participate in the process because of the constantly changing process. The effect is to thwart the original purpose of the WRC, which was to facilitate input from stakeholders on matters of interest

⁴ See Fish and Game Code § 106.

regarding natural resources that the Commission may want to consider.

For these reasons, we respectfully request that the above questions be answered and that the WRC cease taking any actions until official rules and procedures governing it are adopted following a public comment period. If you have any questions, please feel to contact our office.

Sincerely,
Michel & Associates, P.C.

**Re: Comments on Proposed Regulations and Notice of Improper Wildlife
Resources Committee Procedures**

Dear Mr. Mastrup:

We write on behalf of our client, the National Rifle Association of America, to comment on proposed policies and to notify you of apparent improprieties in the proposed adoption of policy and procedures related to the Wildlife and Marine Resources Committee (respectively "WRC" and "MRC").

The agenda for the Fish & Game Commission ("Commission") meeting of February 5, 2014, includes the following agenda item: "DISCUSSION OF DRAFT POLICY AND PROCEDURES FOR WILDLIFE AND MARINE RESOURCES COMMITTEES" (the "Draft"). A copy of the Draft is available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

The Draft, as written, is a "regulation"¹ under state law. So the Commission appears to be

¹ Government Code section 11342.600 states, in its entirety,

'[r]egulation' means every rule, regulation, order, or standard of general application or the amendment, supplement, or revision of any rule, regulation, order, or standard adopted by any state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure.

Further, as used in section 11342.600, the term "state agency" includes every state commission. Gov't

improperly attempting to create “underground regulations[,]” i.e., regulations that are not valid because they were not adopted in accordance with the proper procedural guidelines.

I. The Proposed Procedures Must Be Properly Enacted Before They Can Be Implemented

California law is clear about the prohibition on the issuance or use of underground regulations:

No state agency shall issue, utilize, enforce, or attempt to enforce any guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule, which is a regulation as defined in Section 11342.600, unless the guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule has been adopted as a regulation and filed with the Secretary of State pursuant to this chapter.

Gov’t Code § 11340.5(a).

Case law confirms that the proposed rules in the Draft would be improper “underground regulations” if they arose as part of the implementation of the duties created by Fish and Game Code section 105 and 106, which, respectively, created the MRC and WRC. *See Engelmann v. State Bd. of Educ.*, 2 Cal. App. 4th 47, 62 (1991) (holding Board of Education was required to go through rule making process found in the Administrative Procedures Act when creating the guidelines and manuals for the multi-level review process used for selecting the textbooks that could be used in public schools).

Accordingly, the Commission should follow normal regulatory standards (e.g., a series of three properly noticed Commission meetings used to introduce, discuss, and vote on a proposed regulation that was noticed via publication in the state’s Regulatory Notice Register) to move forward with the creation of the proposed policies/regulations. Once the proper process has been complied with and the regulations have been filed with the Secretary of State, only then can the regulations be relied upon by the WRC.

II. Substantive Comments Regarding the Proposed Regulations

1. Based on the lack of notice regarding the formation and dissolution of the Predatory Policy subcommittee, it is clear the WRC needs rules to explain exactly how and when subcommittees will be formed. The Draft should be revised accordingly.
2. Fish & Game Code section 106 does not actually authorize or suggest the WRC is to perform its *own* meetings; the Commission should explain to the public why the Commission is going beyond its statutory mandate.
3. The WRC should have at least two members; there appears to be no difference between

Code § 11000. Thus, the Commission is clearly a state agency for the purposes of section 11342.600.

a Commissioner's own abilities and a one-person WRC, and having two members will decrease the possibility of hasty or unfairly biased decision making.

4. The Draft should include a provision that, when the Commission makes its yearly appointment to the Committee, it should, to the extent practicable, appoint two WRC members who have differing backgrounds (e.g., a hunter and a member with non-hunting interests) to help ensure that recommendations have been "vetted" as much as possible before they get to the Commission.
5. Because the WRC is required to make recommendations (i.e., take "action[,]") as that term is defined in Government Code section 11122), that means final decisions will need to be made, which could be problematic if there are two Commissioners sitting on the WRC (e.g., a "tie"). The proposed regulations should address how any disputes between WRC members shall be resolved.
6. The WRC is, "to the extent practicable," to "attend meetings of the department staff, including meetings of the department staff with interested parties, in which significant wildlife resource management documents are being developed." Fish & Game Code § 106. Are these meetings all going to be open to the public and publicly noticed? Is there going to be a public record of these meetings occurring? If they are not, and further assuming the department has discretion as to who it meets with in private concerning the development of "significant wildlife resource management documents[,]," there are real transparency and equal access problems here.
7. Because the WRC was created by statute and because it includes more than one member, it is subject to the requirements of the Bagley-Keene Act. Gov't Code §§ 11121, 11123. Regardless, if it is the Commission's position is that the WRC, or any "subcommittees" it produces, will not be treated as if subject to the Bagley-Keene Act, the Commission should explain to the public the considerations that the Commission has found to outweigh the public's interest in open government.
8. Three Commissioners should never participate in any WRC meeting. The Draft obscures, at the least, the limits of Government Code section 11122.5(c)(2)(6). That section states:

[a] majority of the members of a state body [e.g., the Commission] shall not, outside of a meeting authorized by this chapter, use a series of communications of any kind, directly or through intermediaries, to discuss, deliberate, or take action on any item of business that is within the subject matter of the state body The prohibitions of this article do not apply to . . . attendance of a majority of the members of a state body at an open and noticed meeting of a standing committee of that body, *if* the members of the state body who are not members of the standing committee attend only as observers.

(Emphasis added).

It seems, however, that someone within the Commission or related staff wants to blur the lines about non-committee member Commissioners attending committee meetings. This can be seen via a comparison of the Draft and the prior "approved" MRC rules previously posted on the Commission's website.

Compare the following.

- In the event that another Commissioner wishes to attend a meeting of the MRC, and there are two members of the MRC present at the meeting, that Commissioner may attend the meeting but must recuse himself or herself from any discussions related to Commission business. [²]
- Non-chair Commissioner [sic] may attend committee meetings.[³]

There is no legitimate reason to make this language *less* clear than it was in the prior draft. Further, it is debatable if the passage, as originally stated, is an accurate representation of the limitation stated in section 11122.5(c)(2)(6). Having three Commissioners on the dias during a committee meeting is inappropriate. If the Commission is going to have a meeting, it should be clearly noticed as a *Commission* meeting. History has show that non-committee Commissioners are likely going to speak at committee meetings even though doing so is patently inappropriate, and the rules should be absolutely clear to everyone, *including Commissioners and staff*, that non-committee Commissioners cannot legally speak at committee meetings.

9. WRC meetings should not be video recorded and posted on the internet. It was mentioned at the last WRC meeting that the cost of such service would be a problem. Though no actual cost information was provided, with the availability of YouTube and inexpensive digital cameras (perhaps even state-owned cellular phones), that statement is difficult to accept. Indeed, if the Commissioners and staff are all having travel costs reimbursed, it seems that the cost of video, which would *guarantee public access*, is likely much less than that which is already expended.

During the meeting of February 5, 2014, the Commission discussed the possibility of live-streaming WRC meetings. During that discussion, you mentioned that live-streaming meetings costs approximately six to eight thousand dollars per meeting, and the it was unclear if the Department of Fish and Wildlife had the money in its budget needed to live-stream the meetings. Because of the importance of public participation,

² <http://www.fgc.ca.gov/meetings/committees/MRCrulesandprocedures052213.pdf>.

³ http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

Mr. Sonke Mastrup
April 14, 2014
Page 5 of 5

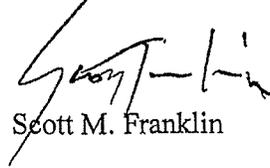

live streaming and later web access should be considered a priority.

10. To the extent that the Draft states committee meetings “may be taped and broadcast on the internet at the discretion of the Commission[,]” this provision should be clarified, as it can reasonably be interpreted as a prohibition on the public recording committee meetings, subject only to express permission of the Commission. *See* Gov’t Code § 11124.1 (members of the public have the right to use a video recording device to record meetings of state bodies).

III. Conclusion

In summary, the Commission should incorporate all of the above comments into a new draft set of regulations that can be considered and adopted through the appropriate procedural mechanisms.

Sincerely,
Michel & Associates, P.C.

**Re: Request Wildlife Resources Committee Procedure and Meeting Protocols
Be Put In Place *Before* That Committee Makes Any Recommendations to
the Fish & Game Commission**

Honorable Commissioners:

We write on behalf of our client the National Rifle Association.

Recently while conducting meetings, the Commission and the WRC have blurred the lines between a true Commission hearing, where policy decisions can legally be made and official actions can be taken, and WRC meetings where apparently the only action possible is the WRC making a recommendation for the Commission to consider. This letter is a formal request that the Fish & Game Commission (Commission) require the Wildlife Resources Committee (WRC) to establish and publicize rules and procedures under which it will operate before the WRC takes any further substantive action, and that such procedural rules be vetted through the normal regulatory approval process before they become effective.

1. The Commission is Sending Mixed Signals About the Authority of the WRC

There is confusion about the role and authority of the WRC because at Commission and WRC meetings, the Executive Director, as well as Commissioners Sutton and Baylis, have inaccurately stated that WRC meetings are a form of, or can operate as, official Commission meetings. The Commissioners and Commission staff have also made numerous other confusing and conflicting comments about the role, limitations, and procedural rules of the WRC. Commissioner Sutton said that the WRC meetings are of an "informal nature." But there has been no clarification about whether

the WRC is going to be the only opportunity for public comment on issues raised at WRC meetings, or if the public will have opportunity to comment on all issues agendized for Commission meetings, even if that issue was already discussed (or not) at a WRC meeting. This is compounded by the fact that WRC meeting videos are not available online, notwithstanding multiple requests from various segments of the stakeholder community for that type of access.

If the WRC meeting will provide for a longer format pre-discussion of a discussion that will take place again before the full Commission, then no binding action (other than perhaps a recommendation to the Commission action) takes place at a WRC meeting. If that is the case, then the Commission should say so unequivocally. This clarification would drastically reduce the amount of confusion being created by the uncertain state of the WRC's procedures and its authority.

2. *The Commission Must Establish Procedural Rules for the WRC Before It Allows the WRC to Address Substantive Issues*

Based on the recently released agenda for the July 28, 2014, WRC meeting, it appears that the Commission is moving forward with potentially substantive decision making at the upcoming next WRC meeting, even though the procedures for how the WRC will operate, and significantly, how the public can participate in WRC meetings, have not been publicized and apparently do not exist. Because there is no system or procedures in place, our clients, other stakeholders, and the interested public are unable to effectively participate in the rule and policy making process.

This office sent the Executive Director of the Commission a letter on April 14, 2014, raising concerns that the previously proposed WRC rules would be improper as "underground regulations." That letter also outlined nine other specific issues that are confusing or otherwise unclear as to plans for the future operation of the WRC. A copy of the letter is attached.

Our office recently followed up with the Executive Director about that letter. We were informed that the Commission has addressed the concerns raised our letter of April 14, 2014. We respectfully disagree. No new proposed procedural rules have been published, nor have we received a response letter addressing the issues noted in the letter of April 14, 2014.

So we now ask the Commission to please tell us; how have our client's concerns as recited in our April 14, 2014 letter, been addressed?

3. *The Commission Seems Biased, Favoring Participation by Anti-Hunting Groups Over Pro-Hunting Groups*

Holding WRC meetings without established procedures facilitates the impression that different rules apply to different stakeholders. Certain stakeholders appear to have more access and to information about WRC activities and plans. This not only creates an appearance of impropriety and fosters an antagonistic situation, it will result in increased investigations by watchdog associations suspecting bias in the way the Department and Commission are conducting their affairs.

If published rules are put in place, it would not only provide some clarity, it would also help limit unfair treatment, reduce the appearance of bias or conflicts of interest, alleviate concerns of bias,

and facilitate a more productive regulatory process.

4. *Stakeholder Presentation Materials Should Be Made Publicly Available Well Before WRC Meetings*

Furthermore, it was only because this office asked the Executive Director that we found out that the deadline for making a request to make a presentation at the July 28, 2014, WRC meeting was July 7, 2014. Assuming this was a deadline that was applicable to all who wanted to make a presentation to the WRC, shouldn't it have been publicized? And if that deadline did not apply to every group that wanted to make a presentation, our clients object to any content-based scheduling advantage that is being granted to other stakeholders.

If the purpose of the WRC is to have the most enlightened discussion possible concerning issues headed to the full Commission for consideration, then stakeholders and the public should not be surprised by new information presented for the first time at WRC meetings when there is no opportunity to prepare a rebuttal.

It is our understanding that there is a currently unwritten rule that presenters at WRC meetings are required to give the Executive Director a copy of presentation materials a few weeks prior to the WRC meeting. Though our clients don't necessarily agree with such a rule, if it is going to be enforced, why couldn't that information be circulated publicly beforehand?

5. *The Commission's Attempt to Create an "Alternate" WRC Member Is Disconcerting*

Another unsettled and troubling issue related to the WRC is the attempt (foiled by a loss of quorum at the June 4, 2014, meeting of the Commission) to create an "alternate" WRC "member" position. By law, the WRC is only required to have one member, so the claim that two members are need for meetings is inaccurate. Fish & Game Code § 106 ("The commission shall form a wildlife resources committee from its membership consisting of at least one commissioner.").

The WRC has *two* committee "members," Commissioners Kellogg and Baylis. If only one of committee "members" is unable to attend a WRC meeting, there is still no quorum or other procedural limitation that prevents a single WRC committee member from going forward with a WRC meeting.

The fact that some Commissioners are pushing very hard to have a third Commissioner appointed as a "member" to the WRC, even though there is no need to do so, raises concerns that by having three Commissioners at WRC meetings, those Commissioners would then attempt to act as the Commission and take a binding vote on Commission business.

At the January 15, 2014, WRC meeting, both the Executive Director and Commissioner Baylis indicated that had the three Commissioners present at that meeting wanted to, they could have acted as the Commission (an assertion we vigorously disagree with). Though the January 15, 2014, meeting was technically a Commission meeting, it was also an illegal meeting because it was not properly noticed as a Commission meeting.

If the Commission tries to use a noticed WRC meeting as an opportunity to take a Commission

Honorable Commissioners
July 11, 2014
Page 4 of 4

vote on a controversial topic, that will result in litigation.

The Commission should consider the implications of the WRC's current methods of operation, and should draft a new set of proposed procedures for the WRC. In doing so, the "alternate" issue should be resolved.

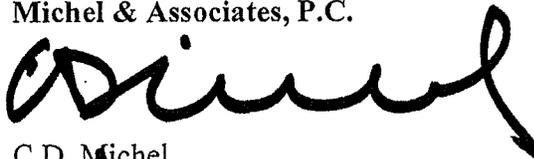

6. *Reservation of Rights*

Because it is not clear to us what the limitations are about making comments at the upcoming WRC and at later, related Commission meetings, our clients expressly reserve all rights to make a comment/presentation and at the July 28, 2014, WRC meeting and the August 6, 2014 Commission meeting, regardless of whether our client participates in one or both of these meetings.

7. *Conclusion*

The next WRC meeting should be used to formalize a set of proposed procedural rules that can be reviewed and approved by the Commission through its normal regulatory process. Otherwise the WRC's actions will continue to cause stakeholders and the public to believe that the Commission has lost its objectivity, and that it is now a biased politicized body. This directly conflicts with the reason the Commission was created in the first place. See *Young v. Dep't of Fish & Game*, 124 Cal. App. 3d 257, 273 (1981) (noting that the constitutional amendment that resulted in the Commission being a constitutional body "was to remove the old Fish and Game Commission from political influence").

Sincerely,
Michel & Associates, P.C.

**Re: Petition for Rule Making by the Fish & Game Commission Regarding the
Need for Formal Procedures and Rules for the Proper and Fair Operation
of the Wildlife Resources Committee**

Dear Mr. Mastrup:

This Petition, submitted by the National Rifle Association of America ("NRA") pursuant to Government Code sections 11340.6 and 11340.7, requests that the California Fish & Game Commission (the "Commission") enact regulations to ensure public participation and fair debate vis-à-vis the Wildlife Resource Committee (the "WRC").

I. STANDING OF PETITIONERS

Petitioner NRA is an Internal Revenue Code § 501(c)(4) nonprofit corporation, incorporated in the State of New York in 1871, with principal offices and place of business in Fairfax, Virginia. NRA has approximately five million members, and hundreds of thousands of members in California.

The founders of NRA desired to create an organization dedicated to marksmanship, or, in the parlance of the time, to "promote and encourage rifle shooting on a scientific basis." NRA's bylaws, at Article II, Section 5, state that one of the purposes of NRA is "[t]o promote hunter safety, and to promote and to defend hunting as a shooting sport and as a viable and necessary method of fostering the propagation, growth, conservation, and wise use of our renewable wildlife resources."

NRA has been a party to or supported multiple lawsuits throughout the nation supporting and

defending the right to keep and bear firearms for hunting, sport shooting, and self-defense. Indeed, one of NRA's key functions is to preserve the tradition of hunting, by protecting it from unreasonable and unnecessary restrictions.

NRA has an established record of advocating against restrictions on hunting based on scientifically unsupported claims of alleged environmental harm.

Petitioner David Halbrook resides in Victorville, California, and has been a hunter for basically his entire life. Mr. Halbrook has hunted various big and small game in California in the past, and he intends to hunt in California in the future. Mr. Halbrook is a member of NRA and is the executive director of the Hunt For Truth Association.

Based on the foregoing, the petitioners have standing to make the requested regulatory changes.

II. REQUESTED REGULATORY CHANGES

Petitioners hereby seek the amendment of California Code of Regulations ("CCR"), title 14, via the addition of a new section dedicated to the procedural aspects of the operation of the WRC, including, but not limited to, public meetings held by the WRC.

The following provisions, based on draft language created by the Commission, should be included in the new section.

- (A) Section 108 of the Fish and Game Code requires the commission to adopt rules to govern the business practices and processes of the Commission. Sections ~~105 and~~¹⁰⁶ of the Fish and Game Code require the commission to establish ~~a minimum of two committees, the Marine Resources Committee and~~^[2] the Wildlife Resources Committee; respectively.
- (B) A minimum of one, but no more than two members of the Commission will be appointed to the Wildlife Resources Committees at the first Commission meeting of each calendar year. To the extent feasible, the Commission shall place at least one Commissioner with substantial hunting experience on the Wildlife Resources Committee.
- (C) All public are welcome to attend and participate meetings as defined in subsection (a).
- (D) The Commission will establish the meeting schedule for the WRC committees each year

¹ ~~Strikeout~~ and underline are used herein to reflect deletions and additions, respectively, that Petitioner proposes be made regarding language previously put forth by the Commission in the Draft.

² Petitioner is not taking any position on what regulations should or should not be adopted for the operation of the Marine Resources Committee, but reference thereto is omitted herein because this Petition does not concern the operation of the Marine Resources Committee.

as part of the annual rulemaking calendar the prior November and may schedule additional meetings as needed.

- (E) Agenda will be approved at the Commission meeting before the committee meeting. Agendas will be developed by staff and will be comprised of standing items and topics requested by: referred by the Commission, topics requested by the Department, and/or state agencies, and federal agencies, and standing items. Public requests for agenda items must be made to the Commission and subsequently referred to the appropriate committee Wildlife Resources Committee.

Agenda items to be considered for the year will be adjusted based on urgency, need, and interest as determined by the Commission. Findings and recommendations will be made to the Commission for possible action by the two chairs Wildlife Resources Committee. If the Wildlife Resources Committee has two members, any finding or recommendation it makes must be unanimous.

- (F) All Wildlife Resources Committee meetings of committees shall be noticed at least 10 days prior to the meetings. Meeting agendas will be noticed on the Commission's website and distributed electronically.
- (G) Commission staff will secure appropriate meeting venues for Wildlife Resources Committee meetings with preference given to those that are provided free of charge. Meetings will be run by at least one of the Wildlife Resources Committee members or the designee, two chairs and facilitated by Commission staff.
- (H) ~~In general~~ Unless specific conditions dictate otherwise, meetings will be structured to provide participants opportunities to engage in detailed discussions with Commission staff, Department staff, the presenter (if applicable), and stakeholders. ~~Meetings~~ The Wildlife Resources Committee will strive to provide an informal setting at its meetings, where all participants will have an opportunity to provide input into the conversation. However, if required, the ~~chairs~~ Wildlife Resource Committee retains the option to apply a more structured setting whereby discussion and public comment are governed by speaker cards and time limits.
- (I) ~~Non-chair member~~ Commissioners may attend Wildlife Resource Committee meetings, however, they are expressly prohibited from participating in anything other than an observational capacity. Non-member Commissioners shall not make any comment, either directly or indirectly, during a Wildlife Resources Committee meeting.
- (J) Commission staff shall prepare a ~~Meeting~~ Summary following each Wildlife Resources Committee meeting that summarizes the main discussion points and any recommendations developed by the Wildlife Resources Committee ~~committee chairs.~~ Draft meeting summaries shall be provided to the Department and Wildlife Resources Committee ~~committee chairs~~ prior to finalization for review and comment. The final meeting summary shall be posted on the Commission's website and serve as the formal record of the meeting. Any recommendations developed by a committee shall be clearly

identified in the meeting summary and presented to the Commission for consideration at a future Commission meeting.

- (K) Wildlife Resources Committee meetings shall be audio recorded. Wildlife Resource Commission meetings may shall be taped video recorded and broadcast on the internet at the discretion of unless the Commission and available makes a specific finding that, as to a specific fiscal year, funding is not reasonably available for video recording. This provision does not in any way inhibit any right that members of the public have concerning the use of a recording device to record public meetings of a state body.

Furthermore, the following provisions, drafted by the Petitioner, should also be included in the new section requested hereby.

- (L) A meeting is subject to the Bagley-Keene Act if (a) any portion of the meeting relates to one or more matter within the Commission's jurisdiction, and (b) the meeting is attended (whether in person or otherwise) by all of the following: at least one Wildlife Resources Committee member (or a Wildlife Resources Committee designee), at least one Department of Fish & Wildlife (the "Department") employee, and at least one person who is neither a member of the Department nor affiliated with the Commission (e.g., non-committee member Commissioners or Commission Staff). This provision only applies to meetings that concern, at least in part, nonmarine wildlife resource issues.
- (M) The ability of the public to speak at a Wildlife Resources Committee meeting on a particular item does not preclude a member of the public from attending a later Commission meeting and commenting on that item, or a related item, during the Commission meeting but prior to the Commission taking action on the relevant item.
- (N) If the Wildlife Resources Committee has a designee, the name of that designee shall be announced at a Commission meeting prior to that designee acting as the designee of the Wildlife Resources Committee.
- (O) The WRC shall strive to adhere to an "equal time" model to the extent practicable, to prevent an unreasonable disparity of non-public Wildlife Resources Committee meetings being granted to specific parties holding disparate viewpoints.
- (P) The Wildlife Resources Committee shall not create any sub-committee or other entity without express approval by the full Commission after the Commission has taken public comment on the issue. All subcommittees or similar entities created by Wildlife Resources Committee with Commission approval shall meet only as a part of Wildlife Resources Committee meetings, and all communications between members of these entities shall be treated as public records.
- (Q) A log should be kept of all Wildlife Resources Committee-related meetings attended by Wildlife Resources Committee members or the Wildlife Resources Committee designee.

III. JUSTIFICATION FOR THE REQUESTED REGULATORY CHANGES

A. Any Rules Used by and for the WRC Are Regulations, Thus They Must Be Approved through the Proper Regulatory Process

The agenda for the Fish & Game Commission (“Commission”) meeting of February 5, 2014, included the following agenda item: “DISCUSSION OF DRAFT POLICY AND PROCEDURES FOR WILDLIFE AND MARINE RESOURCES COMMITTEES” (the “Draft”). A copy of the Draft is available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf.

The Draft, as written, is a “regulation” under state law. Government Code section 11342.600 states, in its entirety,

‘[r]egulation’ means every rule, regulation, order, or standard of general application or the amendment, supplement, or revision of any rule, regulation, order, or standard adopted by any state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure.

As used in section 11342.600, the term “state agency” includes every state commission. Gov’t Code § 11000. Thus, the Commission is clearly a state agency for the purposes of section 11342.600. Section 11342.600 is in accord with Fish & Game Code section 108, which “requires the commission to adopt rules to govern the business practices and processes of the Commission.”³

Should the Commission attempt to utilize any rules regarding the operation of the Wildlife Resources Committee without having them adopted via proper regulatory rulemaking, that would violate Government Code section 11340.5(a). That section states:

No state agency shall issue, utilize, enforce, or attempt to enforce any guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule, which is a regulation as defined in Section 11342.600, unless the guideline, criterion, bulletin, manual, instruction, order, standard of general application, or other rule has been adopted as a regulation and filed with the Secretary of State pursuant to this chapter.

Case law confirms that the Wildlife Resources Committee would be using illegal “underground regulations” if the Commission allowed the Wildlife Resources Committee to operate by a set of rules that were not properly enacted. *See Engelmann v. State Bd. of Educ.*, 2 Cal. App. 4th 47, 62 (1991) (holding Board of Education was required to go through rule making process found in the Administrative Procedures Act when creating guidelines and manuals for a mutli-level review process used for selecting textbooks that could be used in public schools).

³ See the Draft, available at http://www.fgc.ca.gov/meetings/2014/feb/proposed_committee_procedures.pdf

B. Equal Access and Transparency Interests Will Be Served if the Petition Is Granted

The Petitioner sent a letter to the Commission on April 14, 2014, outlining why the Wildlife Resources Committee needed rules adopted pursuant to the proper regulatory process. A copy of that letter is attached and incorporated by reference. Put simply, that letter outlined the various potential pitfalls related to the draft rules that the Commission circulated earlier this year, rules that, it seemed, the Commission wanted to adopt without adhering to the proper regulatory process. Because three months have passed since that letter and the July 28, 2014, meeting of the Wildlife Resources Committee is being held without any binding rules or regulations, the Petitioner is now forced to make this formal demand that the lack of regulations be addressed.

Indeed, to prevent any possible argument that a Commission decision was made as the result of a fault in the undefined Wildlife Resources Committee public comment process in place as of July 28, 2014, the Petitioner strongly suggests that the Wildlife Resources Committee not make any final decisions or recommendations at that meeting.

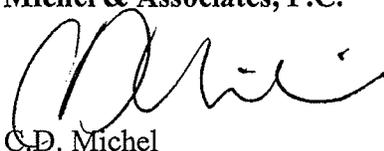

IV. THE COMMISSION HAS THE LEGAL AUTHORITY TO ADOPT THE REQUESTED REGULATORY CHANGES

Section 108 of the Fish and Game Code requires the commission to adopt rules to govern the business practices and processes of the Commission. Thus, the regulations sought hereby are clearly within the Commission's regulatory authority. *See also* Gov't Code § 11340.6 ("any interested person may petition a state agency requesting the adoption, amendment, or repeal of a regulation").

V. CONCLUSION

For the reasons stated herein, this Petition should be granted.

Sincerely,
Michel & Associates, P.C.

C.D. Michel

Subject: Wildlife Resource Committee

Dear Sirs and Madams,

I am writing to respectfully oppose any further action by the WRC, and to request the the Committee establish required procedures in a manner compliant with California law. All stakeholders should have an opportunity to take part in the rule-making that relates to hunting and wildlife, and clear, public procedures for the WRC are necessary for that to happen.

Thank you for your consideration,
Padraic MacLeish

[REDACTED]

Commission Procedures

The Evolution

Presented to the California Fish and Game Commission by
Commission Staff on **December 9, 2015**

Evolutionary Forces

Public expectations:

- Greater transparency
- More access
- Active engagement
- Effective outcomes

Staff expectations:

- Efficient process
- Responsiveness
- Excellent service
- Procedures legal

Proposed Adaptations

- Commission quorum
- Agendas
- Committee recommendations
- Public participation
 - Written
 - Verbal
 - Audio/visual presentations
 - Prohibited behavior

Commission Quorum

Meetings may not be conducted without a quorum of members present:

- Commission meetings require three members
- Committee meetings require one appointed member
- **No more than two commissioners may attend committee meetings**

Commission Agendas

Establish agenda-setting procedures:

- Public requests for agenda items must be received no later than the Commission meeting immediately prior to the desired meeting
- Commission meeting agendas will be established by majority vote of the Commission but **items may be added** by the president **or the president's designee**

Committee Agendas

- Committee agendas are approved by majority vote of the Commission but **items may be added** by the president **or the president's designee**
- Public requests for agenda items must be received no later than the Commission meeting immediately prior to the desired meeting
- Committee agendas may not contain items on Commission meeting agendas for action unless directed by majority vote of the Commission

Commission Voting

- A motion shall pass or fail only upon a majority vote of the membership**
- The commission may make and vote on more than one motion related to an agenda item. If no motion receives a majority vote of the membership, the agenda item shall be continued to a subsequent commission meeting**

Committee Recommendations

Establish procedures for committee recommendations:

- Committees may meet to make recommendations no later than 15 days prior to the Commission meeting at which action on the subject of the recommendation may be taken
- Committee recommendations shall be posted to the Commission website at least five days prior to said meeting

Public Participation - Written

- Establish procedures for submitting written comments and materials for Commission and committee meetings
- Establish procedures for what written comments and materials are posted to the Commission website and when

Public Participation - Verbal

Establish procedures for speaking at Commission and Committee meetings:

- Public comment taken before the Commission makes a decision on an agenda item
- During public forum, public may address Commission policies or other matter within its jurisdiction, for items not already on the agenda
- Time allotted per speaker shall be set by the presiding commissioner at between one and three minutes

Public Participation – Verbal

- The public may be granted additional time, either through pre-approval by the president or by having three people cede time
- The Commission may limit the total time for public comment on a particular item by publishing the limit on the meeting agenda

Public Participation – Audio/Visual

Establish procedures and criteria for audio/visual presentations at meetings:

- Must be pre-approved by the executive director
- Disapproval only if irrelevant, inappropriate, contains unauthorized copyrighted material, or, for Commission meetings only, exceeds the allotted time

Prohibited Behavior

Identify behaviors that could result in **removal** from a meeting:

- Behavior preventing orderly function of meeting

CONFLICT OF INTEREST CODE
FOR THE
FISH AND GAME COMMISSION

The Political Reform Act (Government Code Sections 81000, *et seq.*) requires state and local government agencies to adopt and promulgate conflict of interest codes. The Fair Political Practices Commission has adopted a regulation (2 Cal. Code of Regs. Section 18730) that contains the terms of a standard conflict of interest code, which can be incorporated by reference in an agency's code. After public notice and hearing, the standard code may be amended by the Fair Political Practices Commission to conform to amendments to the Political Reform Act. Therefore, the terms of 2 Cal. Code of Regs. Section 18730 and any amendments to it duly adopted by the Fair Political Practices Commission are hereby incorporated by reference. This regulation and the attached Appendices, designating positions and establishing disclosure categories, shall constitute the conflict of interest code of the Fish and Game Commission (Commission).

Individuals holding designated positions shall file their statements of economic interests with the Commission. Upon receipt of the statements of the members of the Commission, the Commission shall make and retain a copy and forward the original of these statements to the Fair Political Practices Commission. All other statements of designated employees shall be retained by the Commission.

NOTE: Authority cited: Sections 81008, 87300, 87306, Government Code. Reference: Section 87302, Government Code.

A designated position in this category must report:

- (a) All interests in real property.
- (b) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are engaged in any of the following:
 - (1) A business related to fish and wildlife, including boating or fishing related business such as commercial fishing (including aquaculture), fish processing plants, recreational boating and fishing (including boat and equipment rentals, charter services, and guide services); or the manufacturing or supplying of boating or fishing equipment.
 - (2) A business related to hunting such as game processing, manufacturing and/or supplying of outdoor related equipment, or outdoor recreation (including rental outlets, gear rental, guide services, dog services, charter services, and providers of recreational services such as resorts and fishing and hunting lodges.

- (3) The sale or possession of species that are the subject of a license or permit issued by the Department of Fish and Wildlife.
- (4) A construction, demolition, or maintenance related business that may have an impact on fish, wildlife, or related businesses.
- (5) The utilization of natural resources that may have an impact on fish or wildlife , or related businesses, such as mining, oil-related businesses (e.g. production, exploration, transportation, cleanup, or response), logging, dredging, or land development.
- (6) The removal, storage, or containment of materials hazardous to fish or wildlife.
- (7) The conservation of natural resources, activities related to mitigation banking, the protection of fish or wildlife, or the promotion of boating or outdoor recreation (including fishing, hunting, environmental advocacy, and outdoor activity clubs.).
- (c) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that provide services, facilities, consulting, equipment, office space, materials, or supplies of the type utilized by the Commission.
- (d) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that the official knows, are, or will be before the Commission on appeal from the Department of Fish and Wildlife.
- (e) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are the type that receive grants or contracts from, through or are managed by the Commission or that make appearances on behalf of an applicant for funding or recipient of a grant from or through the Commission

Category 2:

A designated position in this category must report all investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that provide services, consulting, equipment, office space, materials, supplies or facilities of the type utilized by the Commission.

Category 3

A designated position in this category must report:

- (a) All interests in real property.
- (b) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are engaged in any of the following:

(1) A business related to marine fish or wildlife, including boating or fishing related business such as commercial fishing (including aquaculture), fish processing plants, recreational boating and fishing (including boat and equipment rentals, charter services, and guide services), providers of marine recreational services such as resorts and fishing lodges, or the manufacturing or supplying of boating or fishing equipment;.

(2) The sale or possession of marine fish or wildlife species that are the subject of a license or permit issued by the Department of Fish and Wildlife.

(3) A construction, demolition, or maintenance related marine business that may have an impact on marine fish or wildlife related businesses.

(4) The utilization of natural resources that may have an impact on marine fish or wildlife related businesses such as mining, oil-related businesses (e.g. production, exploration, transportation, cleanup, or response), logging, dredging, or land development.

(5) The removal, storage, or containment of materials hazardous to fish or wildlife in marine areas.

(6) The conservation of marine fish or wildlife resources, activities related to mitigation banking, the protection of marine fish or wildlife, or the promotion of outdoor marine recreation (including fishing, environmental advocacy, and outdoor activity clubs.).

(c) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that the official knows, are, or will be before the Commission on appeal as to marine fish or wildlife issues from the Department of Fish and Wildlife.

(e) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are the type that receive grants or contracts from, through or are managed by the Commission or that make appearances on behalf of an applicant for funding, or recipient of a grant, related to marine fish or wildlife resources from or through the Commission.

Category 4

A designated position in this category must report:

(a) All interests in real property.

(b) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are engaged in any of the following:

(1) A business related to hunting such as game processing, manufacturing and/or supplying of outdoor related equipment, or outdoor recreation (including rental outlets,

gear rental, dog services, charter services, guide services, and providers of recreational services such as resorts and hunting lodges.

(2) The sale or possession of terrestrial wildlife or inland fish species that are the subject of a license or permit issued by the Department of Fish and Wildlife.

(3) A construction, demolition, or maintenance related business that may have an impact on terrestrial wildlife or inland fish, or related businesses.

(4) The utilization of natural resources that may have an impact on terrestrial wildlife or inland fish such as mining, oil-related businesses (e.g. production, exploration, transportation, cleanup, or response), logging, dredging, or land development.

(5) The removal, storage, or containment of hazardous materials.

(6) The conservation of terrestrial wildlife or inland fish resources, activities related to mitigation banking, the protection of terrestrial wildlife or inland fish, or the promotion of hunting or outdoor wildlife related recreation (including environmental advocacy, and outdoor activity clubs.).

(c) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that the official knows, are, or will be before the Commission on appeal as to terrestrial wildlife or inland fish issues from the Department of Fish and Wildlife.

(d) All investments, positions in business entities, and income (including gifts, loans, and travel payments) from sources that are the type that receive grants or contracts from, through or are managed by the Commission or that make appearances on behalf of an applicant for funding, or recipient of a grant, related to terrestrial wildlife or inland fish resources from or through the Commission.

* Contractors/Consultants and new positions who make or participate in making governmental decisions as those terms are described in 2 Cal. Code of Regs. Section 18704 shall be included in the list of designated employees and shall disclose pursuant to the broadest disclosure category in the code, Category 1, subject to the following limitation:

The executive director of the Commission may determine in writing that a particular consultant or contractor, although in a “designated position,” is hired to perform a range of duties that is limited in scope and thus is not required to fully comply with the disclosure requirements in this section. Such written determination shall include a description of the consultant or contractor’s duties and a statement of the extent of disclosure requirements (which category of reporting, if any, that contractor/consultant must use or how the category is tailored to address the specific work). The director’s determination is a public record and shall be retained for public inspection in the same manner and location as this conflict of interest code. (Gov. Code Section 81008.)

DUTY STATEMENT

EXECUTIVE DIRECTOR FISH AND GAME COMMISSION 565-001-0771-401

Under general direction of the Fish and Game Commission, the Executive Director oversees the administration of a critical statewide regulatory program, maintains close contact with legislators, makes operational decisions on budget, personnel, and program management, represents the Commission and performs the following duties.

<u>Percent</u>	<u>Activity</u>
25	Oversees and directs the items that appear on the Commission meeting agenda and coordinates the development of background information on agenda items. Advises the Commission regarding these issues. Briefs the audience on agenda items at the Commission's meetings, facilitates the meetings and assures compliance with the provisions of the Administrative Procedure Act. Conducts public hearings as directed by the Commission. Disseminates information concerning actions of the Commission. Certifies Commission orders and rulemaking files with the Office of Administrative Law for inclusion in the California Code of Regulations.
20	Manages and resolves a wide variety of complex issues, many of which are of a sensitive and controversial nature and which may have legal implications. Represents the Commission in negotiations on issues within its jurisdiction.
15	Maintains liaison with members of the Legislature and legislative committees, the Resources Agency, other boards and commissions, the public, conservation groups, Department administrators, county boards of supervisors and allied agencies, both state and federal. Speaks to a variety of groups on Commission affairs.
10	Responsible for researching and developing for Commission ratification, general policies for the conduct of the Department. Provides interpretation of those policies and ensures compliance.
10	Responsible for legislative proposals and amendments, and being aware of new or proposed legislation that impact the powers, duties and responsibilities of the Commission, and state fish and wildlife conservation activities. Maintains a comprehensive working knowledge of Department programs and operations.

- 7 Schedules and assists in conducting quasi-judicial license and permit revocation and appeal proceedings and provides legal notification to individuals involved. Provides certified copies of such actions to appropriate entities as requested.
- 5 Investigates and reports to the Commission members on complaints received relating to Commission rules, regulations or policies and recommends appropriate corrective action. Keeps apprised of statewide resource issues and promotes discussions with the Commission members.
- 5 Advises the Commission, the Department and the Attorney General's Office regarding the provisions of the Fish and Game Code and related statutes. Schedules matters which require specific action by the Commission. Takes independent action, as required, to implement Fish and Game Code provisions.
- 3 Prepares and administers the Commission's annual budget.

DUTY STATEMENT

BRIEFLY DESCRIBE THE POSITION'S ORGANIZATION SETTING AND MAJOR FUNCTIONS The CEA serves as a member of the Fish and Game Commission Executive Leadership Team, working with and on behalf of the Executive Director, and acting in his/her absence. The CEA identifies and directs formulation and development of statewide policies; oversees and directs consistent application and implementation of those policies; and ensures policies are consistent with and support the Commission's mission and goals through collaboration with the Department of Fish and Wildlife (DFW) and Natural Resources Agency. Advises the Executive Director and members of the Commission on matters relating to issue resolution; delivers reports and makes presentations to DFW's Executive Leadership Team, and members of the Commission. Manages the statewide regulatory program, conducts strategic planning, manages media relations and public outreach, and supervises Commission staff.		

PERCENTAGE OF TIME PERFORMING DUTIES	INDICATE THE DUTIES AND RESPONSIBILITIES ASSIGNED TO THE POSITION AND THE PERCENTAGE OF TIME SPENT ON EACH. GROUP RELATED TASKS UNDER THE SAME PERCENTAGE WITH THE HIGHEST PERCENTAGE FIRST.
20%	<u>ESSENTIAL FUNCTIONS</u> <i>Policy Development and Advice.</i> Independently and in collaboration with the Executive Director, makes policy decisions on legislative matters and political strategies. Identifies and develops policies on complex resource management issues within the Commission's statutory authority, makes recommendations on policy decisions before the Commission, and reviews and makes recommendations for changes to existing policies. Advises the Executive Director, Commission, DFW's Executive Leadership Team, Natural Resources Agency, and Governor's Office on policy issues concerning fish and wildlife resources.
20%	<i>Intergovernmental Affairs.</i> Represents and independently makes recommendations on behalf of the Executive Director and Commission in a variety of local, state and national settings, including before legislative committees, the DFW Leadership Team and the Ocean Protection Council, and in high-level task forces. Conducts meetings and work sessions with the highest level executive officers within DFW, Natural Resources Agency, other government agencies, and the California State Legislature. Assists the Executive Director in establishing and maintaining cooperative relations with tribes and tribal communities concerned with the conservation of fish and wildlife resources. Works closely with other government agencies to identify opportunities for collaboration on resource conservation and recreational opportunities. Gathers information from DFW, other government agencies, tribes, and stakeholders, and integrates all information to provide Commissioners with recommendations and advice on natural resource policy and regulatory decisions.
20%	<i>Public Affairs.</i> Establishes and maintains cooperative working relationships with constituents concerned with fish and wildlife resources. Works with constituents in collaboration with senior DFW, legislative and Natural Resources Agency staff to help resolve complex policy issues with substantial economic or political ramifications and that significantly affect fish and wildlife resources. Acts as the Commission's ombudsman to

DUTY STATEMENT

	constituent organizations, hearing and helping settle their concerns and reporting outcomes to the Executive Director and Commission. Represents the Commission in a variety of public settings and in meetings and events with constituent organizations. Manages public communication, education and outreach efforts, and interacts with the media.
15%	Regulatory Program. Oversees the Commission's statewide regulatory program, providing policy direction in creating, modifying and implementing regulations, as well as ensuring California Environmental Quality Act compliance. Effectively coordinates with DFW leadership, government agencies, tribes and stakeholders in identifying potential regulation changes to resolve complex fish and wildlife policy issues. Advises the Executive Director and Commission on policy issues related to the statewide regulatory program.
15%	Strategic Planning. Conducts planning, coordination and implementation of annual Commission programmatic work plan; integrates the programmatic work plan into annual strategic plan tracking and measurement; reviews and makes recommendations for changes to Commission policies in support of the Commission's strategic plan; and reviews and makes recommendations for changes to the strategic plan.
10%	Administration and Personnel. Supervises and directs the work of multidisciplinary professional and administrative staff; analyzes administrative policies, organization and practices to attain common goals; oversees operational processes to promote staff development and retention; and ensures administrative consistency with state policies and regulations, including equal employment opportunity and preventing discrimination and harassment.

BEFORE THE
FISH AND GAME COMMISSION
STATE OF CALIFORNIA

In the Matter of the Permanent Revocation of
the Hunting Privileges of:

PETER VITALI,

Appellant.

Case No. 14ALJ15-FGC

OAH No. 2014060844

PROPOSED DECISION

Administrative Law Judge Coren D. Wong, Office of Administrative Hearings (OAH), State of California, heard this matter on July 30, 2015, in Sacramento, California.

Linda Barrera, Staff Counsel, represented the Department of Fish and Wildlife (Department), State of California.

Attorney David A. Grow of the Law Offices of David A. Grow represented appellant Peter Vitali, who was present throughout the hearing.

Evidence was received, and the record was left open for the parties to submit written briefs addressing the admissibility of Exhibit B (a written report from the Department's Wildlife Forensic Laboratory). The parties' briefs were received and marked as Exhibits I (the Department's opening brief), 2 (appellant's opening brief), and J (the Department's reply brief). The record was closed, and the matter was submitted for written decision on August 28, 2015.¹

¹ After considering the parties' briefs, appellant's objection to Exhibit B is sustained on the grounds of relevance, Exhibit B is not admitted for any purpose, and it was not considered. Appellant was convicted of illegal possession of bear parts for profit or personal gain, not of killing any of the bears whose parts he possessed. Therefore, specific information about the bears whose parts he illegally possessed is not relevant, and only relevant evidence is admissible. (Evid. Code, § 350.) And even if such evidence was relevant to a disputed fact that is of consequence to the determination of this action, it is proper to exclude the evidence because its "probative value is substantially outweighed by the probability that its admission will ... create a substantial danger of undue prejudice" (Evid. Code, § 352.)

On August 31, appellant filed a request to reopen the record to produce additional evidence and argument regarding the admissibility of Exhibit B. The Department opposed the request. The parties' briefs on the issue were marked as Exhibits 3 and 4 (appellant's request and supplemental brief, respectively) and K (the Department's opposition). Appellant's request to reopen the record is denied as moot since his objection to Exhibit B is sustained.

SUMMARY

The Department seeks to permanently revoke appellant's hunting privileges in the State of California because he was convicted of illegal possession of bear parts for profit or personal gain. Cause exists to permanently revoke appellant's hunting privileges. When all relevant evidence is considered, appellant did not introduce sufficient evidence demonstrating his ability to exercise the privileges granted pursuant to a hunting license in a manner consistent with the Department's mission to manage California's diverse wildlife for the use and enjoyment by the people of the State of California. Therefore, his hunting privileges in the State of California should be permanently revoked.

FACTUAL FINDINGS

Procedural Background

1. On November 25, 2013, Michael P. Carion, Chief of the Law Enforcement Division of the Department, sent correspondence to appellant, which read:

This letter is to inform you that you are not eligible for bear tags for the 2014/2015 hunting season.

On November 4, 2013 you were convicted in the El Dorado County Superior Court of Fish and Game Code section 12012(a) – illegally possess wildlife parts for profit or personal gain (bear). Fish and Game Code Section 4754 states that a person convicted of a violation involving bear shall not apply for a bear tag for the following license year.

Additionally, please be advised that information regarding the suspension of your bear tag privileges for the 2014/2015 hunting season is being provided to member states of the Wildlife Violator Compact.² It is your responsibility to verify your

² The Wildlife Violator Compact is an agreement amongst member states to recognize the suspension and revocation of hunting, fishing, and trapping licenses in member states. Therefore, illegal activities in one state can affect a person's hunting or fishing privileges in

revocation status in other member states before attempting the purchase of hunting, fishing and/or trapping licenses. Please see the attached document for contact information.

2. On January 10, 2014, Mr. Carion sent correspondence to appellant, which read:

On November 4, 2013 you were convicted in the El Dorado County Superior Court of a violation of Fish and Game Code (FGC) section 12012 related to your possession of three bear gall bladders [*sic*] and twenty bear claws for commercial purposes. FGC section 12154 (attached) authorizes the California Department of Fish and Wildlife to suspend or permanently revoke a person's hunting or sport fishing privileges upon a conviction of FGC section 12012. **Pursuant to this authority, your hunting privileges in the State of California are hereby permanently revoked.** You may appeal this revocation to the California Fish and Game Commission pursuant to FGC section 12154(b)(1) by sending a request for an appeal hearing to:

California Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Additionally, please be advised that information regarding the suspension of your hunting privileges is being provided to member states of the Wildlife Violator Compact. It is your responsibility to verify your revocation status in other member states before engaging in hunting activities or attempting to purchase any hunting licenses. Contact information of the member states is attached.

(Bold in original.)

3. Appellant timely appealed the Department's decision to permanently revoke his hunting privileges.³

all other member states, and the suspension or revocation of a person's hunting or fishing privileges in one member state could result in the suspension or revocation of his hunting or fishing privileges in all other member states without further violation of the law. California is a member state. (Fish & G. Code, § 716 et seq.)

³ While no evidence of appellant's appeal was introduced at hearing, a reasonable inference that appellant timely appealed the Department's decision is drawn from the fact

Criminal Conviction

4. On November 4, 2013, in the Superior Court of the State of California, in and for the County of El Dorado, Case No. P13CRF0298, appellant pled no contest to, and was convicted of, a misdemeanor violation of Fish and Game Code section 12012, subdivision (a), illegal possession of bear parts for profit or personal gain. Imposition of sentence was suspended, and appellant was placed on informal probation for three years. He was also ordered to serve 60 days in the El Dorado County Jail, one-half of which was suspended. He was approved for alternative sentencing for the remaining 30 days, and was granted permission to complete such program in the State of Idaho. Appellant was also ordered to pay restitution to the Department in the total amount of \$12,500, \$5,000 of which was to be paid forthwith while the remaining amount was to be paid at the rate of \$208 per month starting December 30, 2013. The court also issued the following order: "Defendant is to only engage in lawful hunting."

5. The factual basis for appellant's conviction arose out of his April 20, 2013 arrest by a Fish and Game warden for possessing three bear livers with the gallbladders attached and 20 bear claws.⁴

6. At hearing, Fish and Game Warden Darrell Stevenson testified about his April 20, 2013 arrest of appellant. That day, he and his partner were on routine patrol when they encountered two men, one of whom was appellant, in what they recognized as a "houndsman's rig."⁵ Based on his experience as a Fish and Game warden, Warden Stevenson knew that houndsman's rigs are commonly used to hunt bears. However, bear hunting season had not yet opened in California. Therefore, Warden Stevenson drove his vehicle next to appellant's and engaged him in conversation. During the conversation, appellant denied that he was hunting and said he did not have any firearms with him. During a consensual search, however, Warden Stevenson found a .22 caliber revolver hidden in the back of the truck. When asked, appellant explained that the gun belonged to his passenger. Warden Stevenson found a second .22 caliber revolver in the back of the truck, which appellant admitted was his. Upon further search of the vehicle, Warden Stevenson found a gray/black backpack. Inside the backpack, he found a large plastic bag containing 20 bear claws with fresh blood, another plastic bag containing one bear liver with the gallbladder attached, and a third plastic bag containing two bear livers with the gallbladders attached.

that the hearing was held and the Department did not object to appellant's appeal as being untimely.

⁴ The individual phalanges of one or more bears.

⁵ A houndsman's rig is a vehicle, commonly a pickup truck, that is outfitted with a raised platform in the back that hunters who use tracking dogs commonly use. The tracking dogs are usually tethered to the platform while the vehicle is driven in search of game, using the dogs' strong sense of smell. There are locking compartments underneath the platform for transporting the dogs to and from the hunting site.

While appellant claimed to have found the backpack lying in the middle of the road, he identified a flashlight found in the backpack as his. He also stated that a knife found in the backpack belonged to his passenger. Appellant's claim that he found the backpack was not credible.

Additional Evidence at Hearing

7. Eric Crawford, a Senior Conservation Officer/Regional Investigator with the Idaho Department of Fish and Game, testified at hearing. He explained that the State of Idaho is a member of the Wildlife Violator Compact. He first met appellant in April 2014 when appellant voluntarily surrendered his Idaho sportsman license in light of the permanent revocation of his hunting privileges in the State of California.

8. Officer Crawford's most recent contact with appellant prior to hearing occurred on March 3, 2015. That morning, Officer Crawford was on routine patrol for mountain lion and bobcat hound hunters in Clearwater County, Idaho. Snow had fallen early that morning, which often leads to mountain lion and bobcat hound hunters heading out to hunt because it is easier to track their prey by following their footprints in the fresh snow.

Officer Crawford came across a pickup truck parked on the other side of a U.S. Forest service road that was blocked by a locked gate. He observed five hound dogs that were of a breed commonly used to hunt mountain lions and bobcats in the bed of the truck. As he approached the truck, he recognized it as belonging to appellant. When he did not see appellant in or near the truck, he called out appellant's name, and appellant appeared shortly thereafter.

As appellant approached, Officer Crawford engaged him in conversation, which was recorded on Officer Crawford's body camera. Appellant explained that he was "shed" hunting,⁶ and denied that he was hunting for mountain lions, bobcats, or any other animal. The only evidence of any firearm appellant had during the encounter was the revolver he told Officer Crawford he had in his truck. He also explained that he had a permit to carry a weapon.

In discussing his criminal conviction, appellant told Officer Crawford: "What I got busted for was really pitiful. It was a terrible thing. And it's totally legal here."

9. During their encounter and at hearing, Officer Crawford accused appellant of illegally hunting on March 3, 2015. He based his accusation on the following facts: 1) it was mountain lion and bobcat hunting season; 2) fresh snow had fallen early that morning, which creates conditions favorable to mountain lion and bobcat hunting; 3) appellant had with him dogs of a breed commonly used for mountain lion and bobcat hunting; and 4) appellant is a "houndsman's man" and hunting is "in his blood." But Officer Crawford's conclusion was supported by nothing other than his supposition and conjecture, which does

⁶ Searching for antlers shed by deer, moose, and elk.

not constitute admissible evidence. (*Borders Online, LLC v. State Board of Equalization* (2005) 129 Cal.App.4th 1179, 1188 [mere speculation and conjecture does not constitute admissible evidence].)

10. Officer Crawford did not arrest or issue a citation to appellant for violating any laws on March 3, 2015. No criminal charges had been filed against appellant as a result of his March 3, 2015 conduct as of the date of hearing. After considering all admissible evidence, there was insufficient evidence to support the conclusion respondent was illegally hunting on March 3, 2015.

11. Appellant's wife testified at hearing, and explained that she has known her husband for 38 years and has been married to him for 36 of those years. She, like her husband, is an avid hunter.

12. Mrs. Vitali described her husband as being "very remorseful" over the conduct which led to his criminal conviction. She explained he "breaks down" when discussing his conviction. She also adamantly stated that "he doesn't need rehabilitation" because "he's not a criminal."

13. Appellant did not testify at hearing, and there was no evidence of what he intended to do with the three bear livers with attached gallbladders and 20 bear claws he had in his possession on April 20, 2013.

Discussion

14. Fish and Game Code section 12154, subdivision (b)(1), provides the following with regard to the determination of an appeal of the Department's decision to permanently revoke a person's hunting license privileges: "The commission shall consider at least the nature, circumstances, extent, and gravity of the person's violations, the person's culpability for the violations, and the injury to natural resources by the violations, and may restore a person's hunting or sport fishing license or permit privileges."

15. Here, respondent was convicted of illegally possessing three bear livers with the gallbladders attached and 20 bear claws for profit or personal gain. There was no evidence of what he intended to do with any of those body parts. And while it is irrelevant whether he actually killed the bears to obtain those body parts, it is important to note that bear hunting season was still closed when he was caught. Additionally, he was not truthful with Warden Stevenson when he initially stated he did not have any firearms in his truck. Appellant was also untruthful when he told Warden Stevenson he found the backpack. Furthermore, appellant's description of his criminal conduct as being "pitiful" and "a terrible thing" when describing the basis for his criminal conviction to Officer Crawford demonstrates that he has yet to take full responsibility for such conduct.

16. As explained in the Legal Conclusions below, appellant's conviction for violating Fish and Game Code section 12012 establishes cause to permanently revoke his hunting license privileges. When all the evidence discussed above is considered, appellant did not demonstrate that he is capable of exercising the privileges granted pursuant to a hunting license in a manner consistent with the Department's mission to manage California's diverse wildlife for the use and enjoyment by the people of the State of California. Therefore, his hunting license privileges should be permanently revoked.

LEGAL CONCLUSIONS

Applicable Burden/Standard of Proof

1. The Department has the burden of proving the existence of legal cause to permanently revoke appellant's hunting privileges. (*Mann v. Department of Motor Vehicles* (1999) 76 Cal.App.4th 312, 320 ["[T]he DMV's burden was to prove by a preponderance of the evidence that Mann exercised the privilege of his license in derogation of the public interest".]) And it must do so by a preponderance of the evidence. (*Imports Performance v. Department of Consumer Affairs, Bureau of Automotive Repair* (2011) 201 Cal.App.4th 911, 916-917 [proceedings to discipline a nonprofessional or occupational license "are governed by the preponderance of evidence standard of proof".])

Once the Department has met its burden, the burden shifts to appellant to demonstrate, by a preponderance of the evidence, that his hunting privileges should not be permanently revoked, despite the existence of legal cause to do so. (*Martin v. Alcoholic Beverage Control Appeals Board of California* (1959) 52 Cal.2d 259; *Southern California Jockey Club v. California Horse Racing Board* (1950) 36 Cal.2d 167; *Breakzone Billiards v. City of Torrance* (2000) 81 Cal.App.4th 1205.)

The Department's reliance on *Housman v. Board of Medical Examiners* (1948) 84 Cal.App.2d 308, for the proposition that appellant bears the burden of proving by clear and convincing evidence to a reasonable certainty that his hunting privileges should be reinstated is misplaced. In *Housman*, the petitioner was a physician who was seeking reinstatement of his license to practice medicine. The court concluded that the petitioner had the burden of proving sufficient rehabilitation to justify reinstating his license by clear and convincing evidence to a reasonable certainty. (*Id.*, at pp. 315-316.) Here, on the other hand, appellant is not seeking reinstatement of his hunting privileges, but is exercising his appellate rights pursuant to Fish and Game Code section 12154, subdivision (b)(1), to challenge the Department's decision to permanently revoke such privileges.

//

Applicable Law

2. Fish and Game Code section 12012, subdivision (a), provides:

Any person who illegally takes, possesses, imports, exports, sells, purchases, barter, trades, or exchanges any amphibian, bird, fish, mammal, or reptile, or part thereof, for profit or personal gain is guilty of a misdemeanor punishable by a fine of not less than five thousand dollars (\$5,000), nor more than forty thousand dollars (\$40,000), or imprisonment in the county jail for not more than one year, or by both that fine and imprisonment.

3. “[T]he department may suspend or permanently revoke a person’s hunting or sport fishing license or permit privileges” after he has been convicted of violating Fish and Game Code section 12012. (Fish & G. Code, § 12154, subd. (a).) And once the Department take such action, the person may appeal.

Any person whose privileges are suspended or revoked pursuant to this section may appeal the suspension or revocation to the commission. The commission shall initiate the appeal process within 12 months of the violator’s appeal request. The commission shall consider at least the nature, circumstances, extent, and gravity of the person’s violations, the person’s culpability for the violations, and the injury to natural resources by the violations, and may restore a person’s hunting or sport fishing license or permit privileges.

(Fish & G. Code, § 12154, subd. (b)(1).)

Cause for Permanent Revocation

4. Cause exists pursuant to Fish and Game Code section 12154, subdivision (a), to permanently revoke appellant’s hunting privileges based on his conviction of violating Fish and Game Code section 12012, subdivision (a), as discussed in Factual Finding 4.

Conclusion

5. When all admissible evidence is considered, appellant did not demonstrate that he is capable of exercising the privileges granted pursuant to a hunting license in a manner consistent with the Department’s mission to manage California’s diverse wildlife for the use and enjoyment by the people of the State of California for the reasons discussed in Factual Findings 14 through 16. Therefore, his hunting privileges should be permanently revoked.

ORDER

Appellant Peter G. Vitali's hunting privileges are PERMANENTLY REVOKED.

DATED: September 16, 2015

Re: In the Matter of the Appeal of PETER G. VITALI
Case No. 14ALJ15-FGC
OAH No. 2014060844

Dear Commissioners,

Attached please find Appellant's request regarding the proposed decision. I urge you to examine this matter carefully, as I am sure you will. I cannot express to you how strongly I feel that the proposed revocation is unnecessarily punitive.

Mr. Vitali, who is 58 years old, has led a productive law-abiding life. He made a terrible mistake in judgment, which he regrets deeply. Hunting is and always has been his primary source of recreation and is very important to him. Despite the error that brings him before you, he has hunted lawfully and responsibly for many years. He always fully utilizes the animals he hunts and does not engage in 'sport' hunting.

I believe in second chances. I am hopeful, under these circumstances, that the Commission does as well. Hopefully there is some punishment, short of permanent revocation, that will serve the State's interest and adequately punish Mr. Vitali.

Your consideration of this request is greatly appreciated.

Very truly yours,

OBJECTION TO AND REQUEST TO
VACATE THE OFFICE OF ADMIN-
ISTRATIVE HEARINGS PROPOSED
DECISION

HEARING: DEC 9, 2015

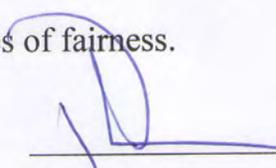

TO THE STATE OF CALIFORNIA FISH AND GAME COMMISSION:

Appellant hereby objects to the Office of Administrative Hearings' proposed decision dated September 16, 2015, and respectfully requests that it be rejected and that the permanent revocation of Appellant's hunting privilege be substantially reduced.

This request is made on the grounds that the permanent revocation recommended in the proposed decision is excessive and is not supported by the evidence presented at the hearing and violates fundamental principles of fairness.

Dated: November 20, 2015

By

David A. Grow

1 SUMMARY:

2 Appellant is a 58 years old contractor who has been an outdoorsman and hunter all
3 of his life. He has no significant criminal record. He is an experienced hunter and has
4 taught hunting techniques and guided other hunters. He has held various hunting
5 licenses all of his adult life. He has always possessed a valid hunting license. Hunting is
6 his primary recreational activity. He made one mistake, for which he has taken full
7 responsibility, and the California Department of Fish and Wildlife now wishes to
8 permanently revoke his hunting privileges. Because of the interstate compact this
9 decision would permanently terminate his hunting rights in virtually every state,
10 including his home state of Idaho. This proposed punishment is too severe considering
11 the conduct.
12

13 Appellant was found guilty, following his plea of no contest, to illegally
14 possessing bear parts; a misdemeanor. The plea followed several months of plea
15 negotiations between Appellant and the El Dorado County District Attorney's Office. As
16 part of the agreement the defendant was to complete volunteer work in Idaho, where he
17 lives, and pay substantial fines and restitution. The plea agreement was monitored by
18 representatives of the California Department of Fish and Wildlife whom actively
19 participated in the final agreement.
20

21 Evidence of the Department's involvement was introduced at the hearing in the
22 form of an email from the Deputy District Attorney who handled the case, and was
23 acknowledged by Fish and Game Warden Darrell Stevenson, who testified at the hearing.
24
25
26
27
28

1 At no time did the District Attorney's Office or the Department request either
2 suspension or revocation of Appellant's hunting privileges as part of the plea
3 agreement. This was, in part, because of Appellant's lack of a prior record and because
4 the crime was a single incident. Additionally, the court made no orders with respect to
5 Appellant's hunting privileges, having given the matter careful consideration during
6 months of negotiations. As mentioned, Appellant satisfactorily complied with all
7 conditions of his probation regarding this matter.
8

9
10 First Letter:

11
12 Following his conviction, Appellant received a letter dated **November 23, 2013**,
13 from Michael Carion, Chief of the Law Enforcement Division of the Department,
14 advising Appellant that he was not eligible for bear tags for the 2014/2015 hunting
15 season. Appellant received the letter and complied.
16

17 Second Letter:

18
19 On **January 10, 2014**, Mr. Carion sent a **second** letter advising Appellant that his
20 hunting privileges were now *permanently revoked*, based on the same conduct and
21 conviction in El Dorado County referenced in the November 23rd letter. In compliance
22 Appellant contacted the Department of Fish and Game in Idaho where he resides and
23 advised them of his revocation. Appellant contacted Idaho Fish and Game on his own
24 in order to comply with any requirements Idaho might have had in this regard. Despite
25 Appellant's efforts, the Department argues that Appellant is non-compliant. There is
26 nothing in the record to support this assertion.
27
28

1 Appellant timely appealed and his hearing before the Office of Administrative
2 Hearings' was held on July 30, 2015, before Administrative Law Judge Coren D. Wong.
3 Judge Wong recommended that Appellant's hunting privileges in California be
4 permanently revoked finding:
5

6 *"When all relevant evidence is considered, appellant did not introduce*
7 *sufficient evidence demonstrating his ability to exercise the privileges*
8 *granted pursuant to a hunting license in a matter consistent with the*
9 *Department's mission to manage California's diverse wildlife for the*
10 *use and enjoyment by the people of the State of California."*
11

12 ARGUMENT:

13 The permanent revocation of Appellant's hunting privileges is too severe a
14 penalty. Appellant has been a lifelong hunter with no significant prior criminal record.
15 He took responsibility for his crime. He satisfied his probation and all orders of the
16 court, including paying a substantial fine which, by statute, goes directly to the
17 Department of Fish and Game. In fact, the fines were paid early before they were due.
18 Appellant subsequently voluntarily notified his home state of Idaho of his revocation
19 after receiving the January 10th revocation letter.
20
21
22

23 Contrary to assertions made by the Petitioner, Appellant was and is remorseful for
24 his conduct. His wife testified passionately in his defense in this regard at the hearing.
25 He took full responsibility for his actions by pleading no contest in court. All of
26 Appellant's actions following his conviction demonstrated that he took full responsibility
27
28

1 for his conduct. He accepted the punishment imposed by the court and he accepted the
2 sanction imposed by the Department.
3

4 Appellant's conviction was for a single misdemeanor count and involved a single
5 hunting violation, for which he received neither jail time nor suspension of his hunting
6 privileges. The District Attorney's Office made no request in this regard. **An email was**
7 **accepted as evidence at the hearing demonstrating that the Department was**
8 **involved in the final plea agreement with the court.** Appellant relied, in good faith,
9 on all of these actions in making his decision to plead to the charge. It is patently unfair
10 for the Department to, under these circumstances, seek a permanent revocation of
11 Appellant's hunting privileges.
12
13

14 While the Department has the authority to do so, under these facts it is
15 unfair and the penalty excessive. The Administrative Law Judge concluded that
16 Respondent *'did not demonstrate his ability to exercise his hunting privilege.'* This
17 assertion is not supported by the evidence introduced at the hearing, the defendant's
18 compliance with all orders of the court concerning his criminal conviction, and his
19 lifetime of compliance with hunting laws.
20
21
22

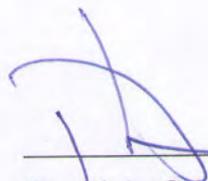

23 The Department pointed to a taped conversation with Idaho Conservation Officer
24 Eric Crawford during which Respondent stated *"what I got busted for was really pitiful.*
25 *It was a terrible thing. And it's totally legal here."* This partial statement was from a
26 lengthy conversation Appellant had with Officer Crawford.
27
28

1 At the hearing the Department argued that this statement evidenced that Appellant
2 had no remorse. It should be noted that the recording of the statements was taken
3 surreptitiously by Officer Crawford and that Appellant did not know he was being
4 recorded. Clearly the statement is capable of more than a single interpretation and alone
5 would not support a conclusion that Appellant was not remorseful for his conduct. It
6 should be noted that the Judge rejected Officer Crawford's opinion that Appellant was
7 unlawful hunting on the date of the contact.
8
9

10 The facts and circumstances surrounding this case and the Appellant's background
11 and character do not warrant a permanent revocation of Appellant's hunting privilege.
12 The Commission should use its discretion and reject the proposed decision and
13 substantially reduce Appellant's punishment.

Subject: Response to Appellant's Request Regarding Proposed Decision, *In the Matter of the Permanent Revocation of the Hunting Privileges of Peter G. Vitali*, Case No. 14ALJ15-FGC, OAH No. 2014060844.

Dear Commissioners:

Thank you for the opportunity to respond to Appellant's (Peter Vitali) request regarding the Proposed Decision of Administrative Law Judge Coren D. Wong dated September 16, 2015 ("Proposed Decision"), *In the Matter of the Permanent Revocation of the Hunting Privileges of Peter G. Vitali*, in a letter submitted by David Andrew Grow on behalf of Peter Vitali on November 23, 2015. The Department of Fish and Wildlife ("Department") strongly agrees with the Proposed Decision and respectfully requests that the Fish and Game Commission ("Commission") permanently revoke Peter Vitali's hunting privileges.

There is no dispute that Mr. Vitali was convicted for possessing three black bear gall bladders and twenty bear claws for profit in violation of Fish and Game Code section 12012 ("Section 12012"), subdivision (a). Pursuant to Fish and Game Code section 12154 ("Section 12154"), the Department permanently revoked Mr. Vitali's hunting license. The issue before the Commission is whether to restore Peter Vitali's hunting privileges. Section 12154, subdivision (b) requires that the Commission "consider at least the nature, circumstances, extent, and gravity of the person's violation, the person's culpability for the violations, and the injury to natural resources by the violation" when determining whether to "restore a person's hunting license or permit privileges."

As determined by Judge Wong, the Department successfully demonstrated to the hearing officer that Mr. Vitali's hunting license should remain revoked. The following exhibits (attached) and hearing testimony admitted into evidence during the administrative hearing proves that Mr. Vitali violated Section 12012(a) and demonstrates the gravity of Mr. Vitali's violation and lack of remorse and rehabilitation.

- Exhibit A - Arrest report prepared by Warden Darrell Stevenson and photographs of the evidence seized from Mr. Vitali's backpack and pickup truck on April 20, 2013. This evidence shows that Mr. Vitali possessed three bear livers with attached gall bladders and 20 bear claws

along with three bloodied knives, one pair of gloves, and a camo flashlight in a backpack hidden inside the ceiling of a dog box in the back of his pickup truck. The evidence shows that Mr. Vitali was not truthful when he told Warden Stevenson that Mr. Vitali found the backpack containing the bear parts, and that Mr. Vitali had attempted to hide the bear parts from law enforcement officials.

- Exhibit B - Superior Court of El Dorado County disposition of criminal case No. P13CRF0298. This evidence shows that on November 4, 2013, Mr. Vitali pled *nolo contendere* to violating Section 12012(a) in the Superior Court of El Dorado County. A *nolo contendere* plea is a conviction of a violation of the Code under Fish and Game Code section 12158.5 for the purpose of invoking any provision of the Code relating to the revocation of any license. This evidence also shows that Mr. Vitali was placed on court probation for a period of 36 months for the convicted charge and required to "obey all laws" and "only engage in lawful hunting."
- Exhibit C - Letter from the Department to Peter Vitali dated January 10, 2014. This evidence shows that because of the egregious poaching by Mr. Vitali, the Department exercised its authority under Section 12154 subdivision (a) to permanently revoke Mr. Vitali's hunting license upon conviction of Section 12012.
- Exhibit D - Includes the declaration of Eric Crawford, a regional investigator with the Idaho Department of Fish and Game, Crawford's investigation report, and photographs taken on March 3, 2015. This evidence establishes that the Idaho Department of Fish and Game revoked Mr. Vitali's hunting license pursuant to the Wildlife Violator Compact. This evidence shows that on March 3, 2015, after the revocation of his Idaho hunting privileges, Mr. Vitali was driving a pickup truck behind closed and locked gates on U.S. Forest Service roads after a fresh snow and was carrying dog boxes with five hound dogs commonly used to hunt mountain lions and bobcats. Neither season was open. This evidence also shows that Mr. Vitali attempted to hide his identity by removing his vehicle's rear license plate and allowing it to swing under the rear bumper area of the truck; there was no license plate visible on the front of the vehicle.
- Exhibit E - A video recording of the conversation between Investigator Crawford and Mr. Vitali on March 3, 2015. This evidence shows Mr. Vitali describing his criminal conduct in California as

“what I got busted for is really pitiful and an awful thing. It’s totally legal here [in Idaho].”¹ This evidence demonstrates that Mr. Vitali showed no remorse for his wildlife poaching conviction in California or respect for California’s bear harvest restrictions.

- Testimony of Warden Darrell Stevenson. Warden Stevenson testified that based on his observations, Mr. Vitali possessed claws, a liver, and a gall bladder removed from a female bear and two livers with attached gall bladders removed from two young bears. Warden Stevenson testified that the young bears were likely the cubs of the female bear. He explained that the bear hunting season is open approximately from September through December, and taking bears is prohibited during other times of the year. (California Code of Regulations, Title 14 (“Title 14”), section 365 (“Section 365”), subd. ((b).) Warden Stevenson also explained that Mr. Vitali was not only caught with fresh bear parts outside of the bear hunting season, but he killed a female bear and her cubs when they were at their most vulnerable – waking up from hibernation and barely coming out of their den. In California, cubs and females accompanied by cubs may not be taken. (Section 365, subd. (c).) Warden Stevenson also testified that Mr. Vitali did not return to the Department the report card portions of bear license tag for any of the bears he killed. In California, every person who takes a bear shall immediately fill out and return the report portion of the bear license tag. (Title 14, section 708.12, subs. (a) and (b).)
- Cross examination of Mrs. Cherri Vitali. Ms. Vitali testified that she is an expert hunter and regularly accompanied her husband (Peter Vitali) to harvest bears. Ms. Vitali’s inconsistent statements regarding how many bears she and her husband had harvested when they lived in California, and whether or not they had returned bear tags after killing a bear, demonstrate that Mr. Vitali had a penchant for disregarding the Department’s hunting regulations. Ms. Vitali’s testimony also failed to show that Mr. Vitali is truly remorseful or apologetic as she insisted that Mr. Vitali was “not guilty” of the crime and adamantly stated that “he doesn’t need rehabilitation” because “he’s not a criminal.”

¹ Mr. Vitali also claims that “the recording of the statements was taken surreptitiously by Officer Crawford and that Appellant did not know he was being recorded.” (Peter Vitali’s November 23, 2015, letter to the Fish and Game Commission (“Vitali’s Letter”), p. 6.) Idaho law allows such recordings by law enforcement officers.

Mr. Vitali's objection to the Proposed Decision mischaracterizes the facts presented at the hearing and should be rejected because he failed to demonstrate that his hunting privileges should not be permanently revoked. The Proposed Decision concludes:

"When all admissible evidence is considered, appellant did not demonstrate that he is capable of exercising the privileges granted pursuant to a hunting license in a manner consistent with the Department's mission to manage California's diverse wildlife for the use and enjoyment of the people of the State of California for the reasons discussed in Factual Findings 14 through 16. Therefore, his hunting privileges should be permanently revoked."

The Department fully agrees with the Proposed Decision and accordingly, respectfully requests that the Commission adopt it in its entirety.

I. Response to Vitali's Letter

a) Mr. Vitali Has Failed to Show that He Has Taken Full Responsibility for His Prior Misconduct

In his November 23, 2015 letter, Mr. Vitali claims that all of his actions following his conviction demonstrate that he took full responsibility for his conduct.² However, Exhibit F shows that only five months before the hearing on this matter Mr. Vitali stated that "what [he] got busted for is really pitiful" and "it's totally legal [in Idaho]."³ These statements were videotaped by Investigator Crawford and were admitted into evidence at the hearing. These statements show Mr. Vitali's disregard for California wildlife law and important bear hunting regulations. At the hearing, Mr. Vitali did not apologize for his prior misconduct or for prior statements that demonstrate a lack of remorse for his conviction.

Mr. Vitali also claims that his wife's testimony shows that he is remorseful for his conduct.⁴ However, as discussed above, Mrs. Vitali's testimony did not show that Mr. Vitali is apologetic for his crime. In fact, despite stating that her husband was "very remorseful" over the conduct which led to his criminal conviction, Mrs. Vitali insisted that her husband was not guilty of the crime and adamantly stated that "he doesn't need rehabilitation."⁵ After inconsistent statements are made such as the ones made by Mr. Vitali's closest family member and hunting partner, it is difficult to conclude that Mr. Vitali is truly remorseful of his actions and is capable of complying with California hunting laws and regulations.

² Vitali's Letter, p. 4.

³ Exhibit F-A, Report of Investigation, p. 3.

⁴ Vitali's Letter, p. 4.

⁵ Proposed Decision, Factual Findings No.12, p. 6.

Mr. Vitali argues that the Proposed Decision's assertion that he did not demonstrate an ability to exercise his hunting privilege is not supported by the evidence introduced at the hearing.⁶ Yet, the evidence introduced by the Department at the hearing shows that Mr. Vitali has repeatedly been untruthful with law enforcement officers regarding his hunting activities⁷ and therefore cannot be trusted to abide by the state's wildlife laws and regulations. Because Mr. Vitali was not successful in conveying this argument to Judge Wong before the record on this matter was closed, he now seeks to convince the Commissioners that he is remorseful of his conduct. It is important to note that Mr. Vitali's letter to the Commission does not discuss why he is remorseful or acknowledge the impact of his illegal conduct on the Department's management of bears in California. In fact, at no time during the hearing or in Mr. Vitali's letter does he express regret for hunting bears outside of the hunting season, killing a female bear accompanied by her cubs and killing her cubs in violation of Department's regulations, or for failing to fill out and return bears tags upon killing a bear.

Mr. Vitali now also argues that permanent revocation to his hunting privileges is too severe because he has satisfied his probation and all orders of the court.⁸ Exhibit B shows that Mr. Vitali's November 2013 conviction and court order placed him on probation for a period of 36 months following his conviction in November 2013 and requires him to "obey all laws" and "only engage in lawful hunting." Although the Proposed Decision found there was insufficient evidence to conclude that Mr. Vitali was in fact illegally hunting in Idaho while permanently revoked in that state, the video recording in Exhibit F showing Mr. Vitali's behavior – hiding the license plate on his pickup truck, driving his pickup truck behind closed and locked gates on U. S. Forest Service roads after a fresh snow, carrying dog boxes with five hound dogs commonly used to hunt mountain lions and bobcats, and stating that "what I got busted for is really pitiful and an awful thing. It's totally legal here" – strongly suggests that Mr. Vitali cannot be trusted to obey all laws and therefore comply with terms of his probation.⁹ The Department notes that Mr. Vitali continues to be subject to a three year court probation which ends in November 2017. As such, until his court probation ends, Mr. Vitali cannot claim that he has fulfilled all the terms of his probation and court order.

The Department has a legitimate and vital interest in ensuring that Mr. Vitali can no longer engage in activities which significantly impact the Department's management of bears for the use and enjoyment of the people of the State of California. An appellant who makes no effort to acknowledge the consequences of his misconduct and impact on wildlife resources should not have his hunting

⁶ Vitali's Letter, p. 5.

⁷ Proposed Decision, Factual Findings No. 15, p. 6.

⁸ Vitali's Letter, p. 4.

⁹ Exhibit F, Report of Investigation, pp. 1-5; *see also* Video Recording.

privileges restored. Based on all the foregoing facts, there is no basis for the Commission to find that Mr. Vitali is entitled to have his hunting privileges restored in California.

b) Vitali's Claims Regarding Department Involvement in Plea Negotiations Are False

In his November 23, 2015 letter, Mr. Vitali claims that the Department actively participated in the final plea agreement with the court.¹⁰ Mr. Vitali argues that it is unfair for the Department to seek a permanent revocation of his hunting privileges given that it allegedly was involved in the final plea agreement.¹¹ Yet, at the hearing, Warden Stevenson unequivocally stated that he did not participate in any plea negotiations or provide any input concerning Mr. Vitali's plea agreement. The Department was not a party to the agreement between Mr. Vitali and the El Dorado County District Attorney's Office, and it had no involvement in setting the terms of Mr. Vitali's probation terms. Mr. Vitali has failed to provide evidence that shows the contrary. After Mr. Vitali offered an exhibit into evidence that shows an email dated November 1, 2013, between Mr. Vitali's counsel and Ms. Jodi Jensen, the prosecutor assigned to the criminal case, Warden Stevenson testified that he did not discuss any plea agreement with Ms. Jensen concerning Mr. Vitali's criminal case. Most importantly, the email that Mr. Vitali introduced into evidence does not state that the Department was a party to the plea agreement, nor does it state that the Department set the terms of Mr. Vitali's court probation.

Mr. Vitali's supposition that the Department approved a plea agreement that would allow Mr. Vitali to engage in lawful hunting is incorrect. The El Dorado County District Attorney's Office and the superior court were the only entities with authority to approve the resolution of Mr. Vitali's criminal case, and he voluntarily agreed to terms of his plea conviction and court probation. Upon Mr. Vitali's criminal conviction, the Department exercised its authority to permanently revoke his hunting privileges pursuant Section 12154, subdivision (a). For the reasons explained above, Mr. Vitali's criminal conviction and his conduct post-conviction demonstrate that he is not entitled to have his hunting privileges restored.

Conclusion

Mr. Vitali illegally possessed three black bear gall bladders and twenty bear claws for profit. This violation and abuse of his hunting privileges and state resources were so severe, that the Department properly exercised its authority pursuant to Section 12154 and permanently revoked his hunting privileges.

In his letter, Mr. Vitali did not claim that the nature, circumstances, extent, and gravity of his violations, his culpability for the violations, and the injury to natural resources caused by the violations

¹⁰ Vitali's Letter, pp. 2 and 5.

¹¹ Vitali's Letter, p. 5.

show that the Commission should restore his privileges. Instead, he claims that he has taken full responsibility for his violations, a claim contradicted by his failure to apologize, his statement to Investigator Crawford that "what [he] got busted for is really pitiful," and the testimony of his wife in which she stated that her husband was not guilty of the crime and that he "doesn't need rehabilitation." He also claims that the Commission should restore his privileges because an agreement between him and the District Attorney's office did not mention revocation as a punishment, and it is therefore unfair to revoke his privileges now. This claim is also unpersuasive because the Department was not a party to that agreement.

The evidence presented at the hearing demonstrates that Mr. Vitali is incapable of exercising the privileges granted pursuant to a hunting license in a manner consistent with the Department's mission to manage California's diverse wildlife for the use and enjoyment of the people of the State of California. The Department respectfully requests that the Commission adopt the Proposed Decision in its entirety and sustain the Department's permanent revocation of Mr. Vitali's hunting privileges in California.

Sincerely,

A handwritten signature in blue ink, appearing to read 'DAG', is written over a faint, illegible typed name.

Case Synopsis

On 04-20-13 at approximately 1100 hours, the above subjects Peter George Vitali and Arthur Martin Blake (page 2) were contacted by Fish and Wildlife Wardens on National Forest Road 63 (Cat Creek Road), 6/10ths of a mile north west of Highway 88, El Dorado County. Vitali and Blake had three hound dogs, two .22 caliber revolvers, 20 large bear claws and three bear livers with gall bladders attached. Both Vitali and Blake were arrested and booked into the El Dorado County Jail, their vehicle was impounded and stored as evidence and the three dogs were taken by Animal Control. Vitali and Blake were in violation of sections 2000, 2002, 4758 (a) and 4758(b) of the Fish and Game Code. See attached narrative, supplements for further.

1. On 04-20-2013 at approximately 1100 hours, Warden L. Gregory #591 & I were
 2. in uniform and in a marked Fish and Game patrol vehicle. Traveling north west
 3. along National Forest Road 63, Cat Creek Road, El Dorado County 6/10th of
 4. one mile north west of Highway 88, I observed a light tan colored Toyota
 5. pickup occupied by two white male adult subjects. The vehicle was stopped
 6. along the right shoulder of NF 63 and headed in a south east direction. We
 7. immediately recognized the vehicle as a "houndsman's rig". I observed carpet
 8. with a chain on the hood of the vehicle and dog boxes on the rear. I pulled along
 9. side and spoke with the driver. I asked if he had any dogs in the vehicle and he
 10. told me he had three dogs in the boxes in the rear of the vehicle. I immediately
 11. exited my vehicle. I asked the driver if he was hunting and he told me no. He
 12. stated the dogs were on the boxes earlier in the morning. Currently, the use of
 13. dogs for pursuit/take of mammals or for dog training is closed(section 265(4)
 14. CCR, T-14). The area where contact was made is in the Central California Dog
 15. Control Zone(section 265(A) CCR, T-14).
 16.
 17. I asked the driver if he had any firearms and he replied no. I asked the driver
 18. and right front passenger for identification. The driver was identified as Peter
 19. George Vitali through Idaho DL. The passenger was identified as Arthur Martin
 20. Blake through CDL. I recognized Vitali from previous contacts. He told me he
 21. is in the process of moving to Idaho and that is why he had an Idaho Driver's
 22. License. I asked Vitali if there were any firearms or game in the vehicle and he
 23. told me no. I asked if we could take a look and he replied go ahead. I had both
 24. Vitali and Blake step out.
 25.
 26. I visually inspected the front cab driver's side, while Warden Gregory talked
 27. with suspect Blake and inspected the passenger side of the vehicle. I inspected a
 28. tool box directly behind the cab and observed two ice chests, one on driver's
 29. side and the other on the passenger side. I found food and beer in both. I moved
 30. around to the back of the pick-up and
 31.

32. peered through the holes on the back of the dog boxes. I observed two dogs in the				
33. passenger side box and one dog in the drivers side box. At which time, I observed a				
34. brown paper shopping bag covered with a brown plastic shopping bag in the box.				
35.				
36. I put the tailgate down and opened the drivers side box. I removed the brown				
37. shopping bag. Inside I observed a .22 caliber revolver in a black nylon holster in				
38. the bag. I showed the revolver to Vitali and told him, I thought you didn't have any				
39. firearms. He told me the handgun belonged to Blake.				
40.				
41. I then observed a grey/black back pack further back inside the dog box. I had Vitali				
42. remove all three of his dogs. I retrieved the back pack and inspected it. Inside I				
43. found one large plastic bag containing 20 bear claws with fresh blood, one large				
44. plastic bag containing one liver with gall bladder attached and another plastic bag				
45. containing 2 livers with gall bladders attached. In addition, amongst other items, the				
46. backpack contained one pair of dried blood stained leather gloves, one Cabela's				
47. camo flashlight with dried blood on the handle, 3 knives (one with dried blood and				
48. hair at base of blade). Suspect Vitali told me the camo flashlight was his and one of				
49. the knives belonged to Blake. He further told me he				
50. found the backpack lying in the middle of the road.				
51.				
52. Inside the the passenger side dog box, I found a second .22 caliber revolver in a				
53. black leather holster, which was bungee chorded to the top of the dog box unable to				
54. view, but accessible. Vitali indicated the revolver was his. I inspected both firearms				
55. and found they were unloaded. Vitali and Blake were taken into custody for				
56. several violations of the Fish and Game Code, the dogs were taken by Amador				
57. County Animal Control and the Toyota pick-up was seized and towed by Amador				
58. Towing and Recovery.				
59.				
60. See Wardens L. Gregory and E. Elliott's attached supplemental reports and copies				
61. of evidence photos attached.

Location/Subject/Incident Name Cat Creek Road / Arthur Martin Blake & Peter George Vitali		Arresting/Case Officer Warden Darrell Stevenson #336		Citation Number AD1823761

1 On 04/20/2013, I was in uniform on patrol in a marked vehicle with Warden Darrell Stevenson #336 in El
 2 Dorado and Amador Counties. At approximately 1100 hours, we made contact with Peter George VITALI
 3 and Arthur Martin BLAKE parked in a Toyota truck on Cat Creek Road in El Dorado County.

4
 5 Warden Stevenson made contact with the owner/driver, later identified as VITALI. He asked and received
 6 permission to search the Toyota truck from VITALI. While Warden Stevenson was searching the vehicle, I
 7 acted as a cover officer and asked the passenger, later identified as BLAKE to step out of the vehicle.

8
 9 BLAKE and I were standing near the hood of the Toyota, while Warden Stevenson inspected the bed of the
 10 truck which contained a large dog box with three dogs. I asked BLAKE if they had any guns in the truck.
 11 He said, "Maybe." I asked him again, if they have guns in the truck. He stated there were two guns in the
 12 truck, one handgun belonged to him (not registered) and the other handgun belonged to VITALI. He told me
 13 he bought the handgun and never registered the firearm. I asked BLAKE for the location of the guns in the
 14 truck. He stated they were in the bed of the truck.

15
 16 Before I could relay the information to Warden Stevenson regarding the handguns, Warden Stevenson found
 17 the two handguns, a backpack containing zip lock bags filled with Bear organs ((3) Liver and Gallbladders)
 18 and (20) Bear Claws in the dog box. While Warden Stevenson was holding the bags up for me to see, I
 19 asked BLAKE if he knew what was in the zip lock bags. He stated it was Bear parts.

20
 21 While Warden Stevenson continued his search on the truck, I did a cursory search for weapons on BLAKE
 22 and I found (6) live 22. MAG rounds in his right front pant pocket. After I searched for weapons, I asked
 23 BLAKE several questions regarding the live rounds in his pocket, when and where they killed the Bears and
 24 if they used the dogs to locate the Bears. BLAKE stated VITALI picked him up at this residence (Forest
 25 Service Road 10N83K, El Dorado) this morning at first light and they drove on North South Road to Cat
 26 Creek Road. Once they were on Cat Creek Road, VITALI let his dogs out of the boxes and placed them on
 27 top of the boxes and hood of the vehicle. The dogs had telemetry tracking collars on their necks. VITALI
 28 drove on Cat Creek Road, until the Hounds alerted VITALI to a mammal (Bear or Deer) in the area and he
 29 turned the dogs loose to follow the scent trail. BLAKE stated he stayed in the truck (to keep eye on the

30 truck), while VITALI went after the dogs carrying a backpack. BLAKE did not know if VITALI was
 31 carrying a gun. After approximately one hour, VITALI returned back to the truck with the dogs. VITALI
 32 was caring the same backpack and BLAKE assumed he had brought something back in the backpack, but he
 33 did not know what was inside it.

34
 35 I asked BLAKE to tell me again what happened. This time his story was different, he stated after VITALI
 36 went after the hounds, BLAKE left the vehicle went down a hill (same direction VITALI traveled) and took
 37 a nap. After approximately 30 minutes later, VITALI returned to the truck with the hounds and put
 38 something in the dog boxes. I asked BLAKE to tell me again what VITALI did after the hounds were loose.
 39 Again, his story was different, he stated VITALI was not carrying a backpack when he went after his hounds,
 40 but after a while VITALI returned back to the truck, grabbed a backpack and went back to the dogs down the
 41 hill. Approximately 30 minutes later, VITALI contacted BLAKE via two-way radio, asking BLAKE to go
 42 pick him up down the road (Cat Creek Road). When BLAKE arrived at VITALI's location, he was carrying
 43 the backpack and he was with his hounds. He put the backpack in the dog box. BLAKE stated he knew the
 44 backpack was filled with Bear parts.

45
 46 I went to interview VITALI, but VITALI stated he was sick to his stomach and did not want to talk to me
 47 about anything.

Location/Subject/Incident Name USFS Rd 10N83K / Peter Vitali and Arthur Blake		Arresting/Case Officer D. Stevenson Citation Number AD1823713 and AD1823762

1 BACKGROUND:

2 On 04/20/2013, Warden D. Stevenson began an investigation into the unlawful taking of bear and the possession of bear
3 parts (gall bladder) for sale. Warden Stevenson contacted me (Warden E. Elliott) and asked me to attempt an interview
4 with Suspect Blake. It was determined Suspect Blake was no longer in custody and was out on bail.

6 INTERVIEW WITH ARTHUR BLAKE- 04/21/13:

7 On 04/21/13, Warden M. Galli and I drove to Suspect Blake's residence (off USFS Road 10N83K). Suspect Blake was
8 standing outside the residence as we drove up and we asked him if he would be willing to communicate with us.
9 Suspect Blake advised he had bailed out of jail the night before and was willing to talk with us. He also expressed a
10 desire to cooperate with us. The following is a summary of this communication with Suspect Blake:

11
12 Around daybreak on 04/20/13, Suspect Peter Vitali and he loaded up their (2) pistols (which he identified as being both
13 Ruger .22 caliber magnums) and (3) hunting/ hound dogs and entered Suspect Vitali's white Toyota pickup for the
14 purpose of exercising the dogs and to hunt wildlife (raccoon and fox). He knew they shouldn't be pursuing bears
15 because bear season was closed, but the dogs pursued and later treed bears. Suspect Vitali had his pistol hidden inside
16 one of the dog boxes as it was attached with a couple "bungee cords" to the roof of this dog box. He thought Suspect
17 Vitali placed this pistol here because Suspect Vitali was being sneaky. Suspect Blake put his Ruger .22 magnum pistol
18 in a brown paper bag and placed this pistol/ bag in the sawdust within one of the dog boxes. Throughout the course of
19 the day, Suspect Vitali removed two of the dogs from the boxes and placed them on top of the boxes so they could better
20 smell wildlife and "strike" (alert Suspect Vitali and Suspect Blake they had smelled wildlife). As they were driving on
21 USFS roads in the area, the dogs occasionally "struck" (smelled familiar scent and barked) After the dog(s) "struck",
22 Suspect Vitali (operator of the vehicle) would stop the truck, and let the dog(s) loose so the dogs could check the scent
23 and pursue wildlife. Throughout the course of the day's hunting, Suspect Vitali let all (3) hunting dogs loose and the
24 dogs began chasing what Suspect Blake thought was a wild animal/ wildlife. They tracked the dogs with "tracking
25 devices" (telemetry equipment) as the dogs pursued the wild animal. The (3) dogs continued to pursue wildlife until
26 they indicated they had something "treed" along Cat Creek Rd. Suspect Vitali instructed Suspect Blake to stay with the
27 pick-up while Suspect Vitali walked toward the dogs with Suspect Vitali's Ruger .22 magnum pistol. Suspect Blake
28 knew the dogs had a wild animal "treed" on the upslope side of Cat Creek Rd because he heard the dog's "chomping" at
29 the tree. Suspect Blake later drove the white Toyota south on Cat Creek Road (away from the treed animal) and exited

30 his vehicle. Suspect Blake heard multiple shots coming from the area where the dogs had the animal treed Suspect
 31 Vitali later radioed Suspect Blake and Suspect Blake knew this meant he was supposed to pick Suspect Vitali up in the
 32 same general area where he had dropped Suspect Vitali off. Suspect Vitali was walking south towards the pickup on
 33 Cat Creek Rd, and Suspect Vitali was carrying the same backpack he left the truck with. Suspect Vitali returned to the
 34 pickup and told Suspect Blake he shot and killed (3) bears a sow and two cubs. Suspect Blake thought Suspect Vitali
 35 hid/ secured Suspect Vitali's Ruger pistol back to the roof of the dog box with "bungee cords". Suspect Blake advised
 36 his Ruger .22 magnum pistol never left the vehicle on this hunt. Suspect Vitali told Suspect Blake he had (3) bear livers
 37 with the attached (3) gall bladders which were in Suspect Vitali's backpack. Suspect Blake knew Suspect Vitali placed
 38 the backpack containing the (3) gall bladders into one of the truck's dog boxes. Suspect Blake knew Suspect Vitali had
 39 a connection with a "Chinaman" who had purchased gall bladders from Suspect Vitali in the past and would continue to
 40 purchase the gall bladders for about \$300 per gall bladder. Suspect Blake never received any money from the sale of
 41 bear parts, nor did he ever intend to sell bear parts. Suspect Blake had first-hand knowledge Suspect Vitali was
 42 involved in illegal bear hunting (guiding bear hunters without a guide's license) and gave specific information regarding
 43 this illegal hunting activity. Suspect Blake advised he witnessed Suspect Vitali remove the gall bladder from a bear in
 44 the past.

45
 46 -We asked Suspect Blake if he would be willing to take us to the kill site. Suspect Blake advised he would be willing
 47 and wanted to cooperate with us fully. Suspect Blake stopped along Cat Creek Rd. and pointed out an area where he
 48 said we would find the (3) bear carcasses/ kill site. We searched the area thoroughly and found no kill site
 49

50 **INTERVIEW WITH ARTHUR BLAKE- 04/22/13:**

51 On 04/23/13, DFW Warden D. Moskat and I contacted Suspect Blake at the intersection of Omo Ranch Road and North
 52 South Rd. We informed Suspect Blake we did not find the kill site in the area where he advised us we would find the
 53 kill site. Suspect Blake immediately informed us he was willing to go back to Cat Creek Road and thoroughly search
 54 with us until we found the kill site. Suspect Blake escorted us to Cat Creek Road and we stopped/ searched multiple
 55 areas where Suspect Blake thought the kill site may have been. We found no evidence of the kill site in any of these
 56 areas. Suspect Blake advised us he was certain the kill site was on Cat Creek Road, but was uncertain to the exact
 57 location. Suspect Blake continued to tell us he was not at the kill site when the bears were killed and his only
 58 involvement was being the driver of the vehicle who picked up Suspect Vitali after the (3) bears were killed and their

59 gall bladders removed.

60

61 **INTERVIEW WITH ARTHUR BLAKE- 04/24/13:**

62 I contacted Suspect Blake at his residence at USFS Road 10N83K and asked to talk with him. Suspect Blake indicated
63 he was willing to talk with us and again advised he wanted to cooperate with us. I asked Suspect Blake to be more
64 honest with me about the incident. Suspect Blake immediately informed me he had not been completely honest and said
65 he had told me a "white lie". The following is a summary of this communication with Suspect Blake:

66

67 On 04/20/13, Suspect Vitali's (3) hunting dogs had been pursuing wildlife for about an hour and a half before they
68 heard the dogs indicate they had the wild animal "treed" along Cat Creek Rd. Suspect Blake and Suspect Vitali both
69 exited the vehicle with firearms and both walked toward the sound of Suspect Vitali's dogs. Suspect Blake knew the
70 treed animal was likely a bear because that is what Suspect Vitali normally hunts and is most interested in. Suspect
71 Blake knew Suspect Vitali and his dogs were not as interested in pursuing other wild animals but were primarily
72 focused on bears. Suspect Blake and Suspect Vitali arrived in the area where the (3) dogs were and knew there were (4)
73 bears (a sow with three cubs) which the dogs had "treed" in different trees, but in the same general area. Suspect Blake
74 shot a bear cub two or three times with his own Ruger .22 magnum pistol. This cub fell out of the tree and died.
75 Suspect Vitali shot the sow bear with Suspect Vitali's Ruger .22 magnum pistol and this sow bear fell out of the tree and
76 died. Suspect Vitali additionally shot a cub and wounded it. This wounded cub fell out of the tree and Suspect Vitali's
77 (3) dogs began mauling the wounded cub. Suspect Blake saw the dogs mauling the injured cub so he walked up to the
78 wounded cub, shot the cub in the head with his .22 magnum caliber pistol and killed it. The third cub ran out the "back
79 side of the tree" and escaped unharmed. Suspect Blake knew these (3) bears were killed because Suspect Vitali was
80 going to remove their gall bladders and sell them to a "Chinaman" from the Sacramento area who would purchase as
81 many gall bladders as Suspect Vitali could provide him. Suspect Vitali and Suspect Blake went back to the pickup,
82 placed the dogs in the dog boxes, and Suspect Vitali retrieved his backpack with half gallon jug of water (so Mr. Vitali
83 could clean his hands after removing the bears' organs). Suspect Vitali went back to the kill site with his backpack and
84 told Suspect Blake he would be back about (15) minutes later. Suspect Vitali directed Suspect Blake to drive south on
85 Cat Creek Road, out of the immediate area and to stay with the vehicle. Suspect Blake advised he knew by removing
86 the vehicle from the kill site area, he was acting as a type of lookout in case law enforcement was in the area. Suspect
87 Blake knew law enforcement would "shake him up" while Suspect Vitali was busy removing the gall bladders from the

88 (3) bears at the kill site. Suspect Blake received a radio call from Suspect Vitali informing Suspect Blake it would be
 89 longer than expected because Suspect Vitali was doing "extra" work. Suspect Blake knew what Suspect Vitali meant by
 90 this and described this "extra" work Suspect Vitali was engaged in as removing bear claws from the bear paws. Suspect
 91 Vitali returned to the truck with the backpack he left the pickup with. Suspect Blake knew this backpack belonged to
 92 Suspect Vitali. Suspect Blake knew this backpack contained (3) gall bladders with attached livers and multiple bear
 93 claws. Suspect Blake knew Suspect Vitali placed this backpack into one of the dog boxes. After Suspect Vitali returned
 94 to the truck, Suspect Vitali informed Suspect Blake that Suspect Vitali thought he could get \$300 for the sow's gall
 95 bladder, but thought he may only get about \$200 for each of the cub's gall bladders because they were smaller. Suspect
 96 Blake knew Suspect Vitali had sold a whole bear to a black man in Los Angeles for \$500 in the past and described the
 97 transaction as being secretive like a "dope deal". Suspect Blake knew it was illegal to sell wildlife parts and was
 98 personally not involved in the selling of wildlife. Suspect Blake knew Suspect Vitali for about five or six years.
 99 Suspect Blake knew Suspect Vitali was involved in killing bears and selling their gall bladders for as long as he knew
 100 Suspect Vitali. Suspect Blake thought Suspect Vitali was lying to him about receiving only \$300 per gall bladder and
 101 thought Suspect Vitali was being paid much more for each gall bladder. Suspect Blake thought each gall bladder was
 102 worth three to five thousand dollars. Since the time of their arrest, Suspect Blake received multiple telephone calls from
 103 Suspect Vitali. In these telephone conversations, Suspect Vitali instructed Suspect Blake not to talk with law
 104 enforcement and told Suspect Blake they should come up with a lie about where they obtained the backpack which
 105 contained the (3) gall bladders, claws, etc. Suspect Vitali said they should each stick to this one fabricated story and tell
 106 the authorities they were driving on Cat Creek Rd. when they rounded a corner and saw an unknown vehicle in front of
 107 them on the road. The unknown occupants of the vehicle "spooked" and left this backpack in the road. They picked up
 108 this backpack, which contained the bear parts, and placed it in the dog box. Suspect Blake responded by telling Suspect
 109 Vitali this story was not believable and would not work, but Suspect Vitali said this was their only option to escape
 110 being prosecuted for their crimes. Suspect Blake advised he was being completely honest, knew what he did was wrong
 111 and wanted to fully cooperate with us. I gave Suspect Blake my business card with direct cell phone number and asked
 112 him to call me when/ if he ever could direct us to the kill site. Suspect Blake has never provided this information.

Location/Subject/Incident Name USFS Rd 10N83K / Peter Vitali and Arthur Blake		Arresting/Case Officer D. Stevenson	Citation Number AD1823713 and AD1823762

1 **BACKGROUND:** On 04/24/13, I spoke with Arthur Blake about his involvement in this case and asked him to call me
 2 if he had any additional information regarding the kill site location. I had not heard anything back from him since that
 3 time. I drove to his residence on 05/18/13 to ask Suspect Blake for the last time if he had any better recollection of
 4 where they killed the (3) bears.

6 **SYNOPSIS OF INTERVIEW WITH ARTHUR BLAKE- 05/18/13:**

7 Suspect Blake met me outside of his residence and informed me he did not know the location of the bear kill site. He
 8 again gave the same general story regarding the killing of the (3) bears as outlined on my supplemental report dated
 9 04/25/13. In addition, Blake advised Suspect Vitali and he were involved in the unlawful take of (8) bears since they
 10 had been hunting together. Blake stated most of these bears were killed for the specific purpose of training Vitali's dogs.
 11 Blake told me these bears were primarily shot by Vitali and left to rot in the woods after they were killed. Blake stated
 12 he knew he was wrong for poaching bears with Vitali and should have stopped illegally hunting as he knew he was
 13 likely to get caught. Blake told me he did not stop illegally hunting bears because he enjoyed the thrill of the hunt.
 14
 15 Additionally, Blake stated he told Vitali to drive the back way home (Cat Creek Rd to North-South Rd) on 04/20/13
 16 after they killed the (3) bears and Vitali removed their galls/ claws. Blake told me he wanted to go the back way and
 17 avoid transporting the illegal bear gall bladders/ parts on Hwy. 88 because he did not want to get caught with them. He
 18 thought they were less likely to get caught if they avoided the highway and kept to the back roads.
 19
 20 Suspect Blake advised I was welcome on his property anytime to talk with him and he wanted to be forthright about his
 21 involvement in this case. Blake indicated he planned on showing up to court as promised, but hinted around that Suspect
 22 Vitali may flee to Idaho to avoid prosecution.

Location/Subject/Incident Name Peter Vitali		Case Number AD1823713 & 762	Case Officer Darrell Stevenson #366	

On April 26, 2013 at approximately 0900 hours Warden Galli contacted Peter Vitali. Warden Galli wanted to interview Vitali regarding his involvement on April 20, 2013 when he was arrested on Cat Creek Road, El Dorado County for multiple Fish and Game violations. Warden Galli contacted Vitali at a jobsite located at 4217 Putah Creek Road, Winters, Solano County. A new custom home was in the process of being built at the jobsite. Vitali is a carpenter who was working on location.

Warden Galli interviewed Vitali in a room of the custom home. Galli sat on a block of wood and Vitali sat on a pile of boards. Galli recorded the interview using a digital voice recorder that was on Galli's person. The interview is summarized as follows:

Galli asked Vitali what happened. Vitali stated he was not going to say anything. Galli asked Vitali what he was going to do with the bear gall bladders. He stated he has never ever sold any animal parts in his life. Galli asked Vitali why he had the gall bladders. Vitali stated he picked the pack up and he saw the livers and discovered the rest inside. Vitali figured why not pick it up; there were things of value inside. Vitali continued to state that when they bag (take) a bear, all the leftover meat scrapes, parts, and liver get boiled and are feed to the dogs. Vitali stated again that he has never sold any animal parts and he would not know where to begin to sell parts.

Vitali denied killing any bear. Based on Galli's training and experience and Vitali's statements and actions Galli did not believe Vitali was being truthful with regards to the killing of bears and how he obtained the bear gall bladders.

After the interview, Vitali gave Galli a tour of the custom home. At approximately 0945 hours Galli left the job site.

January 10, 2014

Mr. Peter Vitali

Dear Mr. Vitali:

On November 4, 2013 you were convicted in the El Dorado County Superior Court of a violation of Fish and Game Code (FGC) section 12012 related to your possession of three bear gall bladders and twenty bear claws for commercial purposes. FGC section 12154 (attached) authorizes the California Department of Fish and Wildlife to suspend or permanently revoke a person's hunting or sport fishing privileges upon a conviction of FGC section 12012. **Pursuant to this authority, your hunting privileges in the State of California are hereby permanently revoked.** You may appeal this revocation to the California Fish and Game Commission pursuant to FGC section 12154(b)(1) by sending a request for an appeal hearing to:

California Fish and Game Commission
 P.O. Box 944209
 Sacramento, CA 94244-2090

Additionally, please be advised that information regarding the suspension of your hunting privileges is being provided to member states of the Wildlife Violator Compact. It is your responsibility to verify your revocation status in other member states before engaging in hunting activities or attempting to purchase any hunting licenses. Contact information of the member states is attached.

Sincerely,

Michael P. Carion, Chief
 Law Enforcement Division

WILDLIFE VIOLATOR COMPACT NOTICE OF APPLICABILITY AND DUE PROCESS

This is official notice that the member states of the Interstate Wildlife Violator Compact have agreed to recognize, as applicable, the attached wildlife license suspension or revocation notice and/or order as if the qualifying offense, conviction, and suspension or revocation had occurred in those states. Obtaining or attempting to obtain any license, tag or permit that is prohibited by the attached notice may be an additional and separate violation if the license, tag or permit is obtained from any of the member states.

Any license, tag or permit obtained in violation of the attached notice and/or order may be invalid. It is your responsibility to contact any member state where you intend to obtain or attempt to obtain any license, permit or tag to determine your eligibility to purchase that license, permit or tag, or to determine if appeal procedures are available. You may determine your eligibility by inquiring in writing to the specific member state at the address listed below. This list is subject to change as new states are added. It is recommended you contact any state in which you wish to hunt/fish to determine if they are a member.

Member states contact information is as follows:

12 In the Matter of) FGC Case No. 14ALJ15-FGC
13) OAH No. 2014060844
14 PETER G. VITALI,)
15) AFFIDAVIT OF ERIC CRAWFORD
16 Respondent.)
17) Hearing Date: July 30, 2015
18) Time: 9:00 a.m.

19 I, Eric Crawford, declare as follows:

20 1. I am a regional investigator at the Idaho Department of Fish and Game. My business
21 address is 3316 16th Street, Lewiston, Idaho 83501.

22 2. I have been employed in the Enforcement Bureau of the Idaho Department of Fish and
23 Game since November 2000. Prior to my position in the Enforcement Bureau, I worked
24 seasonally with the agency for four years as both a fisheries and wildlife technician. During my
25 tenure with the Enforcement Bureau, I worked for approximately 12 years in a uniform
26 patrol capacity and three years in a plain clothes investigator capacity. I currently hold an
27 Advanced Peace Officer Certificate from the Idaho POST Council. I primarily conduct
28 compliance patrols for licensing, and investigate the unlawful take, sale and possession of fish and
wildlife.

3. I am familiar with Peter G. Vitali's appeal of the permanent revocation of his hunting
privileges by the California Department of Fish and Wildlife. On November 4, 2013, Vitali was

1 convicted in El Dorado County Superior County, State of California, for possession of black bear
2 parts for profit or personal gain and sentenced to 36 months probation. On January 10, 2014,
3 the California Department of Fish and Wildlife notified Vitali that his hunting privileges were
4 permanently revoked and that information regarding the revocation of his hunting privileges
5 would be provided to member states of the Wildlife Violator Compact.
6

7 4. On March 25, 2014, the California Department of Fish and Wildlife entered Peter G. Vitali
8 into the Interstate Wildlife Violator Compact database; notifying member states that Vitali had a
9 lifetime hunting license revocation. Idaho is a member of the Interstate Wildlife Violator
10 Compact. The Idaho Department of Fish and Game has revoked Peter G. Vitali's hunting
11 privileges. Pursuant to the Wildlife Violator Compact, obtaining or attempting to obtain any
12 license, tag, or permit is prohibited, and may be an additional and separate violation if the license,
13 tag, or permit is obtained from any of the member states.
14

15 5. On April 5, 2014, I contacted Vitali at his residence in Helmer, Idaho because Vitali had
16 purchased a 2014 Idaho Sportsman License. At that moment, Vitali voluntarily surrendered his
17 Idaho Sportsman License because his hunting license was permanently revoked in California
18 and his revocation was entered into the Interstate Wildlife Violators Compact.
19

20 6. On March 3, 2015, I was conducting a routine patrol for mountain lion and bobcat hound
21 hunters in the Cloverleaf area, Clearwater County, State of Idaho. At approximately 8:33 am,
22 March 3, 2015, I saw a white Toyota pickup truck parked behind a locked gate on US Forest
23 Service Road 3924. In the fresh snow I could clearly see where the vehicle drove around the
24 closed and locked gate. The vehicle's rear license plate had been removed by detachment and
25 allowed to swing under the rear bumper area. After a brief inspection, I determined the license
26 plate, Idaho 1L C9657 was in fact there. The vehicle is registered to Peter G. Vitali and Cherri J.
27 Vitali of Deary, Idaho.
28

1 7. I observed five hound dogs consistent with breeds commonly used to hunt mountain lion
2 and bobcat in a dog box; filling up the bed of the pickup truck. During the initial contact, there
3 was no one at the vehicle. Based on a prior contact, I recognized the vehicle belonged to Peter
4 Vitali. I called for Vitali to come out from where ever it was that he was, moments later Vitali
5 appeared up the road near the gate he had drove around. I instantly recognized Vitali from
6 previous contacts. At that moment, I activated my body camera to record the contact.
7

8 8. During the contact, Vitali did not admit that he was hunting, instead he indicated that he
9 was shed hunting. I explained to Vitali that I too was a houndsman. I confronted Vitali with the
10 fact that we got a fresh snow and that is when we as houndsman go out looking for a tracks. Vitali
11 was in control of the five hounds, 4 Plotts and one Black and Tan, that he had in possession.
12 Vitali offered to let them out so I could see them. Vitali made statements which I recorded on
13 my body camera.
14

15 9. During the contact, I also reminded Vitali of a previous contact I had with him and an
16 individual named Robert Britton on January 10, 2015. At that time, I observed that Vitali was a
17 passenger in his own vehicle and had dog out. Britton did not have a hunting license at the time. I
18 recorded my January 10, 2015, contact with Vitali on my body camera.
19

20 10. On March 3, 2015, the mountain lion hunting season was open in Idaho. On the night of
21 March 2 and early morning of March 3, 2015 the area received a fresh snow. The area where I
22 contacted Vitali is known to have mountain lion and bobcat present. Vitali drove approximately
23 8.75 miles on forest roads.

24 11. I back tracked all of Vitali's vehicle tracks that morning. On USFS Road 3924, Vitali
25 traveled approximately 5.6 miles behind the locked gate on the closed road. At no point I was
26 able to locate where he had gotten out of his vehicle to look for shed antlers. Vitali also traveled
27 USFS Road 1445C for approximately 3 miles. USFS Road 1445C is closed to full size vehicles
28

1 from October 1 through June 15 and is clearly marked with a sign.

2 12. I have been an avid houndsman for approximately 15 years, having treed over 40
3 individual mountains and a handful of bobcats. I have harvested two mountains and two bobcats
4 over the last 15 years. I have owned a hound, hunting him specifically for mountain lion and
5 bobcat. I annually hunt approximately 10 plus days for mountain lion and bobcat. I am familiar
6 with the techniques used to locate tracks of mountain lions and bobcats. I know that driving a
7 vehicle, either wheeled or tracked is the best and most productive way to locate mountain lion and
8 bobcat tracks. From my 15 years of experience, I also know that a fresh snow is the most
9 productive time to locate fresh tracks of mountain lion and bobcat.
10

11 13. Based on my training and experience, I believe that on March 3, 2015, Vitali was using his
12 hound dogs to hunt mountain lions and bobcats. My case file has been delivered to Clearwater
13 County Prosecutor Lori Gilmore for review and drafting of a formal complaint. See attached
14 REPORT OF INVESTIGATION, photographs, enclosed disc with digital videos and photographs,
15 copy of the California Department of Fish and Wildlife revocation notice, and copy of the
16 Interstate Wildlife Violator Compact database records of Peter G. Vitali.
17

18 14. I prepared the REPORT OF INVESTIGATION attached herein. This report presents a
19 true and correct description of my contact with Peter G. Vitali on March 3, 2015.
20

21 15. I took the photographs (P1010210.JPG, P1010211.JPG, P1010212.JPG, P1010213.JPG,
22 P1010214.JPG, P1010215.JPG, P1010216.JPG, P1010217.JPG, P1010218.JPG, P1010219.JPG,

Subject: Agenda Item 15; Climate Change Adaptations

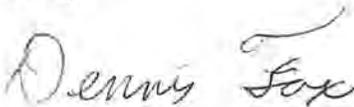

Mister Chairman, Commission Members and Staff:

Kudos to the Department for its recognition and willingness to confront the challenges presented by climate change. I believe that a hard copy of the presentation for not just myself but also the press, relevant academics and agencies, and the public is in order.

- The impacts to water and its conveyance such as anadromous fish in the Sacramento and its Delta have far reaching impacts.
- The impacts of fire such as this year works both ways; not only does climate and weather impact wildland fire propensity, but also the fire production of carbon should be considered. I am not a fan of the park lobby types who see fire as natural so more fire means more natural. Historically sized fires, before negative interventions, not conflagrations, are to be seen as beneficial.
- The banning of active forest management, such as thinning should be made an issue. Banning of spraying herbicides happened because of what is grown in forests that could not be legally grown there or elsewhere more so than actual environment damage. Culling the sylvan farmers just might be a significant societal benefit.
- I am old enough to remember the Department doing air drops of hay to deer in order to augment the habitats shortage of food during "crisis years" and wonder if this practice will ever again occur- cynically, and admittedly sarcastically, adding that feeding the deer benefits the mountain lions, an iconic tool for those who feel a need to control other's behavior.

In conclusion, it would be beneficial if there were a report of the results of climate change, fires and erosion on habitats, reservoir, refuge and river turbidity and capacity, both next spring and annually thereafter. In addition to giving information, I hope that annual presentation will encourage the department to not lock in its adaptations, but to continue to adapt as the climate impacts change.

Sincerely,

Dennis Fox

CALIFORNIA FISH AND GAME COMMISSION
DECISION LIST FOR REGULATORY REQUESTS RECEIVED THROUGH OCT 8, 2015
 Revised 11-24-2015

FGC - California Fish and Game Commission DFW - California Department of Fish and Wildlife WRC - Wildlife Resources Committee MRC - Marine Resources Committee

Grant (previously Accept): FGC is *willing to consider* the petition through a process **Deny (previously Reject):** FGC is *not willing to consider* the petition
Refer: FGC *needs more information* before deciding whether to grant or deny the petition

 **Green cells:** Referrals to DFW for more information **Blue cells:** Referrals to FGC staff or committee for more information
 **Lavender cells:** Accepted and moved to a rulemaking **Yellow cells:** Current action items

Tracking No.	Date Received	Date Response Due (10 working days)	Response letter to Petitioner	Accept or Reject	Name of Petitioner	Subject of Request	Code or Title 14 Section Number	Short Description	FGC Decision
	8/25/2015 8/30/2015				Julia Fuller Barbara Longmuir Raphael Zandra	Trapping		Requests complete ban on trapping of all furbearing animals because taking animals for profit is unnecessary.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; pending WRC review
	9/2/2015				Carol Johnson	Trapping		Requests ballot initiative to ban commercial and recreational trapping of all furbearers.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; FGC has no authority over ballot initiatives
	8/27/2015 9/11/2015 9/14/2015				Elaine Trogman Jill Franzke Diane Pease	Drift Gill Nets		Requests ban on drift gill net use in California to curb take of non-target species.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; FGC has no authority over this matter
	8/11/2015				George Burkhardt	Save Water		Requests two options to reduce water waste: (1) eliminate fish flow release, and (2) raise the level of all existing reservoir dams	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; FGC has no authority over this matter and eliminating fish flow is contrary to FGC policy
	7/31/2015				Greg Helms, Ocean Conservancy; Anna Weinstein, Audubon California, and others	Forage Species Policy		Requests FGC consider planning for a rulemaking process to establish conforming forage regulations such that federal and California actions unfold on roughly parallel timelines.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; requires fisher management plan for FGC action. DFW has authority under 7652.
	8/10/2015				Jason Robinson	Rock Crab Transfer Process		Requests to amend the south coast rock crab permit process to allow for transfer permits on a first come first serve basis or to give applicants that have been attempting for consecutive years more points in the lottery as is the case with the sea urchin lottery.	Action scheduled 12/9-10/2015 Staff Recommendation: Refer to DFW for evaluation
	8/3/2015				Chris Borden	Fishing		Requests to stop fishing because too many whales are dying.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; No evidence provided to support request. DFW working on whale entanglement issue.
	8/21/2015				Greg Ross	Tehama Wildlife Area Rules		Requests revocation of the rules banning ATVs in the Tehama Wildlife Area because use does not impact wildlife or plants.	Action scheduled 12/9-10/2015 Staff Recommendation: Refer to DFW for evaluation
	8/28/2015				Del Norte County Board of Supervisors	Klamath River -- Blue Creek Closure		Requests FGC repeal or amend the closure of Blue Creek to fishing because the decision was made without consideration of science or the impact on residents, including small businesses.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; pending evaluation by DFW.

Tracking No.	Date Received	Date Response Due (10 working days)	Response letter to Petitioner	Accept or Reject	Name of Petitioner	Subject of Request	Code or Title 14 Section Number	Short Description	FGC Decision
	9/24/2015				Mercer Lawing, CA Trappers Association	Bobcat Trapping		Requests FGC reconsider ban on bobcat trapping because the decision failed to address the biological and economic impacts.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; FGC will only revisit the issue with new information on bobcats.
2015-001	9/29/2015	10/15/15	10/2/2015	A	Curtis Haney	Barnacles		Add barnacles to the list of invertebrates that can be harvested, and remove them from being prohibit to take or possess.	Action scheduled 12/9-10/2015 Staff Recommendation: Deny; no new data to support request.
2015-002	10/2/2015 10/7/2015	10/16/15	10/15/2015	R	Andrea Treece, Earthjustice	Forage Species	New Section	Prohibit new or expanded directed commercial fishing in state waters on seven groups of unmanged forage fish species.	Staff rejected as incomplete

Date Received	Name of Petitioner	Subject of Request	Short Description	FGC Decision	DFW/FGC Staff Response	Final Action, Other Outcomes
9/24/2015	Sean Brady, Michel & Associates, representing National Rifle Association	Committee Procedures	Requests rules and procedures be established for the WRC through normal regulatory approval process before WRC takes any further action.	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; FGC is currently working on both regulations and policies/procedures for committee function		
8/6/2015	Ilson New, representing Dan Yoakum	Herring Eggs on Kelp (HEOK) Experimental Permit	Requests clarification on the definition of HEOK fishing.	Action Scheduled 12/9-10/2015 Staff recommendation: Refer to legal counsel and DFW for evaluation		
9/10/2015	Michael Flores, Al Taucher Conservation Coalition	Predator Policy Workgroup	Requests clarification of actions from FGC Aug 2015 meeting in Fortuna whereby individuals were publicly appointed to the Predator Policy Workgroup in conflict with the process previously established by FGC.	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; FGC will be implementing the approved process at its Dec 2015 meeting		
8/11/2015	Diane Pleschner-Steele, CA Wetfish Producers Association	MRC Meeting Agenda	Request to provide update on industry squid research at MRC and FGC meetings.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not timely for oral presentation. Written form welcome.		
9/11/2015 9/13/2015	Hazel Kimberly Leonard Frances LiBrandi	Urban Coyotes	Request to help control urban coyote problems.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; DFW appropriate entity to address the subject		
6/18/2015	William Lemos	North Coast Human Waste	Requests something be done to address the human waste problem occurring along the north coast during abalone season.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not within FGC's authority		
9/25/2015	George Osborn, et al.	Fishing Licenses	Support for moving to a 12-month fishing license; requests FGC support SB 345 with this included.	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; FGC referred to MRC and WRC for evaluation		

Date Received	Name of Petitioner	Subject of Request	Short Description	FGC Decision	DFW/FGC Staff Response	Final Action, Other Outcomes
10/7/2015	Sara Nichols, Sullivan Canyon Property Owners Assoc.	Wetland Permit	Concerned that DFW and FGC do not take the appropriate steps to investigate impacts on ecosystems before granting permits.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not within FGC's authority		
10/7/2015	Sara Sickich, Heal the Bay	Pollution Enforcement	Requests more DFW enforcement of pollution issues along the coastline.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not within FGC's authority		
10/7/2015	Greg Paully	Non-native Species Identification	Requests DFW dedicate more resources to response for increasing reports of non-native and invasive species.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not within FGC's authority		
10/8/2015	Chris Smitz, Democrats of Napa Valley	CA Wolf Pack	Requests update on the status of California wolf packs, specifically an indication about whether DFW plans to collar them.	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; referred to DFW for update		
10/8/2015	Jerry Hans, Friends of Griffith Park	Griffith Park Wildlife	Requests increased dialogue with DFW about wildlife connectivity issues and use of rodenticides in the park and the risk to wildlife.	Action Scheduled 12/9-10/2015 Staff recommendation: Deny; not within FGC's authority		
10/8/2015	Brendan Cummings, Center for Biological Diversity	Trapping Licenses	Requests clarification about FGC Section 4006 which demands that all licensing fees be set to recover fees. Does CBD need to petition for a mandate or not?	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; referred to DFW for evaluation		
10/8/2015	Kathy Lynch	Nonlead Phase-in	Requests (1) DFW provide a formal protocol for annual certification of non-lead ammunition; (2) DFW provide some formal protocol for making a determination about when hunters will be exempted from regulation because of no availability of non-lead ammunition; and (3) some review of the non-lead phase-in process to determine whether adjustments need to be made as we proceed with implementation.	Action Scheduled 12/9-10/2015 Staff recommendation: Grant; referred to DFW for evaluation		

Domoic Acid Impacts

Dungeness and Rock Crab

Presented to the California Fish and Game Commission by
Commission Staff on December 9, 2015

Domoic Acid Threat

- Massive toxic bloom of the marine diatom *Pseudo-nitzschia*
- Produces a potent neurotoxin, known as domoic acid (DA), which can accumulate in shellfish, other invertebrates
- Leading to illness and death in a variety of birds and mammals
- Persistently high levels of DA in Dungeness and rock crab

Domoic Acid Threat

- DA levels exceed State's action level for the crabs' body meat as well as the viscera
- Pose a significant risk to the public if they are consumed
- The Office of Environmental Health Hazard Assessment (OEHHA), in consultation with the California Department of Public Health (CDPH), has recommended the fisheries be closed

Recreational Crab Closure

- Regulation prohibits recreational take and possession of Dungeness crab and all rock crab from ocean waters, including bays and estuaries, north of the Ventura/Santa Barbara county line
- Closure in effect until OEHHA and CDPH determine that domoic acid levels no longer pose a significant risk to public health and no longer recommends the fishery be closed

Commercial Crab Closure

- The California Department of Fish and Wildlife (CDFW) delayed the start of the commercial Dungeness crab season
- CDFW also closed the commercial rock crab fisheries in the affected area

Commercial D-Crab Closure

- Reopening procedures are designed to maintain the existing structure by providing the recreational sector fishing opportunities prior to the start of the commercial season

**State of California
Department of Fish and Wildlife**

M e m o r a n d u m

Date: November 13, 2015

To: Sonke Mastrup
Executive Director
Fish and Wildlife Commission

From: Craig Shuman 
Regional Manager, Marine Region

Subject: December 9, 2015 Fish and Game Commission Meeting: Marine Region Update on the Marine Region Strategic Work Plan

The Department of Fish and Wildlife Marine Region is pleased to transmit the attached conceptual framework for the Marine Region Strategic Work Plan. This work plan is designed to take a strategic approach to improve marine resource management in California with a focus on state fisheries managed under the Marine Life Management Act (MLMA).

The work plan takes a phased approach, with the first phase focused on electronic data collection, evaluation of data streams, and amendment of the MLMA Master Plan.

The Marine Region looks forward to working with the Commission, the Marine Resources Committee, and stakeholders as we begin to work on achieving the objectives of the work plan.

Attachment:

Department of Fish and Wildlife Marine Region Work Plan - Summary

ec: Tom Barnes, Program Manager
State Managed Fisheries
Marine Region
Tom.Barnes@wildlife.ca.gov

Department of Fish and Wildlife Marine Region Strategic Work Plan - Summary
Advancing Marine Resource Management in California
Updated - October 2015

Goal

Align statewide interests in marine resource management and fully utilize current technology, best available science, and best management practices to advance marine resource management in California.

Objectives

- Develop and implement electronic data collection and reporting structure relevant to management
- Amend Marine Life Management Act (MLMA) Master Plan to guide implementation of MLMA and increase scope of active management
- Determine appropriate structural organization and capacity to facilitate proactive management
- Identify and fill existing management gaps
- Evaluate and implement sustainable funding structure

Needs

- Joint work plan to achieve objectives
- Discipline exercised by all parties to focus short-term efforts on the Strategic Work Plan and critical resource management needs
- Leverage external support opportunities

Timeline

- Initial focus on electronic data collection and MLMA Master Plan amendment through mid - 2018

Metrics for success

- Implementation of electronic reporting of updated data streams
- Recognized achievement of management objectives mandated in the MLMA
- Sufficient and appropriate structural organization and capacity for effective management

MEETING OUTCOMES FOR OCTOBER 7-8, 2015

These meeting outcomes were prepared by staff.

The official meeting minutes – video and audio recordings – may be obtained from www.cal-span.org.

Embassy Suites – LAX North
9801 Airport Blvd., Los Angeles

DAY 1 – OCTOBER 7, 2015

Pursuant to the call of the president, the California Fish and Game Commission (Commission) met at the Embassy Suites – LAX North, 9801 Airport Drive, Los Angeles, California on October 7, 2015.

The meeting was called to order at 8:40 a.m. by President Baylis, who introduced Executive Director Sonke Mastrup. Executive Director Mastrup introduced the meeting format and indicated that there was a request to move agenda item 15 to earlier in the day.

FISH AND GAME COMMISSION ATTENDANCE

Jack Baylis	President	Present
Jim Kellogg	Vice President	Present
Jacque Hostler-Carmesin	Member	Absent
Eric Sklar	Member	Present
Anthony C. Williams	Member	Present

1. Public Forum

No action taken.

CONSENT ITEMS

2. Receive and approve request from Mr. Francesco Licata to transfer his California Halibut Trawl Vessel Permit No. BT0050 to Mr. Thomas Nguyen
3. Approve settlement agreement between the Department of Fish and Wildlife (Department) and Mr. Craig Yerkins, et al. regarding appeal of the Department's denial to reinstate Transferable Dungeness Crab Vessel Permit No. CT0068-T7 for F/V Terry S (FG03513)

CONSENT (continued)

4. Approve settlement agreement between the Department and Mr. Robert Jackson regarding his appeal of the Department's denial to reinstate Transferable Dungeness Crab Vessel Permit No. CT0215-T7 , for F/V Brooke Michelle (FG70433)
5. Approve settlement agreement between the Department and Mr. John Reid regarding his appeal of the Department's denial to reinstate Transferable Dungeness Crab Vessel Permit No. CT0108-T7 for F/V Huson (FG06579)
6. Approve Neushul Mariculture, Inc.'s request to renew state water bottom lease M-654-03 for aquaculture

The Commission adopted the consent calendar, items 2-6, as presented.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

7. Tribal Committee
 - (A) Meeting summary
 - I. Receive recommendations
 - (B) Work plan development
 - I. Update on current work plan and timeline
 - II. Discuss and approve new topics

No action taken.

8. Marine Resources Committee
 - (A) Work plan development
 - I. Update on current work plan and timeline
 - II. Discuss and approve new topics

The Commission approved draft agenda topics for the November 2015 Marine Resources Committee meeting, and approved placing on a future Commission meeting agenda a presentation from the California Wetfish Producers Association regarding squid research.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

9. Adopt proposed changes to commercial squid logbook and regulations (Section 149 and Appendix A, Title 14, CCR)

The Commission adopted squid logbook and regulation changes as proposed.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

10. Adopt proposed changes to commercial hagfish regulations
(Section 180.6, Title 14, CCR)

The Commission adopted commercial hagfish regulation changes as proposed, including a change from two lines to three which will require a 15-day notice.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

11. Adopt proposed changes to commercial herring regulations and certify the final supplemental environmental document
(Sections 163 and 164, Title 14, CCR)

The Commission certified the final supplemental environmental document for commercial herring and adopted commercial herring regulation changes as proposed.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

12. Adopt proposed changes to Dungeness crab and crab trap sport fishing regulations and negative declaration
(Sections 29.80 and 29.85, Title 14, CCR)

The Commission adopted the negative declaration for Dungeness crab and crab trap sport fishing and adopted Dungeness crab and crab trap sport fishing regulations as proposed.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

13. Discuss proposed changes to marine protected area regulations
(Section 632, Title 14, CCR)

No action taken.

14. Update and direction on petition for changes to sea urchin regulations

The Commission directed staff to begin working with the California Sea Urchin Commission on a draft initial statement of reasons and appropriate California Environmental Quality Act document for the proposal as presented, and to schedule a rulemaking for 2016.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

15. Climate change adaptation presentations and discussion
(A) Charlton Bonham, Director, Department of Fish and Wildlife

- (B) Dr. Mark Gold, Associate Vice Chancellor, UCLA Institute of the Environment and Sustainability

The Commission will work closely with the Department and other relevant state agencies to develop policies specific to wildlife and climate change.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

- 16. Announce results from Executive Session

Christopher Ames reported that the Office of Administrative Hearing's proposed decision for Mr. Fred Todd has become final.

- 17. Department informational items
 - (A) Director's report
 - (B) Wildlife and Fisheries Division, and Ecosystem Conservation Division
 - (C) Law Enforcement Division
 - (D) Marine Region
 - (E) Overview of aquaculture in California
 - (F) Other

No action taken.

- 18. Other items
 - (A) Staff report
 - (B) Legislative update and possible action
 - (C) Federal agencies report

No action taken.

The Commission meeting recessed at 4:31 p.m. to reconvene on October 8, 2015 at 8:00 a.m.

DAY 2 – OCTOBER 8, 2015

Pursuant to the call of the president, the Commission reconvened at the Embassy Suites – LAX North, 9801 Airport Drive, Los Angeles, California on October 8, 2015. The meeting was called to order at 8:04 a.m. by President Baylis.

FISH AND GAME COMMISSION ATTENDANCE

Jack Baylis	President	Present
Jim Kellogg	Vice President	Present
Jacque Hostler-Carmesin	Member	Absent
Eric Sklar	Member	Present
Anthony C. Williams	Member	Present

19. Public Forum

No action taken.

CONSENT ITEMS

20. Receive and approve initial Private Lands Wildlife Habitat Enhancement and Management Area (PLM) plans and 2015-2020 licenses for:
(Pursuant to Section 601, Title 14, CCR)
(A) Pacheco Ranch (Santa Clara County)
(B) Camp 5 Outfitters Roth Ranch (Monterey and San Luis Obispo Counties)
21. Approve the Department's request for a 30-day extension to complete its evaluation of the petition to list the Humboldt marten (*Martes caurina humboldtensis*) as an endangered species under the California Endangered Species Act
(Pursuant to Section 2073.5, Fish and Game Code)

The Commission adopted the consent calendar, items 20-21, as presented.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

22. Wildlife Resources Committee
- (A) Meeting summary
- I. Receive and adopt recommendations
 - II. Update and direction concerning definition of frangible bullet
 - III. Update and direction concerning take of sambar deer
- (B) Work plan development
- I. Update on current work plan and timeline
 - II. Discuss and approve new topics
 - III. Appointments to predator workgroup

The Commission approved recommendations of the Wildlife Resources Committee:

- 1. Modify the definition of legal bullets for big game to exclude "frangible" bullets, after discussions with stakeholders.**
- 2. Start a rulemaking to delete the prohibition on the use of GPS for hounds.**
- 3. Support Department proposals for changes to upland game, mammals, Klamath River and waterfowl regulations.**
- 4. Conduct additional investigation into the 12-month fishing license proposal and ways to encourage public participation in fishing.**
- 5. Support efforts to increase efficiency in addressing depredating pigs.**
- 6. Support the continuing effort to implement Fish and Game Code Section 3080(e).**

7. Move forward with the predator policy workgroup nomination process, with initial, potential appointments in December.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

23. Items of interest from previous meetings

- (A) Action on petitions for regulatory change received at the August 2015 meeting
- (B) Action on petitions for non-regulatory changed received at the August 2015 meeting

The Commission adopted the staff recommendations for actions on the petitions for regulation change and requests for non-regulatory action.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

- (C) Commission budget review

No action taken.

- (D) Update on bobcat trapping prohibition effective date

No action taken.

- (E) Update on at-risk fisheries rulemaking

No action taken.

- (F) Other

No action taken.

24. Adopt proposed changes to the transgenic definition, application and fee regulations
(Sections 1.92 and 703, Title 14, CCR)

The Commission adopted changes to the transgenic definition, application and fee as proposed.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

25. Discuss proposed changes to sport fishing regulations
(Sections 1.05, et al., Title 14, CCR)

No action taken.

26. Request for authorization to publish notice of intent to amend commission meeting procedures regulations
(Section 665, Title 14, CCR)

The Commission directed staff to amend the agendas section of the proposed verbatim to (1) strike the vice president from the list of those who can amend agendas, and (2) change “amend” agendas to “add to” agendas.

Ayes: J. Baylis, E. Sklar, A. Williams

Noes: J. Kellogg

Absent: J. Hostler-Carmesin

The Commission provided additional suggestions and directed staff to bring a revised proposal for commission meeting regulations to the December 2015 meeting.

27. Tricolored blackbird (*Agelaius tricolor*)
- (A) Acknowledge receipt of petition from the Center for Biological Diversity to list as endangered via emergency regulation and via the listing process set forth under the California Endangered Species Act (Pursuant to Sections 2073.3 and 2076.5, Fish and Game Code)
 - (B) Receive the Department’s evaluation of the petition to list as an endangered species (Pursuant to 2073.5, Fish and Game Code)
 - (C) Receive and act on requests from the Center for Biological Diversity to reconsider the Commission’s June 2015 decision on whether listing as a threatened or endangered species may be warranted and to move consideration to the Commission’s December 2015 meeting.

The Commission rejected the request for reconsideration of its June 2015 decision regarding the tricolored blackbird.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

The Commission acknowledged receipt of the August 2015 petition for emergency listing of the tricolored blackbird and received the Department’s evaluation of the petition.

Ayes: J. Baylis, J. Kellogg, E. Sklar, A. Williams

Absent: J. Hostler-Carmesin

28. Department report on the status of Coho salmon
(Pursuant to Section 2113, Fish and Game Code)

No action taken.

29. Discussion and action on future meeting items

- (A) Next meeting – December 9-10 in San Diego

The Commission approved the December agenda topics, with the addition of a presentation from the Department on the review of state laws and other resource agency policies related to climate change.

- (B) Perpetual timetable for regulatory action updates (including changes to timing of DFW Lands Pass, falconry clean-up, spiny lobster, and commercial logbooks)

The Commission approved changes to anticipated regulatory actions as identified in the perpetual timetable.

- (C) New business
I. Commission name
II. Timing of officer elections

No action taken.

There being no further business, the Commission meeting adjourned at 1:31 p.m.

EXECUTIVE SESSION

(Not Open to Public)

Pursuant to the authority of Government Code Section 11126(a)(1) and (e)(1), and Section 309 of the Fish and Game Code, the Commission will meet in closed Executive Session. The purpose of this Executive Session is to consider:

- (A) Pending litigation to which the Commission is a party
 - I. Big Creek Lumber Company and Central Coast Forest Assoc. v. California Fish and Game Commission (Coho listing, south of San Francisco)
 - II. James Bunn and John Gibbs v. California Fish and Game Commission (squid permits)
 - III. Center for Biological Diversity and Earth Island Institute v. California Fish and Game Commission (black-backed woodpecker)
 - IV. Dennis Sturgell v. California Fish and Game Commission, California Department of Fish and Wildlife, and Office of Administrative Hearings (revocation of Dungeness crab vessel permit No. CT0544-T1)
 - V. Kele Younger v. California Fish and Game Commission, et al. (restricted species inspection fee waiver and Administrative Procedure Act)
- (B) Possible litigation involving the Commission
 - I. Tricolored blackbird
 - II. Bobcat trapping prohibition
- (C) Staff performance and compensation
- (D) Update on hearing officer recommendations for license and permit items
 - I. Mr. Fred Todd

Staff Report on Staff Time Allocation
November 25, 2015

Staff time is a tangible and invaluable asset. This report identifies where Commission staff allocated working time to general categories during September and October 2015 (see table); note that the total percentage of staff time is greater than 100% as a result of overtime. This report also highlights some of the specific activities for October, November and December.

General Allocation

Category*	Sep Staff Time Expended	Oct Staff Time Expended
Regulatory Program	15%	12%
Commission Meetings	20%	17%
Legal Matters	2%	2%
External Affairs	7%	8%
Special Projects	2%	1%
Administration	18%	25%
Leave Time	18%	17%
Unfilled Positions	21%	22%
Total Staff Time	103%	103%

Note: Total staff time is greater than 100% due to overtime

Activity Highlights

Highlights for activities conducted in October:

- Prepared for and conducted the October Commission and Tribal Committee meetings
- Prepared for the November Marine Resources Committee meeting
- Participated in the fishing from piers stakeholder meeting in Santa Monica
- Began preparations for arrival of new attorney
- Participated in Tribal Leaders Forum in Sacramento
- Hosted commissioner for office hours
- Participated in a “climate change and fisheries” meeting with the Ocean Protection Council and California Department of Fish and Wildlife
- Participated in the California Department of Fish and Wildlife’s red abalone fishery management plan development meetings
- Six staff completed a 3-day course titled “Economic Tools for Resource Management”
- Participated in California Department of Fish and Wildlife kickoff meeting for Marine Life Management Act master plan amendments and a related data evaluation workshop

Highlights of activities conducted or expected for November:

- Prepared for and conducted the November Marine Resources Committee meeting
- Prepared for and conducted emergency Commission meeting, and participated in follow-up meetings, regarding domoic acid in crabs
- Prepared materials for the December Commission meeting
- Hosted commissioners for office hours
- Begin onboarding new attorney
- Presented to the Governor's Tribal Drought Task Force regarding tribal consultation
- Conducted interviews with potential wildlife resource advisor candidates
- Reviewed personnel files and conducted reference checks for potential wildlife resource advisor candidates
- Participated in the Marine Protected Areas North Coast Collaborative meeting
- Participated in quarterly regulatory coordination meeting with the California Department of Fish and Wildlife
- Assist in search for interim executive director and begin preparations for the transition from executive director

Highlights of activities expected for December:

- Prepare for and conduct the December Commission meeting
- Assist Commission in recruitment of new executive director and interim executive director
- Prepare for the January Wildlife Resources Committee
- Participate in the California Department of Fish and Wildlife's Joint Leadership Team meeting
- Participate in a legislative hearing on crab in Santa Rosa
- Conduct second round of interviews for wildlife resource advisor candidates
- Participate in meetings on fisheries and fishery management plans
- Participate in California Sea Urchin Commission meeting in Los Alamitos
- Participate in the Marine Protected Areas Statewide Leadership Team meeting
- Participate in a tour of the Fund for Animals Wildlife Center in Ramon

*** General Allocation Categories with Sample Tasks**

Regulatory Program

- Coordination meetings with DFW to develop timetables and notices
- Prepare and file notices, re-notices, ISORS and FSORs
- Review and process CESA petitions
- Track and respond to public comments
- Consult, research and respond to inquiries from OAL
- Prepare administrative records

Commission/Committee Meetings and Support

- Research and review practices and procedures for adaptive management
- Research and compile subject-specific information
- Review and develop policies
- Develop and distribute meeting agendas and materials
- Agenda and debrief meetings
- Prepare meeting summaries and audio files
- Maintain voting records
- Develop and distribute after-meeting memos/letters
- Make travel arrangements for staff and commissioners
- Conduct onsite meeting management
- Process submitted meeting materials
- Provide commissioner support (expense claims, office hours, etc.)
- Process and analyze regulatory petitions and non-regulatory requests

Legal Matters

- Respond to Public Records Act requests
- Process appeals and accusations
- Process requests for permit transfers
- Process kelp and state water bottom leases
- Litigation

External Affairs

- Engage and educate legislators, monitor legislation
- Maintain state, federal and tribal government relations
- DFW partnership, including joint development of management plans and concepts

Special Projects

- Predator Policy Workgroup
- Fishing from piers and jetties
- Fisheries Bycatch Workgroup
- Streamline routine regulatory actions

Administration

- Correspondence
- Purchases and payments
- Contract management
- Personnel management
- Strategic planning
- Budget development and tracking
- Health and safety oversight
- Internal processes and procedures
- Staff training and professional development

Leave Time

- Holidays
- Sick leave
- Vacation
- Absence without leave

Unfilled

- Wildlife Advisor
- Executive secretary

New award recognizes outstanding efforts to increase awareness and safeguard U.S. natural resources from climate change

Individuals or groups can be nominated until January 8, 2016

November 12, 2015

As part of President Obama's [Climate Action Plan](#) and the [National Fish, Wildlife & Plants Climate Adaptation Strategy](#), an interagency group of federal, state, and tribal agencies today announced creation of a new [Climate Adaptation Leadership Award for Natural Resources](#).

The Award will recognize the actions of individuals and organizations that are making a difference by increasing understanding of climate impacts, adapting to and reducing threats, increasing response capabilities, and providing other innovative approaches to reducing impacts and increasing resilience in a changing climate. It will help spotlight innovative tools and actions that are making a difference now, and serve as a source of inspiration for additional efforts that advance climate smart resource conservation and management.

"Our climate is changing, and these changes are already affecting the nation's valuable wildlife and natural resources," said Michael Bean, Principal Deputy Assistant Secretary of the Interior for Fish and Wildlife and Parks. "This new Award recognizes outstanding leadership by organizations and individuals that is critical to help advance the resilience of our natural resources and the people, communities, and economies that depend on them."

Establishment of the Climate Adaptation Leadership Award for Natural Resources was one of the commitments announced as part of the Administration's [Priority Agenda for Enhancing the Climate Resilience of America's Natural Resources](#) in 2014. The agenda calls for a commitment across the federal government to support resilience of America's vital natural resources.

The Award also directly addresses the goals of the National Fish, Wildlife, and Plants Climate Adaptation Strategy, which was developed by a coalition of federal, state, and tribal natural resource agencies. These include:

- Goal 1: Conserve and connect species, habitats and ecosystems;
- Goal 2: Manage species and habitats to protect ecosystem functions and provide sustainable use;

- Goal 3: Enhance management capacity;
- Goal 4: Support adaptive management;
- Goal 5: Increase knowledge and information on natural resource impacts and responses to climate change;
- Goal 6: Increase awareness and motivate action to safeguard natural resources; and
- Goal 7: Reduce non-climate stressors to natural resources.

"State fish and wildlife agencies serve as stewards of the nation's fish and wildlife resources," said Dave Chanda, President of the Association of Fish and Wildlife Agencies, which is helping to lead implementation of the National Fish, Wildlife, and Plants Climate Adaptation Strategy. "Today's threats to fish, wildlife, and their habitats are exacerbated by climate change and underscore the need for incorporating climate adaptation in to conservation and science-based management." [Nominations will be accepted](#) until January 8, 2016. Individuals, groups, organizations and government agencies are eligible to apply. Three to five Awards are expected to be announced in 2016.

Fish, wildlife, and plant resources provide important benefits and services to Americans every day, including jobs, income, food, clean water and air, building materials, storm protection, tourism and recreation. For example, hunting, fishing and other wildlife-related recreation contribute an estimated \$120 billion to our nation's economy every year, and marine ecosystems sustain a U.S. seafood industry that supports approximately 1.7 million jobs and \$200 billion in economic activity [annually](#).

Award sponsors include the U.S. Department of the Interior, U.S. Fish & Wildlife Service, the Commerce Department's National Oceanic and Atmospheric Administration, the Natural Resources Conservation Service and the U.S. Forest Service. They will sponsor the award in collaboration with the National Fish, Wildlife, and Plants Climate Adaptation Strategy's Joint Implementation Working Group, which is composed of representatives from 21 federal, state and tribal natural resource agencies.

For more information about the Award or how to apply, please visit [the Climate Adaptation Leadership Award main page](#).

NOAA's mission is to understand and predict changes in the Earth's environment, from the depths of the ocean to the surface of the sun, and to conserve and manage our coastal and marine resources. Join us on [Facebook](#), [Twitter](#), [Instagram](#) and our other [social media channels](#).

State of California
Department of Fish and Wildlife

Memorandum

Date: ~~October 23,~~ ^{November 11} 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham 
Director

Subject: Petition from the Environmental Protection Information Center and the Center for Biological Diversity to list the Humboldt marten as Endangered under the California Endangered Species Act

The Department of Fish and Wildlife (Department) prepared the attached petition evaluation report in response to a petition, dated June 1, 2015, received by the Fish and Game Commission (Commission) on June 8, 2015 (Petition) from the Environmental Protection Information Center and the Center for Biological Diversity to list the Humboldt marten (*Martes caurina humboldtensis*) as an endangered species under the California Endangered Species Act (CESA). (See generally Fish and Game code §2073.5, subd. (a); Cal Code Regs., title 14, §670.1, subd. (d)(1).)

In accordance with CESA, the attached petition evaluation report delineates the categories of information required in a petition, evaluates the sufficiency of the information in the Petition, and incorporates additional relevant information that the Department possessed or received during the review period. Based upon the information contained in the Petition, the Department has determined that there is sufficient information to indicate that the petitioned action may be warranted. The Department recommends that the Petition be accepted.

If you have any questions or need additional information, please contact Dan Yparraguirre, Deputy Director, Wildlife and Fisheries Division at (916) 653-4673 or Eric Loft, Chief, Wildlife Branch at (916) 445-3555.

REPORT TO THE FISH AND GAME COMMISSION

EVALUATION OF THE PETITION
FROM THE ENVIRONMENTAL PROTECTION INFORMATION CENTER AND
THE CENTER FOR BIOLOGICAL DIVERSITY
TO LIST THE HUMBOLDT MARTEN (*MARTES CAURINA HUMBOLDTENSIS*)
AS ENDANGERED
UNDER THE CALIFORNIA ENDANGERED SPECIES ACT

Prepared by
California Department of Fish and Wildlife

October 13, 2015

I. Executive Summary

The Environmental Protection Information Center (EPIC) and the Center for Biological Diversity (CBD, collectively Petitioners) submitted a petition (Petition) to the Fish and Game Commission (Commission) to list the Humboldt marten (*Martes caurina humboldtensis*) as endangered pursuant to the California Endangered Species Act (CESA)(Fish & G. Code, § 2050, et seq.).

Pursuant to Fish and Game Code Section 2073.5 and Section 670.1 of Title 14 of the California Code of Regulations, the Department of Fish and Wildlife (Department) has prepared this evaluation report for the Humboldt marten petition (Petition Evaluation). The Petition Evaluation is an evaluation of the scientific information discussed and cited in the Petition in relation to other relevant and available scientific information possessed by the Department during the evaluation period. The Department's recommendation as to whether to make Humboldt marten a candidate for listing under CESA is based on an assessment of whether the scientific information in the Petition is sufficient under the criteria prescribed by CESA to determine that listing of the Humboldt marten may be warranted.

In completing its Petition Evaluation, the Department has determined there is sufficient scientific information to indicate that the petitioned action may be warranted. Therefore, the Department recommends the Commission accept the Petition for further consideration under CESA.

After reviewing the Petition and other relevant information, the Department makes the following findings:

- I. Population Trend. The population of Humboldt martens in California has declined from an unknown "fairly numerous" number in the early 20th century to a present population which likely numbers less than 100 individuals.
- II. Range. The Petition and other available information indicate the Humboldt marten's range in California is substantially reduced from its historical extent.
- III. Distribution. Humboldt martens are unevenly distributed within the bounds of their California range. Whether changes in distribution have occurred over time is unknown.
- IV. Abundance. Information in the Petition and other information available to the Department indicate that historically martens were far more abundant than they are today.
- V. Life History. The Petition contains sufficient information on the relevant life history traits of Humboldt marten.
- VI. Kind of Habitat Necessary for Survival. The Petition and other information available to the Department indicate that Humboldt martens are dependent on specialized habitats for their survival and reproduction, and those habitats are limited on the landscape.
- VII. Factors Affecting the Ability to Survive and Reproduce. The Petition contains sufficient information to conclude that Humboldt martens are subject to a variety of threats that have the potential to adversely affect their ability to survive and reproduce.

- VIII. Degree and Immediacy of Threat. The Petition contains sufficient information to conclude the degree and immediacy of some threats have the potential to adversely affect Humboldt martens at the population level.
- IX. Impacts of Existing Management. The Petition contains sufficient information to conclude that existing management efforts alone are unlikely to maintain a self-sustaining population of Humboldt martens in California.
- X. Suggestions for Future Management. The Petition contains sufficient information to conclude that additional management efforts may be necessary to maintain a self-sustaining population of Humboldt martens in California.

II. Introduction

A. Candidacy Evaluation

CESA sets forth a two-step process for listing a species as endangered. First, the Commission determines whether a species is a candidate for listing by determining whether “the petition provides sufficient information to indicate that the petitioned action may be warranted.” (Fish & G. Code, § 2074.2, subd. (a)(2).) Within 10 days of receipt of a petition, the Commission must refer the petition to the Department for evaluation (Fish & G. Code, § 2073.) The Commission must also publish notice of receipt of the petition in the California Regulatory Notice Register. (Fish & G. Code, § 2073.3, subd. (a).) Within 90 days of receipt of the petition, the Department must evaluate the petition on its face and in relation to other relevant scientific information and submit to the Commission a written evaluation report with one of the following recommendations (Fish & G. Code, § 2073.5, subd. (a)(1)-(2)):

- Based upon the information contained in the petition, there is not sufficient information to indicate that the petitioned action may be warranted, and the petition should be rejected; or
- Based upon the information contained in the petition, there is sufficient information to indicate that the petitioned action may be warranted, and the petition should be accepted and considered.

If the petition is accepted for consideration, the second step requires the Commission to determine, after a year-long review of the subject species based on the best scientific information available to the Department, whether listing as endangered is or is not actually warranted. (Fish & G. Code, § 2074.6, subd. (a) and 2075.5.)

In *Center for Biological Diversity v. California Fish and Game Commission* (2008) 166 Cal.App.4th 597, the California Court of Appeals addressed the parameters of the Commission’s discretion in its application of the threshold candidacy test. The court began its discussion by describing the candidacy test previously set forth in *Natural Resources Defense Council v. California Fish and Game Commission* (1994) 28 Cal.App.4th 1104, 1114:

As we explained in *Natural Resources Defense Council* [citation], “the term ‘sufficient information’ in section 2074.2 means that amount of information, when considered

with the Department's written report and the comments received, that would lead a reasonable person to conclude the petitioned action may be warranted." The phrase "may be warranted" "is appropriately characterized as a 'substantial possibility that listing could occur.'" "Substantial possibility," in turn, means something more than the one-sided "reasonable possibility" test for an environmental impact report but does not require that listing be more likely than not.

(*Center for Biological Diversity*, at pp. 609-610.) The court acknowledged that "the Commission is the finder of fact in the first instance in evaluating the information in the record." (*Id.* at p. 611.) However, the court clarified:

[T]he standard, at this threshold in the listing process, requires only that a substantial possibility of listing could be found by an objective, reasonable person. The Commission is not free to choose between conflicting inferences on subordinate issues and thereafter rely upon those choices in assessing how a reasonable person would view the listing decision. Its decision turns not on rationally based doubt about listing, but on the absence of any substantial possibility that the species could be listed after the requisite review of the status of the species by the Department[.] (*Ibid.*)

B. Petition History

On June 8, 2015, the California Fish and Game Commission received Petitioners' Petition to list Humboldt marten as endangered under CESA. On June 18, 2015, the Commission referred the Petition to the Department for evaluation. The Department requested of the Commission, and was granted, a 30-day extension to the 90-day Petition evaluation period. This is the first time the Humboldt marten has been petition for listing under CESA.

The Humboldt marten was petitioned for listing under the federal Endangered Species Act (ESA) by the same Petitioners in 2010. In April 2015 the United States Fish and Wildlife Service (USFWS) found that listing the coastal distinct population segment (DPS) of the Pacific marten as threatened or endangered under the ESA was not warranted (80 FR 18742). Importantly, the USFWS evaluated coastal Oregon populations of Pacific marten (*Martes caurina caurina*) and the California Humboldt marten population collectively as one DPS when making its determination.

The Department evaluated the sufficiency of the scientific information presented in the Petition it received, using information in the Petition as well as other relevant scientific information available at the time of review. Pursuant to Fish and Game Code section 2072.3 and Section 670.1(d)(1) of Title 14 of the California Code of Regulations, the Department evaluated whether the Petition includes sufficient scientific information regarding each of the following petition components:

- Population trend;

- Range;
- Distribution;
- Abundance;
- Life history;
- Kind of habitat necessary for survival;
- Factors affecting ability to survive and reproduce;
- Degree and immediacy of threat;
- Impacts of existing management;
- Suggestions for future management;
- Availability and sources of information; and
- A detailed distribution map.

C. Humboldt Marten Description and Ecology

The Humboldt marten is a carnivorous mammal (order Carnivora, family Mustelidae), classified as a subspecies of Pacific marten (*Martes caurina*), a species occurring west of the Rocky Mountain Divide which was recently split from the American marten (*Martes americana*, Dawson and Cook 2012). The taxonomy of martens in the Pacific Northwest is currently unsettled, and some recent genetic evidence suggests that Humboldt martens and martens in coastal Oregon currently classified as *M. caurina caurina* are closely related, and should all be classified as Humboldt marten (Slauson et al. 2009a, USFWS 2015 p.5). California is also home to the closely related Sierra marten subspecies (*M. caurina sierrae*), which ranges throughout the Sierra Nevada and northern interior mountains and is not the subject of this Petition (figure 1). Humboldt martens historically occupied the coastal mountains of California from Sonoma County north to the Oregon border from sea level to 915m (3,000 ft.) within 80 km (50 mi.) of the coast, (Grinnell and Dixon 1926, Zielinski et al 2001, USFWS 2015). The current distribution is limited to areas of Humboldt, Del Norte, and Siskiyou Counties, encompassing less than 5% of the probable historical range (figure 1, Slauson et al. 2009b, USFWS 2015).

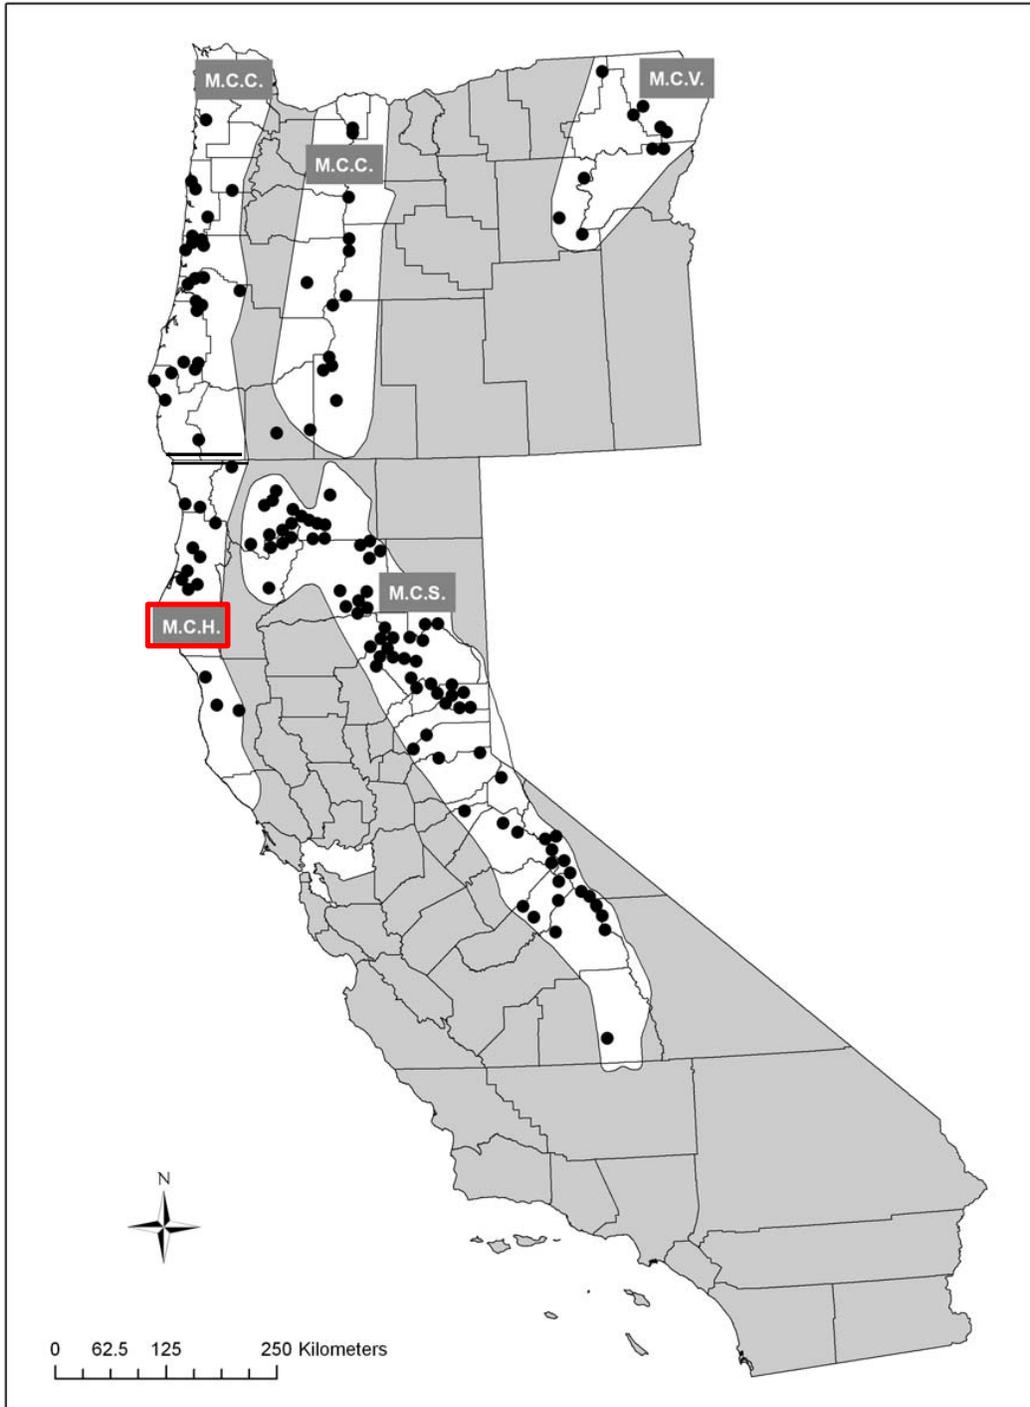

Figure 1. Historical range and distribution of Pacific marten subspecies occurring in Oregon and California. Range boundaries (white polygons) and historical records of occurrence (black circles) are modified from Zielinski et al. (2001, p. 480). Subspecies: *M. c. humboldtensis* (M.C.H.), *M. c. sierrae* (M.C.S.), *M. c. caurina* (M.C.C.), *M. c. vulpina* (M.C.V.). Source: USFWS 2015. Used with permission.

Martens appear elongated and low to the ground as do other members of the weasel family, though larger and stockier than long-tailed weasels (*Mustela frenata*), and with longer tail and body fur than similarly sized minks (*Neovison vison*). Pelage (fur) is brown (varying from yellowish buff to nearly black), with a contrasting lighter patch on the throat and chest. Bushy tails constitute more than 1/3 of the overall body length. Overall body lengths range from 45-70cm (18-28 in.) and weights range from 0.4-1.25 kg (0.88-2.76 lbs.), with males averaging 15% longer than females and up to 65% heavier than females (Powell et al. 2003, Clark et al. 1987). Humboldt martens differ from Sierra marten by having darker, richer golden fur, reduced throat patch, more extensive dark fur on feet, legs, and tail, smaller skulls, narrower faces (rostra), and differences in dentition (Grinnell and Dixon 1926, Grinnell et al. 1937, USFWS 2015).

North American martens are polygamists, with females producing their first litter at around 24 months of age (Markley and Basset 1942). Parturition typically occurs in March or April, with litters averaging 2-3 kits (Strickland et al. 1982). Marten young begin dispersing from their natal range as early as August, and may continue through the following summer (USFWS 2015). The average dispersal distance of North American martens is typically short, less than 15km (9.3 mi., Ibid.). The number of kits that survive to reproductive age is unknown. In California, Pacific martens seldom survive longer than 5 years in the wild (USFWS 2015). Martens are intrasexually territorial (i.e. adults exclude members of the same sex from their territories, but not members of the opposite sex, Powell et al. 2003), with marten home ranges in the Sierra Nevada varying from 170 - 733 ha (420 - 1,811 ac.) for males and from 70 - 580 ha (173 - 1,433 ac.) for females (Buskirk and Zielinski 1997). The limited available information on Humboldt marten home ranges suggests they are similar in size to Sierra marten home ranges (USFWS 2015).

Humboldt marten are strongly associated with two distinct habitat types: late successional conifer stands with dense shrub layers where abundant live and dead standing and downed tree structures are used for resting, denning, and escape cover; and serpentine soil communities of various seral stages with variable tree cover, dense shrubs, and rock piles and rock outcrops used for resting, denning, and escape cover. Large patches of late successional conifer forests or serpentine soil formations appear to be necessary for Humboldt marten occupancy (Slauson et al. 2007). The diet of Humboldt martens consists primarily of small mammals, berries, birds, insects and reptiles. Chipmunks (*Tamias spp.*), red-backed voles (*Myodes californicus*), Douglas's squirrels (*Tamiasciurus douglasii*) and flying squirrels (*Glaucomys sabrinus*) constitute 85 percent of the mammalian biomass in the diet during the summer and fall. Diets shift seasonally, with berries consumed more frequently in the summer and fall (Slauson et al. 2007).

Known predators of martens in western North America include coyote (*Canis latrans*), red fox (*Vulpes vulpes*), bobcat (*Felis rufus*), and great horned owl (*Bubo virginianus*). Fishers are also known to kill martens, and the distribution of fisher populations may limit the distribution of marten (USFWS 2015, Krohn et al. 2004).

II. Sufficiency of Scientific Information to Indicate the Petitioned Action May Be Warranted

A. Population Trend (pp. 4-5)

1. Scientific Information in the Petition

The Petition states that Humboldt martens were historically common, but had become so rare by the late 1990's that some believed the subspecies was extinct before they were detected again in 1996, and no verifiable detection records of Humboldt martens have been found for the period of 1945-1995 (citing Slauson et al. 2001, "Kucera et al. 1995" which is not listed in the literature cited section of the Petition but appears to refer to Kucera and Zielinski 1995 based on content, Zielinski and Golightly 1996, Slauson et al. 2009b, Slauson and Zielinski 2004). The Petition states that the extant population in California is likely less than 100 individuals and the population appears to have declined by over 40% over the period of 2000-2008, and then remained unchanged during the period of 2008-2012 (citing Slauson and Zielinski 2009, but based on content presumably referring to Slauson et al. 2009b and USFWS 2015). Additionally, the Petition states the size of the coastal population of martens in Oregon is unknown, but believed to be small. The Petition also references USFWS (2015) which notes that experts have serious concerns about the viability of the three extant populations of coastal martens (two in Oregon and one in California, citing Slauson et al. 2009a). The Petition further indicates that Kucera (1998) reported concern for Humboldt marten based in part on severe population declines, and Slauson et al. (2009b) expressed concern for the viability of coastal marten populations due to small population size, population isolation, and ongoing threats.

2. Other Relevant Scientific Information

In addition to the sources cited in the Petition, Grinnell et al. (1937) stated that Humboldt martens were "fairly numerous" in "earlier years" (p. 209), however, apparent declines in the Humboldt marten population, at least locally, were noted as early as the 1920s (pp. 209-210). Grinnell et al. (1937) report a tale of one trapper capturing 50 Humboldt martens in a single winter. Although it is impossible to quantify the statement that the species was once "fairly numerous", one can reasonably infer that the number of martens present at that time was larger than the population present in the 1990s when no detections of the species had been recorded for the previous 50 years (Zielinski and Golightly 1996).

3. Conclusion

The Petitioners cite relevant literature regarding the population trend of Humboldt martens in California. While no quantitative data exist regarding the population in the era of European American settlement, qualitative statements suggest the species was not uncommon (Grinnell et al. 1937). The Petitioners reference and accurately represent the findings and conclusions of the only known rigorous

quantitative estimate of the species' population in California derived from occupancy rates (i.e. Slauson et al. 2009b) which found a significant decline in occupancy between the 2000 -2001 field season and the 2008 season. This resulted in an estimate of less than 100 martens in northwestern California. Based upon the Petition and other information available to the Department, it appears the population of Humboldt marten in California has declined from an unknown "fairly numerous" number in the early 20th century to a present population estimate of fewer than 100 individuals.

B. Range and Distribution (pp. 6-7)

1. Scientific Information in the Petition

The Petition describes the historical range of Humboldt marten in California as coastal forests from Sonoma County north to Curry County Oregon (referencing Grinnell et al. 1937, Kucera 1998, and Slauson et al. 2001), and notes records of the species from Colusa, Del Norte, Glenn, Humboldt, Lake, Mendocino, Siskiyou, Tehama, and Trinity Counties from NatureServe (2015). The Petition states that Humboldt martens have been extirpated from 95% of their historic range in California (Slauson et al. 2007), and are now limited to an area approximately 2,273 km² (877 mi²) (Petitioners state the estimate is based on analysis of Slauson et al 2009c data, however it appears the estimate was based on Slauson et al. 2009a).

2. Other Relevant Scientific Information

The Department possesses historical records of Humboldt marten from Del Norte, Humboldt, Siskiyou, Trinity, Tehama, Mendocino, Lake, Colusa, and Glenn Counties (California Natural Diversity Database [CNDDDB] query August 8, 2015, fig. 2). Colusa and Glenn Counties are included due to a single record attributed to Snow Mountain near where Colusa, Glenn, and Lake Counties intersect. There are some experts who question whether the Humboldt marten historically occurred in Lake County because historical records from the area are attributed to trapper reports which are known to sometimes refer to the locations of the trapper's camps rather than the locations animals were taken, and because the habitat in Lake County today is dissimilar to the habitat known to be occupied by Humboldt marten in northwestern California (Slauson and Zielinski 2007, Greg Schmidt pers. comm. 7/23/15, USFWS 2015). However, trappers interviewed by Twining and Hensley (1947) reported that martens had formerly been taken as far south as Hull Mountain in northern Lake County and Fort Ross in Mendocino County, suggesting that historical records from this area may be accurate. All historical CNDDDB observation records appear to be less than 100 km (<60 mi.) from the coast. The historical range described by Grinnell et al. (1937) was roughly 22,000 km² (8,500 mi²), although not all of the habitat within the bounds of the historical range would have been suitable or occupied. Within the historical range, the distribution of marten record locations is uneven, with concentrations of records from northern Lake and east-central Mendocino County, an area southeast of Eureka, and near the intersection of Del Norte, Humboldt, and Siskiyou counties (fig. 2). Whether these concentrations reflect the relative density of martens within the range or are artifacts of uneven trapping or survey efforts is unknown. By the 1940s a significant decline in Humboldt marten trapping returns and a retraction of the southern

end of the range had been noted (Twining and Hensley 1947). Zielinski et al. (2001) conducted an exhaustive review of historical coastal marten records including published reports, museum specimens, unpublished notes of naturalists and trappers, and interviews of tribal members and others. Based on their review they concluded that a significant reduction in occupied range has occurred.

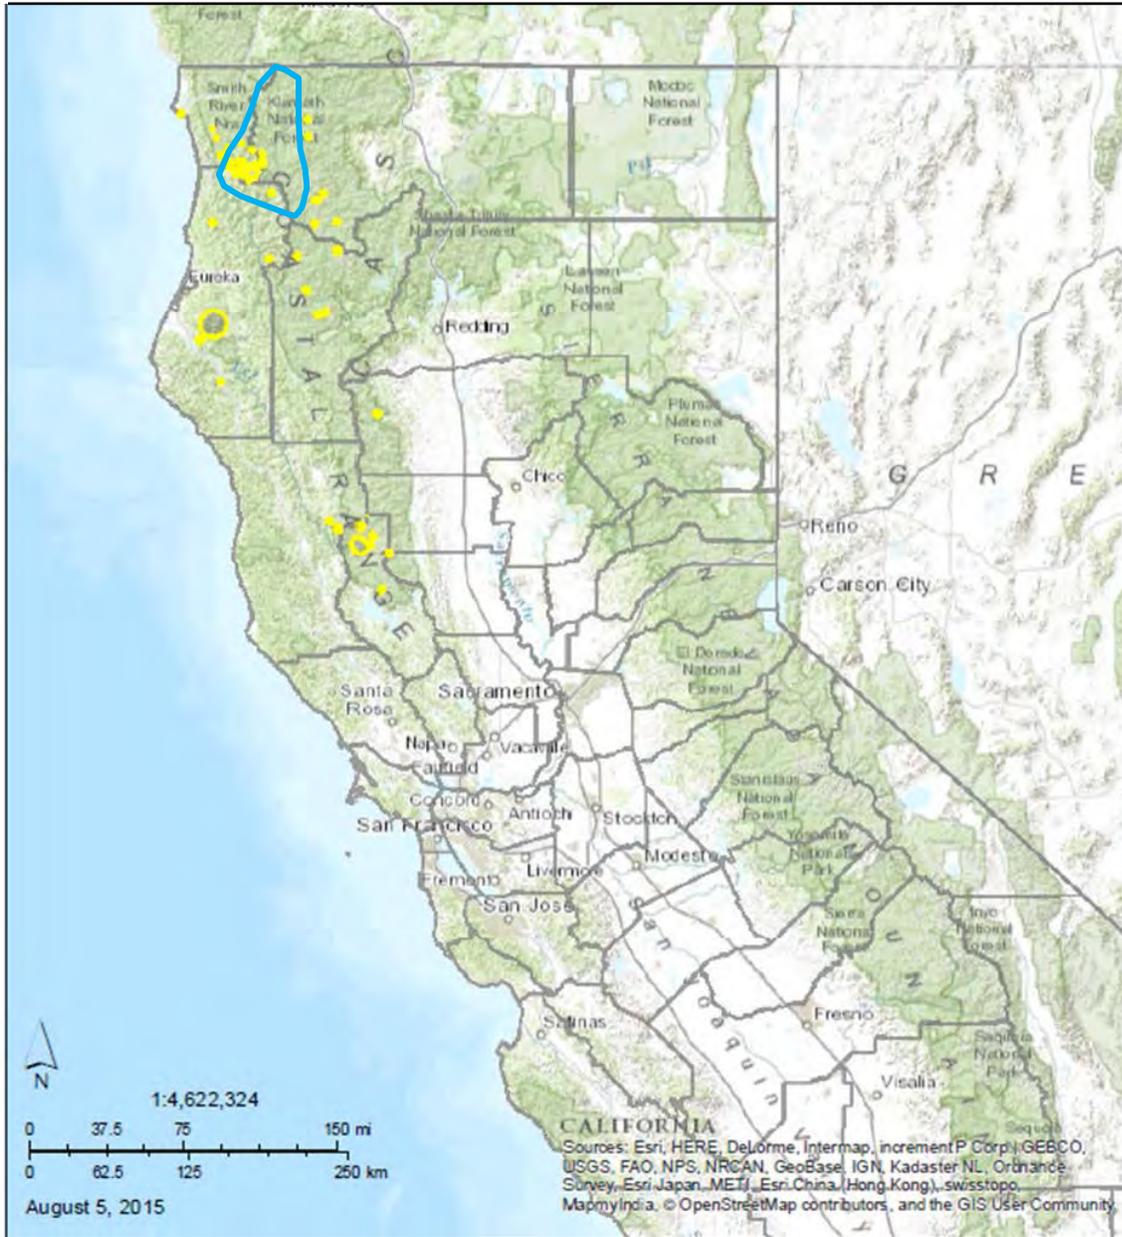

Figure 2. Humboldt marten occurrence records from the California Natural Diversity Database 1889-2004. Blue polygon represents approximate contemporary range in California (Humboldt marten records from database and literature 1995-2015).

The Department is aware of Humboldt marten records only from southern Del Norte, northern Humboldt, and extreme eastern Siskiyou Counties since 1995 (CNDDDB query August 8, 2015) despite the fact that surveys during that period covered a much larger portion of the historical range (USFWS 2015). The occupied range (as of year 2008) as circumscribed by a minimum convex polygon drawn around detection locations was recently found to be 627 km² (242 mi²) by Slauson et al. (2009b). Since that time, the known occupied range has expanded slightly with two detections of Humboldt martens in Prairie Creek Redwoods State Park in 2013, a few kilometers from the coast (CDFW 2014). Although there have been recent surveys at over 3,000 locations and 50,000 survey nights, no comprehensive range-wide survey has been conducted for this species (USFWS 2015).

3. Conclusion

Humboldt marten historically ranged from Sonoma County north to the Oregon border within 96 km (60 mi.) of the coast. The size of the historical range described by Grinnell et al. (1937) was roughly 22,000 km² (8,500 mi²), and the area known to be occupied by Humboldt marten in northern California since 1995 is slightly larger than 627 km² (242 mi², Slauson et al. 2009b). Humboldt martens are distributed unevenly within their range. Based upon the Petition and other information available to the Department, the current range of Humboldt marten in California is clearly substantially reduced from the historical range.

C. Abundance (p. 8))

1. Scientific Information in the Petition

The Petition presents information on the abundance of Humboldt marten in California in a short table listing the estimate of Slauson et al. (2009b) of less than 100 individuals in north coastal California.

2. Other Relevant Scientific Information

The study referenced by the Petitioners is the only known estimate of Humboldt marten abundance in California.

3. Conclusion

The only known estimate of Humboldt marten abundance in California is less than 100 individuals. Historical estimates of abundance do not exist, but anecdotal information on trapping success, and the much larger historical range (Grinnell et al. 1937, Twining and Hensley 1947, Zielinski et al. 2001) could reasonably lead one to conclude that historically martens were more abundant and more widely distributed. Based upon the Petition and other information available to the Department, current abundance of less than 100 individuals leads the Department to conclude that listing marten may be warranted.

D. Life History (pp. 9-13)

1. Scientific Information in the Petition

The Petition describes the physical appearance of Humboldt martens and the morphological differences between Humboldt martens and the Sierran subspecies of martens. The Petition then describes the current accepted taxonomy of Humboldt marten (*M. caurina humboldtensis*) and the results of recent genetic investigations that found both Humboldt martens and martens in coastal Oregon (currently classified as *M. Caurina caurina*) shared unique genetic signatures, suggesting Humboldt martens and coastal Oregon martens share an evolutionary lineage, and calling into question the separation of the two subspecies (Slauson et al. 2009a, USFWS 2015).

In describing the life history of Humboldt martens the Petitioners emphasize the traits that limit martens' (all North American marten species) ability to quickly repopulate following a population decline: late sexual maturity (24 months to first litter [Strickland et al. 1982]), low pregnancy rates during times of environmental stress (as low as 50% [Thompson and Colgan 1987]), a single litter per year (Calder 1984), small litter size (ranging from 1-5, averaging 2.85 [Strickland and Douglas 1987]), and relatively low population densities for an animal or their size (Buskirk and Ruggiero 1994, Kucera 1998). Reproductive cycle and longevity are then described in detail.

Home range size and composition are described as well as the relationship between habitat quality and home range size. The Petitioners, citing USFWS (2015), described the strong habitat selection exhibited by martens at the home range scale, with Pacific and American marten home ranges typically including 70% or more late successional forest habitat. The Petitioners note an inverse relationship between habitat quality and home range size, with the largest Pacific marten home ranges in California and Oregon occupying the most intensively logged landscapes (USFWS 2015).

2. Other Relevant Scientific Information

See life history information under Section I above.

3. Conclusion

The Petition accurately describes the appearance of Humboldt martens (see section I of this report for description), and the current taxonomic understanding of the subspecies. The reproductive biology of martens is well described and supported by appropriate literature. Home range size and composition is also accurately described and referenced.

E. Kind of Habitat Necessary for Survival (pp. 13-16)

1. Scientific Information in the Petition

The Petition emphasizes the highly habitat-specific nature of North American martens and their vulnerability to habitat loss and degradation (citing Harris 1984, Buskirk and Ruggiero 1994, Slauson 2003). Petitioners describe the strong association of martens to closed-canopy old-growth forests with complex structure near the ground (Buskirk and Powell 1994, Buskirk and Ruggiero 1994, Bull et al. 2005), the avoidance of young forests and open areas (Drew 1995, Buskirk and Ruggiero 1994, Slauson et al. 2007), and unwillingness to cross large areas with low canopy closure (Hargis and McCullough 1984, Bissonette and Sherburne 1993, Thompson and Harestad 1994, Hargis et al. 1999). The Petition describes the preference of martens for unlogged, old-growth stands with high canopy cover, multiple canopy layers, and high tree and log densities over harvested stands, early seral stages, and stands with few dead trees (citing Spencer et al 1983, Buskirk and Ruggiero 1994, Raphael and Jones 1997, Bull et al. 2005, and others). Regarding Humboldt martens specifically, the Petition quotes Slauson et al. (2003): “The [Humboldt] marten does not occur in extensively logged redwood forests and currently only occurs in conifer-dominated, late-mature and old-growth forests with dense shrub cover or near-coast serpentine communities with dense shrub cover.”

The Petition describes three types of coastal conifer forest used by Humboldt marten in California: Old-growth Douglas-fir forests, mixed conifer forests on serpentine soils, and old-growth redwood forests (Slauson 2003, Slauson and Holden 2009). Serpentine soils are described as sites where the mineral composition of the soil creates a harsh growing environment for most plants and results in open, rocky sites with stunted trees (citing Slauson et al. 2007). The Petition further states that in both serpentine soil forests and non-serpentine soil forests, Humboldt martens occupy large areas of dense shrub cover associated with older forest habitats, and are not associated with shrub species that occur in areas of clear cuts and regrowth (Slauson et al. 2007).

The Petition states that martens select habitat at four spatial scales: microhabitat (resting and denning sites), stand, home range, and landscape, and at all scales there is a strong preference for old-growth habitats (no reference).

The Petitioners’ description of Humboldt marten microhabitat associations is excerpted directly from USFWS (2015) with citations omitted. Regarding resting structures, the Petition states that rest structures are used daily by martens to provide thermoregulatory benefits and protection from predators. Rest structures are re-used infrequently, and the type of structures used varies seasonally, so multiple structures are required within a home range. Large diameter trees, snags, and logs are the most frequently used rest structures, with martens typically selecting the largest available structures. Humboldt marten rest structures average 95 cm (37 in.) diameter at breast height (dbh) for snags and 88 cm (35 in.) diameter at the larger end for logs. Live trees averaged 94cm (37 in.) dbh. Within these structures, martens typically use cavities, platforms, or chambers created within log piles or rock outcrops. The Petition states there are two types of dens used by Humboldt marten: natal dens where kits are born, and maternal dens to which kits are later moved. Pacific and American marten den site selection appears to be based on the characteristics of the structure as well as the surrounding stand, with females likely selecting for den sites in proximity to quality foraging sites. Cavities within large

trees and snags are most commonly used by denning Pacific and American martens. Three maternal dens from California Humboldt marten have been described, but no natal dens. Two dens were in cavities within the broken tops of a 66 cm (26 in.) dbh golden chinquapin (*Chrysolepis chrysophylla*) and a 113 cm (45 in.) Douglas-fir, and the third den was in a cavity in a 115 cm (45 in.) dbh Douglas-fir snag. All were located within the same old-growth Douglas-fir dominated riparian stand.

The Petition describes the forest stand scale as an area of several hectares containing the structural features required by martens for resting, denning, foraging and mating; and states that martens prefer old-growth stands (citing Buskirk and Powell 1994, Katnik et al. 1994, and Slauson et al. 2007). The Petition references Bull et al.'s 2005 study in northeastern Oregon where the authors found Pacific martens used stands with 50-74% canopy cover more than stands with <50% canopy cover, used stands with more canopy layers than in unused stands, used stands with a greater distance to forest openings more than stands with a shorter distance to openings, and used stands with higher densities of snags, logs, and large trees than unused stands. Additionally, Bull et al. (2005) found that martens used stands with no timber harvesting history more often than stands with any harvesting history, and that martens used stands with harvesting history less than expected based on availability. Specifically referring to Humboldt martens in non-serpentine soil stands the Petition states that martens used late successional stands more than expected based on their availability, used late-mature stands similar to availability, and made little use of all other seral stages (citing Slauson et al. 2007), and that earlier seral stages are not likely selected because they lack one or more key structural features (citing Slauson 2003).

At the home range scale the Petition states that Humboldt martens select the largest available patches of old-growth and late-mature, or serpentine habitat (citing Slauson et al. 2007). The Petition refers to Slauson et al.'s (2007) habitat models which found a 19-26% increase in the probability of Humboldt marten occurrence in an old-growth habitat patch for each 20 ha (49 ac.) increase in patch size, and the authors' conclusion that "The best models suggest that home range areas with larger patch sizes of old-growth, old-growth plus late-mature, or serpentine habitat within a 1-km radius of each sample unit are important for marten occurrence. Martens disproportionately used sample units within these largest patch sizes." The Petition also relates Slauson et al.'s (2007) finding that mixed-scale models which consider both the stand and home range scales explained Humboldt marten occurrence better than single scale models. The Petition then states that, because Humboldt martens are negatively associated with logging activities at the microhabitat, stand, and home range scales, logging at the landscape scale (tens to hundreds of km²) inevitably negatively influences marten occurrence as well.

At the landscape scale, the Petition states loss and fragmentation of mature forest constrain marten movement and demography (Bissonette et al. 1989 [does not appear in Petition literature cited], Frederickson 1990, Phillips 1994, Chapin 1995, Chapin et al. 1998, Hargis 1996 [does not appear in Petition literature cited], Slauson 2003), and martens avoid landscapes where 25-30% of mature forest has been lost (Bissonette et al. 1989, Hargis et al. 1999 [does not appear in Petition literature cited], Potvin et al. 1999, Slauson 2003). The Petition states that fragmented forests and small patches of old-growth do not ensure the long term viability of marten populations. Citing Slauson et al. (2009b), the

Petition states that although Humboldt martens occasionally occupy old-growth forest patches <50ha (124 ac.), occupancy is stable only in larger patches. Further, Slauson et al. (2009b) found declines in sample unit marten occupancy from 2000 -2001 to 2008 in units with highly fragmented old-growth and in serpentine soil areas. The authors calculated that a 30 ha (74 ac.) increase in the amount of old-growth in a sample unit resulted in a 37% decrease in the probability of extinction in that unit. The Petition includes an excerpt from USFWS (2015) which emphasizes the high sensitivity of American and Pacific martens to landscape scale habitat loss and fragmentation created by timber harvesting, and the fact that habitat loss and fragmentation effectively lowers the number of marten home ranges a landscape can support. The Petition's landscape habitat associations section concludes with the statement that patches of suitable habitat in highly fragmented forests may be effectively unavailable to martens if martens cannot cross open areas to reach them. Therefore fragmented landscapes have a lower marten carrying capacity (citing Buskirk and Powell 1994, Thompson and Harestad 1994).

2. Other Relevant Scientific Information

The Petitioners' description of American and Pacific marten preferred habitat types are generally accurate. The term "old-growth" used by the Petitioners can be imprecise. Slauson (2003) uses the term in reference to specific structural attributes of Douglas-fir (*Psuedotsuga menziesii*) and tanoak (*Lithocarpus densiflora*) stands, but other cited authors used terms such as "old structure, unlogged stands" (Bull et al. 2005), and "late successional stands" (Buskirk and Ruggiero 1994) rather than old growth to describe stands favored by martens. Important structural features of these old forests stands, whether termed "old-growth," "late successional," or "late seral," include: multiple canopy layers including different tree species, canopy openings which allow the development of dense vegetation on the forest floor, the presence of snags and coarse woody debris on the ground, and the absence of major stand-altering disturbance by humans (Bolsinger and Waddell 1993).

The Petition quotes Slauson et al. (2003), which in turn references Slauson (2003) which was in press at that time. The published version of Slauson (2003) does not contain as strong of a statement about Humboldt marten "only" using late-mature and old-growth forests, and in fact includes reference to marten use of three earlier seral stage stands where structural diversity was present (two were pole sized stands with heavy shrub cover adjacent to old growth stands, and one was a mid seral stand with a large component of larger trees). Additionally, Slauson (2003) contrasts his findings with Baker's (1992) finding that coastal martens on Vancouver Island, B.C. preferentially selected for 10-40 year old stands and against mature and old growth stands, speculating that one reason for the use of the younger stands in the Vancouver study area was the presence of a great deal of residual large woody structure remaining on the site following timber harvest (e.g. large stumps and logs).

The Petitioners' statement regarding the shrub species Humboldt marten are associated with is incomplete. Slauson et al. (2007) wrote that Humboldt martens favor a shade-tolerant, long-lived, mast producing shrub community composed of salal (*Gaultheria shallon*), huckleberry (*Vaccinium spp.*), rhododendron (*Rhododendron macrophyllum*), shrub oak (*Quercus vaccinifolia*), and tanoak, and noted

that this community does not include the shade-intolerant, short lived species such as *Ceanothus spp.* shrubs that occupy more xeric (dry) sites, and dominate sites following logging and other disturbances.

The Petitioners' discussion of microhabitat use is directly excerpted from USFWS 2015, however the three Humboldt marten maternal dens described were all used by the same female in the same year (Slauson and Zielinski 2009). Whether the habitats selected reflect the availability of structures and stands within her territory or her preferences as an individual, or whether they reflect the preferences of all Humboldt martens is impossible to discern. The discussion of Humboldt marten stand scale habitat use referred to a disproportionate use of late-successional stands while the authors (Slauson et al. 2007) used the term old-growth rather than late-successional. The Petitioners' discussion of Slauson et al.'s (2007) Humboldt marten habitat modeling emphasizes forest seral stage and old-growth patch size. Slauson et al.'s (2007) habitat modeling identified percent shrub cover as the most important predictor of Humboldt marten occurrence in both the stand scale and mixed stand and home range scale models.

The Petitioners' statement that logging at the landscape scale inevitably negatively influences marten occurrence is not supported by references. It is unclear whether the Petitioners are positing that any logging within the landscape will render the landscape unsuitable to martens, or whether they are stating that logging an entire landscape would be detrimental to marten. The latter is a logical conclusion based on scientific evidence, the former is not supported by the literature. Whether or not Humboldt martens can occur within a matrix of logged and unlogged habitat patches has not been directly addressed by any information source available to the Department, and would likely depend on the spatial scale, arrangement, and intensity of the logging. In the Petitioners' discussion of landscape scale habitat loss and fragmentation, many of the references cited are from studies of American and Pacific martens in other parts of North America, for example: Frederickson (1990) in Newfoundland, Phillips (1994) in Maine, and Potvin et al. (1999) in Quebec. Slauson (2003) references these studies, but makes no direct statement about constraint of Humboldt marten movement or demography due to landscape patterns.

3. Conclusion

The Petitioners' description of Humboldt marten habitat at the microhabitat, stand, home range, and landscape scales is generally accurate and well supported by literature. Although it is necessary to include references to other North American marten species and subspecies habitat associations due to the paucity of literature on the Humboldt marten subspecies, it is not always clear in the Petition when Humboldt martens specifically are being discussed, or whether information from martens in distant ecosystems (e.g. eastern deciduous forests) can be extrapolated to Humboldt martens. Additionally the critical association of Humboldt martens with extensive dense shrub layers is underemphasized.

F. Factors Affecting Ability to Survive and Reproduce (pp. 14-29)

1. Scientific Information in the Petition

The Petition states the Humboldt marten is threatened by all six of the factors that must be examined by the Commission per Title 14 of the California Code of Regulations section 670.1 when considering whether listing a species as threatened or endangered is warranted:

- present or threatened modification or destruction of its habitat;
- overexploitation;
- predation;
- competition;
- disease;
- other natural events or human-related activities.

Present or Threatened Modification or Destruction of Habitat

Timber Harvest and Logging:

The Petition states that logging threatens Humboldt marten and the species' habitat because it removes the largest and oldest trees available at all habitat scales (citing multiple studies), later noting that the structural features associated with old forests such as large trees, snags, and logs can take >100 years to develop, and little such habitat is expected to regenerate in the next several decades (citing USFWS 20015). The Petition then includes an excerpt from USFWS (2015) which states that the habitat loss and degradation from historical and current logging is the most plausible reason Humboldt marten are absent from much of their historic range, with most of the remaining suitable habitat located on federally owned land (citing Zielinski et al. 2001). The Petitioners go on to state that the majority of coastal forests in private ownership have been logged at least once, primarily by clear-cutting with short rotations of 60-70 years, which creates structurally simplified early seral forests that do not support martens (citing the following references from within Slauson et al. 2007: USDA 1992, Bolsinger and Waddell 1993, Lettman and Campbell 1997, Thornberg et al. 2000). The Petition notes that timber harvesting not only reduces the total amount of late successional forest, it also fragments it into smaller, more isolated patches, providing the example of the Redwood National and State Parks complex containing only three patches of late successional forest $\geq 2,023$ ha (5,000 ac.), with most patches ≤ 40 ha (100 ac., citing USFWS 2015).

Fire Suppression and Salvage Logging:

The Petition states that wildfire can threaten the already small Humboldt marten population by reducing and fragmenting the available habitat (citing Slauson and Zielinski 2004), and notes Slauson (2003) stated that stochastic (random, unpredictable) events such as wildfire present a major challenge to the persistence of Humboldt marten. The Petition states timber harvest and fire suppression exacerbate the threat of wildfire to marten by further fragmenting landscapes. Referencing USFWS (2015) the Petition states that vegetation management activities designed to reduce the risk of wildland fire by removing shrubs, reducing canopy cover, and removing snags and logs potentially negatively effects marten by removing required habitat structures, and removing shrub cover which can reduce prey abundance and improve access for competitors. The Petitioners state that on federal lands salvage

logging and fuels management activities can occur on all land allocation categories except for wilderness areas (Hamlin et al. 2010), and on private lands salvage logging plans are exempt from normal review procedures and automatically approved by the California Department of Forestry and Fire Protection (Cal Fire) through a ministerial process.

Overexploitation

This section of the Petition consists of numerous excerpts from USFWS (2015) and a summary statement that the threat posed to Humboldt marten in California by accidental trapping capture and poaching may be small, but the small, isolated nature of population makes any additional source of mortality significant. Important points from the USFWS excerpts include:

- There have been no studies on the population level effects of coastal marten trapping, but the loss of even a few adult martens, especially when combined with other mortality sources, could reduce the likelihood of long-term population viability.
- Early trapping of Humboldt marten was intensive, with accounts of individual trappers taking 35-50 martens in a single winter. By the early 1900s annual harvest of coastal martens was already declining, prompting Joseph Dixon to call for closing the trapping season in California to prevent an extirpation, however marten harvest continued until a partial closure was enacted in northwestern California in 1946, depleting populations and likely reducing genetic variation within the remaining population (Dixon 1925, Zielinski et al. 2001).
- Currently, trapping marten is illegal in California, though martens may occasionally be trapped inadvertently by trappers targeting other fur bearing species.
- Trapping of coastal martens remains legal in neighboring Oregon, although only three coastal martens were taken in 2013.

Predation

The Petition identifies predation as a major threat to Humboldt marten, stating that predation is the primary source of marten mortality, citing Bull and Heater's (2001) study of Pacific marten in northeastern Oregon which attributed 18 of 22 documented mortalities to predation. The Petition then identifies bobcats (*Lynx rufus*), foxes (*Vulpes* spp.), coyotes (*Canis latrans*), mountain lions (*Puma concolor*), great horned owls (*Bubo virginianus*), goshawks (*Accipiter gentilis*), and Pacific fishers (*Pekania pennanti*) as marten predators (citing Buskirk and Ruggiero 1994, Bull and Heater 2001, and Slauson et al. 2009). The Petition notes that habitat degradation and fragmentation caused by logging increases the threat to martens from predation by habitat generalist predators (citing Slauson et al. 2009), and that in redwood forests over the last 80 years fishers and gray foxes (*Urocyon cinereoargenteus*) have expanded their ranges into Humboldt marten habitat as martens have declined (citing Slauson and Zielinski 2007b). Citing Slauson and Zielinski (2010, not listed in Petition literature cited) the Petitioners state that roads may facilitate the presence of larger mesocarnivores in the dense shrub habitats preferred by martens. The Petition states that Slauson et al. (2009) found the greatest declines in Humboldt marten sample unit occupancy between 2001 - 2008 in serpentine soil habitats and where old-growth was more fragmented, possibly due to higher predation rates. The Petition notes

that female martens may be more susceptible to predation by other mesocarnivores due to their smaller body sizes (citing Slauson et al. 2009b).

Competition

The Petition states that no data or studies have been produced to assess the impacts of competition between Humboldt marten and other species, but posits that competition for food and space with other predators is currently a limiting factor for the ability of the species to survive and reproduce, and notes that the USFWS (Hamlin et al. 2010) stated that one of the risks to small populations such as the Humboldt marten is environmental fluctuations in food supply.

Disease

The Petition states that although the threat to Humboldt marten from disease has not been studied, disease is a potential threat to Humboldt martens because of their extremely small population size, quoting the USFWS (2015): “The outbreak of a lethal pathogen within one of the three coastal marten populations could result in a rapid reduction in population size and distribution, likely resulting in a reduced probability of population persistence, given the small size of these populations.” The Petition lists several diseases American and Pacific marten are known to be susceptible to, including: rabies, plague, distemper, toxoplasmosis, leptospirosis, trichinosis, sarcoptic mange, canine adenovirus, parvovirus, herpes virus, West Nile virus, and Aleutian disease (citing Strickland et al. 1982, Banci 1989, Green et al. 2008, Brown et al. 2008, Zielinski 1984 – not listed in Petition literature cited), and notes Brown et al. (2008) found dead fisher within the range of Humboldt marten had been exposed to canine parvovirus and canine distemper.

Other Natural Events or Human-related Activities

Vehicle Strikes:

The Petition states that vehicle collisions are a significant threat to Humboldt marten, particularly given their small, isolated populations. Citing USFWS (2015), the Petition states that collisions with vehicles are a known source of mortality for coastal martens, and may negatively affect population viability if roadkill mortalities combined with other sources of mortality exceed annual recruitment rates. Additionally, animals damaged by vehicle strikes would likely be more susceptible to other sources of mortality, such as disease, starvation, or predation.

Inadequacy of Existing Regulatory Mechanisms:

The Petitioners state that although Humboldt marten are protected from trapping in California, there are no regulatory mechanisms in place to protect Humboldt marten habitat from logging which could remove, degrade, and fragment habitat to the point that the species is driven to extinction. The Petitioners further state that conservation of the species will require management to enlarge and reconnect suitable habitat patches because merely aiming to maintain current habitat will not assure marten persistence (citing Slauson et al. 2007, Slauson 2003).

The Petition states that the Humboldt marten occurs on federal lands managed by the U.S. Forest Service and the National Park Service, but the Forest Service manages the majority of the marten’s

range on the Six Rivers and Klamath National Forests. On Forest Service lands in Region 5 (California), the Humboldt marten is designated as a Sensitive Species and a Priority Species. As a Sensitive Species, management projects subject to the National Environmental Policy Act (NEPA) must analyze impacts to the species; however, there is no requirement to minimize or mitigate impacts to the species. The Petition further states that much of the Humboldt marten's range on National Forest land is managed under the Northwest Forest Plan (USDA and USDI 1994) which manages land according to seven allocations: Congressionally Reserved Areas, Late Successional Reserves, Managed Late Successional Areas, Adaptive Management Areas, Administratively Withdrawn Areas, Riparian Reserves, and Matrix lands. The Petitioners note that Matrix lands units are intended for timber harvest, yet Slauson (2003) detected Humboldt marten on Matrix lands in 8 out of 31 sample units, and 20% of Slauson et al.'s (2007) analysis area was designated as Matrix land available for logging with 16% of the Matrix land already logged. The Petition further states that Late Successional Reserves (LSR) are intended to support viable populations of late successional and old-growth dependent species such as Humboldt martens, however logging is not prohibited in this land allocation class, and not all LSR is currently in a late successional condition, but rather managed to grow into late successional habitat and therefore may not currently provide Humboldt marten habitat. The Petitioners note that 40% of Slauson et al.'s (2007) study area was designated LSR, with martens detected in 13 of 66 sample units in LSR, and 13% of LSR in the marten's range has been logged (Ibid.). The Petition states that the Humboldt marten was given only a 67% likelihood of remaining well distributed within the range of the northern spotted owl (*Strix occidentalis caurina*) by the Northwest Forest Plan scientific analysis team (USDA and USDI 1994), and Slauson et al. (2009b) concluded that the Northwest Forest Plan does not completely protect the extant population, with 38% of the Humboldt marten distribution outside of NWFP reserves.

Based upon an approximated range of Humboldt marten in northern California created by buffering known marten detections with the maximum marten dispersal distance (Petition figure 1, Lindsay Holm pers. comm. 8/21/15), Petitioners estimate that only 14% of the California Humboldt marten range is contained within the Siskiyou Wilderness, which the Petition states is an insufficient percentage to ensure long term survival of the species. The Petition goes on to state that not all of the Wilderness area is composed of vegetation suitable for martens, for example, Slauson (2003) detected marten on only 3 out of 23 sample units located in Wilderness. The Petition notes that the Forest Service also manages the Smith River National Recreation Area (SRNRA) which is not vulnerable to logging. Although Petitioners estimate that the SRNRA makes up 9% of the Humboldt marten's range in California, management of the area prioritizes recreation over wildlife values.

The Petition notes that National Park Service land in the Humboldt marten range includes the Redwood National Parks Complex managed by the National Parks Service and California State Parks, consisting of Redwood National Park, Prairie Creek Redwoods State Park, Jedediah Smith Redwoods State Park, and Del Norte Coast Redwoods State Park. Petitioners estimate that 10% of the California range of Humboldt marten is made up of these parks. The Petitioners state that although a marten was detected in Prairie Creek Redwoods State Park in 2009 (Slauson and Holden 2009), the parks do not support a significant marten population (Slauson et al. 2003), and habitat in the parks is not extensive enough to support a viable population of Humboldt martens and is not currently in optimal condition for martens.

The Petition notes that non-federal lands in California are governed by the California Forest Practice Act of 1973 (Pub. Resources Code, § 4511 et seq.) and associated Forest Practice Rules (FPR)(Cal. Code Regs., tit. 14, § 894 et seq.), and states that there are no regulations within the FPRs that adequately protect Humboldt marten or its habitat. Section 919.16 requires landowners to provide Cal Fire with stand information when late successional forest stands are proposed for harvesting if the harvest will “significantly reduce the amount and distribution of late successional forest stands or their functional wildlife value so that it constitutes a significant adverse impact on the environment”, but there are no specified protective or mitigation measures to offset potentially significant impacts. The Petition notes that on nonfederal lands in the Humboldt marten range there are currently no Habitat Conservation Plans, Native Communities Conservation Plans, or Safe Harbor Agreements in place covering the species. Petitioners estimate that approximately one third of the Humboldt marten range in California is owned by Green Diamond Resources Company and managed as industrial timberland. The Petition states that Slauson et al. (2007) estimated 83% of the private land in their study area had been logged, primarily by clear cutting, and detected martens at only 2 of 36 sample units on private lands. The Petitioners conclude that the existing regulatory mechanisms in place on nonfederal lands are do not adequately protect the species or its habitat.

Petitioners estimate that approximately 9% of the California range of Humboldt marten is on the Yurok Reservation, and less than 1% is on Hoopa Reservation. The Petition states that most of the Yurok Reservation is within the Humboldt marten range; however, most of the reservation is in non-tribal ownership, including Green Diamond Resource Company. The Petitioners state that there are no publicly available data on the status of marten on tribal lands so it is unknown what protective measures may be in place.

Toxicant Exposure:

The Petition identifies toxicant exposure as an emerging significant threat to Humboldt marten survival and conservation. It further states that although there have been no studies of the issue specific to Humboldt martens, information from studies of toxicant exposure in other forest carnivores can be extrapolated to martens. The Petition states that Gabriel et al. (2012) recently found that 79% of fishers on forest lands in California tested positive for exposure to anticoagulant rodenticides (ARs), most showing signs of exposure to multiple ARs (range = 1-4 rodenticides, mean = 1.6). The Petition notes that at least six fishers have died from rodenticide poisoning in recent years (Gabriel et al. 2012, Gabriel et al. 2013). The Petitioners state that ARs detected in fishers from northwestern California include brodifacoum, bromodiolone, chlorophacinone, diphacinone, and warfarin; and brodifacoum and bromodiolone are considered second-generation anticoagulant rodenticides which were introduced when rodents developed resistance to first-generation compounds in the 1970s. The Petition states that strong evidence indicates pervasive illegal outdoor marijuana cultivation is the primary source of these ARs in California (citing Gabriel et al. 2012, 2013, Thompson et al. 2014), and additionally, other highly toxic pesticides, some of which are banned in the United States have been found at illegal marijuana grow sites (citing Thompson et al. 2014). The Petition concludes that toxicant exposure is a current and increasing threat to the small Humboldt marten population.

Climate Change:

The Petition states that the Humboldt marten is threatened by global climate change which could change the current climate characterized by moderate temperatures, high annual precipitation, and summer fog which supports dense conifer tree and shrub cover (citing Slauson et al. 2007). The Petition then presents an excerpt from USFWS (2015), summarized below:

Increased temperatures and decreased precipitation projected in the range of coastal marten over the next 40-50 years may cause the loss, degradation, or fragmentation of suitable coastal marten habitat. Suitable marten habitat (moist conifer and mixed conifer-hardwood forests) may be replaced by unsuitable hardwood forests, and the dense, shade-tolerant shrub layer required by marten may be lost. These vegetation transitions would create conditions more favorable to marten predators such as gray fox and bobcat and increase predation rates. Additionally, climate changes could result in more frequent, larger, higher severity wildfires in the Humboldt marten range, potentially causing marten mortality and destroying, degrading, and fragmenting marten habitat. Such habitat effects could threaten the viability of Humboldt marten populations which are already small and isolated (key references cited for this section in USFWS 2015 include: Pierce et al. 2013, Littell et al. 2013, Cayan et al. 2012, DellaSalla et al. 2013, Johnstone and Dawson 2010, Lawler et al. 2012).

2. Other Relevant Scientific Information

Present or Threatened Modification or Destruction of Habitat

The Petitioners' statements about the strong habitat associations of Humboldt marten are generally accurate and well supported by literature (e.g. Slauson 2003, Slauson et al. 2007). The impacts of logging, forest management, and salvaging logging on the vegetative structure required by marten is likewise well supported by the citations provided by the Petitioners.

Overexploitation

Due, in part to Dixon's (1925) recommendation, marten trapping was banned by the California Fish and Game Commission in 1946 in District 1 ½, which includes Humboldt, Del Norte, and western Siskiyou and Trinity counties (Twining and Hensley 1947). Today trapping of all martens is prohibited throughout the state (CCR Title 14, §460). Although it is possible that Humboldt martens could be inadvertently trapped by trappers pursuing legal furbearers, trapping in California is highly regulated, and trappers must pass a Department examination demonstrating their skills and knowledge of laws and regulations prior to obtaining a license (CFGF §4005). Additionally, only use of live-traps is permitted for commercial and recreational take of fur bearers and trappers are required to check traps daily and release non-target animals (CFGF §3303, §4004). With the passage of Proposition 4 in 1998, body-gripping traps (including snares and leg-hold traps) were banned in California for commercial and recreational trappers (CFGF § 3003.1). Martens incidentally captured by trappers must be immediately released (CFGF § 465.5(f)(1)).

Predation

The Petitioners' references to Slauson and Zielinski (2007b) referring to the gray fox and fisher expanding their distributions into Humboldt marten habitat can be further informed by Slauson et al. (2007, p.466), who stated that the dense ericaceous shrub layer found in occupied Humboldt marten habitat likely excluded larger bodied predators like gray fox and fisher which were rarely detected in their study area yet fairly common in nearby areas where shrub cover has been reduced or fragmented by forestry practices. To expand on the Petitioners' reference to Bull and Heater (2001), the authors attributed 44% of marten predation to bobcats, 22% to raptors (birds of prey), 22% to other martens, and 11% to coyotes. In a study of Humboldt martens begun in 2012, nine martens have been found dead to date, and all nine mortalities were attributed to bobcat predation (USFWS 2015). Additionally, all nine mortalities occurred in the more fragmented serpentine soil forest habitat, suggesting a link between habitat quality and predation rates (Ibid.). Finally, Slauson et al. (2009b) hypothesized that predation was the likely cause of the 42% decline in Humboldt marten occupancy in their study area between 2001 - 2008.

Competition

The Petitioners speculate that competition for food and space with other predators is currently a limiting factor for Humboldt marten populations, however this speculation is not supported by literature. The USFWS coastal marten species report (2015) does not identify competition as a significant stressor on coastal martens. Additionally, species with very specific habitat associations such as Humboldt marten would be expected to use their preferred habitat more efficiently than would habitat generalist species (Ricklefs 1990, p. 742, Zabala et al. 2009).

Disease

Although Strickland et al. (1982, p. 607) found that American martens in their central Ontario study tested positive for toxoplasmosis, Aleutian disease (a carnivore parvovirus), and leptospirosis; none of the diseases was considered to be a significant mortality factor for martens. Similarly, although Zielinski (1984) discovered antibodies to plague (*Yersinia pestis*) in four of 13 Sierra martens in the Sierra Nevada, he noted martens only appear to show transient clinical signs of the disease. Conversely, the Petition underemphasizes the potential threat to Humboldt marten from canine distemper virus which is known to cause high rates of mortality in wild mustelid populations (members of the weasel family which includes fishers and martens), and was found in wild fisher from the Hoopa Reservation within or near the range of Humboldt martens (Williams et al. 1988, Brown et al. 2008, Deem et al. 2000). The USFWS (2015) states that canine distemper has the potential to greatly reduce the size and distribution of one or more of the small extant coastal marten populations.

Other Natural Events or Human-related Activities

Vehicle Strikes:

There have been no recorded roadkill Humboldt martens in California since 1980 (USFWS 2015). Of nine Humboldt marten mortalities detected between 2012-2014 by researchers, none were killed by vehicle collisions. In southern Oregon where 14 roadkill martens have been recorded since 1980, roadkills are not likely to constitute a significant population level impact (USFWS 2015).

Inadequacy of Existing Regulatory Mechanisms:

Humboldt marten range in California likely also extends into the Shasta-Trinity and Siskiyou National Forests. In addition to National Park and U.S. Forest Service federal land ownership, a small percentage of the range is owned and managed by the U.S. Bureau of Land Management. Although not explicitly stated in the Petition, it can be inferred that logging of designated Matrix lands could not only directly remove Humboldt marten habitat, but perhaps more importantly fragment remaining patches of late seral forest rendering them unavailable to dispersing martens.

A small proportion of the Humboldt marten range occurs within the Redwood State and National Parks. Although the General Plan/General Management Plan governing the management of the parks does not identify specific management action for Humboldt marten, 32.6% of the Park lands are managed as primitive zones where no development or facilities construction occurs and visitor use is limited to foot traffic on existing trails. Additionally, 55.4% of the Park lands are managed as backcountry zones where the preservation and restoration of the natural environment is emphasized, and modification of the environment related to visitor use is limited. Where suitable marten habitat exists within these management zones, it is likely maintained and protected from significant modification and degradation (USDI NPS and State Parks 2000, USDI NPS 2000).

The California Forest Practice Rules specify that an objective of forest management is the maintenance of functional wildlife habitat in sufficient condition for continued use by the existing wildlife community within planning watersheds. This language may result in actions on private lands beneficial to martens (Cal Code Regs., Title 14, § 897, subd. (b)(1)(B)). Nevertheless, information about what constitutes the “existing wildlife community” is frequently lacking in timber harvest plans, and specific guidelines to retain habitat for martens are not provided in the Forest Practice Rules. Further, this guidance would at best conserve habitat where Humboldt martens are known to exist, but would not be expected to result in the creation of additional habitat. Habitat suitable for martens may be retained within Watercourse and Lake Protection Zones (Cal. Code Regs., tit. 14, § 916 et seq.). Watercourse and Lake Protection Zones are defined areas along streams where the Forest Practice Rules restrict timber harvest in order to protect in-stream habitat quality for fish and other resources. Harvest restrictions and retention standards vary according to the presence of anadromous and other fish species, but these zones may encompass 15 m - 45 m (50-150 ft) on each side of a watercourse, 30 m - 91 m (100-300 ft) in total width depending on side slope, location in the state, and the watercourse’s classification. Generally, within Watercourse and Lake Protection Zones, at least 50% of the tree overstory and 50% of the understory canopy covering the ground and adjacent waters must be retained in a well distributed multi-storied stand composed of a diversity of species similar to that found before the start of timber operations. For watersheds that fall within Anadromous Salmonid Protection rules (Cal. Code Regs., tit. 14, §§ 916.9, 936.9, and 956.9), the 13 largest trees per acre (live or dead) must be retained.

Toxicant Exposure:

The Petitioners’ extrapolation of information on toxicant exposure from other forest carnivores to Humboldt marten, particularly from other forest mustelids such as fisher, is appropriate due to the similar use of habitats and prey species, and because of similarities in physiology and metabolism. The

distinction the Petitioners make between first generation ARs and second generation ARs is important because first-generation compounds generally require several doses to cause intoxication, while second-generation ARs, which are more acutely toxic, often require only a single dose to cause intoxication and persist in tissues and in the environment (Gabriel et al. 2012).

Climate Change:

Miller et al. (2012) reported that the number of fires per year, mean fire size, maximum fire size, and area burned all increased in northwestern California over the period of 1910-2008, and that observed changes in the local climate explained much of the fire trends. Although no trend in percent of high severity fires over time was detected, the authors did note that spikes in high severity fires occurred in years when region-wide lightning strikes caused multiple ignitions. This research demonstrates that the effects of a changing climate may already be impacting Humboldt marten habitat, and highlights the link between climate patterns and wildfire trends in northwestern California forests. In the summer of 2015 the Nickowitz fire burned approximately 2,800ha (7,000 ac.) in and adjacent to the current known range of Humboldt martens (InciWeb 2015). In addition to wildfire-mediated habitat changes resulting from changes in climate, other studies have projected changes in forest disease, insect damage, and other disturbance events which could affect marten habitat quality or availability (USFWS 2015). Finally, Lawler et al. (2012) suggested that martens (all North American species) will be highly sensitive to climate change and will likely experience the greatest impacts at the southernmost latitudes and lowest elevations within their range.

3. Conclusion

Present or Threatened Modification or Destruction of Habitat

Humboldt martens have specific habitat associations which include large trees for structure and cover, and a dense shrub understory. Logging and forest management to reduce fire threat can remove and degrade these requisite features thereby destroying, fragmenting and degrading Humboldt marten habitat. Additionally, modification of marten habitat from these activities may increase the probability of predation by marten predators. These habitat impacts have the potential to reduce Humboldt marten populations by increasing predation rates and decreasing the extent and quality of available habitat.

Overexploitation

Trapping pressure on Humboldt martens was intense during the late 1800s and early 1900s, and likely resulted in significant declines in population size as well as a reduction in range. It is unlikely that trapping currently threatens Humboldt martens in California due to a ban on trapping martens and a ban on lethal traps as well as requirements that licensed trappers check traps daily and release non-target animals.

Predation

Predation is a significant source of Humboldt marten mortality. What is unknown is whether predation rates are greater than Humboldt marten faced historically, or so high that marten recruitment does not exceed the combined mortality rate of predation and all other causes.

Competition

Although the Petitioners state that competition is a significant threat to Humboldt marten populations the statement is largely speculative due to a paucity of information on the subject. Others, including the USFWS (2015) have not identified competition as a significant threat to the species.

Disease

Disease could pose a potential threat to Humboldt marten populations. Martens are known to be vulnerable to several diseases and parasites, including canine distemper which is known to cause high mortality rates in wild mustelid populations and is known to be present in the vicinity of the Humboldt marten population. However, marten mortality rates from disease are unknown. Additionally, it is unknown whether mortality from disease, combined with all other mortality sources exceeds marten recruitment rates.

Other Natural Events or Human-related Activities**Vehicle Strikes:**

The Petitioners are correct that vehicle strikes could impact Humboldt marten populations if roadkill mortalities combine with other sources of mortality to exceed recruitment rates; however, as the USFWS (2015) points out, vehicle strikes alone are not likely to constitute a significant threat to Humboldt marten populations in California as there have been none reported since 1980.

Inadequacy of Existing Regulatory Mechanisms:

The Petition correctly states that Humboldt marten are not specifically protected by regulation on public or private lands (with the exception of protection from trapping in California). Federal land use allocations provide varying levels of protection to Humboldt marten habitat. State and private lands are regulated by the California Forest Practice Act which includes some provisions that require disclosure of impacts and retention of trees and canopy, but requires no specific protections for marten.

Toxicant Exposure:

Although no studies specific to Humboldt marten currently exist, studies of toxicant effects on closely related fishers do exist. Toxicants appear to be widespread on the northwestern California landscape and may increase if marijuana cultivation continues to spread. Toxicant exposure possibly impacts Humboldt martens; however, the nature and magnitude of the impact on the California population is unknown.

Climate Change:

Climate change is likely to negatively impact Humboldt marten habitat through increasing temperatures, decreasing precipitation, and decreasing fog extent. These changes are expected to eventually result in

changes to the vegetation communities that constitute marten habitat in northwestern California. Additionally, climate change appears to have increased the extent of wildfire in the region which can destroy and fragment marten habitat.

G. Degree and Immediacy of Threat (p. 29)

1. Scientific Information in the Petition

The Petition states that there is a significant and immediate threat to the survival and conservation of Humboldt marten, largely due to the small size of the extant population and risks of extinction inherent to small populations, and due to the compounding effects of a small population combined with the other identified threats. The Petition's section on urgency states that there are believed to be less than 50 individuals in California and an unknown, but small and declining number in Oregon, while populations of at least several hundred reproductive individuals are required to ensure the long term viability of vertebrate species, with several thousand individuals being the goal (citing Primack 1993). Additionally, the Petition states martens have a low reproductive rate, making recovery from population-level impacts slow (citing Buskirk and Ruggiero 1994). The Petition states that small, isolated populations are inherently vulnerable to extinction for four main reasons: 1. genetic problems due to loss of genetic variability, inbreeding, loss of heterozygosity, and genetic drift; 2. demographic fluctuations due to random variation in birth and death rates; 3. environmental fluctuation due to variation in predation, competition, disease, and food supply; and 4. natural disturbances that occur at irregular intervals such as drought, fires, and severe storms (citing Primack 1993). The smaller the population size the more likely other threats will drive it to extinction (again citing Primack 1993). The Petition cites Slauson and Zielinski (2009, but based on content appears to be referring to Slauson et al. 2009a), who found that the probability of extinction in their study area was higher than the probability of colonization, and stated that conservation actions were needed immediately to ensure the Humboldt marten's persistence.

2. Other Relevant Scientific Information

The Petition discusses the threat inherently posed to Humboldt marten due to the small, isolated nature of their population. Small population size increases the risk of extirpation through demographic, environmental, and genetic stochastic events (random changes over time), particularly if the population is isolated, and through the deleterious effects associated with low genetic diversity (Traill et al. 2007, Traill et al. 2010). Demographic stochasticity can cause unbalanced age or sex ratios resulting in reduced capacity to breed. Genetic stochasticity can result in the loss of adaptive genes from the population or the proliferation of maladaptive genes. Additionally, small populations are less able to weather and recover from random catastrophic events in the environment. The Petition here uses a Humboldt marten population figure of less than 50 individuals, but elsewhere a figure of less than 100 individuals (see Abundance section above), however the discrepancy is of little import as either figure is well below the population size experts believe to be required to ensure long-term viability of a species (e.g. Traill et al. 2007, Traill et al. 2010, Flather et al. 2011). Regarding the Petitioners' comments about

the minimum population size needed to ensure long-term viability, Flather et al. (2011) noted that generalized minimum population recommendations across taxa are not supported by the historical record. The authors do agree that the population sizes required to sustain individual species over the long term are likely to be in the thousands, not hundreds.

The Petitioners' reference to Slauson et al.'s (2009a) extinction and colonization probabilities requires clarification. Slauson et al. (2009a) were referring to the probability of extinction and colonization at a given sample unit within their study area, not extinction and colonization at the population level.

3. Conclusion

The Petitioners correctly point out the inherent risk of extinction to small isolated populations. This inherent risk can compound the risks of other identified threats in terms of immediacy and degree.

H. Impact of Existing Management Efforts (P. 30)

1. Scientific Information in the Petition

The Petition states that there are no existing species-specific protective measures in place for Humboldt marten. It notes that there is currently a multi-agency Humboldt marten Conservation Group in place.

2. Other Relevant Scientific Information

For a discussion of existing management efforts see the discussion of existing management efforts under "Other Natural Events or Human-related Activities" in the Threats section above.

3. Conclusion

As stated above under "Other Natural Events or Human-related Activities" Humboldt martens are not specifically protected by any existing regulations or management plans, although they likely benefit from protections and management efforts aimed at protecting other resources. In the absence of specific actions to manage, restore, and enhance Humboldt marten habitat, existing management is unlikely to prevent the extinction of this species.

I. Suggestions for Future Management (p. 30)

1. Scientific Information in the Petition

The Petition reproduces the management strategy for Humboldt marten from the USFWS 2010 Humboldt marten Species Assessment (Hamlin et al. 2010):

- Maintain all currently occupied habitat.

- Restore habitat to increase and reconnect suitable habitat patches in the vicinity of the known population (Slauson and Zielinski 2004, p. 63).
- Increase the overall size of suitable patches toward the mean size of 447 ac (181 ha) (Slauson et al. 2007, p. 466).
- Restore functional landscape connectivity to enable recolonization of suitable, but currently unoccupied habitat (Slauson and Zielinski 2003, p. 13) and establish connectivity with habitat corridors between populations.
- Establish high priority restoration areas that enlarge small suitable patches, such as late-successional conifer-dominated stands and serpentine stands with dense shrub cover, so that they exceed the minimum patch size occupied by martens [greater than 205 ac (83 ha)]. This will reconnect suitable patches currently separated by unsuitable habitat.
- Restore or maintain dense, productive shrub layers and reduce road densities in the short-term and accelerate development of late-successional stand conditions, such as large diameter live trees, multilayered canopy, and large snags and logs over the long-term (Slauson et al. 2007, p. 466).
- Develop specific stand recommendations to manage early-seral conifer stands with lower tree densities to encourage maintenance of a productive shrub layer and increase tree growth rates (Slauson 2003, p. 71).
- Protect currently suitable resting and denning structures and plan for the future recruitment of new structures (Slauson and Zielinski 2009, p. 43).
- Establish additional populations within the historical range.

2. Other Relevant Scientific Information

Continued research into the ecology and demography of Humboldt marten is needed to increase the understanding of the species' biology, distribution, vital rates, habitat associations, and the ecology of their predators and prey species. Of particular importance is a better understanding of the relationship between habitat types and demographic rates. Additionally, although there have been extensive surveys for this species in recent years, many areas remain that have not been surveyed, or have not been intensively surveyed. Where the geographic boundary lies between the ranges of Humboldt martens and Sierra martens is currently unknown. Identifying the boundary more precisely would refine future estimates of the extent of available habitat and of population size. It is also important to determine whether Humboldt martens in California and the coastal martens of southern Oregon are members of the same subspecies or separate subspecies in order to more fully understand the potential threats to the species related to small population size and genetic isolation. Finally, the need for and feasibility of facilitated translocations and population augmentations from captive breeding should be studied.

3. Conclusion

The suggested management actions are appropriate for recovering Humboldt marten; however additional research on Humboldt marten genetics, distribution, ecology, and demography is also necessary to plan and implement the recovery of the species, and facilitated translocations and population augmentations should be carefully considered.

J. Detailed Distribution Map

The Petition reproduces figure 8.3 from USFWS (2015) showing the known extant Humboldt marten distribution in California.

IV. Status of the Species

The Humboldt marten population in California likely numbers less than 100 individuals. Although quantitative data is nonexistent, qualitative information suggests they were more common in the state in the early 1900s. The Humboldt marten range in California appears to have declined over the last century as well. The available literature indicates that the species requires specific habitats which are currently limited in distribution and fragmented. Although the degree and immediacy of the factors potentially threatening the persistence of the species are unknown, available information suggests that Humboldt martens may be threatened by historical habitat loss and fragmentation, exposure to toxicants, the effects of climate change, diseases, and the risks inherent to small populations.

Having reviewed and evaluated relevant information, including the material referenced in the Petition and other information in the Department's possession, the Department believes there is sufficient scientific information available at this time to indicate that the petitioned action may be warranted. (See Fish & G. Code, § 2073.5, subd. (a)(2); Cal. Code Regs. tit. 14, § 670.1, subd. (d).)

NOFCA

September 8, 2015

The Honorable Jack Baylis, President

California Fish and Game Commission

1416 Ninth Street, Suite 1320

Sacramento, CA 95814

RE: Predator Working Group Participant Selection

Dear President Baylis:

The United States Sportsmen's Alliance ("USSA") is a national organization dedicated to the protection and promotion of America's sporting pursuits. For nearly forty years, USSA has sought to reinforce the role of hunters, fishermen, and trappers in the furtherance of the North American Wildlife Management model, and partners with the Al Taucher Conservation Coalition ("ATCC") to promote conservation efforts here in California. ATCC is an organization comprised of more than 27 state and national conservation, union, and volunteer organizations, and represents the interests of more than one million Californians who contribute over 3.6 billion dollars to California's growing economy.

ATCC is formally seeking clarification of actions the Commission recently took at the Commission's 5-AUG-15 meeting in Fortuna whereby individuals were publicly appointed to the Predator Policy working group ("PWG"). These appointments appear to be in stark conflict with the protocol the Commission previously set forth whereby parties interested in participating in the PWG could submit their applications in response to the Commission's solicitation, and then be selected according to their qualifications the Commission set forth after an application period of thirty days.

The California Fish and Game Commission is tasked with a very important role in conserving California's natural resources and safeguarding the ability of all Californians to recreate in Nature according to the dictates of their conscience, and as with any action that could potentially impact communities of Californians, our state's flora and fauna, agricultural enterprises, and recreational opportunities, it is

NOFCA

of paramount importance that the Commission establish and adhere to a well-defined process of involving stakeholder and public input. As you know, ATCC has been supportive of the effort to establish policies by which to guide the activities of the Wildlife Resources Committee ("WRC"), so it is concerning to our member organizations that the process has not been observed in this case; doing so only serves to further alienate and disenfranchise public input and invites distrust and antagonism to the governance of our state's natural resources and those tasked with setting forth policy.

I look forward to the Commission's prompt response to my concerns.

Sincerely,

Michael Flores
Al Taucher Conservation Coalition

California Fish and Game Commission

Staff Proposal for Predator Policy Workgroup

July 26, 2015

Background

The response by the public to the Wildlife Resources Committee's (WRC) predator policy workgroup (PWG) meeting in March 2015 was overwhelming, and outstripped staff capacity to host all the interest. Staff presented WRC with a preliminary report and recommendations at the meeting on May 6, 2015, and Co-Chair Baylis proposed appointing a balanced group of stakeholders to draft and vet policy and/or regulatory options for consideration and discussion at future WRC meetings. The proposal was discussed and tentatively approved at the June 11, 2015, Commission meeting with requests by Commissioners Kellogg and Hostler-Carmesin for additional information.

Proposal

The proposal requires the Commission to appoint representatives to one of two workgroups to support predator policy review and development. The first group, consisting of six representatives, is responsible for refining ideas and drafting language for review by the WRC. The second group, consisting of 10-15 representatives, is responsible for receiving input to inform the drafting group.

The workgroups are tasked with presenting draft recommendations in a report to the WRC in 2016, at which point the WRC will discuss and make final recommendations for consideration by the Commission in 2017.

Tier 1: Drafting Group (drafters)

The Commission would appoint six volunteers that can demonstrate their commitment to helping draft policy.

- Consists of six seats
- Meet often with each other and the review group
- Goal: To draft new predator policy and regulatory concepts for WRC consideration
- Objectives
 - Receive input from review group
 - Receive expert input
 - Review existing policy/regulatory concepts
 - Draft policy, best management guidelines and regulatory proposals

Tier 2: Review Group (reviewers)

The Commission would appoint no more than 15 volunteers that can demonstrate their commitment to providing constructive input to the drafters.

- Consists of 12-15 seats
- Meet frequently with each other, the drafting group, and key stakeholders

- Goal: To provide input, guidance, and support for the drafting group
- Objectives
 - Review draft from drafting group
 - Provide recommendations to drafting group based on input from stakeholders
 - Negotiate compromises, identify key issues and conceptual changes
 - Debate proposed policies and regulatory concepts
 - Identify best management practices

Appointment Process

Solicitation – Commission staff will distribute a notice of interest for persons willing to volunteer for either tier on the webpage and through the listserv. The notice will include the list of desired qualifications and will outline the task and anticipated term. There will be a 30-day period to apply.

Selection - The applicants will be screened by Commission staff for those meeting the minimum qualifications. The successful applicants will be presented to the Commission at the next available meeting for final selection to fill both tiers.

Minimum Qualifications

- Both drafters and reviewers must demonstrate ability and willingness to work with others of diverse opinions and views and show a commitment and ability to represent key stakeholders.
- Drafters: must demonstrate writing skills and ability to evaluate policy and regulations.
- Reviewers: must demonstrate ability to evaluate policy and regulations. Experience working collaboratively.

Workgroup Input Needs

1. Clear and specific objectives from the Commission and WRC
2. Commission staff support of effort
3. DFW expertise on science, management practices, law, and administration
4. Public attitudes, expectations, needs (depredation, anthropomorphic, property rights)
5. Webpage platform for announcements, key documents, etc.
6. Independent scientific input and/or review
7. Rules of conduct, expectations, roles and responsibilities of participants
8. Discussion starter (draft list of issues/concerns)

Re: Request for Transparency, Structure and Fairness in the Operations of the California Wildlife Resources Committee

Dear Sirs and Madam:

The National Shooting Sports Foundation ("NSSF") is the trade association for America's firearms, ammunition, hunting, and recreational shooting sports industry. Its mission is to promote, protect and preserve hunting and the shooting sports. NSSF has a membership of nearly 13,000 manufacturers, distributors, firearms retailers, shooting ranges, and sportsmen's organizations. Our manufacturer members make the firearms used by law-abiding California sportsmen, the U.S. military and law enforcement agencies throughout the state.

The purpose of this letter is to address continued concerns of NSSF regarding the transparency of the Wildlife Resources Committee ("WRC"). The policies and decisions of the California Fish and Game Commission ("Commission"), and the actions of the WRC have a direct and substantial, material impact on the businesses of a significant number of our members, including those based in California.

In our July 18, 2014 letter (attached) expressing our concerns about the Wildlife Resources Committee, apparently viewed by the Commission as an "informal" committee, we pointed out that "a committee is no longer considered to be strictly advisory if the committee members advise or make recommendations to the decision maker either directly or without significant intervening substantive review." Note that the WRC is further delegating authority to a self-appointed Predator Policy Workgroup ("Workgroup") that was not statutorily convened and is being appointed by the Commission using subjective criteria with virtually no transparency on

PROMOTE

PROTECT

PRESERVE

the process used to select candidates. Furthermore, while neither the invitation to apply to the Workgroup nor the official Fish and Game Commission website identifies any deadlines for applications, we see on the October 7-8, 2015 agenda that the Commission will be making the appointments at that meeting. As the notice for Workgroup nominations was posted on September 11, 2015 and the appointments are to be made at the October 7-8 meeting, very little time is available for the receipt and evaluation of nomination appointments before the final selection.

Since the WRC's inception on January 15, 2014 and subsequent meetings held in 2014 on May 7, July 28, and September 17, and in 2015 on January 14, May 6, and September 9, the WRC continues to function without formal policies and procedures that have been made clear to the public.

NSSF is again expressing concern as we seek further clarification about recent activities at the FGC meeting on August 5, 2015 when the President of the Fish and Game Commission without public discussion, attempted to appoint members to a Predator Policy Workgroup that had not been previously disclosed to the public. On September 11, 2015 the FGC publicly noticed the request for nominations to the Predator Policy Workgroup, thus creating even more confusion about the working of the WRC and the Commission's actions at its August 5 meeting.

Numerous questions arise in reviewing the proposed nomination process criteria for participation in the Predator Policy Workgroup. Of concern are the proper functioning of the WRC and what appear to be extremely subjective criteria. There is little disclosure of how this process will be conducted and how the subjective criteria will be validated. Under "Review Group: negotiate compromises, identifying key issues and conceptual changes" is an example: stakeholders being appointed to this Workgroup are to negotiate compromises on the behalf of a state-convened body. We would also note that references to such things as "best management practices" and "input from qualified experts" are very subjective and would be the choice of the individual appointed to the committee. Will there be a rating criteria for such appointments, such as knowledge or experience with web-based software under "Criteria for Selection"?

A list of organizations and individuals with whom they would be communicating is included under information that should be provided in the nomination. Knowledge of the names on the list, itself, is not a qualification for appointment without the consensus of the stakeholders. Most troubling in the criteria is the qualification that the individual should be able to work collaboratively with those of diverse opinions. There is nothing in the objectives of the WRC that requires this as a criterion (minority opinions provide valuable input to a fact-finding, deliberative and fair process). Exclusion of those voices appears to be self-defeating to the entire purpose of the WRC.

These are just a few of our concerns about this most recent development of the WRC, and we ask the Commission to step back and prioritize formal policies and procedures in public hearings before it proceeds with the adoption of WRC policy. This request has been made

numerous times in writing and during the Public Forum in both FGC and WRC meetings. For the sake of transparency, a public response is necessary.

NSSF exhorts you to consider the future of the Wildlife Resource Committee's effectiveness if a structure of fairness and openness is not provided that allows the participation of all stakeholders.

Sincerely,

Lawrence G Keane

Re: Request for Transparency, Structure and Fairness in the Operations of the California Wildlife Resources Committee

Dear Sirs and Madam:

Safari Club International (SCI) is a worldwide non-profit organization with the mission to protect the freedom to hunt and to promote wildlife conservation. SCI recognizes and promotes hunting as a valuable wildlife management and conservation tool. SCI currently has over 48,000 members and over 6,500 members in California. SCI also has 30,000 California Affiliates, 950,000 U.S. Affiliates and over 7,000,000 International Affiliates.

There are thirteen California Chapters of Safari Club International, collectively representing over 5,000 of SCI's California members who hunt and participate in sustainable wildlife conservation. SCI's California chapters and their members participate in numerous conservation projects throughout the state. SCI California chapters attend Wildlife Resource Committee (WRC) and Fish and Game Commission (FGC) meetings and make every effort to play active roles in the state's decision-making concerning wildlife conservation and management. Despite SCI California chapters' efforts to contribute to and improve the effectiveness and propriety of the WRC's decision-making process, the activities of the WRC continue to deprive SCI California chapters and their members of fair and equal access to these important decisions.

Since the WRC's inception on January 15, 2014 and subsequent meetings held in 2014 on May 7, July 28 and September 17 and in 2015 on January 14, May 6 and September 9, the WRC continues to function without formal policies and procedures and have not made the process that they follow clear to the public. In a letter dated July 14, 2014 SCI's California

chapters outlined some of our concerns about the operation of the WRC. To date we have received no written communication responding to our concerns nor have we seen remedies to the problems we identified. (Please see attached letter, July 14, 2014)

SCI's California chapters are writing again to express our concerns as we seek further clarification about recent activities at the FGC meeting on August 5, 2015 when, without public discussion, the President of the Fish and Game Commission attempted to self-appoint members to a Predator Policy Workgroup that had not been previously disclosed to the public. Ostensibly to remedy this apparent error, on September 11, 2015 the FGC publicly noticed a request for nominations to the Predator Policy Workgroup. This unexplained request for nominations after the President's announcement of an illegal, unilateral and biased designation of nominees, created even more confusion about the workings of the WRC, the actions of the Commission at its August 5 meeting, and the Commission's relationship with stakeholders at the WRC.

The proposed nomination process criteria for participation in the Predator Policy Workgroup does little to improve the problems introduced by the President's inappropriate actions. The announcement of the nomination process does not answer the numerous ongoing questions about the proper functioning of the WRC or the apparent extremely subjective criteria for nominee selection. The WRC continues to offer little disclosure of how the selection of Predator Policy Workgroup members will be made and/or how the subjective criteria will be validated. We also note that there is no due date clearly listed for nominations to be submitted to the WRC, nor is a date by which the member selection will take place.

Once the members are selected, the problems increase. The process, or lack thereof, remains rife with subjective failings. For example, the "Review Group" is expected to negotiate compromises, identify key issues and conceptual changes. It is curious and likely illegal that stakeholders from specific interest groups that are appointed to this workgroup are being given the authority to negotiate compromises on the behalf of a state-convened body. This authority is being delegated without any rules to govern the conduct of these workgroup members. Further no definitions or criteria have been provided for subjective phrases such as "best management practices" and "input from qualified experts." However, the individuals appointed as members are given no guidance as to how to apply these subjective criteria. As a result, these evaluations will be left to the discretion of the individuals appointed to the committee, without consequence for abusing this discretion. It appears that the Drafting and Review groups within the Predator Policy Workgroup will be dictating policy in a vacuum while conducting meetings outside the public's view.

SCI's California chapters believe that the overall criteria for selection potentially excludes some of the most important voices with technical and on-the-ground experience. The process for selecting members of the Predator Policy Workgroup appears to be skewed towards those who lack this kind of technical and on-the-ground knowledge and is in conflict with the very purpose of the WRC for outreach to a variety of stakeholders and consumptive users who do not possess these attributes.

Aside from the criteria for the selection of the Predator Policy Workgroup with all of its obvious problems, the WRC has not announced or codified any formal procedures for the workings of the WRC or the Workgroup. We refer back to our July 14, 2014 letter in urging the Commission to step back and prioritize formal policies and procedures in public hearings before it proceeds with the adoption of WRC policy. SCI and other organizations and individuals have made this request numerous times in writing and during the Public Forum in both FGC and WRC meetings. We still await an answer and we continue to be subjected to WRC meetings that lack consistency and reliability in their management. For the sake of transparency, a public response to our concerns is necessary.

We urge you to consider the future of the WRC's effectiveness if a structure of fairness and openness is not provided for the participation of all stakeholders.

Sincerely,

Lisa McNamee

Attention: Predator Policy Workgroup Nominations

Dear Commissioners:

I am writing to express my support for the nominations of Rick Hopkins, Ph.D., and Keli Hendricks, both of whom have been nominated to serve on the Commission's new volunteer Predator Policy Workgroup. I also want to commend the Commission for its foresight in creating the Workgroup and for undertaking efforts to update California's predator management policies to reflect current science and ecological conservation needs, as well as the needs of landowners and the public.

Dr. Rick Hopkins is a conservation biologist with a Ph.D. from UC Berkeley in Wildlands Resource Ecology. He has extensive experience in the management of large predator species, including bears, mountain lions and other mammalian species. He is an owner of Live Oak Associates, an ecological consulting firm based in San Jose, President of the nonprofit Cougar Fund, and serves on the board of an applied research collective known as Conservation Science Partners. He also serves on the science advisory board of Project Coyote. With his extensive experience, Dr. Hopkins seems eminently qualified to serve on the Predator Management Workgroup and I believe the Commission would be well served by his participation.

Keli Hendricks serves as the Coordinator for Project Coyote's Predator Friendly Ranching project, where she works to foster partnerships with the agricultural community and to educate the public and ranchers on wildlife friendly farming practices that allow wildlife and livestock to share the land for the benefit of both. Project Coyote is based in Marin and Sonoma Counties, which I represent, and is well known in my district for the collaborative work they do statewide with ranchers and others to find common ground and to educate the public on effective practices that can allow predator species and humans to coexist. I appreciate their interest and commitment to working on these issues.

I object to the lack of established procedures and rules governing the Wildlife Resources Committee. The WRC has now established a subcommittee known as the Predator Policy Workgroup. The PWG is a one sided group established to push through an anti-hunting agenda. The PWG is operating without oversight or regulatory guidelines and may influence policies facing the Fish & Game Commission. Please oppose any actions made by the WRC until established rules and procedures are put in place as required by California law.

Subject: Predatory Policy Workgroup Nomination
Date: Thursday, September 17, 2015 5:33:30 PM

Dear President Baylis, Commissioners, and Sonke Mastrup,

I am applying for an appointment to either one of the two Predator Policy Workgroups, whichever you think that my background and experience would be most useful.

I am a livestock rancher and a licensed hunter. I have a B.S. in Environmental Resources. I have participated in Commission and Workgroup meetings and am aware that the subject of Predator Management is a "thorny issue" with a variety of diametrically opposed opinions. I believe that decisions about Predator Management need to be made based on sound, unbiased, science. Not on emotion and opinion.

That being said... I have over 40 years of volunteer experience working with other volunteers from local and state wide clubs (4-H leader forever), to National all volunteer organizations. I have developed excellent negotiating skills working with individuals and groups who hold strong differing opinions. It is possible to reach consensus.

I am well versed in the State of California regulatory process from beginning to end. I retired from the California Air Resources Board after 20 years. The regulatory process and enforcement were my Job description. My negotiating skills proved to be invaluable working with staff and stakeholders to put new or revised regulations in place. It is possible to blend the concerns of local, regional, national, and international stakeholders into a coherent whole to meet State needs.

I am a member of Ducks Unlimited, the Sacramento County Farm Bureau, and the National Open Field Coursing Association. Outreach is very important. Not only to groups but to ranchers, farmers, hunters and other stakeholders who are not affiliated with any particular group. Their input is equally valuable to the rule making process. I will do this by internet, phone calls, personal visits, and speaking at meetings. The more diverse people involved, the better job we can do.

As I mentioned I am retired so I have the time and the "Willingness to commit the time for full participation..."

Thank You,

Sally Barron

[REDACTED]

I am a resident of Bishop, in the Eastern Sierra region, and I would like to participate in the Predator Policy Work Group under the Wildlife Resources Committee. I am willing to participate in either the drafting or reviewing group.

The development of policy related to human-wildlife interactions inherently involves both science and values. I am qualified to identify, read, and evaluate pertinent biological literature. I have a bachelor's degree in Biology and I excelled in undergraduate Mammalogy and Animal Behavior. I seriously considered graduate studies in wildlife biology but decided eventually to go into medicine instead. My interest in wildlife issues is undiminished and my clinical and public health training has given me strength in understanding scientific issues and writing. I am an experienced and competent writer on technical and non-technical issues, with publications in The Washington Post, The New England Journal of Medicine, the federal Morbidity and Mortality Weekly Report and other journals.

I have a long-standing interest in human-wildlife interactions. Apart from my recent engagement in the bobcat trapping issue I cannot claim substantive experience at the wildlife policy level. However in my professional career as a clinician and public health scientist I have demonstrated appreciation and respect for cultural diversity and I have extensive experience working with diverse stakeholders on sensitive issues, primarily in the health arena. I spent part of my career overseas with the federal government, with diplomatic status, working with foreign national governments on sensitive health policy issues, notably HIV in post-conflict Sudan. I inherently respect values and opinions different from my own.

I am computer and internet savvy, experienced with numerous programs and platforms.

I am a well-known and respected member of the Eastern Sierra community and would represent the views of a substantial proportion of our community. I also have developed a fairly extensive network of wildlife stakeholders within and well-beyond this region. I am a member of the board of directors of Friends of the Inyo, a conservation organization based in Bishop with 700 to 800 active members and supporters. Our organization was engaged in advocacy related to The Bobcat Protection Act, working with many Californians concerned about wildlife issues, in our region and across the state. I am a member of the Sierra Club and worked closely with Sierra Club staff and board members on the bobcat trapping issue. I anticipate that Friends of the Inyo and the Sierra Club Range of Light Chapter will submit letters endorsing my participation in the State predator policy development process.

In addition to my service with Friends of the Inyo I currently serve on two other community boards. I am the elected president of our community service district (Starlite CSD), which is responsible for providing water to our community and I am a long-time board member of our local home health and hospice organization (Pioneer Home Health Care). I am also a volunteer and financial supporter of our community wildlife rescue organization, Eastern Sierra Wildlife Care.

I consider myself an informed and thoughtful constituent stakeholder in wildlife and other conservation issues in California, and follow the activities of the Commission and the Department with interest. I look forward to a greater level of involvement.

Thank you for your consideration. I look forward to being a member of one of the working groups.

Sincerely,

Tom Boo, MD

Predator Policy Workgroup Nomination Submission

Candidate Contact Information

Josh P. Brones

Statement of Candidacy

I would like to take this opportunity to submit my candidacy for consideration of participation within the, "Drafting Group" of the Predator Policy Workgroup ("PWG"). In my personal and professional experience, I have the capability to solicit, organize, capture, and publish input from stakeholders from varied backgrounds, natural resource-related worldviews, and credentials. I have significant breadth and depth of experience and understanding with and of California Fish and Game Code and subsequent regulations and policies including those governing the take of predatory species. In addition, I have incredibly extensive lifelong experience and formal university education involving the biological and ecological implications concerning the management of predators.

In my professional life as an executive for an education software company, along with my graduate-level education, I have developed and demonstrated a strong ability to capture ideas verbally and in writing, and bring my analytical skills to bear in the collateral I craft. In addition, I am very capable with most conventional forms of software include Google tools (Sheets, Drive, gmail, etc), Microsoft tools (Word, Excel, PowerPoint, etc), online surveys, HTML and other webpage tools, and other assets useful for this exercise. I would use my communication skills and experience with technology (such as via email, shared Google Sheets and a PWG-centric Google Drive to capture and distribute the status, relevance, and concepts of interest to the PWG to fellow participants in the Drafting and Review groups and other stakeholders as directed by Commission staff.

Given the respect I have for the passion and dedication to an ideal that a person holds dear, I am not threatened by views that differ from my own. Instead, I have forged friendly and constructive relationships with those of differing views, and my persistent instinctive desire is to seek out and exploit those concepts or points that are mutually agreeable as the foundation for moving forward with a shared effort. In addition, given the various capacities I have served in my personal and professional life and the experience brought as a result, I believe that I can effectively incorporate localized knowledge, experience, and culture with shared or divergent values across the state.

I believe that I understand the intent and spirit of the PWG, and I embrace the opportunity to vigorously participate in this body as stakeholder, member of the public, and representative of the conservation community and can be entrusted to remain committed to its success no matter what challenges or adversity.

Current and Past Affiliations

Sportsmen's Alliance - a conservation organization advocating for the role of hunting, fishing, and trapping in the management of wildlife

Government Affairs Coordinator for Western U.S. Operations (2014-Present)

- Attend Department of Fish and Wildlife and Fish and Game Commission meetings and advocate policies of interest to community
- Advocate for and against legislation of compelling interest
- Represent interests and arguments of community with members of media
- Act as liaison for Al Taucher Conservation Coalition (consisting of thirty conservation, outdoor advocacy, and union organizations)

California Houndsmen for Conservation - a conservation organization protecting and promoting the use of hounds as the only catch-and release method of hunting

President (2004-2006 and 2010-2012), Legislative Affairs Analyst (2008-2010), Webmaster (2004-2010)

- Attended Department of Fish and Wildlife and Fish and Game Commission meetings and successfully advocated policies of interest to community
- Advocated for and against legislation of compelling interest including providing testimony in support of increased civil and penal penalties for poaching, increased opportunities for hunting, fishing, and trapping, establishment of account to collect monies for use on big game projects
- Crafted language increasing penalties for use of technology in the commercialization of black bear parts signed into law by Governor Brown
- Represented interests and arguments of constituents with members of media
- Supported programs designed to promote wildlife conversation
- Hosted Fish and Wildlife staff on two-day black bear hunt in order to provide opportunity to gather video and photographic material for Black Bear Awareness Public Service Announcement
- Accompanied Fish and Wildlife staff on visit to multiple high schools to provide cash awards for selected PSA's
- Provided instruction to students at Advanced Hunter Education Clinics

University of Santa Cruz - an institute of public higher education

Volunteer Houndsman for South Bay mountain lion studies (2010-2012)

- Assisted with capture and collaring of mountain lions in the Los Gatos/Santa Cruz region to determine implications of lack of connectivity and the Island Effect and lion movement along the Urban-Wildland Interface
- Attended tri-annual mountain lion workshops hosting biologists and ecologists from North and South America

Steven Childs

[REDACTED]

I have 13 years of experience as a private investigator licensed by the state of California. My experience as an investigator has allowed me to learn to understand and respect diverse cultural and geographical backgrounds learning to work individually and in a team/group environment. With this background I feel I can meet and exceed all of the selection criteria requested;

- Provide input and feedback to the drafters
- Negotiate compromises, identifying key issues and conceptual changes
- Identify best management practices
- Thorough knowledge of predator management practices and policy
- Demonstrable ability to work collaboratively with others of diverse opinions
- Strong writing skills and ability to evaluate statute, policy, and regulations
- Ability to balance regional perspectives and local knowledge or experience with statewide needs
- Access and use of an effective communication network to reach stakeholders not attending the public meetings
- Committed to all aspects of the charge of the PWG
- Experience with web-based software.

Affiliations with groups actively involved in predator management: I am currently a member of the oldest predator hunting association in California: The California State Varmint Callers Association, Inc. which was started in the late 50's and was incorporated in 1968. We provide assistance to private property owners, ranchers and others who express a need to reduce predation on their property.

While on Active Duty with the United States Army, I served in the 111th MI Brigade where I was responsible for operating a Communications Center. This center supported a large and diverse base of clients and their organizations. I was part of a team responsible for implementing a new system for distributing classified message traffic which helped save the Intelligence brigade over \$10,000.00 a year in expenditures for paper and saved thousands of dollars on associated equipment maintenance costs. After the new system was implemented, I was responsible for educating civilian and military customers base-wide on policy and procedures ensuring a smooth transition. I feel this would satisfy the request for experience in collaborative public processes.

I have participated in every Commission level meeting and associated Wildlife Resource Committee meeting since April of 2014 and intend to participate in the process until all matters are resolved regardless of whether or not I am included in the Predator Policy Workgroup.

Organizations I would communicate with would include six California based predator

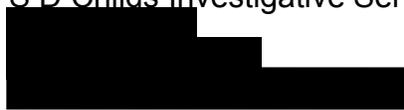

hunting clubs, online forums which would reach hundreds of affected stakeholders throughout the state and staff members from both the National Rifle Association and the California Rifle & Pistol Association.

Over the last year and a half I have spent hundreds of hours reviewing documentation relating to predators, their biology, behavior, suitable habitat and regulatory history in California and throughout the U.S. I feel my experience as a private investigator allows me to use a pragmatic fact based approach which would serve the state of California and its constituents well.

Thank you for your consideration,

--

James R. Conrad's Request for Nomination to the Predator Policy Workgroup

Name: James R. Conrad

Contact information:

Mailing Address:

Phone:

Email:

Mr. Conrad has been a regular and active participant in the WRC meetings and particularly in the Predator Management Committee meetings. He has consistently demonstrated his ability to work collaboratively with others of diverse opinions and is always respectful, polite, and patient. With an undergraduate degree in engineering and a MBA, he has strong writing skills and the ability to evaluate complex statute, policy, and regulation issues. As a Commissioner on the San Diego County Fish and Wildlife Advisory Committee, he has a demonstrated ability to balance regional perspectives and local knowledge and experience with statewide needs.

Mr. Conrad has access to and total familiarity in the use of an effective communication network to reach stakeholders not attending the public PWG meetings (WebEx video and conference call sessions). He is committed to all aspects of the charge of the Predator Policy Workgroup. As the founder and President of SIMS Software, he is knowledgeable and experienced with all manner of software, including web-based software. Perhaps most importantly, he is willing and able to devote the requisite time for full participation on a volunteer basis.

Additional relevant areas of knowledge, expertise and participation with stakeholder groups, wildlife policy, planning and management include:

- Commissioner on the San Diego County Fish and Wildlife Advisory Commission, representing Supervisor Bill Horn, 5th District since March of 2000.
- Charter member of the Big Game and Upland Game Advisory Committees, (established as a result of 2010 legislation SB 1058 that established new dedicated accounts) representing the San Diego County Wildlife Federation and advising the California Department of Fish & Wildlife.
- Charter member of the Al Taucher Preserving Hunting and Sport Fishing Opportunities Advisory Committee (which has now become the WRC) supporting the California Fish and Game Commission.

- Charter member of the California Department of Fish and Game's Game Bird Heritage Program Advisory Committee.
- Coordinated consumptive-use inputs from the recreational hunting community for the U.S Fish & Wildlife Service San Diego National Wildlife Refuge - Public Use Workshop, January, 2007 for the Draft CCP.
- Focus Group participant in the development for the California Fish & Game Commission's Strategic Plan in July, 1998.
- Author of the California Fish and Game Commission's amended policy regarding Multiple Use of Lands Administered by the Department of Fish and Game (8/2/02).
- Past President and current Political Liaison of the San Diego County Wildlife Federation, a coalition of wildlife conservation and outdoor enthusiast organizations that include Ducks Unlimited, California Waterfowl Association, the National Wild Turkey Federation, Safari Club International, Quail Forever, San Diego Sporting Dog Club, the Sportfishing Conservancy, California Rifle & Pistol Association, North American Versatile Hunting Dog Association, San Diego County Varmint Callers and approximately a dozen similar groups.
- Past President of the National Wild Turkey Federation, San Diego Chapter where he worked with the Department of Fish and Game on the successful reintroduction of wild turkeys to San Diego County.
- Life Member of the California Waterfowl Association , Sponsor Member of Quail Unlimited, Life Member of Pheasants Forever and also a member of Safari Club International where he currently is the President of the San Diego Chapter.

CALIFORNIA FARM BUREAU FEDERATION

GOVERNMENTAL AFFAIRS DIVISION

1127-11TH STREET, SUITE 626, SACRAMENTO, CA 95814 · PHONE (916) 446-4647

September 10, 2015

Mr. Jack Baylis, President
Fish and Game Commission
1416 9th Street, Room 1320
Sacramento, CA 95814

RE: Predator Policy Workgroup Nomination

Dear President Baylis:

I am writing to request appointment to the Predator Policy Workgroup as discussed on numerous occasions by the Wildlife Resources Committee (WRC) and the Fish and Game Commission. If appointed I would represent the California Farm Bureau Federation (Farm Bureau). Farm Bureau represents more than 57,000 members as it strives to protect and improve the ability of farmers and ranchers engaged in production agriculture to provide a reliable supply of food and fiber through responsible stewardship of California's resources. Farm Bureau's members are impacted by predators on a regular basis, both through injuries and loss of their animals and through damage to their crops and property. For these reasons, it is important for their perspectives to be included in discussions by the workgroup.

As a representative of Farm Bureau, I have participated in numerous collaborative public processes related to wildlife policy and management. These efforts include serving on the Wolf Management Stakeholder Working Group, the California Fish and Wildlife Strategic Vision process, and the Coho Recovery Team. Additionally, when the WRC began its focus on predator management, I participated in the effort to review the existing policies, regulations, and statutes governing predator management in California. All of these processes have given me experience in working with numerous individuals with very diverse viewpoints to obtain common understanding of complex issues. It has also provided me with a working knowledge of the regulatory and statutory framework governing California's wildlife management.

Farm Bureau is made up of 53 county Farm Bureaus, representing farmers and ranchers in 56 counties. I work closely with our county Farm Bureaus to ensure our members have a voice before state government and to ensure our members are informed of regulatory and statutory changes affecting them. To achieve this information flow, Farm Bureau has a weekly newspaper for our members, as well as regular electronic updates of proposed regulatory and statutory changes.

If selected, I am committed to serving on this workgroup and ensuring my members voices are included in this process. Should you have any questions or need additional information, please don't hesitate to contact me by phone [REDACTED] or e-mail ([REDACTED]).

Sincerely,

A handwritten signature in cursive script that reads "Noelle G. Cremers".

Noelle G. Cremers
Director, Natural Resources and Commodities

We would like to add our names (Ronald Stephens) & (Grandville Crow) to the predator policy work group. This can be tier 1 or tier 2.

We would like to be added to the list for meetings and agendas. Please e-mail ([REDACTED]).

Ronald Stephens

[REDACTED]

(Retired)

Grandville Crow

[REDACTED]

(Retired Engineer)

We have been in stakeholders predator policy for two years and have been predator hunters for 40 + years. We have always been in predator hunting clubs and are connected to and advise many predator hunting clubs and groups. We are also connected to trapper groups.

Our clubs and groups hunt or trap only predators. We are not like other groups that hunt all animals or only hunt predators once in a while. We are the largest stakeholder in Southern California for predator hunting groups.

RE: Stakeholders' Working Groups !

Dear President Baylis, Commissioners and Sonke Mastrup,!

I'd like to formally "put my name in the hat" to be consider for one of the Five who will be helping draft the beginnings of a predator policy and suggest revisions to existing predator management regulations for your consideration.!

I believe I am uniquely suited for this position as I am a writer, I am self employed and can devote time to this endeavor. I am also very familiar with the regulations, in fact, I have already put some time and thought into this (see attached). !

I also recently submitted a first draft of Best Practices for Response, Care and Re-Wilding of Mountain Lions in California to the Department. I believe it is currently being reviewed by Nicole Carion, Steve Torres and Mark Kenyon.!

If I were chosen for this exclusive group, I would be representing Humane Wildlife Control Association (a national trade association) and my nonprofit, Wildlife Emergency Services. Through these two entities I am very well-connected and feel as though I could represent the voices of my colleagues in both fields !

If I may, I think it would be good to share the panel with someone representing the livestock industry, a sport hunter or trapper, I think it would be good to have Camilla Fox or someone she appoints to speak from her camp, and a biologist familiar with California predator species.!

I hope you will consider me for the Five. I have an alternate in mind - my husband Duane, who would be kept apprised and take my place should I be unavailable. If I am not one of the Five, I do hope you'll allow me to serve on the review committee of 10-20.!

Thank you for your time and consideration.!

Rebecca Dmytryk!
Owner / Humane Wildlife Control!
President / Humane Wildlife Control Association!

STRATEGIES TO ADDRESS PREDATOR INTERACTIONS AND CONFLICTS

Objective

Minimize the potential for predator interactions and conflicts through development and implementation of a comprehensive public education and assistance program.

Strategies

- Work with stakeholders to develop and implement a comprehensive outreach and educational program that prepares and guides citizens and livestock producers on coexisting with predators (e.g., media materials, trainings and workshops, website resources) to include ways to avoid predator interactions and depredation losses, and appropriate responses to encounters with predators.
- Work with stakeholders to develop response protocols for reported predator interaction/conflict.
- Develop a streamlined interaction/conflict reporting process (e.g., online submission form).
- Provide education, outreach and technical assistance to citizens and livestock producers to reduce predator interaction/conflict.
- Discourage activities that attract predators (e.g., accessible garbage/refuse, feeding of wildlife, accessible pet food, feral cat feeding stations) and support creation of legislation prohibiting such activities.
- Provide resources for non-lethal predator control supplies and equipment (e.g., fladry, strobe lights, hazing supplies, radio-activated guard devices, and electric fences) and referrals to organizations and businesses that offer non-lethal wildlife conflict services.
- Provide regular training to state and county personnel, volunteers and cooperators on adequate predator-proof livestock housing and management practices, the most current non-lethal techniques for reducing predator conflicts, as well as protocol for securing a depredation scene.
- Provide timely response to predator-related complaints through added assistance from district biologists and working arrangements with NGOs.
- Work with nonprofits and NGOs that offer programs that complement state efforts in reducing predator conflicts.

RESPONSE TO PREDATOR CONFLICTS

NON-INJURIOUS HARASSMENT

Non-injurious harassment of predators in the act of harassing, attempting to harass or in close proximity to pets or livestock allowed by landowners, livestock producers or their agents. Such actions can include scaring off an animal(s) making loud noises or otherwise confronting the animal(s) without doing bodily harm.

For such action to occur, the following criteria apply:

- No permit is required.
- It must not result in injury to the animal.

NON-LETHAL INJURIOUS HARASSMENT

Non-lethal injurious harassment of predators following confirmation of predator depredation on pets or livestock or other predator conflict (i.e., loitering, testing, chasing, or disrupting pets or livestock) allowed by landowners, livestock producers or their agents on private land without a permit. A permit is required on public land, and shall be issued following confirmation by the Department of predator depredation on pets or livestock or other predator conflict to permittees who are legally using public land under valid livestock grazing allotments.

Such non-lethal injurious harassment actions can include use of projectiles – paintballs, rubber bullets or bean bags, vehicle, or other pursuit-oriented hazing.

It is recommended that landowners, livestock producers or their agents confer with the Department or authorized representatives to determine the most effective tool for harassment.

For non-lethal injurious harassment to be undertaken, the following criteria apply:

- No permit is required.
- Predator may be pursued (without the requirement of an unintentional encounter).
- Actions can take place only on private land or public grazing allotment.
- No identified circumstances exist that are attracting predator-livestock conflict.
- The Department or Department-authorized representatives may assist by providing equipment, staff or both if requested.

RELOCATION

Relocation may occur when predator(s) become inadvertently involved in a situation or are present in an area that could result in conflict with humans or harm to the predator. Examples could include a predator caught in a trap set for another animal or a wolf found within or near an urban area, causing human safety concerns. This action differs from translocation in that the need is more immediate to solve a particular situation.

For relocation to occur, four criteria must be met:

- The action must be conducted by Department personnel only.
- Predator(s) will be relocated to suitable habitat at the direction of the Department or Department-authorized representatives.
- The action must be taken to prevent conflict with humans or harm to the predator.
- The predator is not known or suspected to have depredated livestock or pets.

LETHAL TAKE

Lethal take of predators will be authorized in situations of conflict with pets or livestock as described below, and human safety.

1. CAUGHT IN THE ACT

To stop a predator in the act of attacking livestock, a permit is required for landowners, livestock producers, grazing permittees (using public lands), or designated agents to use lethal force to stop a predator that is in the act of biting, wounding or killing pets or livestock.

Such permits are issued only after the Department has confirmed that predator has previously wounded or killed pets or livestock in the area and efforts to resolve the problem have been deemed ineffective. The term “in the area” refers to the area determined by the Department or Department-authorized representatives to be frequented by the predator(s).

Efforts to resolve the problem may be preventative efforts implemented specifically to minimize or avoid predator conflict before the initial depredation or non-lethal control implemented specifically to minimize or avoid predator conflict after the initial depredation.

The permit holder is required to continue implementing non-lethal actions to minimize or avoid predator conflicts during the life of the permit and issuance of future permits will be contingent upon this effort.

If a predator is taken under the “Caught In the Act” permit, the permit holder must preserve evidence (on site) of the animal(s) freshly (less than 24 hours) wounded or killed by the predator for Department or Department-authorized representatives to confirm the loss or wound was caused by the predator.

For lethal take to be undertaken, the following criteria apply:

- A permit is required on private and public land.
- The predator must be found in the act of attacking, not testing or scavenging.
- There must be fresh evidence that an attack occurred (e.g., visible wounds, chase tracks).
- The predator carcass must not be removed or disturbed.
- Any incident must be reported to the Department or Department-authorized representatives within 24 hours.

- No identified circumstances exist that are attracting predator conflict.
- Permit holder is required to implement non-lethal actions to minimize or avoid predator conflict during the life of the permit.

2. TWO STRIKES

To stop chronic predator-related depredation on private and public land: State or federal agents are authorized to use lethal force on a particular predator on public or private land at a property owner's or a permittee's request if the Department has confirmed two depredations in the area by the same predator, or one confirmed depredation following three documented attempted depredations (testing or stalking).

For such action to occur, the following criteria apply:

- The action must be conducted by authorized state or federal personnel only.
- Attempts to solve the situation through non-lethal means must be confirmed and documented.
- No identified circumstances exist that are attracting predator conflict.
- Evidence does not exist of non-compliance with applicable laws.

Controlled take of predators is not allowed.

CURRICULUM VITAE

REBECCA DMYTRYK

P.O. BOX 65, Moss Landing CA 95039 USA

PERSONAL DATA

Date of Birth: [REDACTED]
Place of Birth: Los Angeles, California
Interests: Wildlife, ethology, photography, video and production, journalism.

History: Rebecca Dmytryk, daughter of famous film director Edward Dmytryk and actress Jean Porter, moved to the hills above Malibu in 1974 where her fascination with wildlife and reverence for nature flourished. At age 13 she was relocating rattlesnakes from the backyard, and horseback riding in the mountains from dawn until dusk. Inspired by Jane Goodall and E. O. Wilson she went on to study animal behavior and wildlife rehabilitation. Since the mid-1980's Rebecca has used her success as a small business owner to help organize a number of wildlife rescue programs. In 1996 she founded The California Wildlife Center, based in Malibu, and managed its operations for over four years. Having established one of the first wildlife rescue programs of its kind in the United States, Rebecca has become a leading authority on first response and wildlife capture. She became a published author in 2012 with the release of her first book, *Wildlife Search and Rescue: A Guide for First Responders* (Wiley Blackwell). She currently heads the National Association for Wildlife Emergency Services and continues to pioneer in the field. Her latest work, WildHelp, a mobile app to help finders locate assistance for wild animals in distress is scheduled to debut by the end of 2015.

FORMAL EDUCATION

Pierce College, 1984: Biology
University of California, Los Angeles, 1983: Animal Behavior, Observing Animal Behavior
Diploma, Public High School, Agoura, California, 1978: Biology, Herpetology, Photography

PRESENT VOCATIONS AND POSITIONS

President and CEO, National Association for Wildlife Emergency Services (nonprofit)
President, Humane Wildlife Control Association (nonprofit)
Owner/Operator, Humane Wildlife Control (business)
Voice Talent
Author

PROFESSIONAL APPOINTMENTS AND EMPLOYMENT

2013 to present: Founder, President and CEO, National Association for Wildlife Emergency Services

2013 to present: President, Humane Wildlife Control Association

2012 to present: Owner, Humane Wildlife Control, Moss Landing, CA

2007 to 2015: Owner, Carmel Canines Mobile Pet Services, Moss Landing, CA

2000 to 2013: Founder, Director, WildRescue, a project of EarthWays Foundation

2002 to 2004: California Dept of Fish & Wildlife South Coast Region Wildlife Rehabilitation Committee

2002 to 2003: Board Member, California Council for Wildlife Rehabilitators

1996 to 2002: Founder, President and CEO, The California Wildlife Center

1993 to 2011: International Bird Rescue Oiled Wildlife Response Team. *Jobs included search and collection, lab work, intake, cage construction, washing, and video documentation. Spills included: 1992-1993 Chevron, Mobil, Alinari Quarto, CA; 1993 McGrath, Ventura, CA; 1993-94 Four Corners, Santa Clarita, CA; 1994 Tidelands, Long Beach, CA; 1994 McDonnell Douglas, Long Beach, CA; 1994 Crowley, Seattle, WA; 2/95 Chevron, Venice, LA; 2/95 Metrolink/Unocal, Long Beach, CA; 3/95 Chevron, Coalinga, CA; 11/95 Newport Beach, CA; 3/96 US Navy, Shelter Island, CA; 1/97, Marina Del Rey, CA; 1997 Torch, Vandenburg, CA; 1/98 Carson, CA; 2/98 Luckenbach, Point Reyes, CA; 2/98 Ventura, CA; Huntington Beach, CA; 9/99 Humboldt, CA; 10/99 Culver City, CA; 2/00 Malibu, CA; Santa Paula, CA; 1/01 San Pedro, CA; 2/01 The Jessica, Galapagos Islands, Ecuador; 3/01 Port Hueneme, CA; 9/01 Santa Barbara, CA; 12/01- 2003 Luckenbach, San Mateo-Monterey, CA; 12/04 Pemex, Veracruz, Mexico; 1/05 VOBI I, Ventura, CA; 6/05 Hess, Venice, LA; 7/05 Westin, Marina Del Rey, CA; 6/06 Glass Bottom Boat, Malibu, CA; 3/07 VOBI III, Ventura, CA; 11/07 Cosco Busan, San Francisco, CA; 11/09 Dubai Star, San Francisco, CA; 4/10 BP Deepwater Horizon, Gulf Coast.*

1992: Secretary and Treasurer, International Center for Gibbon Studies, Saugus, CA

1991 - 1993: Co-Founder, Vice President, Marine & Mountain Wildlife Rescue, Malibu, CA

1987: Officer, Los Angeles County Animal Care and Control, Agoura, CA

1986 to 2007: Owner/Operator, Malibu Mobile Pet Services, Malibu CA

1985: Secretary, Marine Wildlife Rescue Station, Agoura, CA

1983 - 1989: Reserve Officer, Los Angeles County Animal Care and Control, Agoura CA. *Hands-on experience in the handling of domestic, wild and exotic animals, shelter operations and volunteer programs. Job included organizing and hosting public education seminars on wildlife.*

1980 to 1982: Co-Founder, Animal Rescue Care Center, Thousand Oaks, CA

SPECIAL TRAINING AND CONTINUING EDUCATION

2014: 8-HR HAZWOPER refresher. Online.

2013: Nuisance Wildlife Trapping Webinar, State Humane Assn. of California

2013: National Wildlife Rehabilitators Association annual symposium, Murfreesboro, TN

2013: Nuisance Wildlife Trapping, webinar presented by State Humane Association.

2013: 8-HR HAZWOPER refresher. Online.

2013: National Wildlife Rehabilitators Association annual symposium, Portland, OR

2012: California Council for Wildlife Rehabilitators annual symposium Yosemite, CA
2012: 8-HR HAZWOPER refresher. Online.
2012: National Wildlife Rehabilitators Association annual symposium, Baton Rouge, LA
2011: 8-HR HAZWOPER refresher. Online.
2011: International Wildlife Rehabilitation Council annual symposium, Fort Lauderdale, FL
2010: National Wildlife Rehabilitators Association annual symposium, Bellevue, WA
2010: 8-HR HAZWOPER refresher. Online.
2009: Effects of Oil on Wildlife, Tallinn, Estonia
2009: 8-HR HAZWOPER refresher. Online.
2008: 8-HR HAZWOPER refresher. Online.
2008: International Wildlife Rehabilitation Council annual symposium, Napa, CA
2007: Effects of Oil on Wildlife conference, hosted by OWCN & IBRRC, Monterey, CA
2007: International Wildlife Rehabilitation Council Rehabilitator's Certification
2007: 8-HR HAZWOPER refresher. Online.
2004: International Wildlife Rehabilitation Council annual symposium, Portland, OR
2003: International Wildlife Rehabilitation Council annual symposium, Chicago, IL
2003: Effects of Oil on Wildlife conference, hosted by IFAW & IBRRC, Hamburg, Germany
2003: 24 Hours HAZWOPER training, Hazard Communication Course 1001, San Luis Obispo, CA
2002: California Council for Wildlife Rehabilitators annual symposium, San Diego, CA
2002: ATV Safety Institute Rider Course, Rancho Cordova, CA
2002: National Wildlife Rehabilitators Association annual symposium, St. Louis, MO
2001: International Wildlife Rehabilitation Council annual symposium, Orlando, FL
2001: California Council for Wildlife Rehabilitators annual conference, Fremont, CA
2001: Oiled Wildlife Care Network Advanced Training, San Pedro, CA
2001: National Wildlife Rehabilitators Association annual symposium, Lake Tahoe, NV.
2000: International Wildlife Rehabilitation Council annual symposium, Montreal, Quebec
2000: California Council for Wildlife Rehabilitators annual symposium, Newport Beach, CA
1999: International Wildlife Rehabilitation Council annual symposium, Tucson, AZ
1999: California Council for Wildlife Rehabilitators annual symposium, Sacramento, CA
1998: National Wildlife Rehabilitators Association annual symposium, Seattle, WA
1998: California Council for Wildlife Rehabilitators annual symposium, San Rafael, CA
1998: Bird Deterrence Workshop provided by UDA, APHIS, Wildlife Services, Sacramento, CA
1997: California Council for Wildlife Rehabilitators annual conference, Morro Bay, CA
1995: International Wildlife Rehabilitator's Council, Basic Skills, Klamath Falls, OR
1995: 40 hours HAZWOPER training, Seattle, WA
1994: 24 hours HAZWOPER training, Department of Fish and Wildlife-OSPR.
1993: 16 hours OSHA / Post Emergency Oil Spill Response Training.
1993: National Wildlife Rehabilitators Association annual symposium, Sacramento, CA

1991 - 1993: Volunteer position with the International Bird Rescue and Research Center
1992 - 1993: The Marine Mammal Center, Sausalito, CA - *Extensive hands-on training in the care of infirm pinnipeds, including field rescues, tube feeding, nutrition, restraint and handling techniques.*
1992: *Shelter Management and Operations, Disaster Preparedness, Wildlife Handling*, American Humane Association Conference, San Diego, CA
1992: UC Davis' Wildlife Health Program Oil Spill and Wildlife Emergency Response Conference.
1986: *Handling of Exotics*, Los Angeles SPCA

PERMITS LICENSES AND CERTIFICATIONS

2015 to present: Pest Control Business License issued by California Dept. of Pesticide Regulation
2015 to present: Dept. of Pesticide Regulation Qualified Applicators License 135684
2013 to present: U.S. Fish & Wildlife Service, Special Purpose Education/Salvage MB05124B
2012 to present: U.S. Fish & Wildlife Service, Rehabilitation MB794662
2011 to 2012: U.S. Fish & Wildlife Service, Special Purpose Relocate MB38756A
2007: International Wildlife Rehabilitation Council, Wildlife Rehabilitation Certification
1994 to present: 24-Hour HAZWOPER Certification
2004 - 2008: NOAA NMFS Marine Mammal Stranding (Malibu)
2000 - present: U.S. Fish & Wildlife Service, Special Purpose MB794662
1998: U.S. Fish & Wildlife Service, Rehabilitation (The California Wildlife Center)
1998: California Department of Fish & Wildlife, Rehabilitation (The California Wildlife Center)
1994 - 1998: U.S. Fish & Wildlife Service, Special Purpose (individual permit)
1989 - 1995: California Department of Fish & Wildlife, Rehabilitation (individual permit)
1981: California Department of Fish & Wildlife, Rehabilitation (Animal Rescue Care Center)

CONFERENCE ACTIVITY AND PARTICIPATION

TALKS, WORKSHOPS AND PAPERS PRESENTED

Good afternoon,

I am applying for the drafting group. If I am not selected for the drafting group, please discuss with me before appointing me to any other group (e.g., review group). I'm not certain I want to serve in an alternative capacity.

Nominee name and contact information, including mailing address, phone number and email address

Jennifer Fearing
Fearless Advocacy, Inc.

[REDACTED]
[REDACTED]
[REDACTED]
[REDACTED] email

A short statement to confirm how the applicant meets each of the selection criteria listed above

I have significant experience in all aspects of these criteria, and am particularly adept at negotiating, writing and communication.

Where appropriate, identify current and past affiliations with stakeholder groups active in wildlife resource management, particularly predator management

Participated actively in the Fish and Wildlife Vision process
Routinely included in stakeholder groups involved in wildlife protection legislation
Member of the CalTIP Rewards committee

A brief summary of past involvement in collaborative public processes to provide advice on wildlife policy, planning, or management

In addition to experience listed in prior question, I have 7+ years experience attending Fish and Game Commission meetings and participating actively with the full Commission and the WRC.

Willingness to commit the time for full participation on a volunteer basis

Yes, and I have a good track record of keeping such commitments.

Descriptions of the organizations and individuals with which the nominee will communicate about the efforts of the workgroup and the mechanisms to be utilized

Through verbal and written communication:

The Humane Society of the United States

Defenders of Wildlife

Fund for Animals Wildlife Center

Humane Society Veterinary Medical Association

San Francisco SPCA

Interested members and of the legislature and legislative staff

Other wildlife care organizations

Areas of knowledge or expertise relevant to the project

Hoping that this is known to the Commission given my years of engagement. Please let me know if I need to provide specific examples.

Thank you,

Jennifer Fearing | President

Subject: Predator Working Group Meeting Notice Request (Bagley-Keene Act)
Date: Thursday, October 01, 2015 11:16:16 AM

Dear California Fish and Game Commission,

I am contacting you as a citizen and hunter living in the State of California. I strongly object to the Commission's Wildlife Resource Committee process and to its unilateral formation of a "Predator Policy Workgroup" ("PWG"). The WRC has been a one-sided platform for anti-hunting groups seeking to push their agenda. The NRA is seeking to level the playing field by ensuring that all stakeholders, not just anti-hunting groups, can access and participate in the process of developing wildlife policy that directly affects hunters.

I also vehemently object to the Commission's ignoring of inquiries made by NRA, joined by the National Shooting Sports Foundation and Safari Club International. These organizations are not faceless entities, but are rather representatives of millions of lawful citizen/tax payers such as myself. You cannot ignore these organizations and selectively partner with organizations such as the Sierra Club, The Nature Conservancy, World Wildlife Fund, Audubon Society, etc. that seek to outlaw hunting.

The State of California is extremely heavy-handed in the development of rules, regulations and policies that affect hunters and sportsmen. Even something as seemingly minor as the Department of Fish & Game changing its name to Fish & Wildlife is significant.

I am a working professional that has dealt with regulations and program development during my 23 year career. I work closely with members of the California Department of Fish and Wildlife - Office of Spill Prevention and Response, the US Fish & Wildlife Service, US Department of the Interior, Bureau of Land Management, California State Lands Commission, San Francisco Bay Conservation and Development Commission (BCDC), East Bay Regional Parks and the US Coast Guard. This experience as an educated outdoorsperson with significant regulatory experience makes me uniquely qualified to serve on a committee such as the Predator Policy Workgroup.

I formally request to serve as a member of the Wildlife Resource Committee and the Predator Policy Workgroup.

Please send me information on the schedule of meetings for the Wildlife Resource Committee, the Predator Policy Workgroup and all other "Workgroups" that have been established by the WRC or are in consideration for development as per the requirements of the Bagley-Keene Open Meeting Act. (Govt. Code §§11120-11132).

Very Respectfully,

James Ferris

Attention: Sonke Mastrup, Executive Director
RE: Predator Policy Workgroup Nomination

Dear Mr. Mastrup:

The California Deer Association is proud to nominate **Patrick Fitzmorris**, to represent the interests of the association as a member of the Commission's newly formed Predator Policy Workgroup.

As the principle non-profit conservation organization focused on increasing the health and population of California's deer herds, the California Deer Association takes a keen interest in the conservation and management of this important species. Ensuring an appropriate policy framework is established to address the myriad concerns surrounding California's predators is an important to the thousands of CDA members and nearly 150,000 deer hunters.

Mr. Fitzmorris has worked in various capacities at a number of important conservation organizations and as a member of multiple governmental advisory groups. This professional experience, combined with his education in Wildlife Management and as a hunter, uniquely qualifies him to offer an educated, reasoned, and experiential based perspective as the workgroup examines this important issue. His demeanor is non-confrontational and he is respectful of the deliberative process and will add value to the efforts of the group.

Attached is Mr. Fitzmorris' introductory letter and vitae. If I can provide any additional information for you or the selection committee, please don't hesitate to ask.

Sincerely,

Roman Porter, CEO

October 7, 2015

Wildlife Resources Committee
California Fish and Game Commission
1416 Ninth Street, Room 1320
Sacramento, CA 95814
Attention: Predator Policy Workgroup Nomination

To Whom It May Concern,

Please accept my application for the Predator Policy Workgroup. I am very eager to participate in this workgroup as I value California's predator populations and native wildlife for current and future Californians to enjoy. Being a native Californian myself, my mother's family emigrated to California in the 1870's, I have seen many changes to California's valuable ecosystems and I want to part of the solution to preserve natural resources and native wildlife for future Californians to appreciate.

I have participated in several workgroups in the past and I value and appreciate the opinions of others. I have been an active participant on the U.S. Department of Agriculture Natural Resources Conservation Service - State Technical Advisory Team, the Yolo Bypass Working Group, and the Central Valley Habitat Joint Venture - Delta, Yolo, and Suisun Marsh Regional Working Group. These appointments have given me great respect of working collaboratively for a common goal.

As the Senior Field Director of the California Deer Association, I work with many concerned sportsmen and sportswomen, and other caring individuals in our great state who want to make a difference in habitat restoration and wildlife conservation. If chosen for this position, I will take the appointment seriously and commit my time as a full participant. I will report on the workgroup findings and actions to our Board of Directors and our Chief Executive Officer.

Thank you for your time and considering me as a full participating member of the Predator Policy Workgroup.

Sincerely,

Patrick Fitzmorris
Senior Field Director
CA Deer Association

Patrick J. Fitzmorris

OBJECTIVE

To use my interpersonal skills and knowledge of wildlife conservation to make my contribution to the wise use of our predator natural resources by advancing the efforts and goals of the California Department of Fish and Game Commission, the Wildlife Resources Committee, and the Predator Policy Workgroup.

EDUCATION

Humboldt State University: Arcata, California. Bachelor of Science in Wildlife Management. Degree Awarded May, 2000

Courses included: Natural Resource Conflict Resolution, Waterfowl Management, Management of Wetlands Habitats, Scientific Writing, Plant Taxonomy, Plant Ecology, Ornithology, Wildlife Techniques, Upland Game Management, Conservation Biology, Soils, Ethology, Statistics, Zoology, Wildlife Management Principles, Botany, Mammalogy, GIS Technology.

CAREER EXPERIENCES

Title: Senior Field Director, California Deer Association - Sacramento, CA

Duties and Accomplishments: I currently am responsible chapter development and fundraising for the California Deer Association. We are a nonprofit conservation group dedicated to improving California deer herds and other wildlife through direct financial support for habitat and research projects. I help and guide chapters on the execution of successful fundraising events to meet annual budget projections. I also write a column and other articles for our magazine and promote CDA through the media and public speaking engagements. I maintain liaison and professional visibility with state wildlife agencies and federal wildlife and land management agencies. I am involved in our habitat and youth projects for the state and work closely with our agency partners in this regard.

Tenure: 2005 - present

Title: Regional Biologist, Ducks Unlimited, Sacramento California.

Duties and Accomplishments: I planned, designed, and conducted wetland, upland, and riparian habitat projects in the Central Valley of California on public and private lands. I developed and implemented plans and worked closely with project partners and funding agencies. I conducted and organized on-site and off-site meetings, managed project budgets, hired and supervised private contractors and invoiced bills for completed work. I searched for funding sources, wrote grant requests to help finance projects and developed management plans for private wetlands. I advised landowners of conservation easements and agency habitat programs such as the Wetlands Reserve Program, the Conservation Reserve Program, the Conservation Reserve Enhancement Program, Wildlife Habitat Incentives Program, Environmental Quality Incentives Program, the CA Wildlife Conservation Board's Inland Wetlands Program, and the USFWS Partners for Wildlife Program. I conveyed information to the general public via the media and gave presentations to private groups.

Tenure: 2001-2005

Title: Waterfowl Habitat Biologist, California Waterfowl Association - Sacramento, California.

Duties and Accomplishments: In this position, I planned, designed, and conducted wetland, upland, and riparian habitat projects in the Central Valley of California on public and private lands. I developed and implemented plans and worked closely with project partners and funding agencies. I conducted and organized on-site and off-site meetings, managed project budgets, hired and supervised private contractors and invoiced bills for completed work. I searched for funding sources, wrote grant requests to help finance projects and developed management plans for private wetlands. I advised landowners of conservation easements and agency habitat programs such as the Wetlands Reserve Program, the Conservation Reserve Program, the Conservation Reserve Enhancement Program, Wildlife Habitat Incentives Program, Environmental Quality Incentives Program, the CA Wildlife Conservation Board's Inland Wetlands Program, and the USFWS Partners for Wildlife Program. I conveyed information to the general public via the media and gave presentations to private groups. I also wrote for the monthly magazine on wetland, waterfowl, and conservation issues.

Tenure: 2000 - 2001

Title: Research Assistant for Humboldt State University - Department of Wildlife, Arcata California

Duties and Accomplishments: I organized and conducted western Canada goose (*Branta Canadensis moffitti*) catches near Humboldt Bay, California, developing the catch program in cooperation with California Department of Fish and Game and private landowners. I managed volunteers, catch equipment and data collection. I evaluated data sets and marked geese with neck collars and USFWS metal tarsal bands.

Tenure: 1998-1999

Title: Biological Science Technician - U.S. Geological Survey - Cordova, Alaska

Duties and Accomplishments: As a U.S. Geological Survey Biological Science Technician, I studied dusky Canada geese (*Branta Canadensis occidentalis*), a species of special concern that nests in the Copper River Delta region of south-central Alaska. I studied mortality, brood survival, predation, nesting and re-nesting success applying intensive nest searching skills, captures of broods on the nest at hatch using bail traps, radio marking hens and goslings, and radio telemetry. My responsibilities also included setting up monitoring cameras at nest sites to document depredation. As part of the overall monitoring effort, I took specific measurements on specimens, attached neck collars, tarsal bands, and web tags. I collected UTM coordinates using GPS and entered all data into a project specific program. In addition, I helped the Alaska Department of Fish and Game with their annual Dusky flightless molt roundup, a cooperative measure designed to capture, band, age, and sex birds by capturing them during the summer molt.

Tenure: May through August, 1998

Title: Biological Science Technician, U.S. Fish and Wildlife Service - Lakeview, Oregon

Duties and Accomplishments: As a Biological Science Technician on the Sheldon-Hart Mountain National Wildlife Refuge Complex, I conducted wildlife surveys and radiotelemetry on game and non-game species, monitoring vegetation plots, keeping detailed field notes, recording data and preparing reports. As part of an antelope fawn mortality study, I captured antelope fawns for radiotelemetry marking, took various samples and monitored fawns with radiotelemetry equipment. I conducted the annual breeding bird survey, sage grouse brood surveys and radiotelemetry on marked sage grouse hens. I also used horses to survey and maintain boundary fences and responded to all livestock trespasses by herding cows off the refuge.

Tenure: 1996 - 1997

SPECIAL SKILLS

- Excellent working knowledge of Microsoft Office Applications, Power Point, Email, ArcView GIS
- Excellent skills in working with others with diverse opinions
- Excellent writing skills, both scientific and layman's
- Excellent public speaking skills
- Excellent organizational skills
- Training in natural resource conflict resolution

PROFESSIONAL COMMITTEES

- U.S. Department of Agriculture Natural Resources Conservation Service, State Technical Advisory Team – past member
- Yolo Bypass Working Group – past member
- Central Valley Habitat Joint Venture, Delta, Yolo, and Suisun Marsh Regional Working Group – past member

PROJECT COYOTE

F O S T E R I N G C O E X I S T E N C E

Oct. 2, 2015

California Fish and Game Commission
1416 Ninth Street, Room 1320
Sacramento, CA 95814
Attention: Predator Policy Workgroup Nominations

VIA email: FGC@fgc.ca.gov

Dear Commissioners:

Project Coyote would like to nominate two candidates for the Predator Policy Workgroup. For the Draft Group/Committee we nominate Rick Hopkins, Project Coyote Science Advisory Board member and co-owner and Senior Conservation Biologist at Live Oak Associates, Inc .:

Rick Hopkins, Ph.D.
Project Coyote Science Advisory Board
Principal and Senior Conservation Biologist, Live Oak Associates, Inc.
6840 Via del Oro, Suite 220

Statement of Qualifications: Rick Hopkins is co-owner and Senior Conservation Biologist at Live Oak Associates, Inc. (LOA), an ecological consulting firm based in California. LOA provides public and private clients with science-based solutions to complex natural resource questions. Rick holds a Ph.D. in Wildlands Resource Ecology from University of California, Berkeley and an M.A. in Biology at San Jose State University. His graduate research involved a 12-year study on the spatial ecology of the cougar in the Diablo Range. Rick has also provided scientific peer review assistance in evaluate proposed management actions with black bears in California, Nevada and Maine.

Conservation biologists have long recognized the importance of connecting large landscapes as integral to conservation of all carnivore species, particularly large carnivores. As such, Rick has been at the forefront advocating for methodologies and analytically approaches that best identify key landscape linkages. Rick has participated in state-wide efforts to identify the important

landscape linkages remaining in the state (i.e., Missing Linkages Conference) and in regional efforts such as the San Francisco Bay Area Upland Goals Workshop and TNC Central Coast Ecoregional Workshop. These efforts have focused Rick's interest in using theoretically grounded spatial tools to inform conservation planning at relevant spatial scales. An integral part of this process is working with applicants and landowners to identify suitable landscapes to conserve and manage to fulfill any required state or federal obligations that the regulated community may have incurred as part of their projects. Presently he is using these approaches in the development of a multi-species HCP for the 47,000-acre Elk Hills Oil Field, a cougar habitat management plan for 35,000 km² area of Southern California, and developing conservation strategies for large-scale solar projects in central to southern the San Joaquin Valley.

Rick is a broadly trained ecologist with experience with several threatened and endangered wildlife species and has dedicated the last 38 years to the study of mammalian carnivores. His research and interest with large carnivores has focused on conservation biology; population ecology; spatial ecology, and human/predator conflicts.

Rick was a founder and serves on the board of Conservation Science Partners (www.csp-inc.org), an applied research collective whose goals are to provide innovate analytics to solve todays conservation questions. Rick also is currently President of the Board at the non-profit Cougar Fund (www.cougarfund.org) due to his strong interest in advocating science-based conservation for cougars and serves on the Scientific Advisory Board of Project Coyote (www.projectcoyote.org).

Rick has participated as a predator expert in numerous conflict resolution workshops for large carnivores throughout the west as he believes collaboration with broad stakeholder groups is the key to long-term conservation for predators. For example, recent efforts of the Cougar Fund have been focused on finding common ground for cougar conservation among many game agencies in the west. The Cougar Fund enjoys a good working relationship with many western agencies.

As noted above, Dr. Hopkins serves on the Scientific Advisory Board for Project Coyote, a national carnivore conservation organization based in Marin County California, whose mission is to push for science and ethically based conservation of carnivores in North America.

We nominate Keli Hendricks for the Predator Working Group Review Group/Committee:

Keli Hendricks
Predator Friendly Ranching Coordinator, Project Coyote

Statement of Qualifications: As the Predator Friendly Ranching Coordinator for Project Coyote Keli Hendricks fosters partnerships with the agricultural community while working to educate the public and ranchers about how wildlife and livestock can share the land to benefit both.

Representing Project Coyote, Keli speaks to audiences throughout California about predator

friendly ranching practices. In 2015 she led a Non Lethal Livestock Protection Workshop for sheep ranchers at the Fibershed Symposium in Point Reyes, California and recently performed field testing of Foxlights (a non lethal livestock protection device) on several ranches in Sonoma and Marin Counties.

Over the last three years, Keli has been actively involved in predator conservation efforts in California, traveling to California Fish and Game Commission meetings and to Wildlife Resource Committee members to testify on behalf of predators.

Keli also volunteers for the Sonoma County Wildlife Rescue where she works in their hospital and rehabilitates injured and orphaned wildlife. She also assists SCWR on their Educational Barnyard Program, which demonstrates predator-proofing methods that help keep pets, livestock and wildlife safe. Keli provides consultations to ranchers who reach out to both Project Coyote and SCWR with questions pertaining to livestock protection. She collaborates with many organizations and people with differing viewpoints to accomplish various tasks for both Project Coyote and SCWR.

Keli would “like to be part of the Predator Policy Workgroup Review Committee and work towards updating our predator management policies and regulations in California so that they better reflect our current understanding of the important role predators play in our ecosystems.”

Thank you for your consideration of these nominations. Feel free to contact me at [REDACTED] or by email at [REDACTED] for any inquires or additional information about these nominees.

Camilla H. Fox
Founder & Executive Director
Project Coyote

Subject: Predator Management Writing Group - Request for Participation
Date: Friday, August 28, 2015 11:26:01 AM

California Waterfowl is interested in participating on the Predator Management Writing Group, and requests that the Commission include us as part of that group. Predation of waterfowl nests by coyotes, foxes, skunks and raccoons can have a significant effect on local waterfowl and other ground-nesting bird production, and CWA also has considerable experience in drafting legislation and other rules as it relates to F&G-related regulations. Thank you for the consideration.

Mark Hennelly, Vice President of Legislative Affairs and Public Policy
California Waterfowl
[REDACTED]

PROJECT COYOTE

F O S T E R I N G C O E X I S T E N C E

Oct. 2, 2015

California Fish and Game Commission
1416 Ninth Street, Room 1320
Sacramento, CA 95814
Attention: Predator Policy Workgroup Nominations

VIA email: FGC@fgc.ca.gov

Dear Commissioners:

Project Coyote would like to nominate two candidates for the Predator Policy Workgroup. For the Draft Group/Committee we nominate Rick Hopkins, Project Coyote Science Advisory Board member and co-owner and Senior Conservation Biologist at Live Oak Associates, Inc .:

Rick Hopkins, Ph.D.
Project Coyote Science Advisory Board
Principal and Senior Conservation Biologist, Live Oak Associates, Inc.

Statement of Qualifications: Rick Hopkins is co-owner and Senior Conservation Biologist at Live Oak Associates, Inc. (LOA), an ecological consulting firm based in California. LOA provides public and private clients with science-based solutions to complex natural resource questions. Rick holds a Ph.D. in Wildlands Resource Ecology from University of California, Berkeley and an M.A. in Biology at San Jose State University. His graduate research involved a 12-year study on the spatial ecology of the cougar in the Diablo Range. Rick has also provided scientific peer review assistance in evaluate proposed management actions with black bears in California, Nevada and Maine.

Conservation biologists have long recognized the importance of connecting large landscapes as integral to conservation of all carnivore species, particularly large carnivores. As such, Rick has been at the forefront advocating for methodologies and analytically approaches that best identify key landscape linkages. Rick has participated in state-wide efforts to identify the important

landscape linkages remaining in the state (i.e., Missing Linkages Conference) and in regional efforts such as the San Francisco Bay Area Upland Goals Workshop and TNC Central Coast Ecoregional Workshop. These efforts have focused Rick's interest in using theoretically grounded spatial tools to inform conservation planning at relevant spatial scales. An integral part of this process is working with applicants and landowners to identify suitable landscapes to conserve and manage to fulfill any required state or federal obligations that the regulated community may have incurred as part of their projects. Presently he is using these approaches in the development of a multi-species HCP for the 47,000-acre Elk Hills Oil Field, a cougar habitat management plan for 35,000 km² area of Southern California, and developing conservation strategies for large-scale solar projects in central to southern the San Joaquin Valley.

Rick is a broadly trained ecologist with experience with several threatened and endangered wildlife species and has dedicated the last 38 years to the study of mammalian carnivores. His research and interest with large carnivores has focused on conservation biology; population ecology; spatial ecology, and human/predator conflicts.

Rick was a founder and serves on the board of Conservation Science Partners (www.csp-inc.org), an applied research collective whose goals are to provide innovate analytics to solve todays conservation questions. Rick also is currently President of the Board at the non-profit Cougar Fund (www.cougarfund.org) due to his strong interest in advocating science-based conservation for cougars and serves on the Scientific Advisory Board of Project Coyote (www.projectcoyote.org).

Rick has participated as a predator expert in numerous conflict resolution workshops for large carnivores throughout the west as he believes collaboration with broad stakeholder groups is the key to long-term conservation for predators. For example, recent efforts of the Cougar Fund have been focused on finding common ground for cougar conservation among many game agencies in the west. The Cougar Fund enjoys a good working relationship with many western agencies.

As noted above, Dr. Hopkins serves on the Scientific Advisory Board for Project Coyote, a national carnivore conservation organization based in Marin County California, whose mission is to push for science and ethically based conservation of carnivores in North America.

We nominate Keli Hendricks for the Predator Working Group Review Group/Committee:

Statement of Qualifications: As the Predator Friendly Ranching Coordinator for Project Coyote Keli Hendricks fosters partnerships with the agricultural community while working to educate the public and ranchers about how wildlife and livestock can share the land to benefit both.

Representing Project Coyote, Keli speaks to audiences throughout California about predator

friendly ranching practices. In 2015 she led a Non Lethal Livestock Protection Workshop for sheep ranchers at the Fibershed Symposium in Point Reyes, California and recently performed field testing of Foxlights (a non lethal livestock protection device) on several ranches in Sonoma and Marin Counties.

Over the last three years, Keli has been actively involved in predator conservation efforts in California, traveling to California Fish and Game Commission meetings and to Wildlife Resource Committee members to testify on behalf of predators.

Keli also volunteers for the Sonoma County Wildlife Rescue where she works in their hospital and rehabilitates injured and orphaned wildlife. She also assists SCWR on their Educational Barnyard Program, which demonstrates predator-proofing methods that help keep pets, livestock and wildlife safe. Keli provides consultations to ranchers who reach out to both Project Coyote and SCWR with questions pertaining to livestock protection. She collaborates with many organizations and people with differing viewpoints to accomplish various tasks for both Project Coyote and SCWR.

Keli would “like to be part of the Predator Policy Workgroup Review Committee and work towards updating our predator management policies and regulations in California so that they better reflect our current understanding of the important role predators play in our ecosystems.”

Thank you for your consideration of these nominations. Feel free to contact me at [REDACTED] or by email at [REDACTED] for any inquires or additional information about these nominees.

Tony Linegar
Agricultural Commissioner
County of Sonoma County

Sonoma County Department of Agriculture
[REDACTED]
[REDACTED]
[REDACTED]
[REDACTED]

I have been working in the Agricultural Commissioner system for over 20 years. I am currently the Ag Commissioner in Sonoma County but served as Ag Commissioner in Mendocino prior to starting with Sonoma in 2012. In both counties I employed either USDA Wildlife Specialists or County Wildlife Specialists to assist ranchers with predation issues. I have been directly involved with responding to legal challenges to the USDA program over the past three years including working on CEQA compliance issues. Through this process, I have consulted CDFW, USDA, UC Cooperative Extension and animal welfare groups. I am also active in our state association, the California Agricultural Commissioner and Sealers Association (CACASA).

*The Mission of the Mule Deer Foundation is
to ensure the conservation of mule deer, black-tailed deer
and their habitat.*

September 30, 2015

California Fish and Game Commission

I would like to nominate myself for inclusion on the Predator Policy Workgroup.

Randy Morrison

I am and have been the California Regional Director of the Mule Deer Foundation for the last six years. I was a member of the Wolf Stakeholder Working Group throughout its two year run. As a member of that committee and two of its sub committees, I attended over 30 meetings, participated in numerous conference calls, and countless emails to help create a working draft of a California Wolf Plan.

I am also a member of CDFW's Big Game Management Account Advisory Committee, and have been since its inception.

As the Regional Director of the Mule Deer Foundation, I am the appropriate person to communicate the efforts of the workgroup to our over 5000 California members.

Given my experience and a willingness to commit to the process, I am confident that I would be a valuable member of the working group.

Thank you for your consideration,

Yours in Conservation,

Randal A. Morrison

September 22, 2015

To: The Wildlife Resources Committee (WRC)

From: Chuck Morse

Re: Nomination for appointment to the Predator Policy Workgroup (PWG)

Dear Committee members,

My name is Chuck Morse and I am the Agricultural Commissioner for Mendocino County. I request your acceptance of my nomination to the Predator Policy Workgroup (PWG) and would be honored to have Commission staff review this application and be considered for appointment to the PWG by the Commission. I feel I can provide valuable input and can work collaboratively to develop ideas and draft recommendations for the Committee relating to predator management policy and regulation in California.

I have a strong understanding of the current predator management practices and policies in California and the critical role CDFW plays in managing wildlife populations in the state. I have over 30 years' experience in reading, interpreting and enforcing various codes and regulations and more recent experience in following the development of and providing comment on the establishment of legislation and subsequent regulation.

While I live and work in the North Coast region of the State, I have a wider perspective and knowledge of predator issues around the state. Additionally, I have the ability to tap into county-level information to get current status and input on wildlife issues through the Agricultural Commissioners' system. By reaching out and communicating through this system, I would provide a balanced state-wide assessment of an issue relating to any given species. My close association with the University of California Cooperative Extension (UCCE) would provide an avenue to reach stakeholders that may not attend the public meetings.

I have worked recently with the USDA-Wildlife Services program to more fully understand the overall wildlife populations, both locally and in the state, to better understand the dynamics of predator management. Additionally, I have worked with Project Coyote to bring predator management information to Mendocino county.

My involvement in collaborative public processes to provide advice on wildlife policy, planning, or management include helping facilitate an informational presentation to my Board of Supervisors on various wildlife management options available to the county and working with the UCCE-Hopland Research and Education Center to hold a community conversation on wildlife management in December of this year.

I appreciate the work the Commissions' staff has in screening the nominations and, for the sake of brevity, I will close here. Thank you for your consideration and I hope to be included in the list of nominees. If any questions arise or more information is sought, please do not hesitate to contact me.

Sincerely,

Chuck Morse

Subject: Predator Policy Workgroup nomination
Date: Tuesday, September 22, 2015 10:22:14 PM

Hi. I would like to apply/nominate myself for the "Review Group" subgroup of the Predator Policy Workgroup. The requested information is below. Please feel free to call or email me if you have questions or need additional information. Thank you for considering my application.

Contact Information:

Damon Nagami
Senior Attorney
Director, Southern California Ecosystems Project
Natural Resources Defense Council (NRDC)

Applicant Statement:

I actively participated in the Wolf Stakeholder Working Group (SWG) for almost two years on behalf of NRDC, traveling from southern California to attend both full group and conservation subgroup meetings, and working constructively with other conservation groups as well as ranchers, sportsmen, and farmers who had differing views in many areas. During my time on the SWG, while I did advocate strongly for our positions on various issues, I also tried to reach, encourage, and broker compromises wherever possible, knowing that the Department would be more likely to adopt any consensus views that the SWG could agree upon. I also helped draft and submit, along with my NRDC colleagues, extensive substantive comments on changes we'd like to see in California's predator policies, and have attended and actively participated in discussions on predator policies at Commission and Wildlife Resources Committee meetings over the last couple of years. In doing this work, I've learned a great deal about predator management practices and policy, and because we have members and activists throughout California I am always trying to balance regional perspectives with considerations at the statewide level. Finally, I am either working in coalition with or loosely coordinating with many other wildlife conservation groups on wolf and predator policy issues, and in that regard would be able to disseminate information to those stakeholders if they don't attend the public meetings. For these reasons, I feel I would be a valuable addition to the Review Group.

Time Commitment:

I am willing to commit the time for full participation in the Review Group on a volunteer basis.

Executive Director Sonke Mastrup
c/o Caren Woodson
California Fish and Game Commission
1416 Ninth St., Ste. 1320
Sacramento, CA. 95814

Sept. 24, 2015

Dear Executive Director Mastrup.

It is my pleasure to nominate Mr. Tom O'Key as a candidate for the Predator Policy Review Group. Tom would be a tremendous asset, as he is fully committed to revising wildlife management, pragmatic and original in his approach to seeking solutions within a landscape of diverse objectives, familiar with law and the legislative process, and is known to the Commission and active stakeholders alike. As the administrator for several websites with large memberships, Tom has demonstrated his ability to communicate, conduct outreach and manage software. For these reasons and many more, Mr. O'Key would be a strong contributor in the task of crafting modern predator policies, and he has expressed his willingness to volunteer the time required for this important undertaking.

Thank you for your consideration of Tom O'Key.

Respectfully,

Miriam Seger

Contact info:

Tom O'Key,

Ton's current and past affiliations with groups active in wildlife management include:

- Project Bobcat –Founder
- Testimony regarding private property rights and bobcat protections on behalf Assembly Member Richard Bloom in Assembly and Senate legislative process
- Recipient, "Environmentalist of the Year, 2014", Soroptimist Int'l of Yucca Valley
- Career technical consultant in personal injury litigation and trial law technology
- Collaborative ongoing relationship with San Bernadino County Board of Supervisors regarding land use, wildlife, and other environmental issues
- Participated in outreach with relevant experts and stakeholder opinion polling through Governor's office.
- Testified during CFGC process and created public campaigns for citizen support regarding numerous wildlife-related agenda items
- Spoke in support of ending inducements for predator killing contests
- Participated in hearing with the Town of Yucca Valley regarding The Native Plant Ordinance for land use protections
- Testified in the Cadiz Valley Groundwater Pumping Conservation Plan as an opponent to ancient aquifer exploitation
- Testified in process for actions coming from the California Energy Commission actions regarding the Desert Renewable Energy Conservation Plan as a land use opponent in desert lands siting and advocate for technical alternatives
- Testified in San Bernardino County actions related to land use issues advocating for preservation of habitat and desert preservation related to industrial scale alternative energy projects, member of the Morongo Basin Dark Sky Alliance active in writing the Night Lighting Ordinance for the Desert Region of San Bernardino County
- Active in environmental efforts related to the Eagle Mountain Mine reversion to public trust with the Joshua Tree National Park
- Active in DRECP actions related to the Blythe Geo-glyph protection effort.
- Volunteered in numerous efforts to restore habitat areas and cultural artifacts

A sampling of organizations and individuals from whom Tom plans to solicit input are listed below. Many have already expressed intent to participate with comments.

Wayne Spencer, Director of Conservation Assessment and Planning, Conservation Biology Institute
Bren School of Environmental Science and Management
Mountain Lion Foundation
Project Bobcat
Urban Carnivores
Citizens for Los Angeles Wildlife
Friends of Griffith Park, Los Angeles
Joshua Tree National Park Association
Joshua Tree National Park
Morongo Basin Conservation Association
Mojave National Preserve
National Park Conservation Association
International Dark-Sky Association
Mojave Desert Land Trust

Statement by Tom regarding his expertise or knowledge relevant to the project:

I have adequate abilities in public speaking, resource research, communication and writing competence and am self-motivated and independently task capable. I have skill sets that have been considered valuable by others in similar endeavors and my experience and expertise brings novel and unique insights that often offer distinctive solutions. I have been involved as an educator, consultant and advisor in professional settings and have created events and undertakings that require full spectrum management and organization.

My past efforts in environmental activities have been engaged with concern and drive to create positive, sustainable, results with pragmatic reasoning and understanding. I am patient in substance and willing to professionally complete relative tasks, cooperatively and with flexibility.

Thank you for this exciting opportunity to participate in The Predator Policy Review Workgroup.

Sincerely,
Tom O'Key

Attention: Predator Policy Workgroup Nominations

Caren.Woodson@fgc.ca.gov

Dear Ms. Woodson:

The California Association for Recreational Fishing (CARF) is pleased to nominate Mr. George L. Osborn to the Predator Policy Workgroup (PWG).

Many of CARF's membership are registered aquaculturists who farm fish with unique predation challenges. CARF believes that having Mr. Osborn as a member of the PWG will provide valuable perspective. Mr. Osborn is well versed in fish farming and the predation challenges faced by the operators in our industry. As more and more of the world's food supply will be provided by aquaculture, CARF believes that fish farming in California will be expanding to meet that need and predator management policy should be informed accordingly.

Following is Mr. Osborn's contact information:

George L. Osborn
Osborn Strategies, LLC

Statement:

1. Knowledge of predator management practices and policy:

Mr. Osborn has attended all meetings of the WRC and is well versed about the unique aspects of predator management in aquaculture as well as predator management for other agricultural operations.

CALIFORNIA ASSOCIATION FOR RECREATIONAL FISHING • 40 CONSTITUTION DRIVE SUITE A • CHICO CA 95973-9927
PHONE TOLL FREE (877) 898-1315 • E-MAIL: info@savecalfishing.org

www.SaveCalFishing.org

2. Demonstrable ability to work collaboratively with others of diverse opinions:

Mr. Osborn has the interpersonal skills and professionalism required to work collaboratively with people on all sides of issues as demonstrated by his many years of significant involvement in the implementation of the Marine Life Protection Act (MLPA).

3. Strong writing skills and ability to evaluate statute, policy, and regulations:

As the legislative advocate for CARF, the California Fish and Game Wardens Association (CFGWA) and others, Mr. Osborn has more than 20 years experience in analyzing and writing complex legislation, statutes, public policy and regulations. As a former newspaper columnist, Mr. Osborn's writing skills are excellent.

4. Ability to balance regional perspectives and local knowledge or experience with statewide needs:

As the MLPA was implemented by region, Mr. Osborn was always looking to balance the needs of the different regional geographies with the broader statewide requirements to fulfill the requirements of the Act.

5. Access and use of an effective communication network to reach stakeholders not attending the public meetings:

Mr. Osborn has access to the communications network of the CARF membership both through email and social media as well as the members of CFGWA through their President.

6. Committed to all aspects of the charge of the PWG:

Mr. Osborn is committed to the charge of the PWG.

7. Knowledge or experience with web-based software:

As a CPA, Mr. Osborn has extensive experience with web-based software.

Mr. Osborn has significant background in working with stakeholder groups active in wildlife resource management including, but not limited to, the California Association for Recreational Fishing, the California Sportfishing League, the California Fish and Game Wardens Association, Coastside Fishing Club, United Anglers of Southern California, and the American Sportfishing Association, among others.

Mr. Osborn was engaged in the implementation of the MLPA for several years and had the opportunity during that period to collaborate and negotiate with stakeholders many complex issues. He did so with professionalism and a keen ability to effectively communicate with all sides.

Sincerely,

A handwritten signature in cursive script, appearing to read "Craig Elliott".

Subject: Request to Wildlife Resources Committee
Date: Wednesday, August 19, 2015 3:14:20 PM

Dear Mr. Baylis, Mr. Kellogg, and Mr. Mastrup:

I am writing to ask for your consideration in appointing me as one of the 12-16 people to the Predator Management Policy Review review group. I am currently on the Wildlife Resources Committee workgroup.

As a Board Member for the California Council for Wildlife Rehabilitators, as well as the chair of the Advocacy Committee, I feel that we should be invited to participate in any review of predator management policy. CCWR represents about 300 permitted wildlife rehabilitators, and wildlife rehabilitation organizations throughout the state. We annually treat over 60,000 animals. Our job/goal is to take in injured, ill, and orphaned wildlife, rehabilitate them and return them to the wild. The vast majority of these animals are brought into wildlife rescue organizations from the general public. Also, the majority of these animals come in because they have had some sort of a run-in with humans, their pets, their cars, their farm equipment, etc. Wildlife rehabilitators perform a valuable service to our communities.

Our members work hands on with the native wildlife in this state, and because of this they get to know these species intimately. In addition, we take classes to learn about the different species, their habits, their habitats, their benefits, their niche in nature and, we network like crazy. Because of our work, we probably know more about these animals than most people. In addition, one of our biggest jobs is educating the public about wildlife. It is a very important part of our work and one that we spent a lot of time on. We explain to people why they should not feed wildlife, why they can't keep that baby raccoon, why they should keep their cats indoors, trapping rules, etc. There is so much misinformation out there about wildlife! I feel strongly that educating the public about wildlife is one of the most important things we can do.

Since I am the one requesting to be on the review group, I will tell you something about me. I've been a wildlife rehabilitator for 12 years. I operate as a satellite branch of Sonoma County Wildlife Rescue and operate out of my home. My specialty is raising and releasing orphaned mammals. I have given presentations on this topic both at CCWR and at our national organization, The National Wildlife Rehabilitators Association. For the past few years I have been writing a monthly column, LIVING WITH WILDLIFE, for my local paper, The Kenwood Press. My goal being to educate the locals about wildlife. I was instrumental in getting CCWR to finally have an Advocacy Committee, and since that time, I have been attending as many DFGC meetings as possible, as well as WRC meetings. I might add that I am doing that on my own dime. I advocate for wildlife on a daily basis. I consider it a very rare privilege to work with wildlife and feel that it the most rewarding thing I ever done.

It is my hope that you will give my request to be on the review group of the Predator Management Policy Review your serious consideration.

Thank you.

Sharon Ponsford

Kimberly Richard

[REDACTED]
[REDACTED]
[REDACTED]
[REDACTED]

I worked for World Wildlife Foundation for 36 years before leaving, I have been a advocate for Wildlife sense I was 17 years old .

I have a great knowledge of how things works when to comes to legislation and working with both sides of the aisle . As Chair for the Environmental and Wildlife Democrats of Napa Valley. I know I can work well with other even if their views are different then mine, There is always room for a compromise.

I have gone and partaken in 2 workshops so far, as well as gone to Wildlife Resource Meeting as well. I am able to work from home so that free me up to be able go and fully commit to either Reviewer or Draft where ever you feel I would be best able to help.

In 1980 I help WWF with the ban of Ivory into the US and bringing to light the plight of Tigers and Rhinos and to this day I am still fighting the poaching , weather it is on the phone with Politicians or calling the White House.

I was a member of Greenpeace in my younger days and still am active. I am also in the process of applying for Matt Pope seat which is Napa Valley Planning Commission.

If you need any more info i am open anytime.

Date: Friday, September 11, 2015 7:28:08 PM

Dear Karen,

I would like to be nominated for the Predator Policy work group and here is a some of my background.

I represent the largest key stakeholder in California. The Predator Callers of Orange County. I am a past president and hold a board position. I am an active sportsmen and a conservationist. I am a life member of the NRA and CRPA. I have done volunteer work and supported the Water for Wildlife program. I have worked as a Fisheries Resource Volunteer Corps in the San Bernardino mountains. I have done Wildlife Calling seminars for the Boy Scouts of American supporting the Sportsmen Alliance. I am retired after 38 years from the Boeing Aircraft Company as a manager over the Quality Assurance functional test laborites.

Please send me a reply confirmation e-mail so I know you have received my request.

Thank you very much for your help and support.

California Fish and Game Commission
1416 Ninth Street, Room 1320
Sacramento, CA 95814
Attn: Predator Policy Workgroup Nominations

To Wildlife Resources Committee,

California Wool Growers Association (CWGA) represents nearly 500 California sheep producers consisting of large scale commercial sheep operations, farm flock producers, lamb feeders, and affiliated industry stakeholders. Since 1860, CWGA has been the voice of the California sheep industry and is the second largest sheep inventory state in the United States. California's sheep producers continue to face challenges in the protection of their sheep, as sheep are the most frequent victims from predators. Coyotes are the number one predator of sheep and lambs in the State. Therefore, it is essential that California Wool Growers Association is actively involved in the Predatory Policy Workgroup and nominates Erica Sanko, Executive Director of CWGA to serve on either the Predator Policy Workgroup Drafting Group or Review Group.

As Executive Director of CWGA, Erica has the professional and personal skillset required to serve on either of the two Predator Policy work groups. As a leader and stakeholder in the California and national sheep industry, Erica has thorough knowledge of predator management practices and policy on both a State and Federal level. As Executive Director of a producer trade association, Erica has proven to have the ability to work collaboratively with others of diverse opinions and relies on effective communication methods such as newsletters, electronic communication, and personal interaction, to reach sheep industry stakeholders. CWGA represents all sheep producers and industry stakeholders pertaining to predator management issues on all levels and balances regional perspectives and local knowledge of its members with the needs of the State regarding wildlife and predator management.

Since 2012, Erica has worked collaboratively with the American Sheep Industry Association (ASI) and USDA's Agricultural Marketing Service (AMS) on improving current Mandatory Price Reporting for Lamb policies and regulations. This endeavor included a thorough analysis of the policies and regulations of the program as well as recommendations on how best to improve the program (policies and statutes) to align with current and future sheep industry needs. Prior to joining CWGA, Erica served as an Agricultural Economist with the California Department of Food and Agriculture Dairy Marketing Branch. Her responsibilities included economic market analysis, dairy policy analysis, and assisting the California dairy industry in the development and feasibility of proposed legislative and marketing policy changes. Given her career experiences, Erica possess strong writing skills and ability to evaluate statute, policy, and regulations at all levels.

President

Frankie Iturriria
Bakersfield, CA

First Vice President

Ryan Indart
Clovis, CA

Treasurer

Dan Macon
Auburn, CA

Executive Director

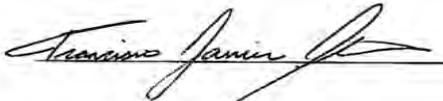

Erica Sanko
Sacramento, CA

California Wool Growers Association Executive Directors have and continue to be an active participant in Wildlife Resource Management Groups and affiliated groups. Currently these groups include:

- American Sheep Industry Association Big Horn Sheep Taskforce
- American Sheep Industry Association Legislative Action Council (establishes industry policy on National and subsequently State predator management)
- California Grey Wolf Stakeholder Working Group
- California Livestock, Poultry and Dairy Coalition
- California Farm Bureau Federation Sheep & Goat Member Advisory Committee

Predator management is a high priority issue not just for sheep producers but for other types of livestock as well as public health and safety. It is essential that CWGA have a seat at the table regarding predator policies in California given the impacts these policies will have on the nearly 500 sheep producers in California. On behalf of these producers, I strongly recommend Erica Sanko, Executive Director of CWGA be appointed to the Predator Policy Workgroup Drafting Group or Review Group to ensure the State's sheep producers are represented.

Respectfully,

Frankie Iturriria

Predator Policy Workgroup Nomination

From: Robert R. Smith, President, San Diego County Wildlife Federation (SDCWF)

To: Wildlife Resources Committee (WRC)

This note is to volunteer (nominate myself) to serve on the Review Group of the Predator Policy Workgroup. I have attended most of the WRC meetings over the last few years, and attend as many of the Fish & Game Commission (F&GC) meetings as possible. I have heard testimony from all sides on the various issues related to predator policy and believe I have a good grasp of the current policy and recommended to changes to that policy. I am a long-time hunter for deer, elk, antelope and upland game birds. I do not personally hunt predators but have talked to several who do and I understand their rationale for doing so. I believe I can represent their point of view but also agree no animal should be killed unless there is a valid reason to do so. My experience in working collaboratively with others comes primarily from my Government career as a project manager, where I helped formulate national research programs that included members from multiple laboratories, including some who were competitors. I understand fully the importance of listening politely to others, trying to understand their rationale and striving to find common ground.

I have developed writing skills from my research and project management and have written several letters to the F&GC to state the positions taken by SDCWF. My most recent letter was to express the support of SDCWF to ban coyote killing contests. I clearly understand that California is a diverse state, both in terms of eco-systems and public perceptions. I consider myself fortunate to have homes in San Diego and in Plumas Counties, so I understand both urban and rural perceptions on wildlife and habitat. My attendance at various WRC and F&GC meetings has provided me with exposure to different perspectives throughout the State. My communication network is primarily with pro-hunting organizations, as I am President of a coalition of 20 organizations in the San Diego area whose interests are as diverse as hunting dog training, target shooting, predator hunting, habitat conservation and fishing. You can find the broad scope of these organizations by visiting our web site www.sdcwf.org. Our member organizations strongly support my nomination and have offered to fund my travel and take up some of my workload to allow me to attend all of the Review Group meetings. I also attend many of the meetings of the San Diego County Fish and Wildlife Commission (SDCFWAC) and personally know many of the Commissioners and can communicate issues and updates to them.

I am supportive of what the WRC is trying to accomplish by convening the Predator Policy Workgroup and understand the many challenges in coming up with a comprehensive policy. In spite of the difficulties involved, I am committed to the success of the effort. Regarding web-based software, I am fluent in use of the Internet, as well as office productivity tools. I have very little experience with software used to create web sites.

I have worked with the Department of Fish and Wildlife (DFW) as a stakeholder, representing the interests of our hunting dog training clubs. I believe that we achieved regulatory changes for hunting

dog training on DFW-owned lands that was acceptable to both the hunting dog training community and to DFW. I have attended meetings of the Upland Game Bird Advisory Group in the absence of the sitting member, Jim Conrad, and feel that I made meaningful contributions in a collaborative manner. I have no specific experience as a stakeholder regarding predator management. However, I serve on the Urban Coyote Sub-Committee of SDCWF, established to address approaches for minimizing coyote-human encounters. I performed a thorough assessment of a Metro Denver symposium, which has issues with coyotes similar to Southern California. I prepared a viewgraph summary of the symposium, which is available upon request.

If I am selected as a member of the Review Group, I will strive to attend every meeting. As described above, I have made arrangements to off-load some of my other volunteer duties, and will make participation in the Review Group my highest priority. Being retired will help. I will communicate primarily via meetings of SDCWF and SDCFWAC. Specifically, I will communicate with the San Diego County Varmint Callers; however, I will not take a hard line to oppose any change if change is warranted by data. Of course, I will communicate with others on the Review Group to gain perspectives, no matter what their position on the issues.

Finally, I consider my education will be valuable in understanding the issues. Although I have a Doctorate in Mathematics, not Biology, I understand the rigor required to do research and prepare peer-reviewed papers. I can read and understand wildlife-related articles and know how to backtrack through references to find relevant material. I also have access to the library at the University of California, San Diego. What I don't know, I know how to find.

Respectfully,

Robert R. Smith

Subject: Revised Predator Policy Workgroup nomination
Date: Wednesday, September 30, 2015 8:17:40 AM
Importance: High

I am resending my nomination information for this workgroup. I've added more references for the information provided and corrected a few typos. Please confirm when you have received this nomination.

Thanks, Dale

To Whom It May Concern:

I am providing information concerning my background experience and interest in joining the predator working group. I understand the PWG is being formed to gather input and make recommendations for predator management policy and regulation in California. I am qualified and willing to help with this important effort.

I have provided summary information below as requested and would be happy to answer questions or provide additional information if necessary.

Thorough knowledge of predator management practices and policy:

During my career as a professional biologist with the California Department of Fish and Wildlife (2000-2013) I regularly worked on complex issues involving predator management issues and policy. This work included research funding and permits, coordination on conflict/issues management, regulations and legal discussion involving depredation issues, and policy review. I also have experience with these issues coordinating with other states and the federal government.

Demonstrable ability to to work collaboratively with others of diverse opinions:

Like many others, I learned about wildlife conservation through sport hunting with family members and friends growing up in California. I recognize the importance of this tradition and support the value of sport hunting for wildlife management. I also acknowledge the challenges and changes faced by those who hunt. I have worked professionally and collaboratively on wildlife issues of local, regional, statewide, national and international significance. Examples include regional habitat conservation and statewide recovery plans, wildlife regulations, the California Wildlife Action Plans, and representing CDFW and California on border wildlife issues involving other states and Mexico. I managed the Nongame Wildlife Program for CDFW and worked on conservation and policy issues throughout this period.

Strong writing skills and ability to evaluate statute, policy, and regulations:

Throughout my career in California I developed and applied writing skills in the review and evaluation of wildlife statutes, draft policies and existing ones, and participated in the FGC process to evaluate many petitions and other regulatory processes involving wildlife.

Ability to balance regional perspectives and local knowledge or experience

with statewide needs:

I worked my entire career of over 33 years in the state of California on complex local, regional, and statewide environmental and wildlife issues requiring me to consider and balance the many inputs that come with such efforts. This includes CEQA, CESA, NEPA, FESA, FGC and CDFW public processes. With CDFW I was responsible for diverse statewide nongame wildlife issues across all major species groups and supervised technical staff experts for the Department.

Access and use of ineffective communication network to reach stakeholders not attending the public meetings:

I regularly use online tools including webcasts, video conferencing, social media, group software as well as written and speaking tools to share information. I am a member of several professional and stakeholder wildlife organizations and very aware and familiar with the need to inform such groups and others throughout a public process.

Committed to all aspects of the charge of the PWG:

I followed and participated in predator policy, conservation, and management activities before retiring in late 2013. I continue to follow these issues now and am committed to the complete charge of the PWG.

Knowledge or experience with web-based software is helpful:

I have knowledge and experience with online tools including webcasts, video conferencing, social media, and group software as part of my professional career and personal activities. I see these tools as both powerful and necessary to adequately reach diverse stakeholders and maintain an open public process.

Where appropriate, ID current and past affiliations with stakeholder groups active in wildlife resource management, particularly predator management:

For example, Channel Island Fox Working Group, California State Wildlife Action Plans, California Condor Recovery Team/Group, Non-lead Ammunition Regulations, Wolf Status Review/Petition Evaluation, Reptile Captive Breeding policy, Aquatic Invasive Species Management Plan, CA/NV Golden Eagle Working Group, Pika Consortium, Tricolor Blackbird Working Group, Falconry Regulations, Bird/Mammal/Fish/Reptile & Amphibian Species of Special Concern updates, etc. These efforts and others included close ongoing coordination with many wildlife agencies and organizations, stakeholder groups and the public at large.

Brief summary of past involvement in collaborative public processes to provide advise on wildlife policy, planning, or management:

Examples of my involvement in public process related to wildlife include both California Wildlife Action Plans, the Wolf Stakeholder Group, Reptile Captive Breeding policy group, Non-lead Ammunition regulations adoption, Various species recovery plans approvals, Western Governors Association Border Wildlife subcommittee, FWS Trilateral Committee, etc.

Willingness to commit the time for full participation on a volunteer basis:

I am retired in good health and committed to actively participate on this issue. I have similar ongoing commitments with several local and regional natural resource issues now.

Descriptions of the organizations and individuals with which the nominee

will communicate about the efforts of the workgroup and the mechanisms to be utilized:

Environmental organizations such as California Audubon, Defenders of Wildlife, National Wildlife Federation, Nature Conservancy, TWS, Society for Conservation Biology, Ecological Society of America, and any other stakeholder groups & individuals as needed.

Areas of knowledge or expertise relative to the project:

Wildlife Conservation, Recovery, Research Permitting, Regulations, Policy, Grant Funding, specific predator species in California including conflict issues such as island fox/golden eagle, mesocarnivores/land management, furbearers/trapping, urban wildlife, invasive species, wildlife care, falconry, and sport hunting, etc.

References for the information provided including former managers, supervisors, and collaborators:

Noelle Cramer, Farm Bureau
Kim Delfino, Exec. Director California Office, Defenders of Wildlife
Kevin Hunting, Chief Deputy Director, CDFW
Eric Loft, Wildlife Branch Chief, CDFW
Sonke Mastrup, Fish and Game Commission
Scott Morrison, Director Conservation Science, Nature Conservancy
Dennis Orthmeyer, California State Director, Wildlife Services
Mark Stopher, Senior Policy Advisor, CDFW
Day Taylor, Audubon California, retired
Dan Yparraguirre, Deputy Director, CDFW

I have worked professionally with nongame wildlife, including predators, on research, conservation, recovery and management issues throughout my career in California. This included research permitting and grant funding, hunting and nongame regulations, legislation, and policy both within the California Department of Fish and Wildlife and the Fish and Game Commission process. I regularly coordinated with other state and federal agencies, stakeholder groups, organizations and the public at large and recognize the importance of doing so. My range of wildlife experience and knowledge would be an asset for the complex issues and perspectives associated with predator management and policy. I see this as an important and necessary step for California to address this challenging subject. I'm willing to help gather input and ideas needed to prepare recommendations for predator management policy and regulation in California. I would draw from my time and experience working with CDFW and FGC and elsewhere to provide professional independent input for this process.

In summary, predator management and policy is a very important and sensitive subject needed now in California. I believe I have good background experience, knowledge and interest to constructively and independently contribute through the committee being formed to help the Fish and Game Commission.

Sincerely,

Dale T. Steele,

Subject: Predator policy work group nomination
Date: Friday, September 11, 2015 5:36:48 PM

I would like to add my name to the list of people that are working on the predator policy work group. I would like tier 1 or tier 2 .

I have been hunting for 40+ years. I have always been in predator hunting clubs. I advise several hunting groups and clubs. All the groups that I am involved with are predator hunting and trapping only.

Re: Predator Policy Workgroup Nomination of Jean Su for Drafting Group

Dear Commissioners Baylis, Kellogg, Hostler-Carmesin, Sklar and Williams and Director Mastrup:

I am writing to seek appointment as a member of the Drafting Group of the Predator Policy Workgroup under the Commission’s Wildlife Resources Committee. My contact information can be found in the signature block below.

I believe that I am a strong candidate for a position on the Drafting Group because I meet the requisite criteria and am committed to being a productive member of the group. Drafting Group members are required to receive input from both reviewers and qualified experts, review existing policies, regulations and concepts, and produce output of draft policies, best management practices and guidelines for regulatory proposals. As a staff attorney with the Center for Biological Diversity (“the Center”), I regularly engage with a range of stakeholders—including scientists, experts, government officials, allies and communities—to solicit their viewpoints and expertise to inform legal arguments and policy, as well as engage with diverse perspectives. In actively participating in the rulemaking process for AB1213 (the Bobcat Protection Act) and previous Wildlife Resources Committee meetings, I have engaged with multiple stakeholders in productive conversation and produced written output with allies, including Project Coyote, the Humane Society, Natural Resources Defense Council, and Mountain Lion Foundation—organizations that represent millions of Californians. As a Drafting Group member, I look forward to respectfully and productively engaging with other members of the Group to understand the reasoning behind positions and create recommendations that take these perspectives—and ultimately, those of the greater California public—into account.

Critically, I have strong writing skills as a lawyer, with the ability to draft policy documents, petitions and amendments to regulatory language, which will be vital as a member of the Drafting Group. My familiarity with the Fish and Game Code, the California Code of Regulations, and other California statutes will also allow me to efficiently and effectively understand the implications of amendments on

California Fish & Game Commission
Re: Nomination for Predator Policy Workgroup
November 16, 2015

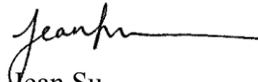

one set of rules to other pieces of law. These writing and analytical skills will be helpful to the Drafting Group.

Further, I have a solid knowledge base in predator policy management issues, most recently fortified during my active engagement in the administrative rulemaking process of AB 1213 (the Bobcat Protection Act) and comment letters to the Wildlife Resources Committee on proposed amendments to trapping and other predator management regulations. In those examples, I worked with multiple groups to understand both their local issues as well as extrapolated state-wide concerns. Ultimately, I also bring the substantive expertise of the Center, which remains a leading organization on the forefront of science-based wildlife policy and law in California and across the country. I look forward to working with other members of the Drafting Group to leverage their scientific expertise and on-the-ground knowledge from their constituents to inform good, reasonable and progressive policy.

Finally, I am committed to dedicating hard work and a can-do attitude to the Drafting Group. I believe, sincerely, in the health of our predator populations and the critical role that human management plays on their populations and the greater ecosystem of which they are at the apex. I also believe the very special role that California has at bringing predator management into the 21st century and look forward to working toward this effort with my fellow stakeholders and Commission and Department members.

Thank you for your consideration of my nomination.

Sincerely,

Jean Su

California Fish and Game Commission
1416 Ninth Street, Room 1320
Sacramento, CA 95814
Attention: Predator Policy Workgroup Nominations

Dear President Baylis and Members:

I am writing to formally request that the Commission place me upon *either* the Drafting Group or the Review Group for the Predator Policy Workgroup. As a full-time Director of Government Affairs for the California Cattlemen's Association (CCA), I am fully available to participate in any predator policy discussions the Commission deems necessary, and I also have the legal and policy experience necessary to effectively participate in the workgroup.

Qualifications

Below, I have addressed each of the selection criteria included in the Draft Request for Nominations. Please note that many of these responses address other information requested by the Commission (e.g., current and past affiliations with stakeholder groups active in wildlife resource management) and I have thus not included that information in separate sub-sections.

Thorough knowledge of predator management practices and policy

Predator management is a primary concern of CCA and its members, and I have actively engaged in predator policy discussions with the Fish and Game Commission, the Department of Fish and Wildlife (including the Department's own Predator Management Group and the Stakeholder Working Group consulting in the development of California's Wolf Management Plan), and federal agencies.

Demonstrable ability to work collaboratively with others of diverse opinions

My position often requires that I work collaboratively with a wide range of diverse interests, from various sectors of agriculture to sportsmens groups to environmental groups. I participated in CDFW's Wolf Management Stakeholder Working Group as one of 15 stakeholders, and nearly every regulatory effort in which CCA is involved requires similar collaboration with widely-varying organizations, individuals, and viewpoints. I am firmly committed to participating in such collaboration civilly and professionally.

Strong writing skills and ability to evaluate statute, policy, and regulations

I graduated from the University of the Pacific McGeorge School of Law in 2012 and passed the California Bar Exam. Throughout my time at McGeorge I not only evaluated statute, policy, and regulations for coursework, but also for scholarly articles which were published in the *McGeorge Law Review*. I have worked in Government Affairs for CCA for two years, regularly conducting legal research and writing for public comment and CCA's publications.

Ability to balance regional perspectives and local knowledge or experience with statewide needs

As a statewide trade association with 35 affiliated local associations, CCA is well-acquainted with the necessity of balancing regional perspectives with statewide needs. During my two years at the Association, I have become well-versed in this balancing act. Additionally, though CCA has statewide policy positions, I regularly advocate for local associations' individual perspectives where they do not conflict with the Association's statewide policy.

Access and use of an effective communication network to reach stakeholders not attending the public meetings

Through a weekly electronic newsletter, monthly print newsletter, and monthly magazine (all of which I contribute to), CCA reaches more than 2,700 members, including more than 1,700 cattle ranchers.

Committed to all aspects of the charge of the PWG

I am committed to the PWG charges as enumerated in the Draft Request for Nominations, and firmly believe that my background in law and in policy development over the past two years enable me to faithfully execute those charges.

Knowledge or experience with web-based software is helpful but not required

I routinely use web-based software both personally and professionally, and am a "quick study" where technology is concerned.

Conclusion

I respectfully request that the Commission consider appointing me as a member of *either* the Drafting Group or Review Group for the Predator Policy Workgroup. Such selection will ensure appropriate representation of California's cattle ranchers, and I believe that my background in law and policy will be of service to the Workgroup.

Sincerely,

Kirk Wilbur
Director of Government Affairs
California Cattlemen's Association

Subject: Predator Policy Workgroup nomination
Date: Thursday, September 24, 2015 12:40:36 PM

I am applying for a place on the Predator Policy Workgroup:

Les Wright
Fresno County Agricultural Commissioner

[REDACTED]
[REDACTED]
[REDACTED]
[REDACTED]

I would represent the California Agricultural Commissioners and Sealers Association (CACASA) through this process of developing a predator management policy. Agricultural Commissioners throughout the state administer wildlife services programs to protect the citizens and agriculture of their respective counties. I currently serve the association as chairman of the Weed and Vertebrate Pest Committee.

Personally I started this career as a wildlife trapper, and have been involved with the family ranch most of my life. I have a thorough knowledge of predator behavior and understand the balancing act of having predators in the eco-system without them causing economic or physical danger to human societies.

As an Agricultural Commissioner, we deal with diverse opinions daily in our work life, from pesticide use to predator management. We are an enforcement agency and understand laws, regulations, and policy and their differences. As a representative of CACASA, I represent all counties in the state and can balance their opinions and communicate effectively to the other commissioners, industry, and other agencies. I believe that a good, sound, and peer reviewed science based policy to guide the Fish and Game Commission in making future regulation decisions is one of the most important goals that the commission has endeared itself to.

Thank you for considering my application.

Memorandum

2015 NOV 30 PM 3:06

Date: November ³⁰ 10, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting: Recommendations for designation of new Wild Trout Waters by the Department of Fish and Wildlife for 2015, as required by Fish and Game Code, Section 1727(b).**

Fish and Game Code, Section 1727(b), requires the California Department of Fish and Wildlife (Department) to prepare a list of no less than 25 miles of stream or stream segment and at least one lake deemed suitable for designation as wild trout waters and to submit this list to the Commission. To comply with these requirements, the Department proposes the following waters:

Little Kern River drainage, including tributaries, from the confluence with the Kern River upstream to the headwaters (Tulare County). This proposed designation incorporates 137 miles of perennial stream habitat, the majority of which are located on public lands administered by the U.S. Forest Service (USFS) Sequoia National Forest. The Little Kern River contains a self-sustaining population of Little Kern Golden trout within their native drainage and is a fast-action fishery (> 2 fish per hour) located in the remote and scenic Golden Trout Wilderness area. Little Kern golden trout are endemic to this drainage and found nowhere else in the world, making this fishery a unique resource in the state and a candidate for designation as a Heritage Trout Water. The Heritage and Wild Trout Program (HWTP) has conducted extensive fisheries and habitat assessments across the Little Kern drainage since 2012, including barrier assessments, population estimates, angling surveys, age and growth analyses and post-fire impact evaluations.

Maggie Lake (Tulare County). "Maggie" Lake (the northeastern-most of the cluster of three Maggie Lakes located in the Little Kern River drainage at 9032' elevation and at the latitude/longitude of 36.27812N, 118.62107W, approximately one mile north of Maggie Mountain) is a fast-action fishery (>2 fish per hour). It is unknown whether the fish population in this lake is hybridized with rainbow trout and, until further genetic analyses are conducted, we propose designation as a Wild Trout Water since it may not meet the criteria for designation as a Heritage Trout Water. Maggie Lake encompasses approximately four surface acres and is located in a remote and scenic wilderness setting. This lake was singled out of the three Maggie Lakes for proposed designation as it supports a more robust sport fishery than the other two lakes in this complex.

Sonke Mastrup, Executive Director
Fish and Game Commission
November 10, 2015
Page 2

The HWTP has conducted angling assessments, gill net surveys and visual reconnaissance of spawning habitat, all of which support designation as a high quality lake fishery.

The recommended streams and lakes meet existing criteria to satisfy the requirements for designation as Wild Trout Waters and no changes in angling regulations are necessary at this time.

If you have any questions or need additional information, please contact Stafford Lehr, Chief, Fisheries Branch at (916) 327-8840 or via email at Stafford.Lehr@Wildlife.ca.gov.

Proposed Changes to the Commission Designated Wild Trout Waters Policy

It is the policy of the Fish and Game Commission to:

- I. Designate certain state waters to be managed exclusively for wild trout. Commission designated wild trout waters should provide a quality experience by providing the angler with an opportunity to fish in aesthetically pleasing and environmentally productive waters with trout populations whose numbers or sizes are largely unaffected by the angling process.

Waters designated by the Commission for wild trout management shall meet the following criteria:

- A. Angler Access:
 1. Open for public angling with unrestricted access when of sufficient dimensions to accommodate anglers without overcrowding; or
 2. Open for public angling with controlled access under a plan approved by the Commission setting forth the number of anglers and the method of distribution.
 - B. Able to support, with appropriate angling regulations, wild trout populations of sufficient magnitude to provide satisfactory trout catches in terms of number or size of fish.
- II. Wild trout waters shall be managed in accordance with the following stipulations:
 - A. Domestic strains of catchable-sized trout shall not be planted in designated wild trout waters.
 - B. Hatchery-produced trout of suitable wild and semi-wild strains may be planted in designated waters, but only if necessary to supplement natural trout reproduction.
 - C. Habitat protection is of utmost importance for maintenance of wild trout populations. All necessary actions, consistent with State law, shall be taken to prevent adverse impact by land or water development projects affecting designated wild trout waters.
 - III. The Department of Fish and Wildlife (Department) shall prepare and periodically update a management plan for each water designated as a wild trout water.

- IV. Certain designated wild trout waters may be further designated by the Commission as "Heritage Trout Waters", to recognize the beauty, diversity, historical significance, and special values of California's native trout. Heritage Trout Waters shall meet the following additional criteria:
 - A. Only waters supporting populations that best exemplify indigenous strains of native trout within their historic drainages may qualify for designation.
 - B. Heritage Trout Waters shall be able to provide anglers with the opportunity to catch native trout consistent with the conservation of the native trout present.

- V. Recognizing the importance of native trout to California's natural heritage, the Department shall emphasize education and outreach efforts to inform the public about our native trout, their habitats, and the activities for restoration of native trout when implementing the Heritage Trout Program.
 - A. Implement a Heritage Trout Angler Recognition Certificate through which anglers will have the opportunity to have their catches of California native trout recognized by the Commission. The criteria for receiving the formal recognition shall be maintained by the Department's Heritage and Wild Trout Program. To receive a certificate of recognition, anglers shall submit an application with supporting materials to the Department for review.

The following waters are designated by the Commission as "wild trout waters":

1. American River, North Fork, from Palisade Creek downstream to Iowa Hill Bridge (Placer County).
2. Carson River, East Fork, upstream from confluence with Wolf Creek excluding tributaries (Alpine County).
3. Clavey River, upstream from confluence with Tuolumne River excluding tributaries (Tuolumne County).
4. Fall River, from Pit No. 1 powerhouse intake upstream to origin at Thousand Springs including Spring Creek, but excluding all other tributaries (Shasta County).
5. Feather River, Middle Fork, from Oroville Reservoir upstream to Sloat vehicle bridge, excluding tributaries (Butte and Plumas counties).
6. Hat Creek, from Lake Britton upstream to Hat No. 2 powerhouse (Shasta County).
7. Hot Creek, from Hot Springs upstream to west property line of Hot Creek Ranch (Mono County).
8. Kings River, from Pine Flat Lake upstream to confluence with South and Middle forks excluding tributaries (Fresno County).
9. Kings River, South Fork, from confluence with Middle Fork upstream to western boundary of Kings Canyon National Park excluding tributaries (Fresno County).

10. Merced River, South Fork, from confluence with mainstem Merced River upstream to western boundary of Yosemite National Park excluding tributaries (Mariposa County).
11. Nelson Creek, upstream from confluence with Middle Fork Feather River excluding tributaries (Plumas County).
12. Owens River, from Five Bridges crossing upstream to Pleasant Valley Dam excluding tributaries (Inyo County).
13. Rubicon River, from confluence with Middle Fork American River upstream to Hell Hole Dam excluding tributaries (Placer County).
14. Yellow Creek, from Big Springs downstream to confluence with the North Fork of the Feather River (Plumas County).
15. Cottonwood Creek, upstream from confluence with Little Cottonwood Creek, including tributaries (Inyo County).
16. Klamath River, from Copco Lake to the Oregon border (Siskiyou County).
17. McCloud River, from Lake McCloud Dam downstream to the southern boundary of Section 36, T38N, R3W, M.D.B. & M. (Shasta County).
18. Deep Creek, from confluence with Green Valley Creek downstream to confluence with Willow Creek (San Bernardino County).
19. Middle Fork Stanislaus River, from Beardsley Afterbay Dam to Sand Bar Diversion Dam (Tuolumne County).
20. Truckee River, from confluence with Trout Creek downstream to the Nevada State line (excluding the property owned by the San Francisco Fly Casters Club) (Nevada and Sierra counties).
21. Sespe Creek, a 25-mile section between the Lion Campground and the boundary of the U.S. Forest Service, Los Padres National Forest (Ventura County).
22. East Fork Carson River, from Hangman's Bridge near Markleeville downstream to the Nevada state line (Alpine County).
23. Bear Creek, Bear Valley Dam (impounding Big Bear Lake) downstream to the confluence with the Santa Ana River (San Bernardino County).
24. Lavezolla Creek (Sierra County).
25. Laurel Lake #1 and Laurel Lake #2 (Mono County).
26. Middle Fork San Joaquin River - Northern boundary of the Devils Postpile National Monument downstream to the Lower Falls (3.6 miles); and footbridge just above the confluence with Shadow Creek downstream to the footbridge just above upper Soda Springs Campground (4 miles) (Madera County).
27. South Fork Kern River watershed from its headwaters downstream to the southern boundary of the South Sierra Wilderness (Tulare County).
28. Golden Trout Creek drainage, including tributaries, from confluence with the Kern River upstream to the headwaters (Tulare County).
29. Eagle Lake, north of Susanville (Lassen County).
30. Upper Kern River, from the Forks of the Kern, upstream to Tyndall Creek in Sequoia National Park (Tulare County).
31. Heenan Lake, near Markleeville and Monitor Pass, Pass (Alpine County).

32. Upper Truckee River, including tributaries, upstream from the confluence with Showers Creek (El Dorado and Alpine counties).
33. Sacramento River, including tributaries, from Box Canyon Dam downstream to Scarlett Way in Dunsmuir (Siskiyou County) and from the county bridge at Sweetbriar downstream to Lake Shasta (Shasta County).
34. Long Lake (Plumas County).
35. Piru Creek, including tributaries, upstream of Pyramid Lake (Ventura and Los Angeles counties).
36. Upper Stony Creek including tributaries, upstream from Mine Camp Campground (Colusa, Glenn, and Lake counties).
37. Lower Honeymoon Lake (Fresno County).
38. Upper East Fork San Gabriel River, including tributaries, upstream from Heaton Flat (Los Angeles County).
39. Royce Lake # 2 (Fresno County).
40. Lower Yuba River, from Englebright Dam to the confluence with the Feather River (Yuba and Nevada counties).
41. Parker Lake (Mono County).
42. South Fork San Joaquin River and all tributaries from Florence Lake upstream to the boundary of Kings Canyon National Park including the Piute Creek drainage (Fresno County).
43. Sallie Keyes Lakes (Fresno County).
44. Sacramento River from Keswick Dam downstream to the Red Bluff Diversion Dam (Shasta and Tehama counties).
45. Pauley Creek from the confluence with the Downie River upstream to the headwaters (Sierra County).
46. Caples Creek from the confluence with the Silver Fork American River upstream to Caples Lake Dam (El Dorado and Alpine counties).
47. Putah Creek from Lake Solano upstream to Monticello Dam on Lake Berryessa (Solano and Yolo counties).
48. Lake Solano (Solano and Yolo counties).
49. Milton Reservoir (Nevada and Sierra counties).
50. Gerle Creek Divide Reservoir (El Dorado County).
51. Manzanita Lake (Shasta County).
52. Maggie Lake (Tulare County).
53. Little Kern River drainage, including tributaries, from the confluence with the Kern River upstream to the headwaters (Tulare County).

The following "wild trout waters" are further designated by the Commission as "heritage trout waters".

1. Clavey River, upstream from confluence with Tuolumne River, excluding tributaries (Tuolumne County).
2. Golden Trout Creek drainage, including tributaries, from confluence with the Kern River upstream to the headwaters (Tulare County).
3. Eagle Lake, north of Susanville; (Lassen County).

4. Upper Kern River, from the Forks of the Kern, upstream to Tyndall Creek in Sequoia National Park (Tulare County).
5. Heenan Lake, near Markleeville and Monitor Pass (Alpine County).
6. Upper Truckee River, including tributaries, upstream from the confluence with Showers Creek (El Dorado and Alpine counties).
7. Piru Creek, including tributaries, upstream of Pyramid Lake (Ventura and Los Angeles counties).
8. Upper Stony Creek including tributaries, upstream from Mine Camp Campground (Colusa, Glenn, and Lake counties).
9. Upper East Fork San Gabriel River, including tributaries, upstream from Heaton Flat (Los Angeles County).
10. Lower Yuba River, from Englebright Dam to the confluence with the Feather River (Yuba and Nevada counties).
11. Little Kern River drainage, including tributaries, from the confluence with the Kern River upstream to the headwaters (Tulare County).

(Amended: 01/04/94; 06/22/95; 03/06/97; 11/06/98; 04/02/99; 12/08/00; 04/03/03; 12/12/08, 11/04/09, 10/21/10, 11/17/11; 11/07/12, 11/06/13, 12/03/14, 12/10/15)

Section 1727, Fish and Game Code

- (a) In order to provide for a diversity of available angling experiences throughout the state, it is the intent of the Legislature that the commission maintain the existing wild trout program, and as part of the program, develop additional wild trout waters in the more than 20,000 miles of trout streams and approximately 5,000 lakes containing trout in California.
- (b) The department shall prepare a list of no less than 25 miles of stream or stream segments and at least one lake that it deems suitable for designation as wild trout waters. The department shall submit this list to the commission for its consideration at the regular October commission meeting.
- (c) The commission may remove any stream or lake that it has designated as a wild trout fishery from the program at any time. If any of those waters are removed from the program, an equivalent amount of stream mileage or an equivalent size lake shall be added to the wild trout program.
- (d) The department shall prepare and complete management plans for all wild trout waters not more than three years following their initial designation by the commission and update the management plan every five years following completion of the initial management plan.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Amend Section 670.5
Title 14, California Code of Regulations
Re: Animals of California Declared to Be Endangered or Threatened

I. Date of Initial Statement of Reasons: October 1, 2015

II. Dates and Locations of Scheduled Hearings:

(a) Notice Hearing: Date: June 4, 2014
Location: Fortuna, CA

(b) Discussion/Adoption Hearing: Date: December 10, 2015
Location: San Diego, CA

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

Section 670.5 of Title 14, CCR, provides a list, established by the Fish and Game Commission (Commission), of animals designated as endangered or threatened in California. The Commission has the authority to add or remove species from this list if it finds that the action is warranted. Currently, gray wolf (*Canis lupus*) is not included on the list in Section 670.5.

The proposed regulatory action would add gray wolf to the Section 670.5 list as an “endangered” species. Once added to the Section 670.5 list, Fish and Game Code (FGC) Section 2080 prohibits the “taking” of a species unless the “take” is authorized pursuant to a California Endangered Species Act (“CESA”) permit or is exempt from CESA’s take prohibition.

On March 12, 2012, the Commission received the “Petition to List the Gray Wolf as endangered under the CESA” (March 12, 2012; hereafter, the Petition), as submitted by the Center for Biological Diversity, Big Wildlife, the Environmental Protection Information Center, and the Klamath-Siskiyou Wildlands Center (collectively “Petitioners”). Commission staff transmitted the Petition to the Department of Fish and

Wildlife (Department) pursuant to FGC Section 2073 on March 13, 2012, and the Commission published formal notice of receipt of the Petition on April 13, 2012 (Cal. Reg. Notice Register 2012, No. 15-Z, p. 494). After evaluating the Petition and other relevant information the Department possessed or received, the Department determined that based on the information in the Petition, there was sufficient scientific information to indicate that the petitioned action may be warranted, and recommended the Commission accept the Petition. The Commission voted to accept the Petition and initiate a review of the species' status in California on October 3, 2012. Upon publication of the Commission's notice of determination, the gray wolf was designated a candidate species on November 2, 2012 (Cal. Reg. Notice Register 2012, No. 44-Z, p. 1610).

Following the Commission's designation of the gray wolf as a candidate species, the Department notified affected and interested parties and solicited data and comments on the petitioned action pursuant to FGC Section 2074.4. (see also Cal. Code Regs., tit. 14, § 670.1(f)(2).) Subsequently, the Department commenced its review of the status of the species. On February 5, 2014 the Department delivered a status review to the Commission pursuant to FGC Section 2074.6, including a "narrowly tailored" recommendation that, based upon the best scientific information available to the Department, the petitioned action is not warranted. However, in the transmittal memorandum accompanying the status review, the Department recognized that CESA allows the Commission, in making its decision whether or not to list a species, to consider information beyond just the Department's narrowly prescribed scientific recommendation. (see Cal. Code Regs., tit. 14, § 670.1(h).) The Department's report also included a preliminary identification of habitat that may be essential to the continued existence of gray wolf, as well as management recommendations.

On April 16, 2014, at its meeting in Ventura, California, the Commission took up consideration of the Petition and received public testimony on the matter. However, in an effort to hear testimony from members of the public in northern areas of the State the Commission voted to table consideration as to whether the petitioned action is warranted until it could receive that additional testimony at its June meeting in Fortuna, California.

The Commission also asked for additional explanation from the Department regarding its recommendation to list gray wolf as a "species of special concern," the status of the Department's draft wolf plan, the potential for future listing of the gray wolf if it were not to happen in response to the current petition, and other regulatory options available to limit impacts to gray wolf in California.

The Commission received additional public and Department testimony at the June 4, 2014 meeting in Fortuna, California confirming that OR7, the

gray wolf that had been intermittently living in California over the past several years, had likely successfully bred with a female wolf and produced a litter of pups in an area of Oregon close to the California border. Both the existence of another wolf in the area and the confirmation that OR7 had probably successfully bred, were new pieces of information for the Commission's consideration. After receiving this additional information and oral testimony and considering the Petition, the Department's 2012 Candidacy Evaluation Report, the Department's Status Review, and other information included in the Commission's administrative record of proceedings at its meeting in Ventura, California on April 16, 2014, and at its meeting in Fortuna, California on June 4, 2014, the Commission determined, based on the requirements of CESA and the evidence before it, that listing gray wolf as an endangered species under CESA is warranted. (Fish & G. Code, § 2075.5(a); Cal. Code Regs., tit. 14, § 670.1, subd. (i)(1)(A).)

The proposed regulatory change is necessary to protect gray wolves in the petitioned area. The Commission finds that substantial evidence supports its determination under CESA that the continued existence of gray wolf in the State of California is endangered by one or a combination of the following factors:

1. Overexploitation;
2. Predation;
3. Disease;
4. Other natural occurrences or human-related activities.

This finding is supported by all of the information in the record of administrative proceedings, including the following facts:

- It is likely that wolves historically occurred in California and were widely distributed in the State. Status Review at 10 ("While limited the available information suggests that wolves were distributed widely in California, particularly in the Klamath-Cascade Mountains, North Coast Range, Modoc Plateau, Sierra Nevada, Sacramento Valley, and San Francisco Bay Area. The genetic evidence from southeastern California suggests that the Mexican wolf may have occurred in California, at least as dispersing individuals. While the majority of historical records are not verifiable, for the purposes of this status review, the Department concludes that the gray wolf likely occurred in much of the areas depicted (CDFW 2011a) (Figure 1)); 2012 Candidacy Evaluation Report at 4 ("As to the science available at this time and the reasonable inferences that can be drawn from that information, it indicates to the Department at this time that wolves were likely broadly distributed in California historically ..."); *id.* at 10 ("In summary, historic anecdotal

observations are most consistent with a hypothesis that wolves were not abundant, but widely distributed in California.”).

- There is sufficient evidence to conclude that wolves occurred historically in California. However, by the late 1920s, the species was extirpated from the state. Status Review at 4 (“2012 Candidacy Evaluation Report at 4) (“As to the science available at this time and the reasonable inferences that can be drawn from that information ... humans likely purposefully extirpated the species in California early in the twentieth century.”)
- Following listing of the gray wolf under the federal Endangered Species Act in 1974 and recovery efforts during the 1990s, a population of gray wolves in the Northern Rocky Mountain states has been re-established through a federal recovery program, and dispersing wolves from this population have established territories and several packs in Washington and Oregon. 2014 Status Review at 28.
- In September 2011, a radio-collared, sub-adult gray wolf known as “OR7” dispersed from the Imnaha pack in northeastern Oregon and arrived in California on December 28, 2011, marking the first documented individual of the species in California since the 1920s. 2012 Candidacy Evaluation Report at 4 (“a single lone wolf, a dispersing young male named ‘OR7,’ entered California in December 2011, remaining largely in the State since that time”); *id.* at 10 (“The first gray wolf detected in California after many decades occurred in December 2011 with the arrival of ‘OR7,’ a radio-collared, sub-adult gray wolf that dispersed from a pack in Oregon.”); *id.* (“OR7 dispersed from the Northeastern Oregon’s Imnaha pack in September 2011.”)
- The gray wolf is once again present in California, on at least an intermittent basis, and foreseeably will continue to be present in California, as discussed below. OR-7’s range now includes California and Oregon. OR7 has established a range that includes portions of Northern California, as this wolf is known to have crossed back and forth across the Oregon-California border since 2011 and to have been present in California in each of those years. Status Review at 4 (“The lone radio-collared gray wolf, OR7, dispersed from northeastern Oregon’s wolf population to California in December 2011 and has been near the Oregon/California border since that time, crossing back and forth.”); *id.* at 18 (“As far as the Department is aware, there is one gray wolf (OR7) that is near the Oregon/California border such that it may be in either state at any time.”); 2012 Candidacy Evaluation Report at 11 (“OR7 has passed back and forth over the California/Oregon border several times over the last five months ...”); California Department of

Fish and Wildlife, Gray Wolf OR7: Updates on wolves migrating to California (available at <http://californiagraywolf.wordpress.com>); see also Oregon Department of Fish and Wildlife, OR-7 Timeline of Events (available at http://www.dfw.state.or.us/wolves/rogue_pack.asp) (documenting OR7's presence in California in each of 2011, 2012, 2013, and 2014).

- OR7 has utilized areas of suitable habitat, primarily on public lands, comprised of ponderosa pine forests, mixed conifer forests, lava flows, sagebrush shrublands, juniper woodlands, as well as private lands including timberlands and agricultural lands, and has exhibited normal dispersal behavior for a young male gray wolf as he has sought to find other wolves, to establish his own pack, or to become part of an established wolf pack. 2012 Candidacy Evaluation Report at 10 (“It is believed that OR7 is exhibiting normal dispersal behavior for young male wolves, seeking to find other wolves, to establish his own pack, and/or to become part of an established wolf pack.”); *id.* at 11 (“OR7 has passed through ponderosa pine forests, mixed conifer forests, lava flows, sagebrush shrublands, juniper woodlands, and agricultural lands”); *id.* (“Although OR7 has used private lands (timberlands in particular), most of its route has traversed public lands.”).
- On June 4, 2014, the State of Oregon Department of Fish and Wildlife confirmed that OR7 had mated with a female wolf of unknown origin, and that the pair was denning with a litter of at least two pups on public land in southwestern Oregon. See Press Release, Oregon Department of Fish and Wildlife, Pups for wolf OR7 (June 4, 2014) (“Wolf OR7 and a mate have produced offspring in southwest Oregon’s Cascade Mountains, wildlife biologists confirmed this week.”); Comments of Pamela Flick, Defenders of Wildlife (June 4, 2014 Commission hearing) (reporting breaking news that a remote camera in southwestern Oregon has detected at least two pups).
- As the gestation period for gray wolves is 62-63 days and OR7 was documented in northern California on February 5, 2014, it is likely that OR7’s mate was traveling with OR7 in California at the time. Status Review at 10 (“The gestation period for wolves is 62-63 days.”); Testimony of Amaroq Weiss, June 4, 2014 Commission Meeting (Powerpoint slides at 15) (“A breeding population is likely on the border right now and a pregnant female was likely present in California already this year.”); L.D. Mech & L. Boitani, editors. *Wolves: behavior, ecology, and conservation*. University of Chicago Press, Chicago, Illinois, USA (cited in 2012 Candidacy Evaluation Report and Status Review) (discussing in Chapter 2 the reproductive behavior of wolves, and how

wolves spend many months together leading up to impregnation and gestation).

- The evidence in the record regarding wolf migration and dispersal behavior at a minimum indicates that wolves other than OR7 have similarly dispersed or will disperse to California, as most wolves from Oregon packs are not collared with radio transmitters and their presence in California may not otherwise have been detected (“we have acknowledged that we know of one [wolf, OR7]” and that “there could be others that we don’t know about”); U.S. Fish and Wildlife Service, Montana Fish, Wildlife & Parks, Nez Perce Tribe, National Park Service, Blackfeet Nation, Confederated Salish and Kootenai Tribes, Wind River Tribes, Washington Department of Wildlife, Oregon Department of Wildlife, Utah Department of Wildlife Resources, and USDA Wildlife Services. 2011. Rocky Mountain Wolf Recovery 2010 Interagency Annual Report. C.A. Sime and E. E. Bangs, eds. USFWS, Ecological Services, 585 Shepard Way, Helena, Montana. 59601. (2011) at 2 (noting that “it is difficult to locate lone dispersing wolves.”); Carroll (2013) (Peer Review) at 5-6 (“[n]ot all Oregon wolves are detected and collared” so “it is possible that not all wolves dispersing to California have been detected”). Petition at 15 (“... it is impossible to rule out the possibility that previous dispersal events to California may ... have occurred, which simply went un-detected because it is difficult to locate and track dispersing individual wolves”); Comments of Eric Loft (April 16, 2014 Commission Hearing).
- The presence of wolves in California is small and is likely to remain small for the foreseeable future. Eisenberg (2013) (Peer Review) at 2 (“Any wolves becoming established in California will initially constitute a small population.”).
- Dispersing wolves and small wolf populations are inherently at risk due to demographic and environmental stochasticity and in the case of wolves, of being killed by poachers, or hunters that mistake them for coyotes. Status Review at 5 (“A small population in California would be at some inherent risk although the species has demonstrated high potential to increase in other states. Dispersing individuals and small packs would likely be at highest risk due to population size.”); *id.* at 19 (“It is possible that a coyote hunter could mistake a gray wolf for a coyote, particularly at a long distance.”); *id.* at 22 (“With at least one gray wolf near the border of Oregon/California, and the knowledge that populations or species ranges are typically so large that they could range across both states ..., an individual wolf, or a small number of wolves would be threatened in their ability to reproduce depending on the number and sex of the animals present in the range.”); 2012

Candidacy Evaluation Report at 6 (“Wolves are often confused with coyotes (*Canis latrans*) and domestic dogs (*C. lupus familiaris*), and wolf hybrids, which result from the mating of a wolf and a domestic dog.”).

- Despite losses of areas of the gray wolf’s historic range in California, large tracts of habitat remain in the State that are sufficient to support a wolf population, particularly in the Modoc Plateau, Sierra Nevada, and Northern Coastal Mountains. Status Review at 17 (“Habitat Suitability Modeling: There are studies that have modeled potential suitable wolf habitat in California. Carroll (2001) modeled potential wolf occupancy in California using estimates of prey density, prey accessibility and security from human disturbance (road and human population density). Results suggested that areas located in the Modoc Plateau, Sierra Nevada, and the Northern Coastal Mountains could be potentially suitable habitat areas for wolves.
- Since entering California, there have been threats to harm or kill OR7 or other wolves found in the State. (See e.g. May 6, 2013 Center for Biological Diversity letter to Department of Fish and Wildlife, p.13.) Although many people are supportive of gray wolves as a component of wildland ecosystems, wolves are considered a threat to livestock and wild ungulates by many other people, and are considered a threat to people by some. For example, the administrative record includes reports of statements by county supervisors from Modoc, Siskiyou, and Lassen counties expressing a desire to kill wolves in the area, a sentiment which represents an imminent threat to wolves that are dispersing to the State. Status Review at 4-5 (“It is believed that limiting human-caused mortality through federal protection has been one of the key reasons that recovery efforts in the northern rocky mountains were successful.”); *id.* at 18-19 (“Public perception of wolf attacks on people, the documented losses of livestock, and the sometimes photographed killing of livestock or big game, continues to influence human attitudes toward wolves.”); Lassen County Board of Supervisors Hearing (Feb. 21, 2012) (quoting Lassen County supervisor to CDFW spokesperson) (“If I see an animal in my livestock, I kill it. If I kill a wolf, you going to throw me in jail? I don’t care what it is.”) (from notes taken at board meeting by Amaroq Weiss, Center for Biological Diversity); Modoc County Board of Supervisors Meeting (quoting Modoc County Supervisor) (“If I see a wolf, it’s dead.”) (Modoc County Board of Supervisors January 24, 2012 Hearing, Audio Archive); Chair of the Siskiyou County Board of Supervisors (“People are pretty much at their wits’ end trying to make a living with all the environmental protections that are being foisted upon them” and “we would like to see [wolves] shot on sight”) (*Los Angeles Times* (Dec. 24, 2011)) (available at <http://articles.latimes.com/2011/dec/24/local/la-me-wolf-oregon-20111225>).The Commission considers these statements

and others like them to be compelling evidence of a threat to the continued existence of gray wolf in California. In a small early population of the species, loss of even one individual from human causes could significantly impact the ability of the species to thrive for years to come. CESA would criminalize such behavior in a more significant way than currently exists and act as a deterrent that may assist in allowing the early members of California's gray wolf population to persist.

- Humans are the primary factor in the past decline of wolves in the conterminous United States, including California, and humans remain the largest cause of wolf mortality as a whole in the western United States. Humans impact wolf populations through intentional predation (shooting or trapping) for sport or for protection; through unintentional killing, as gray wolves are often confused with coyotes (*Canis latrans*), domestic dogs (*C. lupus familiaris*), and wolf hybrids; through vehicle collisions; and through exposures to diseases from domestic animals. For example, the administrative record demonstrates that on more than one occasion, staff from the California Department of Fish and Wildlife have been fearful that OR7 and other unknown wolves that could be in California would be mistaken for a coyote and shot or harmed. Limiting human-caused mortality through federal protection has been one of the key reasons that the recovery effort in the Northern Rocky Mountains has been successful. Status Review at 4-5 ("It is believed that limiting human-caused mortality through federal protection has been one of the key reasons that recovery efforts in the northern rocky mountains were successful."); *id.* at 19 ("Human-caused mortality of wolves is the primary factor that can significantly affect wolf populations (USFWS 2000, Mitchell et al. 2008, Murray et al. 2010, Smith et al. 2010)"); *id.* at 20.
- Gray wolves are susceptible to several diseases including canine parvovirus and canine distemper, which has been responsible for extremely high rates of wolf pup mortality and suppression of wolf populations and which can be contracted from domestic dogs. Wolves are also susceptible to mange; mange-associated wolf population declines in Yellowstone National Park have led to pack extinction. Status Review at 23 (Wolves are vulnerable to a number of diseases and parasites, including, mange, mites, ticks, fleas, roundworm, tape worm, flatworm, distemper, parvovirus, cataracts, arthritis, cancer, rickets, pneumonia, and Lyme disease."); *id.* ("The transmission of disease from domestic dogs, e.g. parvovirus, is a grave conservation concern for recovering wolf populations (Paquet and Carbyn 2003; Smith and Almborg 2007). Recently, two wolves and two pups in Oregon were found to have died from parvovirus (ODFW 2013b). The disease is not thought to significantly impact large wolf populations, but it may hinder the recovery of small populations (Mech and Goyal 1993)."); *id.* ("Canine

distemper and canine infectious hepatitis: Both diseases are known to occur in wolves and more recently canine parvovirus has become prevalent in several wolf populations (Brand et al. 1995)"); E.S. Almborg, P.C. Cross, A.P. Dobson, D.W. Smith and P.J. Hudson. 2012. Parasite invasion following host reintroduction: a case study of Yellowstone's wolves. *Philosophical Transactions of the Royal Society Bulletin*. 367, p. 2840-2851).").

- Listing the gray wolf under CESA will allow the species to benefit from CESA's protections, and would further the intent of the Legislature and be consistent with the objectives of CESA, *i.e.*, the conservation, protection, restoration, and enhancement of species in their range in California. Protecting the gray wolf under CESA will also strengthen the Department's existing stakeholder process to develop a state wolf plan, by providing clarity as to the management tools and options that will be available to the Department and to stakeholders. Status Review at 33 ("If the gray wolf species is listed under CESA, it may increase the likelihood that State and federal land and resource management agencies will allocate funds towards protection and recovery actions."); Carroll (2013) (Peer Review) at 6 ("Rather than using a dubious interpretation of CESA to decline to list a species due to its temporary and uncertain absence from state, California should follow the example of Washington and Oregon in using the relevant state statutes to protect colonizing wolves while at the same time developing multi-stakeholder plans that proactively restore wolf conservation and management issues.").
- The gray wolf is currently listed as endangered throughout portions of its range, including California, under the federal Endangered Species Act ("ESA"). Wolves that enter California are therefore protected by the ESA from activities that result in "take." The ESA defines "take" to mean "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." However, the United States Fish and Wildlife Service ("USFWS") is proposing a rule that would remove the ESA protections for gray wolves in the lower 48 states, with the exception of Mexican gray wolves, which would maintain their listed status as an endangered subspecies. If the federal delisting occurs, there would be more limited protections for gray wolves in California. Listing the species under CESA would reinforce the existing federal protections in place now, and preserve protections for the gray wolf in the event of federal delisting.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Section(s) 240, 2070, 2075.5 and 2076.5, Fish and Game Code.

Reference: Section(s) 1755, 2055, 2062, 2067, 2070, 2072.7, 2074.6, 2075.5, 2077, 2080, 2081 and 2835, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None

(d) Identification of Reports or Documents Supporting Regulation Change:

A petition to list this species; the Department's petition evaluation report; the Department's status review; the Department's related recommendations; written comments received from members of the public, the regulated community, various public agencies, and the scientific community; and other evidence included in the Commission's record of proceedings.

(e) Public Discussions of Proposed Regulations Prior to Notice publication:

Public comments were heard at the April 16, 2014 Fish and Game Commission meeting in Ventura, California and at the June 4, 2014 Commission meeting in Fortuna, California. During the candidacy period the Department also solicited comments from landowners and other affected and interested parties.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified.

(b) No Change Alternative:

If the Commission were not to add gray wolf to the list of endangered species, valuable State mechanisms to protect the species would not be available. The Commission would fulfill its statutory obligation in adopting the proposed regulation.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law..

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment, therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

While the CESA statutes do not specifically prohibit the consideration of economic impact in determining if listing is warranted, the Attorney General's Office has consistently advised the Commission that it should not consider economic impact in making a finding on listing. This is founded in the concept that CESA was drafted in the image of the federal Endangered Species Act. The federal act specifically prohibits consideration of economic impact during the listing process.

The CESA listing process is basically a two-stage process. During the first stage, the Commission must make a finding on whether or not the petitioned action is warranted. By statute, once the Commission has made a finding that the petitioned action is warranted, it must initiate a rulemaking process to make a corresponding regulatory change. To accomplish this second stage, the Commission follows the statutes of the Administrative Procedure Act (APA).

The provisions of the APA, specifically sections 11346.3 and 11346.5 of the Government Code, require an analysis of the economic impact of the proposed regulatory action. While Section 11346.3 requires an analysis of economic impact on businesses and private persons, it also contains a subdivision (a) which provides that agencies shall satisfy economic assessment requirements only to the extent that the requirements do not conflict with other state laws. In this regard, the provisions of CESA leading to a finding that listing is warranted are in apparent conflict with Section 11346.3, which requires an agency to consider economic impacts of its proposed regulations.

Since the finding portion of CESA is silent as to consideration of economic impact, it is possible that subdivision (a) of Section 11346.3 requires the preparation of an economic impact analysis. While the Commission does

not believe this is the case, an abbreviated analysis of the likely economic impact of the proposed regulation change on businesses and private individuals is provided. The intent of this analysis is to provide disclosure, the basic premise of the APA process. The Commission believes that this analysis fully meets the intent and language of both statutory programs.

Designation of gray wolf as endangered will subject the species to the provisions of CESA. This act prohibits take and possession except as may be permitted by the Department.

Presently the gray wolf is listed as endangered throughout portions of its range, including California, under the federal Endangered Species Act of 1973 (16 U.S.C. § 1531 *et seq.*) (ESA). Wolves that enter California are therefore protected by the ESA. Under the ESA, the U.S. Fish and Wildlife Service has lead responsibility for wolves in California.

For species listed as endangered or threatened under the ESA, activities that result in “take” of the species are prohibited. The ESA defines "take" to mean "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Harass is further defined as “an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding or sheltering” (50 CFR 17.3).

As long as the gray wolf remains federally listed, concurrent listing under the CESA, should not result in a significantly greater economic impact. As a result of the federal or State listing, the economic impacts on commercial timber and other industries' whose activities occur near wolf den or rendezvous sites could be significant. To avoid prohibited take under CESA and ESA, may require consultation with the Department and federal counterparts as to the timing of activities and potentially incidental take permitting. Based on these considerations, the Commission finds that the amendment of this regulation may have a significant adverse economic impact on business.

The Commission has made an initial determination that the amendment of this regulation may have a significant, statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The Commission has considered proposed alternatives that would lessen any adverse economic impact on business and invites you to submit proposals. Submissions may include the following considerations:

- (i) The establishment of differing compliance or reporting requirements or timetables that take into account the resources

- available to businesses.
- (ii) Consolidation or simplification of compliance and reporting requirements for businesses.
 - (iii) The use of performance standards rather than prescriptive standards.
 - (iv) Exemption or partial exemption from the regulatory requirements for businesses.

In most cases, conservation measures implemented by the Department for newly listed endangered species have relatively little effect on members of the public. That effect, if any, usually arises from requiring persons to avoid any take of endangered species, or implementing the conditions of an incidental take permit. Fish and Game Code Section 2081(b) addresses the requirements for an incidental take permit:

- Take must be incidental to an otherwise lawful activity.
- Impacts of authorized take must be minimized.
- Impacts of the authorized take must be “fully mitigated.”
- The permit applicant must ensure adequate funding to implement the measures required for minimizing and fully mitigating the impacts of authorized take, and for monitoring compliance with and effectiveness of those measures.
- A permit cannot be issued if the Department determines that issuance of the permit will jeopardize the continued existence of the species.

Designation of threatened or endangered status, per se, would not necessarily result in any significant cost to private persons or entities undertaking activities subject to the California Environmental Quality Act (“CEQA”). CEQA currently requires private applicants undertaking projects subject to CEQA to consider *de facto* endangered or threatened species to be subject to the same protection under CEQA as though they are already listed by the Commission in Section 670.5 of Title 14, CCR (CEQA Guidelines, Section 15380).

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

If the potentially significant economic impact identified above occurs, there could be an adverse impact on new or existing jobs, an adverse impact on creation of new businesses or elimination of existing businesses, and an adverse impact on business expansion. The magnitude of these impacts will depend on the extent to which commercial activities result in take of

gray wolf, and the costs of minimizing and mitigating for that take. The Commission does not anticipate benefits to the health and welfare of California residents or to worker safety. The Commission anticipates benefits to the environment by protecting the gray wolf under CESA.

(c) Cost Impacts on a Representative Private Person or Business:

A representative private person or business may experience economic impacts as described in section (a) above.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

As a project applicant, a state agency may realize costs associated with projects involving the incidental take of gray wolf as described in section (a) above.

The proposed regulatory change is not expected to significantly affect federal funding to the State, but there could be an increase in the likelihood that State and federal land and resource management agencies would allocate funds to the State for protection and recovery actions.

(e) Nondiscretionary Costs/Savings to Local Agencies:

As a project applicant, a local agency may realize costs associated with projects involving the incidental take of gray wolf as described in section (a) above.

(f) Programs mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

As long as the gray wolf remains federally listed, concurrent listing under the CESA, should not result in a significantly greater economic impact. As a result of

the federal or State listing, the economic impacts on commercial timber and other industries' whose activities occur near wolf den or rendezvous sites could be significant. To avoid prohibited take under CESA and ESA, may require consultation with the Department and federal counterparts as to the timing of activities and potentially incidental take permitting.

Effects of the Regulation on the Creation or Elimination of Jobs within the State

There could be an adverse impact on new or existing jobs. The magnitude of these impacts will depend on the extent to which commercial activities result in take of gray wolf, and the costs of minimizing and mitigating for that take.

Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses within the State

There could be an adverse impact on creation of new businesses or elimination of existing businesses. The magnitude of these impacts will depend on the extent to which commercial activities result in take of gray wolf, and the costs of minimizing and mitigating for that take.

Effects of the Regulation on the Expansion of Businesses Currently Doing Business within the State

There could be an adverse impact on business expansion. The magnitude of these impacts will depend on the extent to which commercial activities result in take of gray wolf, and the costs of minimizing and mitigating for that take.

Benefits of the Regulation to the Health and Welfare of California Residents

The Commission does not anticipate any benefits to the health and welfare of California residents.

This regulatory proposal will amend Section 670.5, Title 14, CCR, adding the gray wolf to the list of endangered species.

Benefits of the Regulation to Worker Safety

The proposed regulations are not anticipated to impact worker safety conditions.

This regulatory proposal will amend Section 670.5, Title 14, CCR, adding the gray wolf to the list of endangered species.

Benefits of the Regulation to the State's Environment

The proposed regulation will benefit the environment by protecting the gray wolf under CESA.

Informative Digest/Policy Statement Overview

Section 670.5 of Title 14, CCR, provides a list, established by the California Fish and Game Commission (Commission), of animals designated as endangered or threatened in California. The Commission has the authority to add or remove species from this list if it finds that the action is warranted.

At its June 4, 2014 meeting in Fortuna, California, the Commission made a finding that gray wolf warrants listing pursuant to the California Endangered Species Act (CESA). Specifically, the Commission determined that gray wolf (*Canis lupus*) should be listed as an endangered species.

The Commission therefore proposes to amend Section 670.5 of Title 14, CCR, to add gray wolf to the list of endangered species.

This proposal is based upon the documentation of threats to gray wolf to the point that it meets the criteria for listing by the Commission as set forth in the CESA. The Commission is fulfilling its statutory obligation in making this proposal which, if adopted, would afford gray wolf in California with the recognition and protection available under CESA.

EVALUATION OF INCOMPATIBILITY WITH EXISTING REGULATIONS:

Section 20, Article IV, of the State Constitution specifies that the Legislature may delegate to the Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to establish a list of endangered species and a list of threatened species (Fish and Game Code Section 2070). Commission staff has searched the CCR and has found that the proposed regulation is neither inconsistent nor incompatible with existing state regulations.

Subsection (a)(6) of Section 670.5, Title 14, CCR is amended to read:

§670.5(a). Animals of California Declared to Be Endangered or Threatened.

The following species and subspecies are hereby declared to be endangered or threatened, as indicated:

[No changes to subsections 670.5(a)(1) through (a)(5)]

(a) Endangered:

(6) Mammals:

- (A) Riparian brush rabbit (*Sylvilagus bachmani riparius*)
- (B) Morro Bay kangaroo rat (*Dipodomys heermanni morroensis*)
- (C) Giant kangaroo rat (*Dipodomys ingens*)
- (D) Tipton kangaroo rat (*Dipodomys nitritoides nitratoides*)
- (E) Fresno kangaroo rat (*Dipodomys nitritoides exilis*)
- (F) Salt-marsh harvest mouse (*Reithrodontomys raviventris*)
- (G) Amargosa vole (*Microtus californicus scirpensis*)
- (H) California bighorn sheep (*Ovis canadensis californiana*)
- (I) Gray Wolf (*Canis Lupus*)

[No changes to subsections 670.5(b)(1) through (b)(6)]

COLUSA COUNTY FISH & GAME ADVISORY COMMISSION
546 Jay Street, Suite 202
Colusa, CA 95932

October 29, 2015

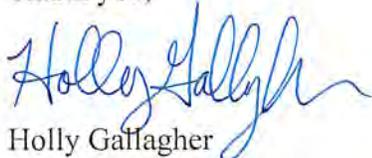

Department of Fish & Wildlife
1416 9th Street, 12th Floor
Sacramento, CA 95814

To Whom It May Concern:

At their recent Fish & Game Commission meeting the Commission discussed the matter of the protection of the gray wolves within the State of California. The Commission feels the wolves are a threat to our state and the people served. They would like to address the issue of liability should there be any losses incurred. If the State would like to protect the wolves, they should also ready be prepared to be responsible for the outcome.

The Commission would ask that you take this matter into serious consideration. Please feel free to call if you have any questions or if you need any additional information. I can be reached at (530) 458-0408 or via email at hgallagher@countyofcolusa.com.

Thank you,

Holly Gallagher
Commission Secretary

Regarding adding the Gray Wolf to the endangered species list. The Gray Wolf is not an indignities species is it???? Either way, without a natural predictor it's numbers can get out of hand quickly. In some states they have declared hunting seasons because of this, in an effort to keep their numbers in check. Our deer and elk herds don't need the added pressure, nor do other species such as rabbits and ground nesting birds. I think this is a case where "If it ain't broke don't fix it" applies. A balance, of sorts, has been established and your meddling can have unintended consequences.

Re: Adoption of proposed changes to endangered or threatened animals regulations to add gray wolf (*Canis lupus*) to the list of endangered species (Section 670.5, Title 14, CCR)

Dear President Baylis:

The California Cattlemen's Association (CCA), California Farm Bureau Federation (CFBF), and California Wool Growers Association (CWGA) welcome the opportunity to comment on the proposal to amend Section 670.5, Title 14 of the California Code of Regulations to list the gray wolf as an endangered species in California. Our organizations remain strongly opposed to listing of the gray wolf as endangered under the California Endangered Species Act (CESA), and we urge the Commission to **reject** the proposed regulatory amendment which would list the gray wolf as endangered in California. The many legal, policy, and factual considerations that our organizations have addressed to the Commission since 2012 continue to weigh against endangered status for the gray wolf, and we urge the Commission to halt the listing process by not adopting the proposed regulatory amendment.

I. THE GRAY WOLF IS NOT LEGALLY ELIGIBLE FOR LISTING AS ENDANGERED UNDER § 670.5

A. The gray wolf is not “in serious danger of becoming extinct throughout...its range” as required by CESA

The term “range” under CESA is susceptible of at least two (though likely more) interpretations. For instance, “range” may be interpreted as “the species’ overall geographic range without regard to physical or political geographic boundaries,” or it may be interpreted as “the species’ California range only,” as the California Third District Court of Appeals held in *California Forestry Association v. California Fish and Game Commission*.¹

Importantly, under either interpretation of “range,” gray wolves were likely not legally listable within § 670.5 at the time that the Commission determined such listing was warranted.

If the former interpretation is applied (that “range” is the species overall geographic range), then gray wolves are clearly not at danger of becoming extinct. In fact, the overall population of gray

¹ No other California case appears to have considered the meaning of “range” under CESA. See Section I. B. for further analysis of *Cal. Forestry Ass’n v. Cal. Fish & Game*, distinguishing that case from the present scenario under analysis of the California Administrative Procedures Act.

wolves is robust and increasing, especially throughout the American West, and gray wolves have made such a great population resurgence that the US Fish and Wildlife Service is currently considering delisting populations of the species under the federal Endangered Species Act and the state of Oregon recently delisted the species from its list of endangered species.

If the latter interpretation of “range” is applied (that “range” means a species’ extent within the borders of California), the same conclusion results: the species is not at risk of extinction throughout its range. This was particularly true at the time that the Commission made its decision to list the gray wolf, as no wolves were present within California. If a species is not present within the state, it cannot be at risk of *becoming* extinct. The Commission’s Initial Statement of Reasons for Regulatory Action (ISOR) confirms that no gray wolves were present within California at the time the Commission determined the species warranted inclusion on the endangered species list. As the Commission notes, “[o]n June 4, 2014 [the date the Commission determined listing was warranted], the State of Oregon Department of Fish and Wildlife confirmed that OR7...was denning...on public land in southwestern Oregon.”² OR7 was the only wolf known to the Commission to have been present (on an intermittent basis) within California, and the Commission was aware that OR7 was not present in California on the date that the Commission determined listing was warranted.

Nor was OR7’s prior intermittent presence in California a sufficient basis to list the gray wolf as endangered under CESA. Not only was OR7 not present at the time of listing, but his forays into California were relatively brief and impermanent, lacking sufficient regularity over a reasonable span of time for the species to be deemed to occupy “range” within California.

Regardless of how one interprets “range” under CESA, it is clear that the Commission had insufficient legal basis to determine that gray wolves warranted listing as endangered.

B. The Commission’s interpretation of “range” as meaning “California range” is an underground regulation in violation of the California APA

As demonstrated above, the term “range” as used in CESA is ambiguous, clearly susceptible of more than one interpretation. “Range” is not defined within CESA itself nor within any regulation formally adopted by the Commission to implement and enforce CESA. Nevertheless, the Commission has interpreted “range” to mean “California range.”

Importantly, however, the Commission has never engaged in the required rulemaking to establish its standard that “range” means only range *within California*. The Commission’s application of this interpretation in adopting subsequent regulations (including the regulatory amendment currently under consideration) is a violation of the California Administrative Procedures Act (APA). By establishing a “guideline...standard of general application, or other rule” without engaging in the formal rulemaking required by the APA, the Commission has effectively developed an “underground regulation” in violation of the APA.

It is not sufficient that legal precedent has on one occasion interpreted “range” to mean “range *within California*,” as held in *California Forestry Ass’n v. Cal. Fish & Game Comm’n* and noted

² Initial Statement of Reasons for Regulatory Action at 5.

by Petitioners at the April 2014 and June 2014 hearings. In that case, the court was not presented with the question of whether such an interpretation was legally defensible without formal rulemaking under the APA, but only the question of whether the term “range” within CESA was *susceptible* of such a limited definition.

To avoid running afoul of the APA, we urge the Commission to reject the proposed amendment to the list of endangered species—rooted as it is in the legally-deficient interpretation of “range.”

C. Gray wolves are not provably “native” to the state of California as required by CESA

CESA defines an endangered species as “a *native* species or subspecies . . . which is in serious danger of becoming extinct throughout all, or a significant portion, of its range.”³

Petitioners did not sufficiently demonstrate this threshold requirement in their petition, nor has additional information subsequently provided by the California Department of Fish and Wildlife (CDFW) provided sufficient evidence to prove that the gray wolf is native to California.⁴ In fact, CDFW Wildlife Programs Branch Chief Eric Loft stated on October 3, 2012 that “historically we do not have much more than anecdotal information on the history of gray wolves” in California.⁵ It would be a mistake, then, to assume that these anecdotal reports add up to certainty of a historic native population of gray wolves in California. As Mr. Loft stated, “we do not know that” there was a significant native population, and CESA requires just such knowledge as a precondition to listing.

CDFW was only highly confident of the accuracy of 3 reports of gray wolf presence in California prior to June 4, 2014—one of which was OR7 himself. The remaining two high-confidence records are anecdotal at best. Three specimens are necessarily insufficient to demonstrate that there was an established, *native* population of gray wolves historically present within California. Indeed, it is entirely possible that these exceedingly few specimens arrived in California not as the result of a native population, but instead in the same manner as OR7—a brief foray into the state.

D. The legislative intent behind CESA was to protect species in decline, precisely the opposite scenario presented by gray wolves in California

CESA defines an endangered species as one “which is in serious danger of becoming extinct throughout all, or a significant portion, of its range.”⁶ However, the presence of the gray wolf in California presents exactly the *opposite* scenario. The gray wolf was not present in California for many decades prior to the passage of CESA, and indeed may never have been a well-established

³CAL. FISH & GAME CODE § 2062 (emphasis added).

⁴ For a detailed discussion of the scant evidence that gray wolves are “native” to California, *see* Letter from the California Cattlemen’s Association, California Farm Bureau Federation, and California Wool Growers Association to Michael Sutton, President, California Fish and Game Commission (Oct. 6, 2014).

⁵ Video recording: Meeting of October 3, 2012, held by the California Fish & Game Commission, at 3:58:21 (Oct. 3, 2012) (*available at* [http://www2.cal-span.org/media.php?folder\[\]=CFG](http://www2.cal-span.org/media.php?folder[]=CFG)).

⁶ CAL. FISH & GAME CODE § 2062.

native species, but it may now expand into the state because there are no significant threats to the species' survival.

The change CESA is meant to guard against is the *disappearance* of a species. CESA has historically only been used where species are on the *decline* within the state because of this fear for the disappearance of a species. However, the situation presented by the gray wolf is precisely the opposite scenario: any appearance of the gray wolf within California would necessarily be an *increase* in the species. The legislature did not intend CESA to apply in instances where species were *appearing* in the state or increasing in number, but rather intended to guard against the decline of native species within the state. As a matter of law and policy, endangered species listing is not the proper means for protecting the gray wolf in California.

II. REJECTING THE PROPOSED AMENDMENT ALLOWS CDFW TO BETTER MANAGE THE SPECIES AND REDUCE HARMS ASSOCIATED WITH LISTING THAT ARE OUTLINED IN THE ISOR

CDFW continues to develop a Wolf Management Plan, which has been developed with the input of a diverse Stakeholder Working Group, upon which representatives of each of our organizations sat. Unfortunately, many nuanced, thoughtful, and balanced management policies being considered by CDFW throughout the development of the wolf management plan had to be abandoned in the wake of the Commission's decision that the species warranted listing as endangered, as some of those management policies ran afoul of the rigid, inflexible requirements of CESA.

In the ISOR, the Commission notes that "the amendment of this regulation may have significant, statewide adverse economic impact directly affecting business."⁷ Indeed, endangered listing of gray wolves is likely to result in significant economic hardship for ranchers.

As predators, wolves are extraordinarily detrimental to the life and health of livestock, and consequently to the livelihood of ranchers. Not only are gray wolves known to directly kill livestock, but scientific study has shown that "[t]he regular presence of wolves in close proximity to livestock may result in a chronic stress situation for the domestic animals" and that "[m]any infectious diseases result from a combination of viral and bacterial infections and are brought on by stress."⁸ Stress can result in increased susceptibility to disease and weight loss, reduction in the value of meat, and can interfere with reproduction.⁹ One study demonstrates that where wolf-pack territories overlapped cattle grazing areas on ranches where there was at least one confirmed prior depredation, the average calf had an average end-of-season weight 3.5% lower than the overall average.¹⁰ In the study, this reduction in weight meant a total loss of \$6,679 for an average affected livestock producer.¹¹

¹⁰ Kellenberg, Derek et al., 2014. Crying wolf? A Spatial analysis of wolf location and depredations on calf weight. Journal of Agricultural Economics.

¹¹ *Id.*

Because of the devastating direct and indirect effects of gray wolves upon livestock, and due to the limited effectiveness of livestock protection measures such as fladry, RAG boxes, and other measures, it is important that ranchers have available to them as many options as possible to protect their livestock and their livelihoods. The statutory restrictions attending CESA listing foreclose many of these protection measures, even some non-lethal measures.

Thus, in order to avoid the significant harm and suffering to livestock and the significant economic damage to ranchers that will attend listing the gray wolf as endangered, our organizations urge the Commission to reject the proposed amendment, and instead defer to CDFW to establish nuanced policies which will better strike a balance between conserving gray wolves and protecting livestock and ranchers.

CONCLUSION

Because the gray wolf is not legally eligible for endangered status under CESA, and because such endangered status will result in significant harm to livestock, ranchers, and the state of California, we urge the Commission to reject the proposed amendment which would list gray wolves as endangered under Section 670.5.

Sincerely,

Kirk Wilbur

BEFORE THE CALIFORNIA FISH AND GAME COMMISSION

A Petition to List the Tricolored Blackbird (*Agelaius tricolor*) as Endangered under the California Endangered Species Act and Request for Emergency Action to Protect the Species

tricolor blackbird, *Agelaius tricolor*, Dave Menke, USFWS

Notice of Petition

For action pursuant to Section 670.1, Title 14, California Code of Regulations (CCR) and Sections 2072 and 2073 of the Fish and Game Code relating to listing and delisting endangered and threatened species of plants and animals.

I. SPECIES BEING PETITIONED:

Common Name: Tricolored Blackbird (*Agelaius tricolor*)

II. RECOMMENDED ACTION: Immediate Listing as Endangered with Emergency Regulations

The Center for Biological Diversity submits this petition to list the Tricolored Blackbird (*Agelaius tricolor*) as endangered throughout its range in California, under the California Endangered Species Act (California Fish and Game Code §§ 2050 et seq., “CESA”). This petition demonstrates that the Tricolored Blackbird clearly warrants listing under CESA based on the factors specified in the statute.

This petition provides identical information as contained in the Center’s 2014 petition with the addition of an addendum providing new research.

III. AUTHORS OF PETITION:

Name: Lisa Belenky, Senior Attorney, Center for Biological Diversity, and
Monica Bond, Wild Nature Institute
Address: 1212 Broadway, Suite 800, Oakland, CA 94612
Phone: 510-844-7107
Fax: 415-436-9683
Email: lbelenky@biologicaldiversity.org

I hereby certify that, to the best of my knowledge, all statements made in this petition are true and complete.

Executive Summary

The Tricolored Blackbird (“Tricolor;” *Agelaius tricolor*) is a colonial-nesting passerine largely endemic to California. It forms the largest colonies of any passerine in North America since the extinction of the Passenger Pigeon (*Ectopistes migratorius*, Bent 1958). Colonially nesting birds are particularly vulnerable to extinction because a small number of colonies can include a large proportion of the population; thus human activities can have catastrophic effects by killing adults or chicks or destroying habitat (Cook and Toft 2005). Such was the fate of the colonial Passenger Pigeon, Carolina Parakeet (*Conuropsis carolinensis*), and Great Auk (*Pinguinus impennis*) and will be the fate of the Tricolored Blackbird if immediate action is not taken. As scientists working with the Tricolored Blackbird noted, early actions are needed to protect colonial bird species from rapid collapse.

“Surely the legacy of Passenger Pigeon should be our understanding of how such extinctions can occur rapidly in extremely abundant organisms because of non-linear population dynamics and thresholds caused by inverse density dependence. Failure to address the impact of habitat and human activities on reproductive success of Tricolored Blackbird may again lead to the extinction of a once-abundant bird.” (Cook and Toft 2005:86.)

Tricolored blackbird populations are declining at an alarming rate in large part due to the direct loss and degradation of habitat from human activities. This includes historical market hunting of blackbirds, poisonings and shootings to protect crops from blackbirds, pesticide use, and harvest of grain crops grown for dairy silage and other agricultural grain crops and routine plowing of weedy fields throughout most of its range during nesting season. For example, every year, thousands of Tricolors, often entire colonies of tens of thousands of birds representing the largest known colonies in a given year, nest unsuccessfully on agricultural lands because their eggs and nests are destroyed during harvest or weed abatement activities (Beedy and Hamilton 1999, Hamilton 2004, Cook and Toft 2005, Meese 2006, 2007, 2008, 2009a, 2011). The concentration of most of the known Tricolor population in a few large breeding colonies increases the risk of major reproductive failures, especially in vulnerable habitats such as active agricultural fields (Cook and Toft 2005, Meese 2013). Moreover, entire colonies are often predated by rats, egrets, herons, coyotes, and other species, some colonies are partially or completely destroyed by storms, and insufficient insect prey in foraging areas near to nesting substrates appears to be causing widespread reproductive failure even in colonies unperturbed by harvest, predation, or storms (Meese 2006, 2007, 2008, 2009a, 2011, 2013). Because these factors are contributing annually to significant breeding failure, efforts to reduce and reverse population decline are critically needed. Unfortunately, voluntary measures undertaken over the past decade have not stopped the decline of the species or destruction of nesting habitat. Therefore, in order to ensure survival of the species the California Fish and Game Commission (“the Commission”) should immediately list the Tricolored Blackbird as endangered and adopt emergency regulations to protect its nesting habitat.

The geographic range of Tricolors is generally restricted to California’s Central Valley and surrounding foothills, and sparsely throughout coastal and inland locations north of the Central Valley and in southern California (Beedy and Hamilton 1999). California supports more than 99% of the population, but the species has also been reported in small numbers in southern

Oregon and northernmost western coastal Baja California with a single colony of 60 birds in western Nevada, and a similar number in central Washington (Beedy and Hamilton 1997, 1999, DeHaven 2000). The Tricolor's basic requirements for selecting breeding sites are open accessible water, a protected nesting substrate such as flooded or thorny or spiny vegetation, and adequate insect prey within a few kilometers of the nesting colony (Beedy and Hamilton 1999, Shuford and Gardali 2008). Historically, rivers flowing into the Central Valley would flood and create extensive marshes, providing abundant high-quality breeding habitat for Tricolors and other wetland-dependent species, but much of this habitat has been obliterated. Tricolors have demonstrated some flexibility in shifting breeding from marshes to other spiny and thorny vegetation types such as non-native Himalayan blackberry and thistles as well as newly developed silage crops such as Triticale. However, none of these new nesting habitat types are given any regulatory protection, rendering entire colonies vulnerable to complete reproductive failure during the active nesting season due to agricultural activities. In addition, Tricolor colonies often switch nesting locations from year to year, substantially complicating conservation efforts.

The Tricolor is sympatric with and morphologically similar to the Red-winged Blackbird ("Red-wing;" *A. phoeniceus*). However, unlike Red-wings, Tricolors breed in dense colonies, often traveling long distances to forage for their chicks, and males defend relatively smaller territories within their colonies, mating with one to several females per year (Beedy and Hamilton 1999). The overall distribution and location of nesting sites vary from year to year, and Tricolors are itinerant breeders, i.e., they may nest more than once at different locations during the breeding season (Hamilton 1998).

Tricolors form the largest breeding colonies of any North American landbird, and breeding colonies recently consisted of tens of thousands of birds at a single site. While Tricolor colonies can consist of thousands of breeding birds, thus giving an appearance of high local abundance to casual observers, the status of the bird is of great concern because the overall population has declined dramatically over the past 70 years, a decline that appears to have accelerated in the past 6 years (Meese 2014), its geographical range is largely restricted to California, and its gregarious nesting behavior renders colonies vulnerable to large-scale nesting failures due to destruction of active nests in its agricultural habitats and high levels of predation in its little remaining native emergent marsh habitat, predominately cattails and bulrushes. Every year, Tricolors experience large losses of reproductive effort to crop-harvesting and other agricultural activities, and predation, and suffer habitat losses to land conversions from rangeland to vineyards, orchards, and urban development and an unknown number are killed in autumn in rice paddies in the Sacramento Valley. Despite awareness of widespread reproductive losses over the past two decades, FWS, the Commission, and DFW have failed to take any serious regulatory action. The Center for Biological Diversity submitted a petition to list the Tricolor as an endangered species under the California and Federal Endangered Species Acts in 2004 due to the documented population decline from historical number and the serious threats from agricultural harvest and habitat loss, but the petition was denied and the threats continued. Consequently, the population of Tricolors continued to drop precipitously to the point where the need for emergency action is now unequivocal.

The Tricolored Blackbird was once considered one of the most abundant bird species throughout much of its range (Cook and Toft 2005). In 1859, Heermann wrote that wintering flocks of Tricolors would “darken the sky for some distance by their masses,” a description similar to that of the now-extinct Passenger Pigeon (Cook and Toft 2005). Beginning in the 1930s and continuing until 2014, numerous efforts have been made to estimate abundance of Tricolors (Neff 1937, DeHaven et al. 1975, Hamilton et al. 1995, Beedy and Hamilton 1997, Hamilton 2000, Kelsey 2008, Kyle and Kelsey 2011, Meese 2014). Numbers of Tricolors estimated in the 1930s compared with numbers estimated in 2014 very clearly and unequivocally demonstrate an extremely precipitous decline in the population of Tricolors in the Central Valley, the historical stronghold of the species, and elsewhere including the Central Coast and southern California. Population trends of Tricolors in the Central Valley indicated a decline of at least 50% between the 1930s and early 1970s (DeHaven et al. 1975), and an additional decline of approximately 56% of the remaining population was reported from 1994 to 2000 (Hamilton 2000). More recent statewide surveys included greatly expanded efforts with more sites, and these surveys documented additional dramatic declines: from an initial survey count of 395,000 birds in 2008, numbers declined dramatically to a count of about 145,000 in 2014—despite the fact that this was the largest effort ever expended to census the entire population of Tricolored Blackbirds, this was the smallest population ever recorded. The situation is dire indeed.

Petitioner requests immediate protection of the Tricolored Blackbird. The Center is extremely concerned about the continued destruction of Tricolor nests on dairy farms and other agricultural lands in the Central Valley and the failure of voluntary measures to stem the decline in abundance. The Center is also concerned with the failure of the wildlife agencies to adequately protect active nests and birds in this critical Tricolor nesting habitat—which currently supports some of the biggest colonies of Tricolors comprising a large proportion of the remaining population. Other important nesting substrates, such as Himalayan blackberry, are occasionally destroyed by herbicide application (Meese 2011). Widespread reproductive failures are regularly documented even in the species’ native marsh habitat, due to predation and lack of insects with which to feed young (Meese 2013). As a result, through this letter, the Center is requesting immediate action by the California Fish and Game Commission prohibiting (or at a minimum delaying) harvesting and plowing activities on private lands used for Tricolor breeding during the upcoming 2015 nesting season. These activities are already in clear violation of the California Fish and Game Code section 3503 which protects all birds’ nests and eggs from destruction (Cal. Fish & G. Code § 3503 [“It is unlawful to “take, possess, or needlessly destroy the nest or eggs of any bird”]). Furthermore, these activities are in large part responsible for current precipitous decline of the species that necessitates immediate listing under the California Endangered Species Acts as discussed in detail below.

Petitioner acknowledges that the California Department of Fish and Wildlife (“CDFW”) and other partners have been engaging in “public/private cooperation” to address the ongoing violations of the applicable statutes and the resultant large-scale nesting failures. Thanks to these voluntary measures, many thousands of nests have been saved from destruction during crop harvest. However, while laudable, these measures are only acceptable mitigation if they are consistently negotiated and proven effective at significantly reducing Tricolor nest failures. Given the past efforts, it is unsurprising that CDFW takes the position that crop purchases or

reimbursements for delayed harvest are not a feasible long-term solution for Tricolor habitat management on private agricultural lands. Petitioner agrees that such voluntary and cooperative methods will not be sufficient to slow or reverse the Tricolor's recent precipitous decline. For example, in 2011 (the last year for which detailed data were available on colony fates) 56% of all nests in silage fields were destroyed despite efforts to contact farmers and coordinate buy-outs of harvest delays (Meese 2011). Numerous voluntary recommendations to halt the population declines have been proposed in the reports on the 2008, 2011, and 2014 statewide surveys, but these recommendations have not been widely adopted and as a result the populations continue to plummet. The Tricolored Blackbird Working Group set a recovery goal of 725,000 Tricolored Blackbirds in 2007 but every year since then the population has declined, so it has rapidly become much more difficult to meet the recovery goal. Because CDFW cannot demonstrate that concrete measures will be implemented immediately to protect critical nesting sites on private lands in the 2015 breeding season under the voluntary and cooperative partnerships, listing is necessary and establishment of regulatory protective measures to reduce known sources of Tricolored Blackbird mortality.

Even with some voluntary public/private cooperation in place for this nesting season, the Tricolor indisputably warrants listing under the California Endangered Species Acts as discussed more fully below. As a result, pursuant to the California Endangered Species Act, California Fish & Game Code §§ 2070, *et seq.*, the Center for Biological Diversity hereby formally petitions the California Fish and Game Commission to list the Tricolored Blackbird as “endangered” under the California Endangered Species Act. In addition, the Center hereby requests that the Commission immediately adopt emergency regulations to list the Tricolored Blackbird as endangered under California Fish and Game Code Section 2076.5.

Procedural History

As the Commission is aware, the Center for Biological Diversity petitioned for an emergency listing of the Tricolored Blackbird in 2004 under both the California Endangered Species Act (“CESA”) and the Federal Endangered Species Act (“ESA”) based on the then-already precarious status of the species due to declining populations. The petition was denied by both the Commission and the U.S. Fish and Wildlife Service (*see* Federal Register 2006). Currently the Tricolor is a nongame species of management concern and California Species of Special Concern, the Bureau of Land Management listed it as a sensitive species, and it has been on the IUCN red list of endangered species since 2006 (IUCN 2011), but given precipitous population declines even since 2004, clearly the Tricolor requires the safety net of the California Endangered Species Act.

While the Tricolored Blackbird is considered a non-game bird of management concern by FWS, this designation does not provide any specific legal protection to the species. Furthermore, while the species is theoretically afforded protection under the federal Migratory Bird Treaty Act (MBTA), the statute is rarely if ever enforced against private parties.

The Tricolor is also designated a species of special concern by CDFW and theoretically must be considered during project actions subject to the California Environmental Quality Act

("CEQA"). However, this status does not protect the species from activities that do not trigger CEQA's environmental review requirements, and even when considered, CEQA's substantive mandates for environmental protection have not been implemented with regards to protection of the Tricolor. The California Fish and Game Code section 3503 protects all active nests and eggs from destruction or "take", however this statutory prohibition has not been consistently if ever enforced by CDFW to protect the Tricolor from impacts on agricultural fields during the nesting season.

The CESA Listing Process and Standard for Acceptance of a Petition

Recognizing that certain species of plants and animals have become extinct "as a consequence of man's activities, untempered by adequate concern for conservation," (Fish & G. Code § 2051 (a)), that other species are in danger of extinction, and that "[t]hese species of fish, wildlife, and plants are of ecological, educational, historical, recreational, esthetic, economic, and scientific value to the people of this state, and the conservation, protection, and enhancement of these species and their habitat is of statewide concern" (Fish & G. Code § 2051 (c)), the California Legislature enacted the California Endangered Species Act.

The purpose of CESA is to "conserve, protect, restore, and enhance any endangered species or any threatened species and its habitat...." Fish & G. Code § 2052. To this end, CESA provides for the listing of species as "threatened"¹ and "endangered."² The Commission is the administrative body that makes all final decisions as to which species shall be listed under CESA, while the CDFW is the expert agency that makes recommendations as to which species warrant listing.

The listing process may be set in motion in two ways: "any person" may petition the Commission to list a species, or the CDFW may on its own initiative put forward a species for consideration. Fish & G. Code § 2072.7. In the case of a citizen proposal, CESA sets forth a process for listing that contains several discrete steps. Upon receipt of a petition to list a species, a 90-day review period ensues during which the Commission refers the petition to CDFW, as the relevant expert agency, to prepare a detailed report. The CDFW's report must determine whether the petition, along with other relevant information possessed or received by the Department, contains sufficient information indicating that listing may be warranted. Fish & G. Code § 2073.5.

During this period interested persons are notified of the petition and public comments are accepted by the Commission. Fish & G. Code § 2073.3. After receipt of CDFW's report, the Commission considers the petition at a public hearing. Fish & G. Code § 2074. At this time the

¹ "Threatened species" means a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Fish & G. Code § 2067.

² "Endangered species" means a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." Fish & G. Code § 2062.

Commission is charged with its first substantive decision: determining whether the petition, together with CDFW's written report, and comments and testimony received, present sufficient information to indicate that listing of the species "may be warranted." Fish & G. Code § 2074.2. This standard has been interpreted by courts as the amount of information sufficient to "lead a reasonable person to conclude there is a substantial possibility the requested listing could occur." *Natural Resources Defense Council v. California Fish and Game Comm.* 28 Cal.App.4th at 1125, 1129. If the petition, together with CDFW's report and comments received, indicates that listing "may be warranted," then the Commission must accept the petition and designate the species as a "candidate species." Fish & G. Code § 2074.2.

Once the petition is accepted by the Commission, then a more exacting level of review commences. CDFW has twelve months from the date of the petition's acceptance to complete a full status review of the species, seek peer review of the draft report, make the final report available to the public for at least 30 days, and recommend whether such listing "is warranted;" CDFW may seek an extension of up to six months if needed to complete peer review and public review. Fish & Game Code § 2074.6. Following receipt of CDFW's status review, the Commission holds an additional public hearing, which may be continued, and determines whether listing of the species "is warranted." Fish & Game Code §2075.5. If the Commission finds that the species is faced with extinction throughout all or a significant portion of its range, it must list the species as endangered. Fish & G. Code § 2062. If the Commission finds that the species is likely to become an endangered species in the foreseeable future, it must list the species as threatened. Fish & G. Code § 2067.

Notwithstanding these listing procedures, the Commission may adopt a regulation that adds a species to the list of threatened or endangered species at any time if the Commission finds that there is any emergency posing a significant threat to the continued existence of the species. Fish & G. Code § 2076.5. Petitioner asks that the Commission do so here.

1.0 Population Status and Trend

If a flock of goldfinches is called a "charm," and a flock of crows, a "murder," what is a flock of Tricolored Blackbirds (*Agelaius tricolor*) called? Whatever the word, it could not possibly be adequate to describe the mind-boggling energy and excitement generated by a flock of over 50,000 Tricolors settling at a colony. Whether an avid birder or weekend naturalist, you can't help but be amazed by this sight, for it is one of the Central Valley's most spectacular natural phenomena. (Edson and Green, Central Valley Bird Club Bulletin 2004:Volume 7.)

Tricolored Blackbirds form the largest breeding colonies of any North American landbird, a distinction once held by the now-extinct Passenger Pigeon. In the 1800s and early 1900s, the Tricolored Blackbird was considered one of the most abundant bird species throughout much of its range, which consists of low-elevation wetlands and grasslands of Central, Coastal, and Southern California (Cook and Toft 2005). In 1859, Heermann wrote that wintering flocks of Tricolors would "darken the sky for some distance by their masses," a description notably similar to that of the Passenger Pigeon (Cook and Toft 2005). However, a history of market hunting and massive loss of native marshland habitat drastically reduced the population by the

mid-twentieth century. The majority of the population, with the last statewide survey counting fewer than 150,000 birds, can still breed in colonies of tens of thousands, but there remain few such large nesting colonies, and those that remain are extremely vulnerable to human activities such as crop harvesting while nests are still active and loss or degradation of suitable foraging habitats (Cook and Toft 2005). This species is on a clear trajectory towards extinction.

Much information is readily and publicly available regarding historical and current population status and trend of the Tricolored Blackbird. The best source of information is from the excellent Tricolored Blackbird Portal that is maintained by the University of California, Davis and available at: tricolor.ice.ucdavis.edu. The Portal provides on-line data entry to hundreds of users and provides access to field data, reports, and published articles about the Tricolored Blackbird. The Portal provides a history of research on population status and trend of the Tricolored Blackbird, which is paraphrased below.

Although the Tricolored Blackbird is mentioned in several articles and books dating to the mid-20th century, the first field work that was focused on Tricolors was conducted by Johnson Neff, a biologist who worked for the Bureau of Biological Survey, the forerunner of today's U.S. Fish & Wildlife Service. Neff's work was primarily focused on the Sacramento Valley, but he also worked at sites in the San Joaquin Valley and in southern California in conjunction with other state and federal biologists and volunteers. After widespread reports of the birds' disappearance from coastal locations, Neff conducted six years of field surveys (from 1931–1936), and additional banding of nestlings until 1940, to determine the status of the birds in the Central Valley.

After 1940, perhaps in response to Neff's finding of fairly large numbers of remaining birds (e.g., over 736,000 adults in eight counties and 282,000 nests at one site in Glenn County in 1934), there followed a more than 20-year period of relatively little research into Tricolor status and biology. Then, during the 1970s, Richard DeHaven of FWS conducted surveys for Tricolors in first the Central Valley and then the entire breeding range (excluding Baja California). These efforts were undertaken to determine changes in the population status of the Tricolor since the last surveys in the 1940s.

In the 1980s Edward (Ted) Beedy began field investigations of Tricolors with an emphasis on estimating the abundance of the species and determining factors responsible for the observed nesting failures of colonies in the Central Valley. Shortly thereafter, William (Bill) Hamilton of U. C. Davis began his field investigations. Hamilton's work extended for 13 field seasons, through 2005, and covered a wide range of topics, including population estimation, productivity estimation, foraging ecology, and the phenomenon known as "itinerant breeding," whereby individuals breed once in one location and then fly northward to a different location to breed again. Beedy and Hamilton wrote the *Birds of North America* treatment of the Tricolored Blackbird (Beedy and Hamilton 1999).

Beedy and Hamilton suggested using volunteers to conduct a statewide survey during a 3-day interval in April to best estimate the global population of the species. Early attempts at statewide surveys to assess population status and trend were conducted in 1994, 1997, 2000, 2001, and

2005. Of these, surveys conducted in 1994, 1997, and 2000 were similar enough in scope and effort to enable the detection of a significant downward trend in the population during this period (Cook and Toft 2005).

Beginning in 2008, the triennial statewide survey was revamped to include a strict new hierarchical coordination structure to standardize methodology and ensure more equal survey effort and thus more comparable results. The Statewide Survey, which occurs in mid-to-late April, is a volunteer effort with participants from most lower-elevation regions of California within the range of the Tricolor, and directed by a statewide coordinator. The 2008 survey was the first to use county coordinators—local experts with extensive experience with Tricolors on the local level—and this new hierarchical protocol (statewide coordinator, county coordinators, local participants) was used in the 2008, 2011, and 2014 surveys. The survey protocol is designed to document both presence and absence at a site, along with an estimate of the number of Tricolors and characteristics of occupied sites (nesting substrate, distance to water, presence of stored grains). These three most recent statewide surveys provide current, relatively more reliable information on the numbers and distribution of Tricolored Blackbirds throughout California and are a means to document trends in the population. These surveys also complement more intensive field efforts that provide insights into the factors causing the observed population decline.

Below this petition describes both the historical and more recent survey methodology and results.

1.1 Historical Population Estimates

The first surveys and population estimates for Tricolors were instigated by Neff in the early 1930s. During the 1960s, other researchers focused their studies on ecology and behavior of the species (e.g., Orians 1960, 1961a, 1961b, Orians and Collier 1962, Payne 1969), but did not provide range-wide population estimates. DeHaven et al. (1975) conducted a second set of more comprehensive range-wide surveys to determine changes in the population status of Tricolors since Neff's work in the 1930s.

From 1930 to 1936, Neff (1937) estimated the population of Tricolors using several methods. The author and cooperators checked the active population of colonies numerous times by conducting flight-line counts (i.e., counting the birds flying in or out across a base line for five minutes); checking distance from base line to feeding ground or nesting site, and estimating probable time required for each trip. Nests were counted by walking nest transects: detailed observations in a randomly-chosen subset of a colony that counted all nests within a 6-foot wide strip and extrapolating from this sample to estimate the total number of nests. Generally, the number of nests rather than the number of breeding adults was reported.

Based on number of nests reported and multiplying by 1.5 (mean estimated sex ratio of 2 females breeding with each male), Beedy and Hamilton (1997) calculated that the surveyors in the 1930s observed as many as 736,500 adults per year in just 8 counties. Neff (1937) documented numerous large colonies, including one in 1934 in Glenn County that contained about 200,000 nests (300,000 breeding adults), over an area greater than 24 ha. Several other colonies in

Sacramento and Butte Counties contained more than 100,000 nests. Hamilton et al. (1995) calculated that Neff observed about 1,105,100 individual Tricolors. Neff, however, concentrated most of his effort in the Sacramento Valley so most likely underestimated total population size at the time.

In 1969 and 1970, DeHaven et al. (1975) surveyed the Central Valley Tricolor breeding range by car, and in 1971, the entire breeding range (excluding Baja California) was surveyed. In 1972, the authors surveyed from the northern San Joaquin Valley to southern Oregon. Additional information was provided to the authors by volunteer ornithologists. Population estimates were made by counts and by projections based on research findings that each Tricolor female attends one active nest and that males mate with on average two females.

DeHaven et al. (1975) estimated the number of breeding birds at 157 colonies. Of these, 40 colonies (25%) had fewer than 1,000 birds, 97 colonies (62%) had from 1,000 to 10,000 birds, and 20 colonies (13%) had more than 10,000 birds. All colonies outside the Central Valley contained fewer than 10,000 Tricolors. They found fewer colonies, fewer non-breeding Tricolors, no nesting areas even approaching the size of some of the previously reported colonies, fewer birds in the largest colonies, and fewer total Tricolors than Neff (1937). Overall, DeHaven et al. (1975) concluded that the population of Tricolors has likely been reduced by more than 50% below levels reported in the 1930s, and that downward trajectory was continuing.

Beedy et al. (1991) summarized all historical and recent breeding accounts, including unpublished observer reports from a variety of sources. Based upon this information they concluded that the Tricolor had declined further from population estimates by DeHaven et al. (1975), and that this decline was coincident with continuing losses of wetland habitats in the Central Valley. They reported a range of about 35,000–110,000 breeding adults per year in the 1980s, with an approximate average of 52,000 breeding adults reported per year in that decade (from Beedy and Hamilton 1997). Unfortunately their population estimates were not based well enough on field surveys and so cannot be considered adequate for evaluating the population for the period addressed. For example, Beedy et al. (1991) estimated a 76% decline in colony size between the 1930s and 1970s, whereas Graves et al. (2013), using a more comprehensive database, documented a 63% decline in mean colony size specifically from 1935 to 1975. Further, Beedy et al. (1991) documented a 62% decline in average colony size from the 1970s to the 1980s and Cook and Toft (2005) demonstrated a decline in average colony size from 1994 to 2000. Although Graves et al. (2013) found no decline from the 1970s to 2009, that study appears to have combined data that were not truly comparable. Since 2009, there has been a well documented marked decline in average colony sizes (Meese 2014), discussed below.

Three even more comprehensive surveys were conducted in 1994, 1997, and 2000 (Hamilton et al. 1995, Beedy and Hamilton 1997, Hamilton 2000). These surveys were co-sponsored by FWS and CDFW to document the Tricolor's population status, including investigating size and location of colonies, nesting habitat characteristics, behavior, reproductive success as correlated with habitat type, patterns of land ownership, and total population size and distribution. The surveys were coordinated by experienced Tricolor researchers at U.C. Davis and included these researchers in addition to numerous local volunteer ornithologists and agency personnel as

participants. U.C. Davis researchers often provided follow-up confirmation of the larger volunteer-reported colonies.

The total number of Tricolors counted during the 1994 statewide survey was estimated to be 369,359 individuals. This suggests a decrease in population abundance of at least 50% (and probably more) based on Neff's (1937) results between the 1930s and early 1990s and a clear downward trend in the population. The ten largest colonies located during the survey and additional full season range-wide surveys in 1994 included 60.5% of all breeding individuals, pointing to the importance of protecting large breeding colonies and their nesting and foraging habitat, if the species is to be conserved. Importantly, full season survey results indicated that 70% of all Tricolor nests and 86% of all foraging by nesting birds occurred on private agricultural land in 1994 (Hamilton et al. 1995). Approximately 54% of all observed Tricolor nesting efforts were associated with agricultural crops, primarily grain crops grown for silage at dairies (Beedy and Hamilton 1997).

The total number of Tricolors counted during the 1997 survey was estimated to be 232,960 individuals. This suggests a decrease in the population by approximately 37% between 1994 and 1997. Population declines were most apparent in the species' historical stronghold in the Central Valley, including Sacramento, Fresno, Kern, and Merced Counties. Approximately 75% of all breeding adults located during the survey were concentrated within the 10 largest colonies.

The total number of Tricolors located during the 2000 survey was estimated to be 162,508 individuals. This suggests an additional decrease in the population by approximately 30% between 1997 and 2000 and an overall decline of approximately 56% between 1994 and 2000. Fewer colonies were located in 2000 than in 1994 (Hamilton 2000) and colonies were smaller on average in 2000 compared to 1994 (Cook and Toft 2005). These data likely underestimate the true magnitude of change that occurred during this time period. The reliability of the censuses to estimate the Tricolor population likely increased over time because the number of participants grew and participants were better informed about colony locations in each succeeding year. Hamilton (2000) states "...the method of the Census and the survey, to reinvestigate all known breeding places and to search for new ones, has become an increasingly complete assessment of Tricolored Blackbird distribution and abundance. The 2000 Census probably located a greater proportion of the entire population that did censuses in previous years."

More than 40% of all Tricolor reproductive effort in 2000 was associated with dairies in the San Joaquin Valley and southern California (Hamilton 2000). Hamilton (2000) pointed out that conditions were more favorable for breeding Tricolors in 2000 than 1999, including the buy-out of the Tevelde and George Colonies in Tulare County and the success of the Delevan NWR and Hills Duck Club (Colusa County) and Merced NWF (Merced County) colonies. However, at least four large colonies, one in Fresno County, two in Kings County, and one in Tulare County, were lost to crop harvest in 2000.

Despite the favorable conditions in 2000, Hamilton (2000) stated that "...the central conclusion of the census and survey is that tricolors are continuing to decline precipitously in numbers ... The conclusion that tricolor numbers are plummeting is based not only upon these data, but also

on the collective experience of local experts throughout California who have observed tricolors over long intervals.” One of the participants in the 2000 survey was DeHaven, who surveyed the same area in the 1970s, and who wrote in a FWS white paper “[e]vidence of habitat loss, from urban expansion and agricultural conversions from such high-value (for Tricolors) uses as livestock forage production, to low- or no-value uses such as vineyards and orchards, was widespread.” He further noted “[t]hese present observations support a conclusion of another large population decline between the 1970s and today.”

In 2001, Point Reyes Bird Observatory (PRBO) coordinated the Tricolored Blackbird survey in California. The PRBO effort did not entail a robust count, but rather cited reports submitted by participants over several months (Humple and Churchwell 2002). The survey included season-long coverage instead of just 2–3 days in April to include colonies that might be completely missed if depredation or draining occurred prior to the visit date. However, this methodology is problematic because as itinerant breeders some of the birds were probably double-counted. Data were available for a total of 48 sites visited: 142, 045 breeding birds were counted and the largest colony size was approximately 30,000 (Humple and Churchwell 2002).

In sum, survey results from 1994 to 2001 show that the number of Tricolors counted plummeted from an estimated 370,000 in 1994, to 240,000 in 1997, to 162,000 in 2000, to 142,045 in 2001. Numbers are unknown from the 2005 survey. These population data suggest a decline of 62% in less than a decade. Fewer colonies were located in 2000 than in 1994 (Hamilton 2000) and colonies were smaller on average in 2000 compared to 1994 (Cook and Toft 2005). The earlier surveys were important in assessing general trends in population and colony sizes in different regions, but starting in 2008 the surveys provided even more comprehensive coverage of the state, and utilized a means for the public to input data with the advent of the Tricolored Blackbird Portal Taken together, the available data and information shows a clear and alarming downward trend of the Tricolored Blackbird population in California.

1.2 Recent Population Estimates

The 2008 statewide survey was coordinated by Audubon California (Kelsey 2008). The goal of the survey was to “develop the best statewide population estimate possible, using volunteers across the state.” Audubon California placed particular emphasis on expanding overall geographic coverage and on thoroughly surveying southern California counties. The survey used a three-tiered system:

- 1st tier is a statewide coordinator,
- 2nd tier is county coordinators, and
- 3rd tier is volunteer participants.

This three-tiered structure allowed for increased recruitment of volunteers, improved survey coverage, and was more thoroughly based on the local knowledge embodied in the county coordinators. The 2008, 2011, and 2014 surveys all were conducted using the same three-tiered structure and same survey protocols for recruiting and training volunteers and conducting the surveys (e.g., identifying birds, estimating colony size, and recording colony attributes such as

nesting substrates, distance to open water, and presence of stored grains). And significantly, the USFWS funded the development of the Tricolored Blackbird Portal prior to the 2008 survey, which enabled for the first time the on-line entry of records of observations of breeding birds.

The 2008 survey was carried out April 25 to 27. However, during this time several large colonies nesting in silage were harvested, thus complicating the count (Kelsey 2008). In response, the 2011 survey was conducted April 15 to 17, earlier than previous surveys to better avoid the harvest time of silage crops. The 2014 survey was conducted from April 18 to 20. The three-day window captures as many birds as possible on colonies during their first breeding attempt of the year while using a narrow window to ensure birds are not double-counted, as colonies and individual birds can shift locations over relatively short periods of time during the breeding season. Below are the population results.

2008—A total of 155 volunteers participated in the 2008 survey, visiting 361 historical and new sites in 38 counties within California. The census total was 394,858 birds at 180 sites. During the survey, 135 sites were documented as breeding colonies with an estimated 392,581 breeding birds. Out of 38 counties surveyed, there were 32 in which Tricolored Blackbirds were detected.

Regional distribution was similar to that reported from previous surveys, with the vast majority of birds (86.4%) occurring in the San Joaquin Valley. Nine of the top 10 and 15 of the top 20 colonies were in the San Joaquin Valley, with 63% of the population occurring at only five colony sites in Merced, Tulare, and Kern counties. In southern California, 5,487 birds were counted at 24 sites. Several known historical sites occurred on private land and volunteers were unable to gain access. As a result, this may be an underestimate of the number of birds, but Kelsey (2008) noted that there is no reason to suspect that a large number of birds were left uncounted in southern California.

2011—A total of 100 volunteers participated in the 2011 statewide survey, visiting 608 historical and new Tricolored Blackbird colony sites in 38 counties. The statewide population estimate was 259,322 birds at 138 sites in 29 counties.

The majority of Tricolored Blackbirds (89%) again were counted in the San Joaquin Valley and Tulare Basin, matching the results in prior surveys. The three largest concentrations of birds occurred in Merced (54%), Kern (24%), and Tulare (9%) counties. The top 10 largest colonies for 2011 were found in these three counties and 16 of the top 22 were from the San Joaquin Valley or Tulare Basin. Notably, 65% of the population was consolidated into only six colony sites in Merced, Kern, and Tulare counties. The southern California subpopulation was estimated to be 5,965 individuals at 32 sites in three counties, with a total of 74 sites visited.

2014—Overall, 38 county coordinators and 143 volunteers participated in the survey. A total of 145,135 birds were counted in 37 counties, out of 41 counties and 802 locations surveyed. Tricolored blackbirds were observed at a total of 143 locations. This represents a near-quadrupling of the number of locations surveyed since the 2000 statewide survey, when only 206 sites were surveyed (Hamilton 2000).

1.3 Summary

In 2014, 75 new location records were added by 27 different Portal users as result of the statewide survey. This is the same number of new location records that were added as a result of the 2011 statewide survey. In 2008, 180 sites were visited, while in 2011, 608 sites were visited and in 2014, 802 sites were visited. Despite this substantial increase in sites that were visited, the total number of birds counted declined dramatically, from 394,858 birds in 2008 to 259,322 birds in 2011 to just 145,135 birds in 2014.

Every major study of *A. tricolor* published since the 1970s has sounded the alarm bell regarding the precipitous conservation status of the species:

“Further research is needed to determine whether this downward trend, which may have reduced the Central Valley population by more than 50%, is continuing, and whether it has yet reached the point of concern....” (DeHaven et al. 1975)

“Reported tricolor colony size estimates in 1994 compared to the total count in 1997...indicated that the total tricolor population declined by about 37%, and the greatest declines occurred in Sacramento, Fresno, Kern, and Merced Counties, which hosted about 72% of the total adults observed in April 1994...In some portions of their range, tricolors have definitely declined or been eliminated, including local extirpation in portions of the Central Valley where they were once abundant...and many historical sites in coastal southern California counties.” (Beedy and Hamilton 1997)

“The central conclusion of the Census and survey is that tricolors are continuing to decline precipitously in numbers, from millions in the 1930s...to an estimated 750,000 in 1975..., 370,000 as of the 1994 Census and 162,000 in this account for 2000. The conclusion that tricolor numbers are plummeting is based not only upon these data, but also on the collective experience of local experts throughout California...Tricolors are a diminished natural spectacle in the Central Valley and in Southern California, the former strongholds of this species.” (Hamilton 2000)

“The long-term population trends and patterns in reproduction reported in this study reveal that the Tricolored Blackbird possesses most of the traits that ultimately led to the extinction of the Passenger Pigeon in the same ecological circumstances. These factors include the loss of vast areas of native wetland along with the increasing loss of upland, non-native vegetation favorable for nesting, the trend of decreasing colony size in a highly social breeder, a habit of itinerant breeding, and wholesale mowing down of the largest breeding colonies in agricultural harvest.” (Cook and Toft 2005)

“We interpret our results to provide clear evidence that extinction is imminent for Tricolored Blackbird if current land-use trends continue, as they certainly will, and if measures are not implemented immediately to protect breeding colonies in non-native nesting substrates. Overall the current decline of the population is strongly correlated with its persistent use and re-use of attractive habitats where reproduction often fails, combined with continuing losses of productive nesting substrates of all kinds... The

protection of native emergent marshes is not the solution to reverse the declining population because this habitat provides attractive population sinks. Under current protections, Tricolored Blackbird may therefore be falling through the policy “cracks”, because it is not targeted directly as an officially endangered species and protecting its native breeding habitat under current environmental policy is not sufficient to reverse the declining population.” (Cook and Toft 2005)

“In 1994 and 2000 the top 10 colonies accounted for 60% and 59% of the total population estimate, respectively. In 2008, this has increased to 77.5%. This increase in concentration of individuals at fewer colonies increases the chances of reproductive failure for a significant proportion of the population in any given year.” (Kelsey 2008)

“This year’s population estimate represents a substantial decrease from 2008 of approximately 135,000 birds, or a 34% decline (far more than would have been missed by any gaps in coverage). This number is more similar to the population estimate in 2005. One important probable cause of this decline is low reproductive success that has been documented in reports over the past three years (Meese 2008, 2009a, 2010). Several of the largest colonies in recent years have had an average nest success rate of 0.25 young fledged per nest and the reproductive success of these colonies has been declining for several years... This may be a major factor in the observed population decline despite continued conservation efforts (Meese 2009a).” (Kyle and Kelsey 2011)

“The 2014 statewide survey is believed to have been the most thorough ever conducted. Concerned citizens have entered dozens of new location records into the Portal, resulting in a rapid increase in knowledge of where the birds breed, and the number of locations surveyed increased from 361 in 2008 to 802 this year. Yet despite this rapid increase in knowledge, the number of birds in California as estimated by the Statewide Survey again declined sharply.” (Meese 2014)

“Bird numbers were down markedly from the two previous statewide surveys in the San Joaquin Valley, especially in Kern and Merced counties, where the breeding birds had recently been most concentrated... Overall, the number of breeding birds in the San Joaquin Valley dropped 78% in 6 years, from 2008 to 2014..., and the number of birds seen in counties along the Central Coast was less than 10% of that seen in 2008...” (Meese 2014)

Graves et al. (2013) analyzed a dataset comprising 2463 records of the size of breeding colonies from 1907 to 2009. The resulting database included 1964 records of breeding or non-breeding birds from 1183 sites in 46 counties. The authors conducted a systematic statistical evaluation of trends for Tricolors to determine the magnitude of overall decline and whether it is continuing, whether trends were apparent across regions, whether trends varied among different types of breeding habitats, whether the geographic distribution of the species has changed, and if so whether distributional changes were linked to changes in habitat used for breeding.

Statewide, colony size, as indexed by the number of birds per record, declined significantly and substantially from 1935 to 1975 (Graves et al. 2013). The authors did not detect a decline in average colony size from 1980 to 2009, however, this may have been due to attempts to combine data that were not comparable. On a regional basis, both the number of birds per breeding site (colony) and total birds per region decreased drastically before and after 1980 (Figure 1). Regions included Central Coast, North Coast, Northeast Interior, Sacramento valley, San Francisco Bay, San Joaquin Valley, and Southern California.

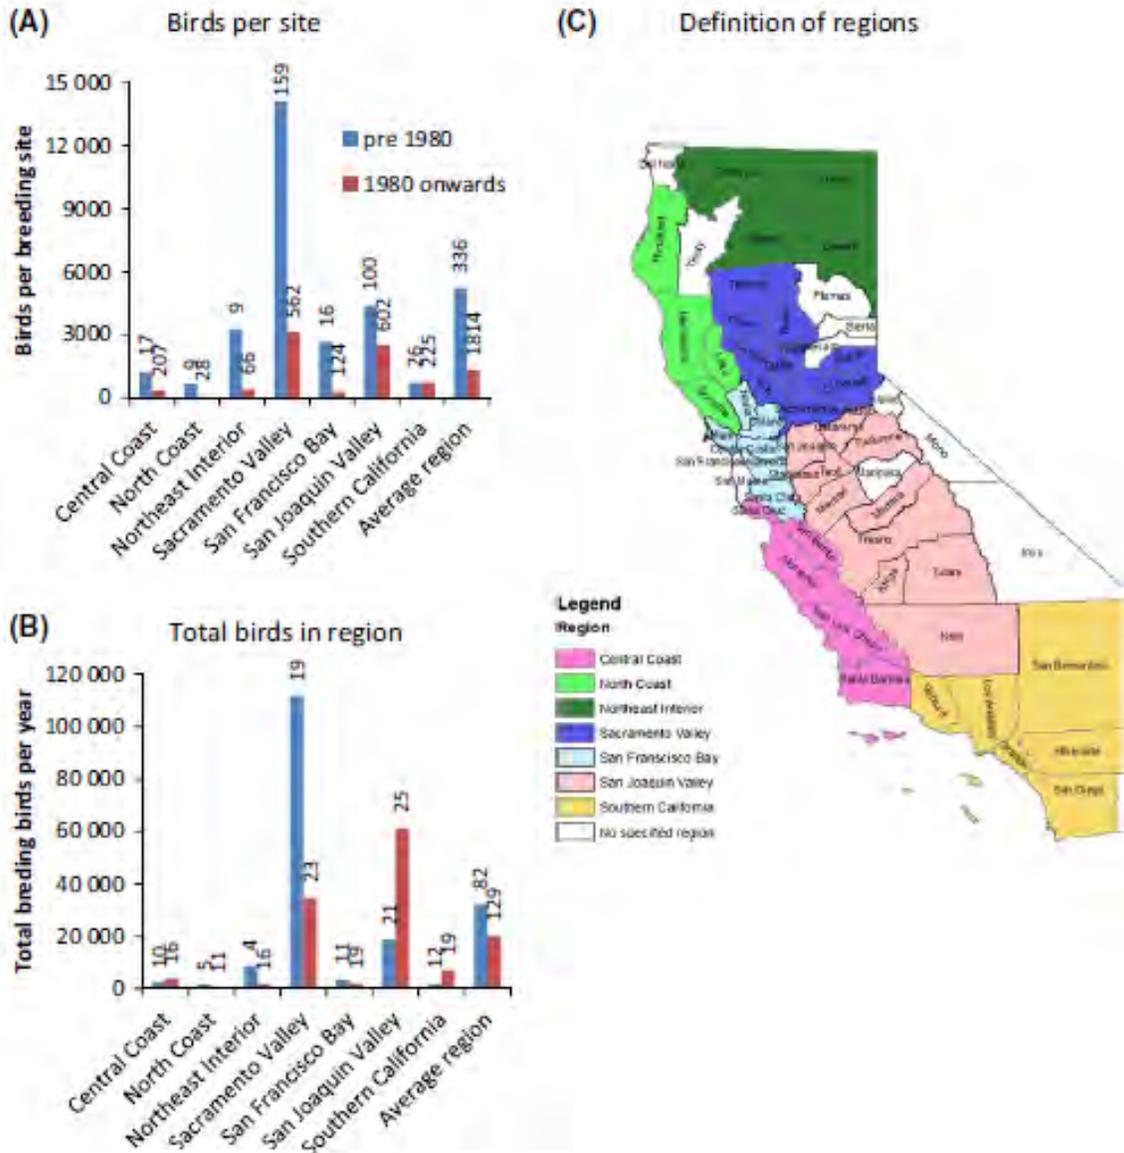

Figure 1: Number of Tricolored Blackbirds Per Breeding Site and Total Number of Breeding Birds Per Year Before and After 1980 By Region

There was evidence for geographical variation in the average size of breeding colonies over time. Prior to 1980, the Sacramento Valley supported far larger populations than any other region, while after 1980 the San Joaquin Valley held that distinction. One of the most hard-hit regions appeared to be the Central Coast. The authors noted on page 4: “In 1935 the Central Coast had 72% larger colonies than the average across all regions but subsequent to this these sites declined 80% more rapidly than colonies in other regions.” Results of the 2014 statewide census survey showed continuing drastic declines in the Central Coast region, with the number of birds counted in that region were only 10% of those counted in 2008 (Meese 2014).

Since 2009 (the last year in the Graves et al. dataset), two more state-wide census surveys were conducted, and additional data were recorded during intervening years regarding colony sizes. The 2014 census reported a substantial downward trend in the sizes of the largest colonies over the past decade. Meese (2014:11) stated “A total of 93,000 birds was seen in the 10 largest colonies, 64% of the total. This is a much lower percentage of the total than was seen in the 10 largest colonies in 2011, when 208,800 birds, or 81% of the total, were seen in the 10 largest colonies, and in 2008, when 306,00 birds, 77.5% of the total, were seen in the 10 largest colonies.” Figure 2 below shows the 10-year trend in the sizes of the largest colonies, from Meese (2014:11).

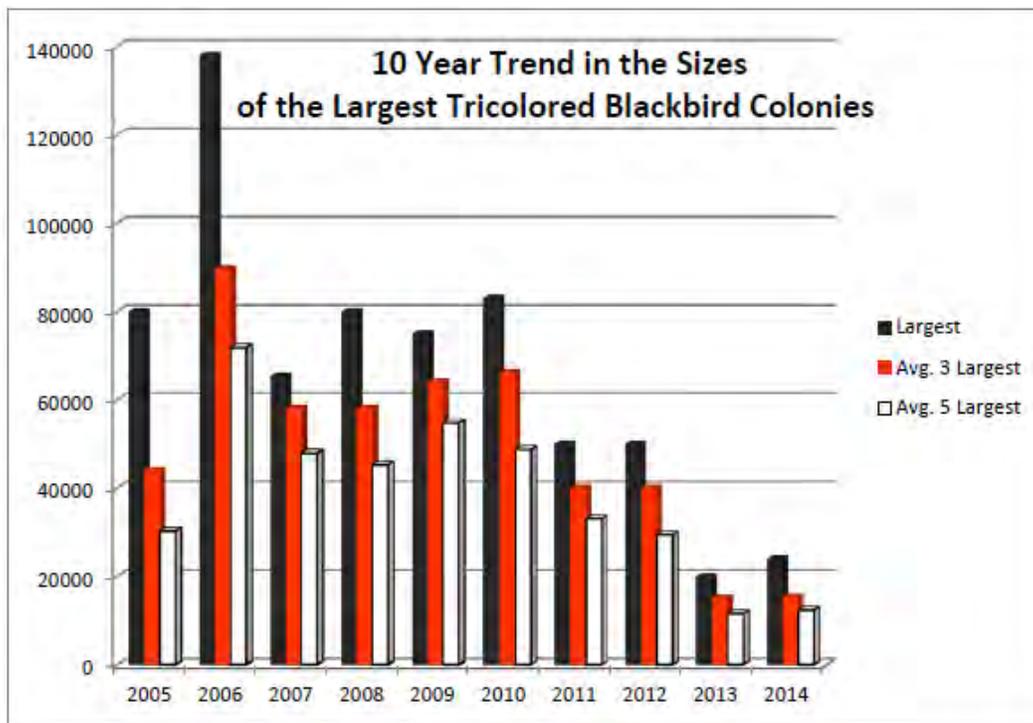

Figure 2: 10-Year Trend in Sizes of Largest Tricolored Blackbird Colonies

In addition to average colony size, the size of the largest colony has declined precipitously since the first reported surveys. Neff (1937) documented numerous large colonies, including one in

1934 in Glenn County that contained about 300,000 breeding adults over an area greater than 24 ha. Several other colonies in Sacramento and Butte Counties contained more than 100,000 nests. In stark contrast, Bob Meese reported that in 2014 the numbers of birds seen at occupied locations ranged from 1 to just 24,000, with only a single colony in Madera County (Road 12 Avenue 24) consisting of more than 20,000 birds and only 3 colonies consisting of 10,000 or more birds. This is a dramatic and extremely troubling decline in the size of the largest nesting colonies compared with historical data, even incorporating the recently described phenomenon of “mega” colonies nesting in silage crops, because forming large colonies is likely an adaptive trait against predation and colony size is positively correlated with reproductive success (Meese 2013). For a species such as the Tricolored Blackbird, bigger colonies are better.

In sum, extensive range-wide surveys for the Tricolor provide clear and unequivocal evidence that the species has experienced and is continuing to experience a precipitous population decline. Total numbers of birds counted, average colony sizes, and size of the largest colony all decreased over time. Further, as documented below, there is no evidence that many of the factors implicated in this decline are being prevented or alleviated, including ongoing destruction of grain silage colonies, failure to protect highly productive nesting substrates (i.e. Himalayan blackberry thickets, thistles, and other productive upland breeding habitats), permanent loss of nesting and foraging habitat due to increasing urbanization and vineyard and orchard deployment in the Central Valley and southern California, continued high levels of predation in marsh nesting habitats by herons and other predators, spraying of agricultural contaminants throughout the range of the species, and shooting of birds in rice fields in the Central Valley. Without the legal protection offered by the California Endangered Species Act, current trends are likely to continue and the Tricolor is likely to become extinct in the foreseeable future.

2.0 Range and Distribution

2.1 Species' Range

More than 99% of Tricolored Blackbirds live in California, with just a few scattered populations in Oregon, Washington, coastal Baja California, Mexico and a single breeding colony in western Nevada (Beedy and Hamilton 1999). The range of the Tricolor is largely restricted to southernmost Oregon and the Modoc Plateau of northeastern California, south through the lowlands of California west of the Sierra Nevada to northwestern Baja California (Neff 1937, Orians 1961a, DeHaven et al. 1975, Beedy and Hamilton 1999) with some rare reports from Nevada and Washington (Beedy and Hamilton 1999). The elevational range of the Tricolor is documented to extend from sea level to approximately 1220 meters (4,000 feet) in Shasta County to 1280 meters (4,200 feet) on Klamath Lake (Neff 1937). Although most of the Tricolor population and the largest colonies are currently found in the San Joaquin and Sacramento valleys, the species also breeds in several southern California counties where, a century ago, it was considered to be the most abundant bird species (Baird in Cooper 1870).

The range of the Tricolored Blackbird is similar to that reported early in the previous century although contractions in some areas, particularly southern California, are apparent as discussed

below. Shuford and Gardali (2008: 438–439) describe the historical and recent range of the Tricolored Blackbird as follows:

“The Tricolored Blackbird’s known historical breeding range in California included the Sacramento and San Joaquin valleys, the foothills of the Sierra Nevada south to Kern County, the coastal slope from Sonoma County south to the Mexican border, and, sporadically, the Modoc Plateau (Dawson 1923, Neff 1937, Grinnell and Miller 1944). Historical surveys, however, did not include large areas of the species’ currently known breeding range and consequently did not document its full extent at the time (see below)...

“The overall range of the species is little changed since the mid-1930s (Beedy and Hamilton 1999), though more recent surveys have documented occurrence in some areas lacking extensive prior coverage that likely were occupied historically (Hamilton et al. 1995; Beedy and Hamilton 1997; Hamilton 2000, 2004; Green and Edson 2004). This mostly includes documentation of local populations at the periphery of the range, such as those on the coast north to Humboldt County, in northeastern California, and in the western Mojave desert, and of new colony sites within the overall historic range (see map). Since 1980, active breeding colonies have been observed in 46 California counties; all of the largest (>20,000 adults) were in the Central Valley or at the Toledo Pit, Riverside County [*sic*: Toledo Pit is in Tulare County].”

The southern California population (in the Los Angeles Basin, Inland Empire/Riverside, and San Diego regions south of the Transverse Range) appears to have been geographically isolated since the 1970s-1980s (R. Cook pers. comm.). There are no recent records from Santa Barbara or Ventura Counties and relatively small numbers in coastal Los Angeles and Orange County. While there have been from time to time, colonies of as much as 5000 birds in the very northern part of Los Angeles and San Bernardino Counties, those are undoubtedly due to migrations of flocks from the Central Valley (R. Cook pers. comm.).

Within its range, the species is nomadic and highly colonial; large flocks appear suddenly in areas from which they have been absent for months, they breed and then quickly withdraw (Orians 1961a). In one season nesting colonies have been found widely scattered, and in another there have been great concentrations in relatively restricted districts (Neff 1937). The size and location of colonies vary from year to year, although certain sites are regularly used (Orians 1961a, Hamilton et al. 1995, Cook 1996, Hamilton 2000, Kelsey 2008, Kyle and Kelsey 2011, Meese 2014).

Wintering Tricolored Blackbird populations move extensively throughout their range in the nonbreeding season. Major wintering concentrations occur in and around the Sacramento–San Joaquin River Delta and coastal areas, including Monterey and Marin counties, where they are often associated with dairies (Shuford and Gardali 2008). Small flocks also may appear at scattered coastal locations from Sonoma County south to San Diego County, and sporadically north to Del Norte County (Beedy and Hamilton 1999, Unitt 2004). They are rare in winter in the southern San Joaquin Valley and in the Sacramento Valley north of Sacramento County

(Beedy and Hamilton 1999). In Riverside County Tricolor populations appear to be residential with similar numbers of birds observed in winter in the same areas where they breed in the spring (R. Cook; unpublished data).

2.2 Historical Distribution

The Tricolor's requirements for selecting breeding sites are open accessible water; a protected nesting substrate, including either flooded or thorny or spiny vegetation; and a suitable foraging space providing adequate insect prey within a few kilometers of the nesting colony (Beedy and Hamilton 1999, Shuford and Gardali 2008). Historically, rivers flowing into the Central Valley would flood and create extensive marshes, providing abundant breeding habitat for Tricolors and other wetland-dependent species. In the 19th century, autumn flocks of thousands of Tricolors were described in the Shasta area, and a wintering flock observed in Solano County "...numbering so many thousands as to darken the sky for some distance by their masses," (Baird 1870 in Beedy and Hamilton 1999). J. G. Cooper noted that the Tricolor was "the most abundant species near San Diego and Los Angeles, and not rare at Santa Barbara," (Baird 1870 in Beedy and Hamilton 1999).

The first systematic range-wide surveys of the population status and distribution of the Tricolor were conducted by Neff (1937). These surveys found Tricolor breeding colonies in at least 26 counties in California, although the survey of the range was still incomplete. Neff (1937) estimated abundance at 252 colonies, mostly associated with freshwater emergent wetlands in rice-growing areas of California, and numerous very large colonies were reported.

Population surveys and banding studies carried out from 1969–1972 by DeHaven et al. (1975) found 168 breeding colonies at 113 locations, each at least 1.6 km apart. About 78% (131) of the colonies were in the Central Valley, with 80 in the Sacramento Valley and 51 in the San Joaquin Valley. The remaining 22% (37) of colonies were in other parts of California and in southern Oregon. The counties where the most colonies were found in a single season were Sacramento, Merced, Stanislaus, Glenn, and Colusa.

The survey results from DeHaven et al. (1975) indicated that the geographic range and major breeding areas of the species had not changed since the first surveys were conducted by Neff in 1937. However, DeHaven et al. (1975) found fewer colonies, fewer non-breeding Tricolors, no nesting areas even approaching the size of some of the previously reported colonies, fewer birds in the largest colonies, and fewer total Tricolors.

It is worth noting that even the earliest surveys had been conducted after most of the Central Valley's wetlands were already lost. Thus, the historical distribution and population abundance of Tricolors prior to the profound and widespread loss of their native wetland and grassland habitats are unknown.

2.3 Current Distribution

Overall, a comparison of the historical and current distribution of the species shows that in some portions of their range, Tricolors have declined or been eliminated (Beedy and Hamilton 1997). Local near or complete extirpation has occurred in portions of the Central Valley where the species was once abundant, and in many historical sites in coastal southern California counties, including Santa Barbara, Ventura, Los Angeles, Orange, and San Diego Counties (Beedy and Hamilton 1997, Meese 2014). Thus the species has been extirpated or nearly extirpated in portions of its former range.

Since 1980, active Tricolor breeding colonies have been observed in 46 counties in California, and most of the largest colonies are still located in the Central Valley (Beedy and Hamilton 1999). The species currently breeds throughout the Central Valley west of the Cascade Range and west of the Sierra Nevada (into the foothills), and from Humboldt and Shasta Counties, south to extreme southwestern San Bernardino County, western Riverside County, and western and southern San Diego County. Breeding also occurs in marshes of the Klamath Basin in Siskiyou and Modoc Counties, Honey Lake Basin in Lassen County and in some central California coastal counties.

Outside California, the Tricolor has bred in southern Klamath and southern Jackson Counties and in northeast Portland (Multnomah County), near Clarno and Wamic (Wasco County), at the John Day Fossil Beds National Monument (Wheeler County), near Stanfield (Umatilla County), and at Summer Lake (Lake County). A small colony reportedly nested in Grant County, Washington in 1998, and small colonies were identified in Douglas County, Nevada and in northern Baja California (Beedy and Hamilton 1999). Several small colonies totaling fewer than 500 birds were reported in Baja California in 2013 (Feenstra 2013).

In 1991 researchers at U.C. Davis initiated a large-scale study of Tricolors, investigating size and location of colonies, nesting habitat characteristics, behavior, reproductive success as correlated with habitat type and patterns of land ownership. This study was expanded in 1994 to include a FWS and CDFW sponsored range-wide population census led by the U.C. Davis researchers and including a volunteer base of experienced local ornithologists. The results of this census and additional season long survey data are reported in Hamilton et al. (1995). Census participants located individuals nesting in 74 colonies in 32 California counties, with breeding occurring in 26 counties. In 1994, the largest Tricolor colonies were found in Merced, Colusa, Tulare, Glen, Kern, Sacramento, and Yuba Counties (Beedy and Hamilton 1997).

Annual population censuses were henceforth attempted in 1995 and 1996 but efforts and methods were not comparable to those of 1994. A second comparable census and additional season long surveys were conducted in 1997 using the same coverage, methods, and surveyors as in 1994 (Beedy and Hamilton 1997). Census results reported individual Tricolors in 32 California counties, including 50 non-breeding adults in Klamath County, Oregon, and 950 breeding adults in northwestern Baja California.

In 1997, the largest Tricolor colonies were found in Colusa, Tulare, Kings, Riverside, Kern, Sacramento, and San Joaquin Counties (Beedy and Hamilton 1997). The two largest observed colonies during the 1997 breeding season were found in Colusa and Tulare Counties. The Colusa County colony formed in May, after the volunteer survey ended, by birds that probably nested elsewhere earlier on in the season. One of the largest colonies found in 1997, of about 23,300 nests, was found at a wetland created in 1994 in San Jacinto, Riverside County. “Although Riverside remains the stronghold for the species in southern California, numbers have declined by 89% since 1997 and 66% since 2005.” (R. Cook, 2014).

During the 2000 census, 25 colonies were located, with the largest colonies occurring in Tulare, Merced, Riverside, and Colusa counties. It is notable that the large colonies that formed in Sacramento county in the early 1990s (including 1994) were absent in surveys conducted between 1997 and 2003.

During the 2008 survey, 135 breeding colonies were documented, with the largest “mega” colonies in Merced, Tulare, and Kern counties, all in the San Joaquin Valley. Again, very large colonies were absent from Sacramento county (Kelsey 2008). In 2011 the three largest concentrations of birds also were found in Merced, Kern, and Tulare counties, with 65% of the population consolidated into only six colony sites in these three counties (Kyle and Kelsey 2011). In 2014, the largest nesting colonies occurred in Tulare, Madera, and Merced counties, but these colonies all supported drastically fewer numbers of Tricolors than in the previous two census surveys (Meese 2014). However, Placer and Sacramento counties saw a marked increase in the number of birds (Meese 2014).

The number of birds observed differed markedly by bioregion in 2014, Southern California (Ventura, the far southern part of Kern, Los Angeles, Orange, San Bernardino, Riverside, and San Diego counties) had 12,386 birds, the San Joaquin Valley (from Kern County in the south to San Joaquin County in the north) had 73,412 birds, coastal locations (from Alameda County to Santa Barbara County) had 1,732 birds, the Sierra foothills (Amador, Calaveras, El Dorado, Placer, and Sacramento counties) had 25,717 birds, and the Sacramento Valley (from Yolo County in the south to Tehama County in the north) had 31,531 birds.

Table 1 below shows the locations surveyed, locations occupied, number of birds, and proportion of total from the most recent statewide census survey in 2014 (Meese 2014:8).

Table 1: Locations Surveyed and Occupied, Number of Tricolored Blackbirds, and Proportion of Total by County (Meese 2014 Table 1:8)

County	Locations Surveyed	Locations Occupied	Number of Birds	Proportion of Total
Alameda	27	1	50	0.034
Amador	6	2	5500	3.793
Butte	6	1	60	0.041
Calaveras	9	5	404	0.279

Tuolumne	8	3	825	0.569
Yolo	33	2	81	0.056
Yuma	25	3	268	0.185

The largest numbers of breeding Tricolors were historically found in the Central Valley; Orians (1961a) and DeHaven et al. (1975) reported that the species’ center of breeding abundance and the largest colonies were in this region. In 1994 and 1997, more than 75% of all breeding adults were located there (Beedy and Hamilton 1997). In 2000 approximately 70% of the population was located in the Central Valley (Hamilton 2000). In 2008, 86.4% of the population was found in the San Joaquin Valley, and in 2011, 89% of the population occurred in the San Joaquin Valley and Tulare Basin. However, in the 2014 census only 50% of the population was documented in the San Joaquin Valley, with more birds counted in the Sacramento Valley than at any time since the 1990s. Meese (2014:10) stated “the 29,272 birds seen in Sacramento County exceeded the total seen in any statewide survey since 1997, when 31,338 birds were seen in the county (Beedy and Hamilton 1997).” Yet the numbers of birds counted in the Sacramento Valley are still a fraction of the hundreds of thousands of birds documented in the 1930s by Ness.

A detailed Distribution Map is provided below in section 11.

3.0 Abundance

3.1 Historical Abundance

Shuford and Gardali (2008: 438) describe the historical abundance of the Tricolored Blackbird as follows:

“Few 19th-century accounts exist of the abundance of Tricolored Blackbirds in California. Heermann (1859:53) described fall flocks of thousands in the Shasta region and a wintering flock in Solano County “numbering so many thousands as to darken the sky for some distance by their masses.” Belding (1890) observed an “immense” colony in San Joaquin County. According to J. G. Cooper, the Tricolored Blackbird was “the most abundant species near San Diego and Los Angeles, and not rare at Santa Barbara” (Baird 1870:266; Baird et al. 1874:166). Grinnell (1898) reported them in “considerable numbers” throughout the year in Los Angeles County.

“Neff (1937) conducted the first systematic surveys of the species’ population status and distribution. In 1934, he observed as many as 736,500 adults in just eight Central Valley counties. From 1931 to 1936, he found 252 colonies in 26 California counties. The largest colony, in Glenn County, contained >200,000 nests (about 300,000 adults) and covered almost 24 ha; several others in Sacramento and Butte counties contained

>100,000 nests (about 150,000 adults). Most large colonies were associated with freshwater emergent wetlands in rice-growing areas of the Sacramento Valley.”

3.2 Current Abundance

Meese (2014) noted that “the rate of decline in the number of tricolors appears to be increasing. From 2008 to 2011 the number of tricolors dropped by 34%, from 395,000 to 258,000 birds (Kyle and Kelsey 2011), but from 2011 until this year the number of tricolors dropped by 44%, from 258,000 to 145,000 birds.” Figure 3 below shows the downward trend in abundance during the three recent statewide surveys, from Meese (2014:7). The total number of Tricolors counted was down 44% in 3 years, and 64% in 6 years.

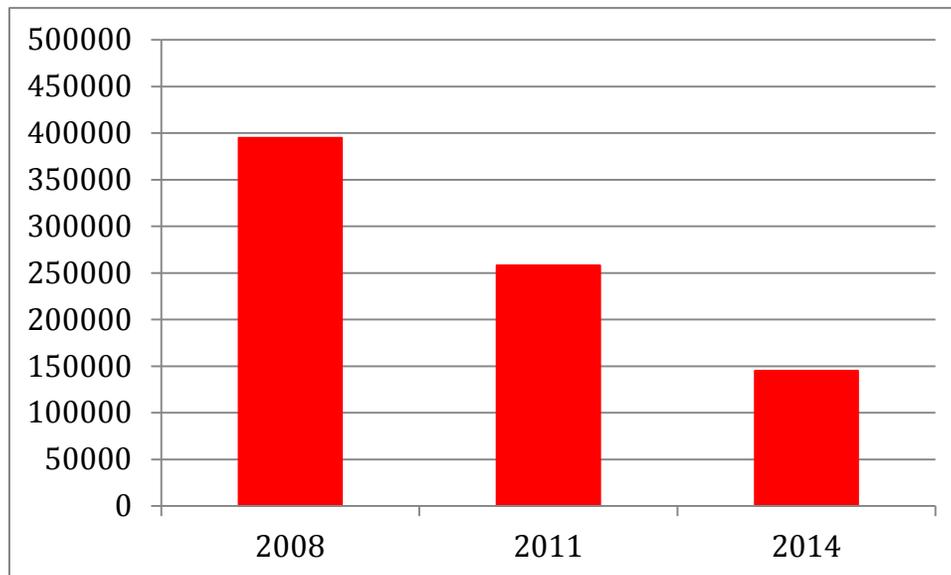

Figure 3: Trends in Abundance of Tricolored Blackbirds from Census Surveys

Meese (2014:12) summed the troubling results of the three most recent statewide surveys, which represent the best estimates of the abundance of Tricolored Blackbirds over the past decade:

“The results of the 2014 Tricolored Blackbird Statewide Survey show that there are far fewer birds now than in the recent past. The results of the past 3 statewide surveys (2008, 2011, and 2014) are most directly comparable due to similar methods and levels of effort And the development of the Tricolored Blackbird Portal in 2008 provided a previously unavailable public resource that has met the needs of concerned citizens and encouraged their participation in tricolored blackbird conservation efforts while greatly improving data quality and management.

“The rate of decline in the number of tricolors is alarming and appears to be accelerating: a comparison of the results of the 2008 to 2011 interval shows that the number of tricolors declined by 34%, from 395,000 to 258,000 birds. But from 2011 to 2014 the number of birds declined by 44%, from 258,000 to 145,000 birds... Thus, conservation efforts to date have been insufficient to stem the decline in the number of tricolors and the rate of decline is increasing.”

4.0 Life History

The highly synchronous and colonial nesting behavior of the Tricolored Blackbird is likely an adaptation that increases reproductive success through predator saturation and mutual defense against predators (Cook and Toft 2005). Much fascinating information has been learned about the adaptive traits of highly colonial nesting birds from studies of the Tricolor, beginning in the 1960s. The Tricolored Blackbird portal administered by U.C. Davis states:

“In the 1960’s, two graduate students from U.C. Berkeley, Gordon Orians and Robert Payne, conducted seminal research on blackbirds, including Tricolors, that focused on behavior and adaptations for marsh nesting (Orians) and reproductive physiology (Payne) and helped to provide an ecological and evolutionary context for tricolor breeding, food preferences, and habitat selection and compared and contrasted tricolors with other blackbird species.

“In the late 1960’s, Frederick Crase, a Bureau of Reclamation biologist, and Richard DeHaven, who worked for the U.S. Fish & Wildlife Service, began working on the tricolored blackbird and studied food habits, habitat relationships, population status, and movement patterns. This work was described in a number of publications from the mid-1970’s until the late 1980’s. This work confirmed the continuing decline in the number of tricolored blackbirds and highlighted the dependence of food supplies, especially insect abundance, on colony productivity, and suggested that otherwise apparently suitable nesting sites might be abandoned if surrounding foraging habitats were not sufficiently productive or extensive.”

The portal further notes that in the 1980s Ted Beedy began field investigations of Tricolors with an emphasis on estimating the abundance of the species and determining factors responsible for the observed nesting failures of colonies in the Central Valley. Shortly thereafter, Bill Hamilton began his field investigations. Hamilton's work continued for 13 field seasons, through 2005, and covered topics such as population estimation, productivity estimation, foraging ecology, and the phenomenon known as “itinerant breeding,” whereby individuals breed once in one location and then fly northward to a different location to breed again. Hamilton’s graduate student, Liz Cook, conducted and published important work on nesting dynamics, and his colleague Bob Meese began banding studies in 2007 and reported extensively on colony fates and productivity. These studies are described below.

4.1 Species Description

The Tricolor is medium-sized and sexually dimorphic, breeding in dense colonies largely in California's Central Valley, Coast Ranges, and southern California (Beedy and Hamilton 1999). Total length ranges from 18-24 cm, and body mass ranges from 40–70 g depending on the season (Beedy and Hamilton 1999).

The sexes of the Tricolor differ in size, plumage and behavior. Beedy and Hamilton (1999) offered a detailed description of the species:

“In general, males are larger than females; have striking red, white, and black plumage; and display when breeding. Adult males are entirely black with a blue gloss in full sunlight, with bright brownish-red lesser wing coverts forming a red patch on the epaulets (wing shoulder), and median coverts buffy (August-February) to pure white (February-July), depending on the season. Adult females are mostly black with grayish streaks, relatively whitish chin and throat (rarely with faint pinkish or peach wash), and small but distinct reddish shoulder patch. Immature males are similar to adult males but with duller black plumage mottled with gray (August-March), becoming almost entirely dull black (April-June), and with shoulder patch mixed with black (August-March only). Immature females are similar to adult females but the wing lacks the reddish patch. Immatures of both sexes usually retain some brownish or grayish underwing coverts, which contrast with newer adjacent black feathers. Juveniles of both sexes (April-August) are similar to adult females, but much paler gray and buff.”

The plumage of the Tricolor and Red-wing is so similar that museum specimens are sometimes misidentified (Orians 1961a). The adult male Tricolor has a bluish luster to its black plumage, and the red of the epaulets is bright scarlet in contrast to the dull orange-red of the male Redwing (Orians 1961a). Both sexes of Tricolors are distinguished from Red-wings by bill shape, tail shape, and primary feathering formula; the outermost primary (P9) is longer than P6 in Tricolors and shorter in Red-wings (Beedy and Hamilton 1999). In addition, Tricolors have longer outer primaries, creating a narrower and more pointed wing shape than other blackbirds (Beedy and Hamilton 1999). The most conspicuous feature of the male plumage is the broad white border to the middle wing coverts (Orians 1961a).

In most races of the Red-wing these feathers are tipped with buffy, but in those races occupying the central Coast Ranges and Central Valley of California, where the Tricolor is most abundant, these feathers are black so that the wing lacks the light-colored stripe (Orians 1961a). Orians (1961a) noted that “[t]his plumage difference between males is not only conspicuous to the human observer, it is the most important means of species identification used by the birds themselves. Occasional Red-wings in a flock of Tricolors are singled out for special attack by a resident male Redwing in whose territory the flock lands.” Orians (1961a) also described the difference between female Tricolors and Red-wings: “[i]n general, female Tricolors are more uniformly sooty than female Redwings, there being less contrast between throat and breast. In the autumn, female Redwings are strongly tinged with rusty on the back, a feature never shown by the female Tricolor.” Females of both species are more difficult to distinguish because,

although female Tricolors are darker than most races of the female Red-wing, female Red-wings are actually the darkest in the region of distributional overlap. Interestingly, there appears to be a convergence of female plumage where the two species overlap, in contrast to a divergence of plumage in the males (Orians 1961a).

Sexual dimorphism in size is less in the Tricolor than in the Red-wing. Male Tricolors are smaller than male Red-wings in wing, tail, tarsus, and bill depth, but are larger in culmen, whereas female Tricolors are larger than female Red-wings in wing, tail, tarsus, and culmen, but are smaller in bill depth (Orians 1961a). This longer, narrow bill of the Tricolor is one of the most reliable morphological differences between the species (Orians 1961a).

Flight of the Tricolor consists of long, shallow undulations and flocks tend to be compact (Beedy and Hamilton 1999).

4.2 Taxonomy and Population Genetics

Mitochondrial DNA (cytochrome *b*) studies indicate that the nine *Agelaius* species are a polyphyletic assemblage of ecologically similar species (Beedy and Hamilton 1999). . “Within *Agelaius sensu lato*, *A. tricolor* clusters with four species, what might be called the true *Agelaius* (i.e., *sensu stricto*): *A. phoeniceus* (the Red-winged Blackbird of North and Central America), *A. assimilis* (the Red-shouldered Blackbird of western Cuba), *A. humeralis* (the Tawny-shouldered Blackbird of Hispaniola and Cuba), and *A. xanthomus* (the Yellow-shouldered Blackbird of Puerto Rico) (Lowther et al. 2004).” (Meese et al. 2014).

Behavioral difference between the Central Valley and southern California populations and an absence of exchange of individual banded birds between the two areas suggests the Tehachapi Mountains may act as a potential dispersal barrier (Berg et al. 2010). Elena Berg and colleagues at U.C. Davis used two complementary molecular markers, nuclear DNA microsatellites and mitochondrial DNA sequences, to examine the genetic structure of seven colonies of Tricolored Blackbirds in the Central Valley. Microsatellites evolve rapidly and are highly variable, and therefore are effective at determining the amount of gene flow among populations. In contrast, maternally inherited mitochondrial DNA (mtDNA) does not recombine, thus allow the description of historical changes in population size (by detecting maternal bottlenecks) and temporal variation in gene flow. The researchers found no evidence for population structuring within the seven areas, suggesting that the Central Valley colonies are a single population at the genetic level.

Berg and colleagues then used similar techniques to determine whether gene flow occurred between northern and southern populations, and whether there was population structuring within the southern populations (Berg et al. 2010). Microsatellite and sequencing results revealed no evidence of significant population structuring between the southern California and Central Valley Tricolor populations, indicating either considerable movement and genetic exchange between regions and few if any isolated populations, or that any isolation is very recent and not yet reflected in the population genetic signatures. Furthermore, the higher allelic diversity of the southern California population, despite its smaller overall population size compared to the

Central Valley population, suggests that the southern California population is an important reservoir of genetic variation for the species overall (Berg et al. 2010). Berg et al. (2010) noted however that “the genetic signature of a recent and dramatic decrease in effective population size in southern California is of high concern, since it suggests that despite the lack of evidence for recent bottlenecks in this species, there are many fewer birds breeding in southern California than in the recent past.”

4.3 Reproduction and Growth

Males begin singing as early as late February. Nesting is initiated in late March to early April, primarily in the San Joaquin Valley, and again in May to June in the rice-growing region of Sacramento Valley and foothill areas (Hamilton 1998, Beedy and Hamilton 1999). Male Tricolors may arrive before females at the colony sites, but sometimes by less than one day, and sometimes both sexes arrive together and begin breeding activity the same day (Beedy and Hamilton 1999). Dense concentrations of birds will gather and suddenly fly to another place, changing locations frequently and then returning to potential nest sites. This is described as “prospecting behavior” (Beedy and Hamilton 1999). Requirements for breeding colony sites are accessible water, protected nesting sites such as flooded or spiny, stinging, or otherwise armored or protective vegetation, and adequate amounts of suitable foraging areas within a few kilometers of the nesting colony (Beedy and Hamilton 1997). Most adults at a colony site begin nesting 2–3 days after prospecting begins. When Tricolors arrive at a breeding site, previously established breeding Red-wings and Yellow-headed (*Xanthocephalus xanthocephalus*) blackbirds may be excluded from territories by extremely large numbers of Tricolors.

Females construct their nest within the small territory of the male, and one male will breed with 1–4 females (Beedy and Hamilton 1999). Extreme synchrony is characteristic of most colonies of Tricolors—even in colonies of up to 100,000 nests, all eggs may be laid within one week (Orians 1961a). Males do not assist with nest construction or incubation, but do assist with food gathering and feeding of the young.

During the breeding season, Tricolors exhibit itinerant breeding whereby individuals often move after their first nesting attempts and breed again at a different geographical location (Hamilton 1998). At some colonies a second wave of nesting follows fledging of the initial cohort (Beedy and Hamilton 1999).

4.4 Diet and Foraging Ecology

Tricolors are opportunistic foragers, taking any locally abundant insect including grasshoppers (Orthoptera), beetles and weevils (Coleoptera), caddis fly larvae (Trichoptera), moth and butterfly larvae (Lepidoptera), dragonfly larvae (Odonata), and lakeshore midges (Diptera), as well as grains, snails, and small clams (Beedy and Hamilton 1999). In earlier studies Tricolors were described as grasshopper followers (Orians 1961b; Payne 1969) and losses of grasslands and reduced grasshopper abundance may have contributed to the decline of the Tricolor population observed between the 1930s and 1970s (Crane and DeHaven 1977). Recently,

however, grasshoppers have been abundant enough locally to support some large Tricolor colonies (Meese 2013).

Tricolors forage in all seasons in pastures, dry seasonal pools, agricultural fields including alfalfa with continuous mowing schedules, rice fields, feedlots, and dairies (Beedy and Hamilton 1997). The birds will also forage in riparian scrub, saltbush (*Atriplex* spp.) scrub, borders of marshes, and grasslands. They do not forage regularly in weed-free row crops and intensively managed orchards and vineyards (Beedy and Hamilton 1997). Rangeland that is not heavily grazed is also important foraging habitat for Tricolors in some portions of their range (Cook 1996).

Adult Tricolors, when foraging for themselves, will consume the most easily obtained food; in many agricultural settings, this means the utilization of feed grains provided to livestock in feeding troughs and/or stored silage (e.g., cracked corn, sometimes available in huge quantities). Where such animal feeds are not available, as in colonies situated outside of livestock rearing areas, adults typically foraged close to the colony on abundant and easily-obtained foods such as spilled rice and unharvested grains (Hamilton and Meese 2006).

The hatching of eggs results in an immediate shift to foraging for animal prey. Foraging behavior exploits the most-abundant and most easily obtained foods that meet immediate dietary needs of nestlings. Animal matter is essential for 0–9 day old nestlings but grains and seeds are utilized by adults and > 9-day-old nestlings. Animal prey fed to nestlings is diverse, including caterpillars of several Lepidopteran species, grasshoppers, aquatic larvae of water scavenger beetles (Coleoptera: Hydrophilidae), midges, beetles, and other invertebrates (Hamilton and Meese 2006).

Hamilton and Meese (2006) found that when foraging for themselves, adults rarely travel more than 3 km from breeding colonies, and frequently take advantage of super-abundant food resources at or near dairies (e.g., stored grains, cracked corn, livestock feed) but will travel greater distances, occasionally more than 8 km, in search of animal prey with which to feed their young. Occasional forays of up to 13 km from the colony have been documented (Beedy and Hamilton 1997), although sustained short-distance foraging within sight of the colony is also observed (Cook 1996). There are some indications that the size of the foraging arena may correlate to nestling starvation as adults travel longer distances to find food (Liz Cook, pers. comm.).

Only a portion of the area within commuting distance from the nest is used for foraging. Many unsuitable areas, including cultivated row crops, orchards, vineyards, and heavily grazed grasslands, are associated with high-quality Tricolor foraging habitat such as irrigated pastures, lightly grazed rangelands, dry seasonal pools, mowed alfalfa, fields, feedlots, and dairies (Beedy and Hamilton 1999, Hamilton and Meese 2006). Wintering Tricolors in the Sacramento Valley appear to forage heavily on the seeds of plants such as rice, grains, and weeds (Crane and DeHaven 1978).

Orians (1961a) demonstrated that the Tricolor's colonial social structure is more energetically demanding than the territorial structure of the Red-wing due to the high energetic requirements

of flying back and forth from distant feeding sites when foraging for young. Tricolors require food supplies that can be rapidly exploited once they reach the feeding site. Thus, the species has an unpredictable breeding distribution and poorer reproductive success than the Red-wing in unfavorable years (Orians and Collier 1962).

4.5 Mortality and Population Regulation

Band recovery data suggest that Tricolors live at least 13 years, although data are currently insufficient to estimate survival rates. Bob Meese of U.C. Davis initiated a number- and color-banding program in 2007. The color-banding continued until 2009 and the banding with USGS aluminum bands has continued through 2014 and has resulted in the banding of nearly 57,000 birds and the recapture of over 1,100 unique individuals. His band and re-sight samples of birds with number bands have been used to estimate an average annual adult survival of 60% (Meese unpub.).

Known causes of mortality include exposure to inclement weather (see “Other Natural or Anthropogenic Factors”); predation (see “Disease and Predation”); starvation (Meese 2010) and possible brood reduction via removal of live chicks from nests by females (Hamilton et al. 1995); competition with other species, including Great-tailed Grackles (*Quiscalus mexicanus*) which are aggressive towards Tricolors and may represent a serious future threat (Beedy and Hamilton 1999); agricultural contaminants and shooting for crop protection (see “Other Natural or Anthropogenic Factors”); widespread destruction of nesting substrate during the nesting season that results in direct mortality of nestlings, as well as historical and ongoing loss of nesting and foraging habitat (see “Present Or Threatened Destruction, Modification, or Curtailment of Habitat or Range”).

5.0 Kind of Habitat Necessary for Survival

The Tricolored Blackbird forms the largest breeding colonies of any North American landbird (Cook and Toft 2005). As many as 20,000 to 30,000 nests have been recorded in cattail (*Typha* spp.) marshes of 4 hectares or less, with individual nests <0.5 meters from each other (Neff 1937, DeHaven et al. 1975b). Nest heights range from a few centimeters to about 1.5 meters above water or ground at colony sites in freshwater marshes (Neff 1937) and up to 3 meters in the canopies of willows (*Salix* spp.) and other riparian trees; rarely, they are built on the ground. The Tricolor’s basic requirements for selecting breeding sites are open accessible water; a protected nesting substrate, including either flooded or thorny or spiny vegetation; and a suitable foraging space providing adequate insect prey within a few kilometers of the nesting colony (Beedy and Hamilton 1999, Shuford and Gardali 2008).

Tricolors are nomadic and highly colonial, and males defend relatively small territories within the colony (Orians and Collier 1962). Territories average about 35 square feet, or 1.8 m² to 2.35 m² in size, and one to three females construct nests within these small territories (Orians and Collier 1962, Beedy and Hamilton 1999). Unlike Red-wing Blackbirds, who gather food on and adjacent to their territories which average about 500–30,000 square feet in size, Tricolors do not forage on their territories but exploit the area around the colony (Orians and Collier 1962).

Historically most Tricolored Blackbird colonies were in the extensive native marshlands, riparian shrubs, upland shrubs, and grasslands of California, but the loss of these native habitats has forced a shift in nesting to largely non-native vegetation. Shuford and Gardali (2008:439–440) stated:

“The colonial breeding system of the Tricolored Blackbird probably evolved in the Central Valley, where the locations of surface waters and rich sources of insect food were ephemeral and varied annually (Orians 1961). Before its rivers were dammed and channelized, the Central Valley flooded in many years, forming a vast mosaic of seasonal wetlands, freshwater marshes, alkali flats, native grasslands, riparian forests, and oak savannas. Virtually all these habitats once supported nesting or foraging Tricolored Blackbirds. The evolution of a colonial breeding system enabled this species to assess changing local conditions rapidly and exploit outbreaks of locusts and other ephemeral insects over large areas to meet their food demands. Nomadic, colonial social organization in birds evolves most frequently in semiarid areas with great annual fluctuations in climate (Orians 1961).

“With the loss of a natural flooding cycle and most native wetland and upland habitats in the Central Valley, Tricolored Blackbirds now forage primarily in artificial habitats. Ideal foraging conditions for this species are created when shallow flood-irrigation, mowing, or grazing keeps the vegetation at an optimal height (<15 cm). Preferred foraging habitats include crops such as rice, alfalfa, irrigated pastures, and ripening or cut grain fields (e.g., oats, wheat, silage), as well as annual grasslands, cattle feedlots, and dairies (Beedy and Hamilton 1999). These blackbirds also forage in remnant native habitats, including wet and dry vernal pools and other seasonal wetlands, riparian scrub habitats, and open marsh borders. Vineyards, orchards, and row crops (tomatoes, sugar beets, corn, peas, beets, onions, etc.) do not provide suitable nesting substrates or foraging habitats for Tricolored Blackbirds.”

Most Tricolored Blackbirds forage within 5 km of their colony sites (rarely up to 13 km; Orians 1961, Beedy and Hamilton 1997). Proximity to suitable foraging habitat may be a determinant in the establishment of colony sites, as Tricolored Blackbirds often forage, at least initially, in the field containing the colony site (Cook 1996). However, often only a minor fraction of the area within the commuting range of a colony provides suitable foraging habitat (Beedy and Hamilton 1999, Hamilton and Meese 2006).

Itinerant breeding of Tricolors suggests that they may be philopatric to more than one nesting site (Beedy and Hamilton 1999). Hamilton et al. (1995) found that 19 of 72 (26%) colonies used the same nesting sites during surveys conducted between 1992 and 1994. Eleven (15%) colonies in 1994 repeated either their 1992 or 1993 nesting location but not both. These results may indicate a low to moderate degree of site tenacity and/or that suitable breeding habitat is limited (Cook and Toft 2005). The yearly shifts in breeding distribution of Tricolors are likely related to insect supplies and other unknown breeding requirements (DeHaven et al. 1975).

Wintering Tricolored Blackbirds often congregate in huge, mixed-species blackbird flocks that forage in grasslands and agricultural fields with low-growing vegetation and at dairies and feedlots (Shuford and Gardali 2008). In February, however, this species segregates into pure Tricolored Blackbird flocks, which may subdivide further into age- and sex-specific flocks (Shuford and Gardali 2008). At this time, foraging flocks roam across the landscape until they find a suitable nesting substrate with an abundant insect source nearby.

Historically, nesting substrate consisted mostly of native emergent marsh vegetation dominated by cattails (*Typha* spp.) or tules (*Scirpus* spp.; Neff 1937). Neff (1937) documented about 93% of nests (n = 252 colonies) in cattails, bulrushes and willows (*Salix* spp.) with some in nettles (*Urtica* spp.) and thistles (*Cirsium* spp.). However, Tricolors have been flexible in their choice of nesting substrates and have shown an increasing trend towards use of upland substrates for nesting following the 1930s, and many of these new substrates consisted of non-native plant species that would not have been present in the California landscape prior to the arrival of Europeans (Cook and Toft 2005). As noted by Cook and Toft (2005), the apparent shift from using wetland to upland habitats is “surely due to the loss of 96% of California wetlands over the last 150 years from 1,500,000 ha before European settlement.” The use of freshwater marshes as breeding colony sites decreased from 93% in the 1930s (Neff 1937) to 54% (n = 158 colonies) in the 1970s (DeHaven et al. 1975b). Orians (1961a) found 64% of colonies in the Sacramento Valley nesting in cattails and other emergent vegetation; other nests were in agricultural fields, and one colony nested in trees along a river. DeHaven et al. (1975) reported that about 69% of colonies had nests built in marsh vegetation including cattails, bulrushes, willows, or some combination, and 49% were in cattails only.

Within the Central Valley, DeHaven et al. (1975) also documented breeding colonies in the rice-growing regions of the Sacramento Valley and in the pasturelands of the lower Sacramento Valley and San Joaquin Valley. In the rice lands, the annually flooded rice was the dominant crop, but small grains, hay, safflower, sugar beets, corn, and beans were also grown. The pasturelands consisted largely of irrigated fields of introduced grasses, alfalfa, hay, and small grains. In both areas, insects in flooded fields probably provide the primary food for breeding Tricolors. Colonies outside the Central Valley were found in a diverse array of habitat types, including within chaparral covered hills (Riverside and Colusa Counties), orange and avocado groves interspersed with grass-covered hills (San Diego County), sagebrush grasslands (Siskiyou County), and salt-marsh habitat of San Francisco Bay (Alameda County) (DeHaven et al. 1975).

An increasing percentage of colonies since the 1970s have been reported in Himalayan blackberry (*Rubus armeniacus*) and thistles (DeHaven et al. 1975b, Hamilton et al. 1995, Cook 1996). The most commonly used substrates today include native emergent marshes, grain silage at dairies, and Himalayan blackberry. Other less commonly used nesting substrates include safflower (*Carthamus tinctorius*), tamarisk (*Tamarix* spp.), elderberry/Western Poison Oak (*Sambucus* spp. and *Toxicodendron diversilobum*), Giant Reed (*Arundo donax*), and riparian scrublands and forests (e.g., *Salix* spp., *Populus* spp., *Fraxinus* spp.; Beedy and Hamilton 1999, Shuford and Gardali 2008).

In recent decades some of the largest Tricolor colonies have been found in triticale and other grain fields in the San Joaquin Valley (many of which are planted for silage) (Collier 1968, Hamilton et al. 1995, Beedy and Hamilton 1999, Meese 2006). The largest colonies occur in fields of triticale, a wheat-rye hybrid the name of which is an acronym of *Triticum* [wheat] and *Secale* [rye]. These fields of triticale are frequently harvested while nests are still active (Cook and Toft 2005, Meese 2007, 2008, 2009a, 2011). In 1994 approximately 40% of all breeding birds located throughout the nesting season were found in silage grain fields while approximately 47% nested in native emergent marshes and 31% in thickets of the introduced Himalayan blackberry (Cook and Toft 2005). In 2000, 17% of the breeding effort occurred in silage grain fields, while 54% of nesting was in emergent marsh and 12% in Himalayan blackberry, and additional colonies nested in other flooded and upland habitats. In 2014, 41% of nesting substrate was Himalayan blackberry and 38% was triticale, with cattails making up only 8.8% (Meese 2014:9; Table 2 below).

Graves et al. (2013) examined records from all surveys conducted from 1907 until 2009, portrayed in Table 2 below. For all records, the dominant breeding habitat was cattails, which comprised 48% of breeding records and 65% of breeding birds. Triticale was also important, with 9% of birds but only 1% of records due to the very large colony sizes (and only appearing as a substrate in recent years since it was not planted in earlier years). Bulrushes contained 7% of breeding birds and 9% of records. Other important upland breeding vegetation included Himalayan blackberry with 6% of breeding birds and 11% of records, and thistles with 5% of birds and 9% of records.

Table 2: Number of Records and Total Number of Breeding and Non-breeding Tricolored Blackbirds in Different Vegetation Types, 1907–2009 (Graves et al. 2013 Appendix A1:14)

Habitat	Total		Breeding		Non breeding	
	Records (%)	Total birds (%)	Records (%)	Total birds (%)	Records (%)	Total birds (%)
Cattails	400 (34%)	2,848,874 (53%)	326 (48%)	1,843,704 (65%)	74 (14%)	1,005,170 (43%)

Graves et al. (2013) documented that since 1980 the majority of nesting birds were recorded in upland nesting substrate types, 29% of breeding birds were recorded in cattails, 21% in triticale, 13% in Himalayan blackberry, 7% were in unknown habitat types, 5% in bulrush, 5% in prickly lettuce (*Lactuca serriola*), 4% in wheat, 4% in thistle, 3% in mustard, 3% in willows, 1% in stinging nettles, 1% in saltbush, and <1% in alfalfa, barley, giant reed, citrus groves, rice paddy, tamarisk, and wild rose. (See also Cook and Toft 2005.) Average colony sizes declined for all habitat types except for colonies in native stinging nettles, although nettles did not support large number of either breeding or non-breeding Tricolors. Mean colony size in cattails was 34%

larger in the early years of records as compared to those in blackberry, bulrush, and thistle, but declined 38% more rapidly than in those other substrates (Graves et al. 2013:6).

The proximity of breeding sites to nearby quality foraging areas is an important determinant of whether a colony will settle in an area for nesting, as described in “Diet and Foraging Ecology” section above.

Another important indicator of breeding-site selection for Tricolor colonies is the presence of young, rapidly and vigorously growing nesting substrates such as cattails, bulrush, and milk thistle (Meese 2007). The plants must be strong enough to support nests for the duration of the breeding period. Thus, not just any spiny or thorny substrate will provide suitable breeding habitat.

The number of birds or colonies nesting in a particular substrate is an important indicator of the value of that habitat, but even more insightful is the reproductive success in different habitat types. Both Cook and Toft (2005) and Meese (2013) reported on reproduction of Tricolored Blackbirds in different nesting substrates using multiple years of data. Cook and Toft (2005) found mean number of chicks per nest varied among nesting substrates, with nests in non-native vegetation fledging significantly more offspring than those in native vegetation. Table 3 below (from Cook and Toft 2005:82) shows mean reproductive success (number of chicks per nest at 8 days after first egg hatched) of colonies by substrate and study region from 1992–2003.

Table 3: Reproductive Success of Tricolored Blackbirds by Nesting Substrate

	Number of chicks per nest		
	n	Mean	SE
Nesting Substrate			
Emergent marsh	40	0.5	0.09
Himalayan blackberry	23	2.0	0.16
Silage – all	26	0.2	0.08
Silage ^a	4	1.0	0.26
Other flooded plants	6	1.2	0.51
Other upland plants	7	1.2	0.37
Total native plants	46	0.6	0.11
Total non-native plants ^a	34	1.7	0.15

^a Excluding colonies that were lost to crop harvesting.

Tricolors nesting in Himalayan blackberry had greater reproductive success than those nesting in grain silage, but colonies in grain silage were far larger than those in any other upland nesting substrate, and where nests were not destroyed by silage harvest, number of fledglings per nest was higher than in native marsh habitat (Table 3; Cook and Toft 2005). These results suggest that the annual loss of nests due to harvest of grain silage during the Tricolor breeding season is a significant factor contributing to the decline of the species.

Meese (2013) documented reproductive success of 870,000 nests from 11 colonies over a 6-year period from 2006 to 2011. He found that only 11% of colonies studied fledged an average of one or more young per nest, revealing chronically low (below-average from previous studies) reproductive success throughout the Central Valley. Importantly, the abundance of insects was positively correlated with reproductive success. The colony with the highest reproductive success of 1.44 fledglings per nest was in milk thistle in Merced County in 2010, surrounded by open rangeland where grasshoppers were super-abundant.

Suitable Tricolor habitat therefore can be more than meets the human eye: factors such as insect availability in proximity to nest sites, age of vegetation, or other currently unknown habitat characteristics provide crucial breeding requirements for Tricolors in addition to suitable nesting substrates (Meese 2013). While many colonies are found in the same location year after year, colonies often move, nesting a second time in one breeding season in a different location, and in different locations in subsequent years. Therefore, it is critical at present to protect the habitat that is documented to be used by Tricolors (each year or occasionally), rather than assuming that protecting habitat that superficially appears suitable but is not actually used (i.e., relying solely on currently protected public lands that do not at present support breeding Tricolors) will be sufficient to conserve the species.

6.0 Factors Affecting the Ability to Survive and Reproduce

Under the California ESA, a petition must include information regarding the population trend, range, distribution, abundance, and life history of a species, the factors affecting the ability of the population to survive and reproduce (*see supra*). The petition must also include information about the degree and immediacy of the threat, the impact of existing management efforts, suggestions for future management, the availability and sources of information, information regarding the kind of habitat necessary for species survival, and a detailed distribution map, all of which are both satisfied below. Cal. Fish & Game Code § 2072.3.

Cited reasons for decline of Tricolors include historical and ongoing loss of suitable breeding and foraging habitats, direct destruction of nests from agricultural harvesting during breeding season, historical market hunting of blackbirds, extensive predation of entire colonies by rats, egrets, herons, coyotes, and other species, poisonings and shootings to protect crops from blackbirds, pesticide use, and an ongoing failure of existing regulatory mechanisms to prevent such threats despite awareness of population declines for decades.

6.1. Present or Threatened Destruction, Modification, or Curtailment of Habitat or Range

The greatest threats to this species are the direct loss and degradation of habitat from human activities (Beedy and Hamilton 1999). Most native habitats that once supported nesting and foraging Tricolored Blackbirds in the Central Valley have been replaced by urbanization and agricultural croplands unsuited to their needs. In Sacramento County, a historical breeding center of this species, the conversion of grassland and pastures to vineyards expanded from 3,050 hectares in 1996 to 5,330 hectares in 1998 (DeHaven 2000) to 6,762 hectares in 2003 (Calif. Agri. Statistics Serv., www.nass.usda.gov/ca/). Conversions of pastures and grasslands to vineyards in Sacramento County and elsewhere in the species' range in the Central Valley have resulted in the recent loss of several large colonies and the elimination of extensive areas of suitable foraging habitat for this species (Cook 1996, DeHaven 2000, Hamilton 2004, Cook and Toft 2005).

DeHaven et al. (1975) pointed out that many marshes and other "apparently suitable" nesting sites were unused by Tricolors each year. Graves et al. (2013) documented a decline of breeding populations in the Sacramento Valley including both a reduction in average colony size and the total breeding population, and hence the number of sites occupied, from 1907 until 2009. These colonies declined in average size despite the fact that many of the marsh (cattail and bulrush/tule) sites in this region were in wildlife refuges and protected from modification. Increased management for wintering waterfowl may have altered the marshes from their historical conditions, or something other than absolute amount of breeding substrate may be affecting breeding populations, such as insect abundances in foraging habitat (e.g., Meese 2013). The 2014 census documented a resurgence of breeding Tricolors in Sacramento County, which supported 20% of the population, but the overall population for the entire species was so low that this only amounted to fewer than 30,000 birds (Meese 2014). In another example, the coastal population of Tricolors declined 91% in 6 of the last years, yet there has been no direct loss of nests due to agricultural harvests, again suggesting other unknown factors such as lack of sufficient insect prey base to support successful reproduction,

6.1.1 Destruction of Native Habitats

Destruction of Tricolor breeding habitat has been documented as far back as the first published population studies on the species. Neff (1937) stated "...the destruction of nesting habitats by man is of most importance. Reclamation and drainage have destroyed many favorable habitats. Areas in the vicinity of San Francisco and Los Angeles are now so highly developed that it is doubtful whether or not any colonies could exist there. Other habitats have been destroyed by the dredging or cleaning of reservoirs, marshes, and canals in order to destroy the growths of cattails and tules." The surveyors documented specific instances of destruction of known colony sites, including draining and burning of some surveyed localities.

DeHaven et al. (1975) also noted the loss of breeding habitat leading to the loss of colonies where they formerly occurred. Colonies studied near Davis in Yolo County during the 1960s were not located again due to the near-complete loss of nesting habitat. No nesting habitat was

found near Riego Road in Sacramento County where Orians (1961a) found colonies, and at Cache Creek in Kern County where Collier (1963) found colonies.

The vast majority of the native habitat for Tricolors has been lost or degraded. Only 560,500 of an original 4,000,000 acres (about 14%) of wetlands in the Central Valley were extant in 1939 (Beedy and Hamilton 1997). By the mid-1980s, an estimated 480,000 acres of freshwater emergent marshes, or 85% of the total remaining freshwater wetlands in 1939, were reduced by one-half to about 243,000 acres (Beedy and Hamilton 1997). Graves et al. (2013) found declines in sizes of colonies in the Central Coast resulted from four early records, and three of these came from cattails in which declines were rapid: remaining marsh nesting habitat has been reduced to small isolated patches of habitat that also support high densities of Tricolor predators. Further, native perennial grasslands—prime Tricolor foraging habitat—have been reduced by more than 99% in the Central Valley and surrounding foothills (Beedy and Hamilton 1997).

6.1.2 Colony Destruction by Agricultural Activities

The relatively recent phenomenon of Tricolors nesting in grain silage fields at dairies was not mentioned by DeHaven et al. (1975) (but see Collier 1968), however silage is well-documented as a primary attribute of present-day Tricolor nest site selection (Beedy and Hamilton 1997, Beedy and Hamilton 1999, Cook and Toft 2005, Meese 2007, 2008, 2009a, 2011). Harvest of grain silage is conducted in relation to moisture content of the forage, the timing of which coincides with Tricolors using the crops for nesting (USFWS 2000). This causes nest destruction and direct mortality, which in turn is threatening much of the remaining breeding population of the species (USFWS 2000). In addition, many former agricultural areas within the range of the Tricolor are now being urbanized, and the trend is projected to continue (Beedy and Hamilton 1997).

Dairy grain silage consists of varieties of wheat, often triticale, but also barley, oats, and other crops. Crops can be monocultures or mixtures of grain plants and may also be infested with weeds such as prickly lettuce (*Lactuca serriola*) and thistles (*Cirsium* spp.). These plants may grow to 3–4 feet in height and appear to provide some protection against predators on Tricolor nests because of their dense growth, somewhat spiny/irritating character, and typically monotonous relief in the landscape.

Silage fields around dairies are probably highly attractive to breeding Tricolors because of relative protection from predators but also because crops at a single location may cover tens of acres or more. Because they are intensely colonial, tens of thousands of Tricolors can potentially occupy a silage field as small as 20–40 acres in size. Nest densities in these fields are often not as great as in some other upland substrates but approximately one nest per square meter is not uncommon (Liz Cook, pers. comm.). In addition to providing a suitable nesting substrate, dairies typically provide abundant grain sources at their feedlots for settling adult Tricolors, large amounts of nearby foraging habitat for insects (e.g. alfalfa), and reliable water supplies.

Silage is grown to be an early cut green feed. Crops are planted in late winter/early spring and mature to harvest stage usually between about mid-April and the first week in May. Harvest

stage occurs when the plants contain the highest amount of moisture in their seed heads (milk stage). This stage may last about a week within which time the plants are most valuable as silage feed. The crop is chopped, often in a single day, into fine pieces and allowed to ferment into the final product that is fed to dairy cows. Fields that grew silage are almost immediately turned over to a second crop such as corn (Liz Cook pers. comm. with David Hardt, refuge manager, Kern National Wildlife Refuge).

Tricolors begin establishing nesting colonies in grain silage in late March/April when the plants are tall and sturdy enough to support nests. This means that the timing of silage harvest usually coincides closely with the late nestling/early fledgling stage of Tricolor offspring. The timing of silage harvest and the Tricolor nesting cycle is such that colonies in silage are always lost unless there is intervention on their behalf or for some other unlikely reason that the crop is not harvested (Liz Cook, pers. comm.).

The concentration of most of the Tricolor reproductive effort into a few large colonies that are selecting grain silage as a nesting substrate has greatly increased the risk of extinction should the annual destruction of such a large proportion of nests continue unabated (Cook and Toft 2005). In 2014, Meese (2014) reported 38% of all nesting substrate was in silage (triticale) although data are not available as to how many colonies or individual birds were lost to harvest during that year. This underscores the heavy reliance on this nesting substrate by these imperiled birds concurrent to the decimation of other suitable breeding habitats such as vast areas of cattail marshes that occurred earlier in the 20th century.

Table 4 below provides examples of breeding failures because of harvest of grain silage from 1993 to 2011. For example, approximately half of the documented Tricolor population in 2000 nested in two silage fields in 2003, and the vast majority of this breeding effort was destroyed. In 2008, 45% of all nests in silage were destroyed, amounting to 140,000 nests in Tulare, Madera, Merced, and Fresno counties. As late as 2011—seven years after the formation of the Tricolored Blackbird Working Group and two years after the updated *Conservation Plan for the Tricolored Blackbird* was published—56% of all nests in silage were still destroyed by harvest. Meese (pers. comm.) reported more colonies lost to harvest in both 2013 and 2014 despite efforts to financially compensate landowners to prevent or delay harvest. Hundreds of thousands of additional nests would certainly have been lost over the years without the concerted effort of a handful of dedicated individuals, who monitored Tricolor colonies and attempted to coordinate buy-outs or harvest delays of the biggest colonies. From 1993 to 2011, more than one million nests were documented to have been destroyed by harvest and certainly many more undocumented nests have been obliterated over the years on private lands.³ Sources for Table 4 below include Hamilton 1993, Hamilton et al. 1995, Beedy and Hamilton 1997, Hamilton et al. 1999, Hamilton 2000, Hamilton and Meese 2005, Meese 2006, 2007, 2008, 2009a, 2011, and Liz Cook unpublished data. This is not a complete summary of all colonies that nested in silage, only a sample of monitored sites.

³ There were likely tens if not hundreds of thousands of nests destroyed by harvest over the years for which there is no data due to their locations on private property.

Table 4: Tricolor Blackbirds Breeding in Silage by County, Estimated Number of Nests Saved by Crop Buy-out or Harvest Delay, and Estimated Number of Nests Destroyed

Year	County	Number of Breeding Birds	Number Saved by Buy-out or Harvest Delay	Estimated Nests Destroyed)
1993	Tulare	48,000		48,000
1994	Fresno	70,000		70,000
1994	Kern	11,600		11,600

2013	Riverside	2000		1330
TOTAL				≥1,000,000

Prior to 1980, the Sacramento Valley held the largest number of birds, whereas from 1980 onwards the San Joaquin Valley supported the largest total breeding populations of Tricolored

Blackbirds (Graves et al. 2013). Graves et al. (2013) postulated one reason for the decline in average colony size in the San Joaquin Valley and decline in total breeding population was that colonies in triticale were all within the San Joaquin Valley (or Sacramento County), all during the last 20 years, and they were >40 times larger than colonies in other habitats during this period. These are the very colonies that were often destroyed.

Other agricultural activities such as sheep grazing can destroy Tricolor colonies. At Owens Creek in Merced County in 2010, a colony of 15,000 birds nesting in milk thistle and mustard produced only 1,500 fledglings after intensive grazing of the vegetation by domestic sheep (Meese 2010).

6.1.3 Destruction of Other Suitable Upland Breeding Substrates and Surrounding Habitats

Cook and Toft (2005) found Himalayan blackberry supported the highest densities of nesting Tricolors among all used substrates and reproductive success was significantly higher in these than other most commonly used substrates (emergent marsh and silage) using data from 1992 to 2003 (Table 4). However, Himalayan blackberry nesting sites are currently not protected and many important traditionally used sites have been lost in recent years (Cook and Toft 2005).

Other important upland nesting substrates, including thistles and prickly lettuce, are likewise not protected because they are considered to be non-native plants and often occur on private property. For example, the 2010 Owens Creek colony in milk thistle and mustard described above was destroyed by grazing sheep. In Merced County in 2011, two large colonies were reported in milk thistle: Owens Creek with 20,000 birds and South of Childs with 10,000 birds: both of these colonies were entirely destroyed by cutting of the thistle (Meese 2011). That same year, Meese (2011:12) also noted that at least four colony sites in Himalayan blackberry substrates on private property were all apparently sprayed with herbicides since 2010. These included Hulen Levee in Merced County, Central American 1 in Stanislaus County, Openshaw Road in Butte County, and Ostrom Road in Yuba County. A colony of 50,000 Tricolors at Sandy Mush and 99 in Merced County in 2011 was reduced to just 15,000 due to harvest of the fava bean crop in which they were nesting.

6.2 Inadequacy of Existing Regulatory Mechanisms

The Tricolored Blackbird is not protected by existing regulatory mechanisms. The Yolo Audubon Society submitted a petition to the Commission to list this species as endangered under the state Endangered Species Act in 1991, but the petition was withdrawn in 1992 (Beedy and Hamilton 1997:19-20). Based on concerns about the Tricolor's population status, FWS included this species as a Category 2 candidate for federal listing as either threatened or endangered. *See, e.g.,* 59 Fed. Reg. 58992 (November 15, 1994).⁴ However, FWS later decided to discontinue the

⁴ Category 2 candidates are species for which information in the possession of FWS indicates that proposing to list as endangered or threatened is possibly appropriate, but for which persuasive data on biological vulnerability and threat are not currently available to support proposed rules.

practice of maintaining a list of Category 2 candidates. 61 Fed.Reg. 64,481 (December 5, 1996). The Center for Biological Diversity submitted a petition to emergency list the species as endangered under the state and federal Endangered Species Acts in 2004, but this was denied.

Currently, the Tricolored Blackbird is only considered a FWS non-game bird of management concern (species are of concern because of (1) documented or apparent population declines, (2) small or restricted populations, or (3) dependence on restricted or vulnerable habitats) and a species of special concern by CDFW (animals not listed under the federal Endangered Species Act or the California Endangered Species Act, but which nonetheless (1) are declining at a rate that could result in listing, or (2) historically occurred in low numbers and known threats to their persistence currently exist). These designations do not provide any specific legal protection to the bird aside from the requirement that project's triggering CEQA review must analyze the impacts of the proposed action on the Tricolor. *See, e.g.*, 14 Cal. Code Regs. §§ 15065, 15380. However, its special status does not protect the species from activities that do not trigger CEQA review. Furthermore, while the nests and eggs of this species are protected under the California Fish & Game Code § 3503 *see supra*, CDFW has failed to enforce the law to end the devastating annual "take" by private property owners during Tricolor nesting season.

6.3 Overutilization for Commercial, Recreational, Scientific, or Educational Purposes

Neff (1942) reported that:

"Market hunting of blackbirds in the interior valleys of California became a thriving business in about 1928 or 1929, and a dependable market for them was developed largely through Italian produce firms in the larger cities. During the depression years the number of men so engaged increased markedly, but decreased by 1936 or 1937. Using automatic shotguns and firing into dense masses of blackbirds feeding on rice stubble, these market hunters killed large numbers of all species of blackbirds; one group of market hunters shipped nearly 400,000 dressed blackbirds from one Sacramento Valley shipping point in five seasons, and during the winter season of 1935-1936 they shipped about 88,000 birds."

6.4 Disease or Predation

Historical accounts documented the destruction of nesting colonies by a diversity of avian, mammalian, and reptilian predators (Beedy and Hamilton 1999). Historically, terrestrial predators have probably included wolves (*Canis lupus*), coyotes (*Canis latrans*), gray foxes (*Urocyon cinereoargenteus*), raccoons (*Procyon lotor*), mink (*Mustela vison*), striped skunks (*Mephitis mephitis*) and spotted skunks (*Spilogale gracilis*), gopher snakes (*Pituophis catenifer*), non-native rats (*Ratus ratus*), western rattlesnakes (*Crotalus viridis*), and king snakes (*Lampropeltis getulus*). Avian predators are reported to be Black-crowned Night-Herons (*Nycticorax nycticorax*), Great Blue Herons (*Ardea herodias*), Common Ravens (*Corvus corax*), Cooper's Hawks (*Accipter cooperii*), Burrowing Owls (*Athene cunicularia*), American Crows (*Corvus brachyrhynchos*), Swainson's Hawks (*Buteo swainsoni*), Northern Harriers (*Circus*

cyaneus), Barn Owls (*Tyto alba*), Short-eared Owls (*Asio flammeus*), Yellow-billed Magpies (*Pica nuttalli*), and Merlins (*Falco columbarius*). Predation by feral cats (*Felis catus*; Beedy and Hamilton 1997), rats (*Rattus* spp.; Meese 2010) and Cattle Egrets (*Bubulcus ibis*; Meese 2013), has recently been reported. Tricolors respond to predators by sitting silently rather than attempting to attack them, as do Red-wings (Beedy and Hamilton 1997, 1999).

Predation is a major cause of large-scale nesting failures in many Tricolor colonies, especially those nesting in native emergent marshes (Hamilton et al. 1995, Beedy and Hamilton 1997; Hamilton 2000). Cook and Toft (2005) found that reproductive success was significantly lower in native emergent marshes than other substrates, excluding silage that was not lost to harvesting operations (Table 3). Heron and raccoon predation upon colonies nesting in marshes, especially, can destroy all or nearly all nests within colonies (Hamilton et al. 1995, Hamilton 2000). For example, Tricolor nesting at Kern NWR, Kern County and at Maxwell I and Maxwell II colonies in Colusa County failed due to night-heron predation. Black-crowned Night Heron predation—which often results in the nest failure of an entire colony—is particularly troubling at national wildlife refuges, which are becoming increasingly important nesting sites for both Night Herons and Tricolors as private range and dairy lands are converted to vineyards and orchards or urban uses, and as grain silage fields are subject to harvest during nesting season. Some large colonies (up to 100,000 adults) may lose >50% of nests to coyotes (*Canis latrans*), especially in silage fields, but also in freshwater marshes when water is withdrawn (Hamilton et al. 1995). Thus, water management by humans often has the effect of increasing predator access to active colonies (Shuford and Garaldi 2008).

Nesting over water provides some protection from predators (Weintraub and George 2012), but the reduction of native wetlands to less than 4% of their original extent has probably concentrated predator populations in the remaining wetlands more than was true historically (Cook and Toft 2005). As noted above, water management in some areas results in reduced water, and because cattails do not have armaments such as thorns or stinging hairs, nesting blackbirds are exposed to higher rates of predation (Meese 2013). Cook and Toft (2005) found that from 1992 to 2003, a larger proportion of colonies in native wetlands than in upland substrates suffered complete reproductive failure attributable primarily to predation. In particular, some of the largest breeding colonies in wetlands, such as those in the Sacramento Valley, failed completely despite the fact that colonial nesting is considered an adaptation against predation.

More recent studies have documented wholesale reproductive failure of entire colonies due to predation by Cattle Egrets (Meese 2013). Since 2006, predation by Cattle Egrets on eggs and nestlings has caused nearly complete reproductive failures of even very large colonies, but this currently is limited to Tulare County. In contrast to Cook and Toft (2005) which found a correlation between nesting substrate and reproductive success, Meese (2013) documented widespread reproductive failures of entire colonies from 2006 to 2011 that appeared unrelated to nesting substrate. Instead, Meese found that insect abundance around these colonies was insufficient to support successful breeding, resulting in nestling starvation and failure of females to lay eggs. Meese (2014:110) states “[t]his loss of foraging habitat may result in a decline in productivity over a period of years that is difficult to detect, but that decline may ultimately lead

to the situation where, despite the availability of suitable nesting substrate, tricolors abandon colonies or decline to extinction in an area where they formerly were abundant.” If this is correct, then colonies adjacent to dairies, which recently represent the largest colonies of breeding Tricolors, may appear to be ecological traps, fledging relatively few young in most years even when not lost to silage harvest (Meese 2013).

Cook and Toft (2005) note that in earlier studies, colony settlement was reported to be sporadic and unpredictable (Neff 1937, Orians 1961) and banded nestlings were only somewhat philopatric (DeHaven et al. 1975b). More recent data, however, indicate repeated settlement of many sites despite poor breeding outcomes. The recent losses of known breeding sites were concomitant with the decline in local breeding populations despite an abundance of what appear to be other suitable sites which do not become used. This trend toward apparent increased philopatry probably reflects the now extremely limited availability of suitable nesting habitat.

6.5 Other Natural or Anthropogenic Factors

6.5.1 Storms and Droughts

Severe storms are documented to cause near-complete reproductive failures of colonies. At the Plumas Arboga colony in Yuba County in 2009, a colony of 20,000 Tricolors nesting in cattails produced fewer than 1,000 fledglings after a severe storm (Meese 2009a). Colony monitoring in 2010 reported hundreds of dead nestlings found on the ground beneath nests in milk thistle at the 2,000-bird colony on San Felipe Ranch in Merced County after a severe storm; this colony ultimately produced only 200 young (Meese 2010). Also during 2010 a second colony of 10,000 birds nesting in mustard and milk thistle at Merced NWR was destroyed by storm, with only 500 fledglings produced.

Meese (2010:11) wrote: “[s]pring storms, and especially the winds associated with storms, played a major role in limiting the productivity of several colonies in 2010, especially those established in milk thistle in Merced County. The second settlement at Merced National Wildlife Refuge Duck Slough appeared to be nearly wiped out due to a storm with high winds on May 20, affecting a colony visually estimated to consist of 15,000 breeding birds. The nearby San Felipe Ranch colony was affected by the same storm, and when surveyed on May 27 was visually estimated to have suffered a greater than 50% mortality of nestlings, as hundreds of dead nestlings were observed on the ground beneath the milk thistle nesting substrate. The Bear Creek colony, also established in milk thistle, was not as severely impacted but hundreds of nests were observed to have been affected, most apparently shaken sideways during strong winds. The eggs in these nests were likely spilled out on to the ground while the nestlings were either ejected or forced to cling precariously to horizontal nest cups.”

Drought also may have adverse effects on Tricolored Blackbird populations, but no empirical data are available (Bob Meese, pers. comm.) Beedy (2014:3) wrote that “the recent drought and effects of climate change have noticeably reduced the extent of suitable nesting and foraging habitat in the Central Valley compared to conditions when I first began my intensive studies of this species in the mid-1980s. The effects of the drought on the available wetlands and moist,

insect-producing agricultural fields, was especially apparent during this year's Statewide Survey—in the third year of a severe drought.” However, the Tricolored Blackbird population had been steadily declining from 2008 to 2014, so drought cannot be implicated in the decline for the entire time period.

The Tricolored Blackbird evolved over millennia in a region (California) that is naturally susceptible to periodic drought and severe storms. However, their population size and available habitat has been so reduced by humans over the past century that natural weather events now have a more pronounced effect on the overall population—this is precisely the problem when small, endangered populations with little remaining habitat are faced with large-scale natural stochastic (unpredictable) events such as droughts and severe storms. Drought and severe storms may have adverse effects on reproductive success, but this only makes protecting active nesting colonies from damaging human activities such as harvest, pesticides, grazing sheep, or poor water management all the more critical.

6.5.2 Poisons and Contaminants

Various poisons and contaminants have caused mass mortality of Tricolored Blackbirds (Shuford and Garaldi 2008). McCabe (1932) described the strychnine poisoning of 30,000 breeding adults as part of an agricultural experiment. Neff (1942) considered poisoning to regulate numbers of blackbirds preying upon crops (especially rice) to be a major source of mortality. This practice continued until the 1960s, and thousands of Tricolored Blackbirds and other blackbirds were exterminated to control damage to rice crops in the Central Valley.

Beedy and Hayworth (1992) observed a complete nesting failure of a large colony (about 47,000 breeding adults) at Kesterson Reservoir, Merced County, and selenium toxicosis was diagnosed as the primary cause of death. Hosea (1986) attributed the loss of at least two colonies to aerial herbicide applications.

Beedy and Hamilton (1997) documented more evidence of Tricolor mortality due to contaminants. A large Tricolor breeding colony of nearly 50,000 birds at Kesterson Reservoir in Merced County experienced a complete nesting failure in 1986 (Beedy and Hayworth 1992). Some of the dead nestlings had club feet; other shorebirds and water birds collected at the reservoir had similar deformities. Pathological examinations of the Tricolor nestlings indicated heart muscle degeneration, and liver sampled showed higher concentrations of selenium than in Red-wing nestlings collected in an uncontaminated area at Merced NWR (Beedy and Hayworth 1992). The cause of the 1986 Tricolor nestling deaths was suspected to be selenium toxicosis (Beedy and Hamilton 1997). A recent incident reported to CDFW was the death of Tricolors from in Riverside County that were poisoned by bait left out for ground squirrels (R. Cook, pers. comm.).

Hamilton observed a colony sprayed by mosquito abatement operators in Kern County, and all sprayed eggs failed to hatch, and the loss of at least two Tricolor colonies was attributed to herbicide applications (Beedy and Hamilton 1999). While the link between environmental contaminants and nesting failure of Tricolors is largely unstudied, enormous amounts of

chemicals are introduced into the environment every year by the California agriculture industry, particularly in the Central Valley, which is the historical stronghold of the Tricolor and the most intensive agricultural region in the state. Table 5 shows amount and type of pesticides applied in five of the counties that support the some of the greatest numbers of breeding Tricolors.

Table 5. Type and Amount of Pesticides Used in Fresno, Merced, Sacramento, San Joaquin, and Tulare Counties (California Department of Pesticide Regulation 2002)

County	Chemical	Pounds Applied	Chemical	Pounds Applied
Fresno	Aluminum Phosphide	15,080.9830	Metam-Sodium	1,981,875.2816
	Bacillus Thuringiensis I	1,690.3241	Methoprene	15.6594
	Chlorophacinone	0.1511	Methyl Bromide	417,510.3194
	Chlorpyrifos	321,888.9509	Oryzalin	11,850.1164
	Copper Sulfate	115,084.1100	Petroleum Oil	2,329,338.9000
	Diazinon	70,289.4242	Phosmet	95,969.6584
	Diphacinone	0.7339	Pyrethrins	162.6464
	Malathion	43,158.9558	Strychnine	40.7266
	Mancozeb	37,528.9088	Zinc Phosphide	35.7129
Merced	Aluminum Phosphide	2,971.6662	Metam-Sodium	422,398.3113
	Bacillus Thuringiensis I		Methoprene	157.8358
	Chlorophacinone	1.1929	Methyl Bromide	131,116.9563
	Chlorpyrifos	61,795.4767	Oryzalin	2,594.6929
	Copper Sulfate	105,569.4900	Petroleum Oil	569,390.7400
	Diazinon	23,995.9920	Phosmet	9,044.3520
	Diphacinone	0.8929	Pyrethrins	590.9544
	Malathion	17,868.8865	Strychnine	89.1223
	Mancozeb	8,991.6591	Zinc Phosphide	265.5314
Sacramento	Aluminum Phosphide	1,957.8636	Metam-Sodium	34,853.1512
	Bacillus Thuringiensis I	77.9603	Methoprene	278.8712
	Chlorophacinone	0.1346	Methyl Bromide	9,339.2350
	Chlorpyrifos	29,307.3649	Oryzalin	6,544.5375
	Copper Sulfate	49,294.402	Petroleum Oil	223,652.1400
	Diazinon	14,780.1577	Phosmet	8,031.6110
	Diphacinone	0.3048	Pyrethrins	71.4711
	Malathion	2,852.0994	Strychnine	0.8122
	Mancozeb	11,154.9237	Zinc Phosphide	60.1408
San Joaquin	Aluminum Phosphide	2,362.2914	Metam-Sodium	10,122.7993
	Bacillus Thuringiensis I	562.7223	Methoprene	95.2427
	Chlorophacinone	0.1439	Methyl Bromide	176,519.4093
	Chlorpyrifos	52,076.1370	Oryzalin	6,757.1516
	Copper Sulfate	100,613.6600	Petroleum Oil	534,153.4400

	Diazinon	17,664.0315	Phosmet	10,195.7060
	Diphacinone	0.3140	Pyrethrins	260.5963

	Mancozeb	23,385.1615	Zinc Phosphide	12.6028
Tulare	Aluminum Phosphide	2,786.4064	Metam-Sodium	117,861.9303
	Bacillus Thuringiensis I	198.8293	Methoprene	0.6954
	Chlorophacinone	0.2265	Methyl Bromide	123,817.5579
	Chlorpyrifos	202,428.6137	Oryzalin	6,219.4719
	Copper Sulfate	267,978.4700	Petroleum Oil	2,978,688.3000
	Diazinon	43,560.2082	Phosmet	81,260.5161
	Diphacinone	1.1976	Pyrethrins	46.7505
	Malathion	25,292.3724	Strychnine	57.4777
	Mancozeb	16,267.6174	Zinc Phosphide	1.6000

While Tricolors were not studied directly, many of the chemicals used within the breeding range of the Tricolor are known to be highly toxic to birds. For example, malathion, chlorpyrifos, and diazinon are organophosphorus pesticides that bind with cholinesterase in animals and disrupt neural functioning. Chlorpyrifos is moderately to very highly toxic to birds (EXTOXNET 2004). Birds are quite susceptible to diazinon poisoning: in 1988, the EPA concluded that the use of diazinon in open areas poses a "widespread and continuous hazard" to birds. Bird kills associated with diazinon use have been reported in every area of the country and at all times of the year. Birds are significantly more susceptible to diazinon than other wildlife (EXTOXNET 2004).

Malathion is moderately toxic to birds. The reported acute oral LD50 values are 167 mg/kg in blackbirds and starlings (EXTOXNET 2004). The precise oral or inhalation median lethal doses for aluminum phosphide or phosphine in birds are not known, but exposure of turkeys and hens to 211 and 224 mg/meters cubed for 74 and 59 minutes respectively resulted in labored breathing, swelling of organs, tonic-clonic convulsions and death (EXTOXNET 2004).

Methoprene is slightly toxic to birds, but non-lethal effects that may affect survival of the birds appeared at acute oral doses of 500 mg/kg, and included slowness, reluctance to move, sitting, withdrawal, and incoordination (EXTOXNET 2004). These effects may decrease bird survival by making them temporarily more susceptible to predation (EXTOXNET 2004).

Phosmet is documented to be highly toxic in Red-wings, with a reported acute oral LD50 of 18 mg/kg (EXTOXNET 2004). Zinc phosphide is highly toxic to wild birds, although blackbirds were found to be less sensitive than other taxa (EXTOXNET 2004).

6.5.3 Killing Blackbirds for Crop "Protection"

Historically, blackbirds were reportedly shot in great numbers by ranchers in order to drive the flocks away from crops, or by pleasure hunters utilizing blackbirds for target practice, and poison

to regulate blackbird damage to crops was a major source of adult mortality (Neff 1942). Beedy and Hamilton (1997) noted that this practice continued until the 1960s, during which thousands of Tricolors were killed in the Central Valley. Reduction in numbers of blackbirds and improved harvesting methods has resulted in a decrease in blackbird extermination programs in the region, but the practice of shooting blackbirds has not ended. A history of widespread persecution of blackbird species has contributed to the Tricolor population decline documented over the past century, and may account for some of the ongoing population decline.

The killing of blackbirds in autumn in paddies of ripening rice in the Sacramento Valley is a known but unquantified source of mortality to post-breeding adult Tricolored Blackbirds. Due to the similarity in appearance to Red-wings, rice farmers who shoot blackbirds kill both species, and perhaps others (Bob Meese, pers. comm.). As noted by Meese (2009a:16):

“Colonies in the Sacramento Valley are much less dependent upon ephemeral substrates than are those in the San Joaquin Valley, but Sacramento Valley birds have their own serious threats. This year, two birds that I banded in 2008 were shot by a rice farmer outside Richvale in Butte County and subsequently reported to me by staff at Sacramento National Wildlife Refuge. Although only two Tricolors were confirmed killed, these were apparently turned in to federal wildlife officials because of the bands that were found on their legs and serve to suggest a potentially much larger problem. One wonders how many Tricolors are shot each summer in the Sacramento Valley? Previously, in 2006, I was told by two Colusa County staff that flocks of blackbirds were annually shot in Colusa County and that such shooting did not require a permit. This is true for most blackbird species, but not for Tricolors, which are protected under the Migratory Bird Treaty Act. Additionally, a rice farmer in Yuba County told me in July, 2008 that he knows of several rice farmers who annually “herd” and then shoot blackbirds. The shooting of blackbirds during the breeding and post-breeding seasons is in all probability a source of additive mortality, that is, mortality in addition to that which would normally occur due to other factors (starvation, disease, etc.), as it involves primarily breeding and post-breeding adults, and thus may be especially important as a limiting factor in population growth in Tricolors.”

6.5.4 Allee Effect of Small Population Size

As noted above, small populations, especially those that are squeezed into ever-smaller areas of suitable habitat, are more vulnerable to stochastic (unpredictable) events such as storms and droughts. Cook and Toft (2005) also raised an alarm bell about the effects of a small population size to a species with socially facilitated breeding. With these species, reduced populations may become extinct through Allee effects, or “inverse density dependence,” defined as a positive relationship between population density and survival and reproduction (Allee 1931, Stephens and Sutherland 1999). Conversely, as population density and colony size decreases, so too does survival and reproduction, even if there may remain several hundred thousand individual birds. The Passenger Pigeon, once the most abundant bird in North America, may have ultimately succumbed to extinction following widespread hunting and habitat loss because it could not survive at low population densities (Stephens and Sutherland 1999).

Cook and Toft (2005:85) stated:

“Like Passenger Pigeons, Tricolored Blackbirds breed colonially and are now adapted to the patchy distribution of a habitat that was widespread before European immigration to North America. The extinction of the Passenger Pigeon has been attributed to a combination of highly social and nomadic breeding, the fragmentation of the mast forests that provided abundant forage, and intense commercial hunting (Stephans and Southerland 1999). Together these factors pushed the population past a lower threshold of inverse density dependence (the Allee effect) and on to the alternative stable state of global extinction (Stephans and Southerland 1999). Importantly, Passenger Pigeon was once the most abundant bird species in North America, with flocks reported to darken the skies for hours (Wilcove 1999), similar to descriptions of flocks of Tricolored Blackbird in California’s Central Valley in the mid-1800s (Heermann 1859).”

Cook and Toft pointed out that because local populations of Tricolored Blackbirds are still found in dense breeding colonies, they can leave a false impression of abundance upon casual observers. The long-term population trends and patterns in reproduction show that the Tricolored Blackbird possesses most of the traits that ultimately led to the extinction of Passenger Pigeon in the same ecological circumstances. These factors include the loss of vast areas of native wetland along with the increasing loss of upland, non-native vegetation favorable for nesting, the trend of decreasing colony size in a highly social breeder, a habit of itinerant breeding (Hamilton 1998), and wholesale slaughtering of the largest breeding colonies in agricultural harvest.

7.0 Degree and Immediacy of Threat And Request for Emergency Action

7.1 Degree and Immediacy of the Threat

The San Joaquin Valley and Sacramento Valley have historically been the heart of the Tricolor’s range and supported the largest populations. The recent population decline has been most severe in the San Joaquin Valley and along the Central Coast. The number of birds counted in the San Joaquin Valley plummeted 78% in 6 years, from 340,700 to about 73,500 birds, and the decline is especially alarming in Kern and Merced counties (Meese 2014). Efforts to provide water in private duck clubs adjacent to dairies in Kern and Tulare counties have been largely ineffective at halting the steep decline in the number of breeding birds in Kern County over the past 3 years, to an all-time low (Bob Meese, pers. comm). Along the Central Coast, the number of birds is down 91% in 6 years, from 7,014 to 627 birds. For many years few birds were recorded nesting in their historical stronghold of Sacramento County where once entire colonies of 100,000 birds were observed (Neff 1937); in 2014 fewer than 30,000 total birds were recorded in the County. Active nesting colonies of the extremely imperiled Tricolored Blackbird continue to be destroyed by crop harvest, grazing sheep, pesticide use, and poor water management, all of which have caused failures of entire or nearly entire colonies in recent years (Meese 2007, 2008, 2009a, 2010, 2011). Further, an unknown number of Tricolors are shot and killed each year while foraging in rice paddies in the Sacramento Valley during autumn.

The population in southern California remains highly endangered as well with an average of fewer than 6,000 birds observed during springtime breeding surveys conducted since 2005. Although Meese (2014) reported an increase of 126% in southern California over the 2008 census, as R. Cook (2014) explained: “this magnitude of change cannot be accounted for by local reproduction and recruitment. On closer examination, it is apparent that the increase occurred predominantly in Los Angeles County, and specifically the Mojave Desert area between the San Gabrielle Mountain range and the Kern County border. In 2014, 4,500 birds were reported from Holiday Lake alone versus 840 in all of Los Angeles County in 2011. Holiday Lake is only 45 linear miles from the city of Bakersfield in the southern San Joaquin Valley and only slightly further through the Tehachapi Pass. The number of birds in this area has varied between survey years from approximately 600 to 5,000. However, the data reflect no concomitant changes elsewhere in southern California which suggests that these fluctuations are local and do not impact population dynamics in the rest of southern California. The most plausible explanation for the apparent increase this year and the changes observed in Los Angeles County throughout the life of the surveys is occasional and temporary influx of birds from the Central Valley.”

Currently the entire global population of Tricolored Blackbirds counted during surveys is less than half the size of a single colony that was reported in 1934 (Neff 1937, Meese 2014). The travesty is that the dire situation of the Tricolor has been known for the past two decades by state and federal agencies, and despite heroic efforts of several dedicated individuals, the trajectory towards extinction has not been reversed. It is time for immediate regulatory action under the California Endangered Species Act to ensure the conservation of nesting and foraging areas known to be important to Tricolored Blackbirds, to prevent the direct killing of blackbirds at rice paddies, and to provide funding for habitat improvement projects such as those proposed by Lowell Young and the Yosemite Area Audubon Society (see “Recommended Management and Recovery Actions.”) If such action is not taken, the Tricolored Blackbird will follow the Passenger Pigeon into the dark abyss of extinction.

7.2 Request for Emergency Action

For the reasons provided above, petitioner requests that the Commission take immediate action on this petition and issue emergency regulations to list the Tricolored Blackbird. The California Fish and Game Code Section 2076.5 permits the Commission to issue emergency listing rules to provide imperiled species with immediate substantive protection. As discussed above, the Tricolor is in immediate need of protection from the severe nesting failures caused each year by agriculture harvesting and plowing activities.

8.0 Impacts of Existing Management Efforts

8.1 Silage Buy-outs and Harvest Delays

The two main grain-field specific conservation actions include silage buy-outs or harvest delays (Meese 2009b). Silage buy-outs involve the payment to landowners of the full market value of the triticale in the portion of the field occupied by nesting Tricolors. Harvest delays are financial

compensation to landowners for the reduction in the value of their crop from the delay in its harvest until the young Tricolors have fledged from their nests. Meese (2009b) explains that the key difference between a harvest delay and a silage buy-out is the timing of the harvest of the crop following the fledging of the young Tricolors. In the silage buy-out, the farmer agrees to wait until essentially all birds, including the breeding adults plus the newly fledged young, have departed and are fully independent of the field. In a harvest delay, the farmer agrees to delay the harvest only until the young have fledged (left the nests). Thus, in a harvest delay, the young are still present in the field on the day of harvest, being fed by adults during the day and roosting there at night. This difference may be due to the desire to minimize the impact of the harvest delay on the yield and nutritional quality of the crop.

The practice of buying out farmers or delaying harvest of silage to prevent nest destruction during active breeding undoubtedly has saved hundreds of thousands of birds. From 2005 to 2009, these efforts resulted in the conservation of the breeding efforts of a low of 16% in 2007 to a high of 86% in 2005 of the birds nesting in silage fields, thus contributing to Tricolor productivity (Meese 2009b:5). Over the five years from 2005 to 2009, payments totaling \$331,921 were made to conserve 11 breeding colonies consisting of 546,000 birds which subsequently produced 396,025 young (Meese 2009b:6). However, this practice has not always been reliable and depends upon the volunteer cooperation of the farmer and available funds. As evidenced in Figure 4 below (from Meese 2009b:4), in some years the vast majority of breeding effort was not conserved.

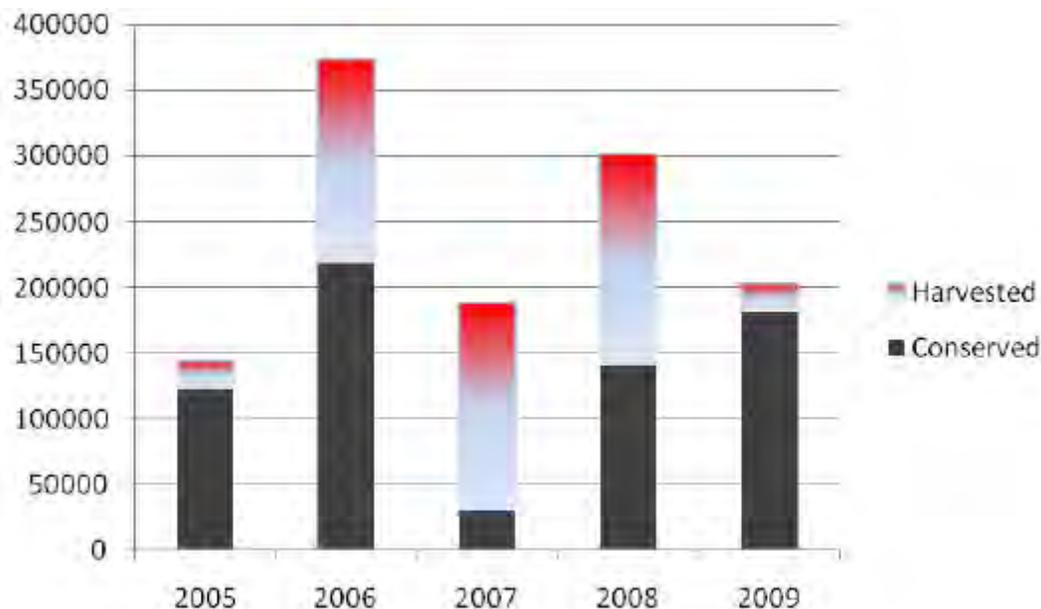

Figure 4: Fates of Tricolored Blackbirds in Silage Fields, 2005 to 2009

Many of the most important recent colonies have been destroyed before it was too late to save them, despite concerted efforts to do so by Tricolor biologists and the FWS. For example,

Meese (2006:5-6) noted: “Deer Creek Dairy, Tulare County, was destroyed days after the owner told Scott Frazer, USFWS biologist, that he would not cut the field until after the birds had fledged. This harvest was reported to the Fresno Field Office, Enforcement Division of the USFWS, and harvest was halted by direct intervention by the USFWS officer but not until an estimated 60% of the colony had been harvested, including a single pass through the center of the colony.”

In 2011, the year for which the most recent data are available on the Tricolor portal regarding specific colony fates, many instances of nest destruction by crop harvesting were documented, with many colonies destroyed, seemingly willfully:

“Colonies from Kern County to Merced County were destroyed by harvest or the cutting of the nesting substrate in 2011. The West Poso colony in Kern County was destroyed by harvest just as the young had begun to fledge from their nests. The Producer’s Dairy colony in Fresno County was destroyed a week after it was discovered. The owner had preferentially harvested the portion of his triticale field that was occupied by the breeding tricolors as only this portion of this field had been harvested when the site was observed on April 12. The Owens Creek and South of Childs colonies in Merced County were destroyed when the weedy fields in which they were situated were cut. The Sandy Mush and Highway 99 colony, also in Merced County, was cut in half despite on-going conversations with the farmer that sought to conserve the colony through a harvest delay whereby the farmer was to be compensated for his lost revenue that would have resulted from the delay in the harvest of his field of fava beans. Only 10-15,000 birds out of an original colony of 50,000 birds remained after half of the field was harvested.” (Meese 2011:12)

Efforts to protect partial colonies have failed to save the nesting effort, even with the cooperation of the farmer, such as this example from 2007: “[n]egotiations between the Service and the landowner, who had prior experience with nesting tricolors and the silage buy-out process, resulted in the signing of a contract to sell the silage occupied by the nesting birds while allowing the farmer to harvest the triticale not occupied. The harvest of the unoccupied triticale proceeded as scheduled, but the day following harvest in excess of 90% of the tricolors deserted the site. The landowner was immediately contacted to inform him of the departure of the birds and to request that the contract be canceled.” (Meese 2007:17).

In 2013, four silage colonies were destroyed due to harvest, including the largest colony in southern California in Riverside County. This harvest occurred despite the fact that the landowner had been contacted and an agreement for financial compensation apparently was in its final stages, yet he harvested his field without informing anyone (R. Cook, pers. comm). In 2014, at least two silage colonies were lost to harvest in Merced County, and an additional is suspected (Bob Meese, pers. comm).

Meese (2009b:6) noted that “a permanent solution to the dilemma between the needs of the nesting birds and the needs of the farmers does not consist of annual negotiations between U.S. Fish & Wildlife Service staff and San Joaquin Valley farmers; rather, it consists of the provision

of permanent nesting habitats surrounded by productive foraging habitats that provide a secure alternative to nesting in triticale fields (Tricolored Blackbird Working Group 2007). Previous attempts to create such alternative nesting habitats (e.g., ECLA Pond in Kern County, Toledo Pit in Tulare County) have met with limited success, but unless the tricolor modifies its breeding distribution, this is the only realistic resolution to the conflicts. Recent changes including intense predation by cattle egrets (*Bubulcus ibis*) and the loss of formerly productive alfalfa foraging habitats to conversion to orchards and vineyards may be reducing the suitability of the southern San Joaquin Valley to tricolor breeding (Meese 2009a), only complicating future attempts to increase the abundance of the species.”

Clearly, however any such voluntary measures to buy-out silage crops or delay harvest over the past decade have not worked. The Tricolor population has declined precipitously despite all efforts to date, and the global population is currently less than half that of a single colony that was reported in 1934 in Glenn County. The species unequivocally warrants immediate listing under the California Endangered Species Acts.

8.2 Tricolored Blackbird Working Group and Conservation Plan

The Tricolored Blackbird Working Group is a voluntary group of state and federal agency biologists, non-governmental organizations, industry representatives, and academic scientists who “share concern for the Tricolored Blackbird and a desire to work cooperatively to help to enhance and sustain the birds and their habitats.”

The Tricolored Blackbird Working Group meets twice per year to discuss both long-term, strategic efforts as well as short-term immediate actions necessary to conserve Tricolors. The Working Group (1) assesses the needs for and effectiveness of strategies and efforts that are already implemented, and (2) identifies steps yet to be taken that are necessary to conserve breeding colonies and surrounding foraging habitats. Generally, a spring meeting emphasizes the needs for the upcoming breeding season, while the fall meeting reviews results of the breeding season and sets priorities for next steps. The Working Group crafted the *Conservation Strategy for the Tricolored Blackbird* from 2004 to 2007 (Tricolored Blackbird Working Group 2007), and designed and prepared for distribution a pamphlet describing the Tricolored Blackbird and efforts underway to try to conserve it. Numerous, less formal communications and meetings occur among Working Group members year-round.

The Tricolored Blackbird Working Group includes: Audubon California; California Association of Resource Conservation Districts; California Farm Bureau Federation; California Cattlemen's Association; California Department of Fish and Game; California Department of Food and Agriculture; Central Valley Bird Club; Central Valley Joint Venture; Natural Resources Conservation Service; Pacific Gas and Electric Company; PRBO Conservation Science; Sonoran Joint Venture; Sustainable Conservation; University of California, Agriculture and Natural Resources; Western Riverside County MSHCP; U.S. Fish and Wildlife Service; U.S. Geological Survey; and the Western United Dairymen.

There are a number of scientific efforts underway by agency and non-agency groups that are part of the Tricolored Blackbird Working Group to monitor the population of Tricolored Blackbirds and understand natural and anthropogenic factors correlated to breeding-site selection and reproductive success. These efforts include:

- annual field work to detect and monitor (i.e. document the fates of) the largest colonies in the Central Valley and Southern California to help to prioritize colonies for conservation actions, to estimate the numbers of breeding adults, to estimate the numbers of young produced (i.e. derive an estimate of colony productivity), and to attempt to identify the factors responsible for observed patterns of productivity
- annual banding of primarily adults birds at several breeding colonies to help to document spatial and temporal movements, estimate life history parameters, and to evaluate patterns of site fidelity
- education and outreach, including the production and distribution of a brochure to describe the efforts being made on behalf of the tricolored blackbird and to encourage agency field personnel and birders to report observations of banded birds
- development of the web portal to provide information on the Tricolored Blackbird and to accumulate, document, and disseminate data on colonies and observations of banded birds and aggregations, both breeding and non-breeding.

These scientific efforts have provided a vast literature documenting population size by region, colony locations and fates, and variables correlated with reproductive success and selection of breeding sites. These intensive scientific efforts have provided clear and unequivocal evidence of severe population declines and confirm the significant adverse effects of silage harvest, water management, depredation by rats and Cattle Egrets, and other factors that are implicated in the Tricolor's current predicament.

Science is important but on-the-ground action is needed. However, it is abundantly clear that volunteer efforts to save active nesting colonies have failed in recent years. The *Conservation Plan* was developed in 2007 and updated in 2009, but few conservation efforts to actually improve habitat on the ground have been implemented, and as noted above, numerous efforts to save colonies from silage harvest were shunned by the landowners and the nestlings were brutally mowed down despite funding available to prevent it. Meese (2013) emphasized the importance of high-quality foraging habitats close to nesting colonies that provide abundant insect prey for high reproductive success, but these habitats have continued to be eliminated, which likely led to the chronic very low reproductive success of colonies documented in recent years (Meese 2013). Habitat-improvement efforts including ideas to lure birds to protected high-quality nesting sites have been suggested, but no funding has been provided to support these efforts.

9.0 Recommended Management and Recovery Actions

Meese (2014) provided the following recommendations for management and recovery of the Tricolored Blackbird:

1. Eliminate all known sources of mortality, including the losses of eggs and young via harvest of their nesting substrate and adults in autumn when causing depredations in rice.
2. It is essential to develop a mechanism for conserving at-risk colonies. A mechanism is required that consists of 1) field workers who *detect settlements* of birds in ephemeral nesting substrates (e.g., triticale fields), 2) a person or persons to whom the field worker *reports the presence of birds in ephemeral, at-risk locations* and who has the responsibility of contacting landowners and informing them of the protected status of the birds and of funding available to compensate them, 3) a cooperative extension specialist or other independent expert who *estimates the loss in value* of the crop as a result of the harvest delay, 4) a field worker who *monitors and documents the results* of conservation actions (successful delay until a week past average date of fledging, an estimate of the number of young fledged, a description of the process of harvest in those cases where fledglings are still present in the field when it is being harvested with an emphasis on the effects on the behavior of the fledglings post-harvest). 5) All of these *actions should be documented and then be reported* to a meeting of the Working Group and provided in a report that is posted to the Portal.
3. A legislative fix to eliminate exemption of protection under the MBTA is needed for red-winged blackbirds in California. If red-wings cannot be shot and shooting stops in autumn in rice, this will also save the lives of an unknown number of post-breeding adult tricolors that are shot by “mistake” as tricolors and red-wings are superficially nearly identical in appearance and flock together during autumn.
4. Better document conditions which result in relatively high reproductive success. Examine patterns in RS to determine whether, on a time-averaged basis, there is relatively higher RS in colonies in some geographic regions or that are established in different nesting substrates. Use these insights to make recommendations for management actions.
5. Study the effects of harvest on populations of fledglings in crèches that persist on nesting substrates until moments before they’re harvested to best document effects on birds. In some situations, fledglings persist on the original nesting substrates until moments before the substrates are harvested. Study these colonies and document where the birds go when the harvester shows up and what do they do when they return to the just-harvested field.
6. Take an ‘all hands on deck’ approach to tricolored blackbird conservation that includes representation by all industries that may be affected by a listing and all systems of protected areas, including the National Wildlife Refuge System, State Wildlife Areas, DOD installations, and private preserves.
7. Work with landowners in foothill and other locations with extensive rangelands where the availability of nesting substrate may be limiting reproduction; add nesting substrates where they are lacking, enhance nesting substrates where they are limiting, and protect nesting substrates where necessary. Fund landowners who want to conserve tricolors but who incur a cost in doing so.

8. Provide supplemental insect foods (meal worms, possibly others) to investigate whether supplemental feeding may increase RS.
9. Provide meal worms or other insects to settling birds at desired locations to see whether the supplemental foods may influence breeding site selection.
10. Focus efforts on regions with a recent history of successful reproduction (e.g., Sierra Nevada foothills) and, where appropriate, seek to create additional breeding sites.
11. Expand monitoring and research into regions which have historically been under-studied (central Sierra foothills, coastal locations) and suggest strategies to sustain or increase reproductive output in these regions. Perhaps fund a volunteer effort by reimbursing volunteers for food and mileage costs for monitoring efforts.
12. Encourage and/or provide monetary incentives to farmers to grow alfalfa, sunflowers, and rice within 3 miles of active tricolored blackbird colonies without insecticides or to delay their use until after the young have fledged and left the area.
13. Investigate the relative abundance of insects in rice paddies under organic culture to that in commercial rice paddies to document whether organic rice provides a better foraging substrate than does commercial rice (as has been suggested by relatively high RS at the Conaway Ranch in Yolo County, where both organic and commercial rice is grown).
14. Provide additional funding and guidance for landowners to provide essential resources for nesting tricolors on private property.
15. Actively maintain all wetlands recently used by breeding tricolors, and especially those in coastal locations, to provide the youthful conditions preferred by nesting birds.
16. Develop and disseminate via the Portal handbooks that illustrate best practices for maintaining wetlands and other nesting substrates for breeding by tricolored blackbirds.
17. Conduct threat assessments of all areas currently used by breeding tricolors and work with local officials to identify these threats and seek ways to reduce or eliminate them.
18. Assess the concentrations of neonicotinoid insecticides in regions with the lowest insect abundances and highest rates of decline in tricolored blackbirds.

Beedy (2014) offered additional suggestions specifically regarding cattle ranching:

1. Recognize that cattle ranching and most other range management activities have mostly beneficial effects on this species and do not result in incidental take;
2. Consider authorizing limited incidental take consistent with typical cattle ranching and range management activities;

3. Establish financial incentive programs to encourage ranchers and farmers to voluntarily create and manage suitable habitats in the context of their normal operations;

4. Educate ranchers, farmers, and other members of the public about the benefits of this species in the control of harmful insect pests that damage agricultural crops.

The Tricolored Blackbird Action Group of the Yosemite Area Audubon Society has created a database of shovel-ready projects to lure Tricolored Blackbirds to secure breeding habitat. These sites include an assessment of the availability of insect-rich foraging habitat and water sources. Similar projects could be expanded to other areas as well outside of the Sierra Nevada foothills.

In addition, efforts are needed by the State and Federal agencies to enhance breeding habitat on wildlife areas and other public lands.

The Center strongly encourages funds to be made available for the highest-priority of these projects, along with funding for scientific monitoring of results.

Abstract

In metapopulations in which habitat patches vary in quality and occupancy it can be complicated to calculate the net time-averaged contribution to reproduction of particular populations. Surprisingly, few indices have been proposed for this purpose. We combined occupancy, abundance, frequency of occurrence, and reproductive success to determine the net value of different sites through time and applied this method to a bird of conservation concern. The Tricolored Blackbird (*Agelaius tricolor*) has experienced large population declines, is the most colonial songbird in North America, is largely confined to California, and breeds itinerantly in multiple habitat types. It has had chronically low reproductive success in recent years. Although young produced per nest have previously been compared across habitats, no study has simultaneously considered site occupancy and reproductive success. Combining occupancy, abundance, frequency of occurrence, reproductive success and nest failure rate we found that that large colonies in grain fields fail frequently because of nest destruction due to harvest prior to fledging. Consequently, net time-averaged reproductive output is low compared to colonies in non-native Himalayan blackberry or thistles, and native stinging nettles. Cattail marshes have intermediate reproductive output, but their reproductive output might be improved by active management. Harvest of grain-field colonies necessitates either promoting delay of harvest or creating alternative, more secure nesting habitats. Stinging nettle and marsh colonies offer the main potential sources for restoration or native habitat creation. From 2005–2011 breeding site occupancy declined 3x faster than new breeding colonies were formed, indicating a rapid decline in occupancy. Total abundance showed a similar decline. Causes of variation in the value for reproduction of nesting substrates and factors behind continuing population declines merit urgent investigation. The method we employ should be useful in other metapopulation studies for calculating time-averaged reproductive output for different sites.

Introduction

A common conservation aim is to understand the relative roles of altered habitat characteristics versus fragmentation in population declines. Armstrong [1] stated this as the need to distinguish between the habitat and metapopulation paradigms. Specifically, that we needed to identify how population declines and dynamics are influenced by habitat characteristics (e.g., in species' distribution or niche models [2]), and the metapopulation processes of extinction and colonization [3,4]). Here we tackle the question of how to evaluate the contribution to long-term regional dynamics of breeding populations in habitat patches of different types when patches do not remain continuously occupied. Our focus is on breeding populations because our study species, the Tricolored Blackbird (*Agelaius tricolor*), is widely dispersed when it is not breeding, and consequently it is difficult to census outside of the breeding season. Spatial concentration of numbers during the

breeding season is also observed in a variety of organisms, including various land birds, pond-breeding amphibians and aquatic insects. Additionally in our study species, Tricolored Blackbirds, low breeding success has been highlighted as a problem during 2006–2011 [5]. We calculate a time-averaged index of reproduction that we believe will be of interest to those studying metapopulations of other organisms that do not use the same sites in all breeding seasons.

The Tricolored Blackbird, a medium-sized songbird that is geographically restricted to California and small portions of adjacent states in the western United States, experienced declines in total abundance on the order of 89% from the 1930's to 1980's [6] and average colony size declines of over 60% between the 1930's and 1970's [7]. The species receives legal protection under the Migratory Bird Treaty Act and is classified as a bird species of conservation concern by the US Fish and Wildlife Service [8], and California Species of Special Concern since 1990 [9]. Additionally,

it is treated as a sensitive species by the Bureau of Land Management since 1999 [10], and it has been listed on the IUCN red list of endangered species since 2006 [11]. The Tricolored Blackbird is the most colonial extant songbird in North America [12], and historically breeding colonies consisting of up to 200000 nests were recorded [13]. The species historically nested primarily in cattail (*Typha* spp.) or tule (*Schoenoplectus* spp.) marshes, but was observed to nest in a wide variety of wetland and upland habitats [13]. From the 1970's onwards the species was increasingly recorded nesting in invasive Himalayan blackberry (*Rubus armeniacus* [9], and silage crops, especially "triticale" [14,15]. The largest recently recorded colonies have mostly occurred in triticale, a wheat [*Triticum*] x rye [*Secale*] hybrid grain grown for dairy cows, and are at risk of being destroyed when the fields are harvested before the young have fledged [5,14,15]. Recently, a federally funded program has paid farmers to delay the harvest of triticale fields occupied by breeding tricolors until after the young have fledged and left the area [16]; however, participation in this program is voluntary and not all eligible farmers participate. We previously showed that long-term (1930's to 1980's) trends in the average size of breeding colonies (numbers of birds) varied both among geographical regions and nesting substrates [7]. Cook and Toft [15] also reported that reproductive success (number of 7–9 day old chicks per nest) was greater for colonies nesting in Himalayan blackberry than for those in native cattail or tule marshes. Additionally, silage colonies had low average reproductive success because of harvest before young birds fledged [15]. Considering only non-harvested colonies, Cook and Toft [15] found that silage colonies produced more offspring per nest than cattail or tule marsh colonies. Meese [5] found no differences in reproductive success among nesting substrate types in a sample of 47 colonies. Weintraub [17] also examined whether reproductive success of colonies in silage differed from that in marsh colonies as part of a Master's thesis study, but found no differences for the 14 colonies studied. Overall, while there have been several studies of population trends (or size) and some studies of reproductive success, no study has simultaneously considered occupancy of sites and reproductive success to determine the time-averaged net value of different habitats for conservation and management.

The occupancy of breeding habitat areas, the sizes of breeding populations, and the reproductive success of breeding efforts are often readily documented, but demographic data for the rest of the life cycle are much harder to obtain. This is especially the case for species that are more widely dispersed in the non-breeding season than when breeding, such as many imperiled birds, amphibians, and aquatic insects. We often lack a good understanding of both the dispersal between populations and survival outside of the breeding season. This arises because dispersal and survival are difficult to measure (e.g., [18,19,20]). These data gaps are typically found in imperiled species where low abundances or restricted distribution may limit study or present ethical considerations. Consequently, conservation biologists have adopted a variety of techniques to look at habitat effects on population dynamics.

One common method is to calculate finite growth rates and apply a source-sink approach [21,22]. However, without information about movement there is a risk of confusing habitat-specific demography with movement [23]. A source-sink approach can also be applied by using available information for reproduction in different habitats and assuming that survival has a constant value [24] and that movement does not confound measurement of finite growth rates. Such additional assumptions (about survival and dispersal) are frequently masked and increase uncertainty in the predictions made about population status. More directly, data on reproductive success is often used to identify ecological traps

(e.g., [25]), although such an approach usually ignores data on the occupancy and population size in different habitats (e.g., reviewed by [26]). Of course there are studies of both source-sink dynamics and ecological traps for cases where more complete year-round data are available and movement was quantified, but this is often not the case for imperiled species. We here use a simple parsimonious method for calculating the net value for reproduction of sites in different breeding habitats by combining occupancy, abundance and reproductive data. We believe that our time-averaging approach will be useful for other species for which occupancy, abundance, and reproductive success data are available but where survival or movement data are lacking. Our approach has a more direct connection to existing data and avoids using additional assumptions to make conservation and management recommendations.

We evaluated the net value of typical sites in different breeding habitats for reproduction of Tricolored Blackbirds. Our focus was on the nesting substrate rather than the habitat surrounding nesting sites, which is used for foraging [14], and within which insect abundance at foraging locations is related to reproductive success [5]. We evaluated the net value of different nesting habitats for production of offspring by looking at the following questions: (1) Does frequency of occupancy, site extinction, or site recolonization vary by nesting substrate? (2) Does the duration of occupancy vary by nesting substrate? (3) Does reproductive success vary by nesting substrate? (4) Statewide, how frequently are breeding colonies recorded in different substrates, what are their sizes, and have their frequencies and sizes changed in recent decades? (5) Is it useful to combine the above information to obtain an overall idea of the net value of colonies in different nesting substrates in a typical year? Answering these questions allows us to provide new conservation recommendations for Tricolored Blackbirds and a methodology that is likely of broader interest to those studying the value of different breeding habitats for imperiled species.

Methods

Ethics

No animals were handled as a part of this study and no permits were required. The study species is not currently protected by the state or federal Endangered Species Acts which would require such permits. Some study sites are privately owned and the landowners of these sites provided access or they were viewed from nearby public rights of way without accessing the land.

Data sources and availability

We use data from three different sources that are all publicly available:

Dataset 1. For colony occupancy and reproductive success from 2006 to 2011 we used data collected by RJM together with 2005 data collected jointly by RJM and William J. Hamilton, III. These data are already available through the public Tricolored Blackbird Portal (<http://tricolor.ice.ucdavis.edu>) and the explicit dataset will be made available and archived through *Dryad* (<http://datadryad.org/>) when this manuscript is published. This dataset includes 26 distinct sites and a total of 45 records for which reproductive success values were estimated [5].

Dataset 2. For a broader view of reproductive success we used data collected during extensive fieldwork by the late William J. Hamilton, III (WJH) between 1992 and 2005 (a few colonies were sampled jointly with RJM in 2005). These data are available in a public archive, the Knowledge Network for Biocomplexity [27]. WJH's data represent the most extensive source of information on

reproductive success available for this species: it includes assessment of 128 distinct breeding sites containing colonies, and 191 records including repeated annual measurements at the same colonies, during 1992-2005. There were 2–30 colonies per year. These data up to 2000 are also discussed by Hamilton [28] but were not then formally analyzed or summarized. We have not included WJH as a coauthor since we have no way of knowing whether he would have agreed with the messages in our paper and instead directly cite the data source [27]. We did not use this dataset for occupancy analyses because it is not always clear which colonies were checked when reproductive success data were not collected.

Dataset 3. We used statewide survey data to obtain a broader view of the frequency of colonies in different breeding substrates and the size of such colonies. These data were used by Graves et al. [7] and are available in the public *Dryad* data archive ([29], file “Graves_et_al_data1.csv”).

Empirical evaluations of reproductive success

Fieldwork generally began in late March in the southern San Joaquin Valley, where breeding commences earliest in the Central Valley, and progressed to the Sacramento Valley as the season progressed and birds move to breed again [30]. A full description of field methods are given by Meese [5], and these reflect general protocols as used by WJH. For example, the number of breeding birds in a colony was estimated either visually at the time of nesting and/or by nest sampling following the breeding season. Nest numbers were multiplied by 1.5 to estimate the number of breeding birds, which reflects that on average each male nests with two females [14]. If visual estimates of the numbers of breeding birds differed from estimates derived from direct counts of nests, the estimate derived from the direct count of nests was used because it was thought to be more accurate.

Analyses of Occupancy, Cessation of Use, Colonization and Survival of Breeding Colonies

Breeding colonies can be treated in analogous ways to populations within a metapopulation [3] with rates of patch occupancy resulting from extinction and colonization. However, because the breeding birds using colonies do not in most cases die, we avoid referring to extinction of colonies and instead refer to “cessation of use” for breeding each year. It should however be noted that in metapopulations when a local population experiences an extinction the individuals may also have moved to another habitat patch, so the metapopulation analogy is quite strong. Analyses in this section used occupancy information from Dataset 1.

We scored nesting sites as “occupied” when birds were present and breeding, and “unoccupied” when sites were visited but breeding birds were not found at any point during the annual monitoring period (the species’ breeding season); hence sites with no information were not recorded as either unoccupied or occupied. Occupancy was analyzed using linear mixed effects models (using *lmer* in the *lme4* package in *R* [31]) with a logit link function and binomial error distribution, which are appropriate for binary data (occupied or not). In this analysis and all similar analyses, p-values (“pMCMC”) were calculated using Markov-chain Monte Carlo sampling using the function *pvals.fnc* from *R* library language [32]. Models used year as a random factor to account for repeated measures in the error structure (we also investigated using site identity as a random factor but model fit was not improved, as measured using AICc, and results were similar). We excluded substrates that had less than five total records because the sample sizes were too small to provide reliable

estimates of occupancy; these included colonies situated in *Arundo donax*, buttonbush (*Cephalanthus occidentalis*), mesquite (*Prosopis* sp.), and oats (*Avena sativa*). Sample sizes for included substrates are given as the numbers above the bars in Figure 1A. We attempted to include models with the number of breeding birds as a covariate (including interactions with breeding substrate type), or the same for the area of occupied habitat prior to extinction, but neither improved model fit and we therefore do not report the results further. Because preliminary analyses indicated substantial variation in occupancy from year to year we included year as a fixed effect in the model (in addition to as a random effect to allow for repeated measures; removing the random effect of year also did not produce substantial changes in the fixed effect for year, indicating that temporal autocorrelation was weak).

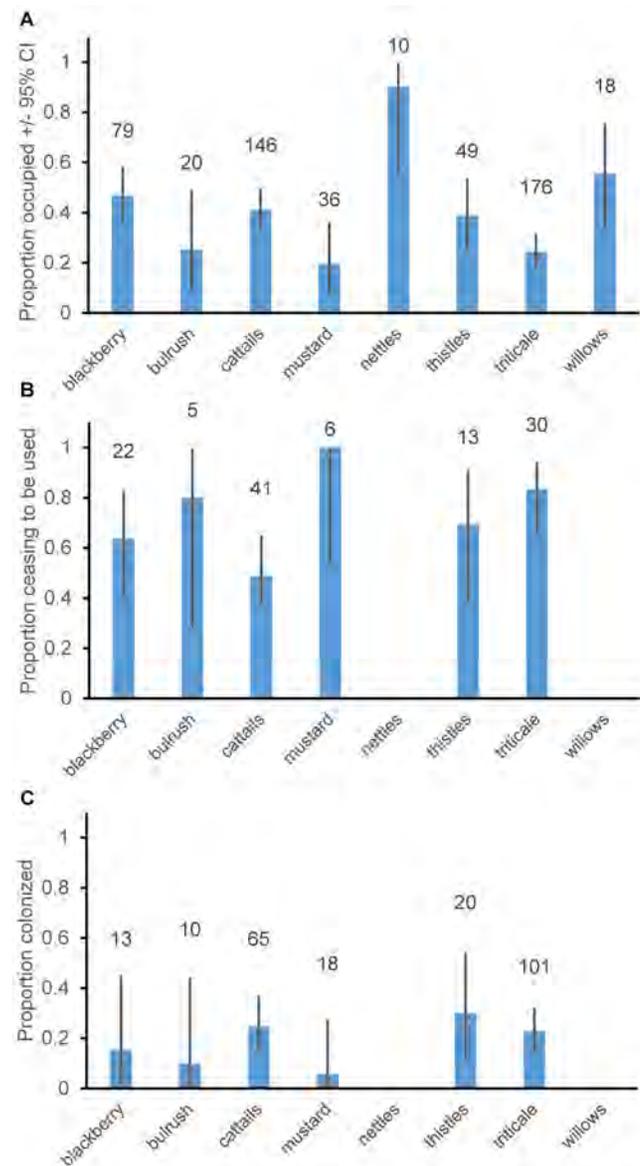

Figure 1. Mean proportion of breeding sites A. occupied, B. showing extinction or C. colonization per year. Numbers above bars indicate sample sizes. Error bars show 95% confidence intervals from a binomial distribution. Nettles and willows are not shown in b and c because sample sizes were less than 5. doi:10.1371/journal.pone.0096980.g001

Table 1. ANOVA-style results of linear mixed effects models testing for differences in occupancy.

Fixed Effects:	SS	DF	MS	F	p	h ²
Substrate	8.52	7	1.22	5.79	0.001	0.07
Year	4.33	6		38.46	0.003	0.04
Error	109.55	520	0.21			

The whole model adjusted R²-value was 11%. Random effects were: Year (Intercept) variance = 0.11423, standard deviation = 0.33798, from 534 observations in 7 groups (years). Effect size is given as the proportion of variance explained by explanatory variables, partial eta-squared ($h^2 = (SS_{effect}) / (SS_{effect} + SS_{error})$). doi:10.1371/journal.pone.0096980.t001

A “cessation of use” event was recorded as occurring when a site was occupied by breeding birds in year $t-1$ and was not occupied in year t , which could have occurred either because the habitat became unsuitable (e.g., many triticale fields) or because the habitat was present and suitable, but birds no longer used it for breeding. Cessations of use were recorded as possible when a site was occupied in year $t-1$ and was monitored for nesting birds in year t ; this procedure avoided censoring of the data. For the probability of cessation-of-use analyses we used linear mixed effects models in the same way as for occupancy listed above including covariates and year as a fixed effect. Only nesting substrate improved model fit based on delta AIC values and for brevity we do not report the factors and covariates that did not improve model fit. We included nesting substrates if there were at least 5 possible extinctions within each (sample sizes in Figure 1B), and this restriction resulted in exclusion of *Arundo*, bulrush, buttonbush, mesquite, nettles, oats, and willow substrates.

A “colonization” was recorded for sites from 2006 onwards if a site was unoccupied in year $t-1$ and became occupied in the current year t . Our data represent a mix of colonizations of sites that were likely unoccupied during our study and recolonizations of sites that had experienced cessations of use during our study period. Analysis was conducted in the same way as for occupancy and cessations of use, and sample sizes for included substrates are reported in Figure 1C.

We also analyzed for how many years colonies remained occupied in common breeding substrates (blackberry, cattails, thistle and triticale), and refer to this as “colony longevity.” (We use the term as a shorthand while recognizing that colonies may relocate rather than dying, hence colony longevity represents the duration of occupancy of a site.) The analysis was formerly a survival analysis using the *survreg* function from library *Survival* in R [33]. Preliminary analyses showed that parametric survival analyses were more informative than non-parametric (Cox’s proportional hazards) analyses, and that models with a Weibull hazard function (describing instantaneous risk of death) were a significantly better fit to the data than those with an exponential hazard function. The analysis recognized that data are censored both because some colonies remained occupied by breeding birds during the breeding seasons throughout the study period and we do not know when some sites were colonized.

Analyses of Reproductive Success

Datasets 1 and 2 were used to assess reproductive success (RS) of colonies. RS was defined as the number of chicks alive per nest at c. 7–9 days after hatching of the first egg. RS was estimated either by visual estimates or by sampling. Visual estimates of RS were derived from the estimates of the number of breeding birds obtained during monitoring and the number of fledglings observed at the end of the breeding season. Because one male breeds, on average, with two females [14], each two nests have three birds

Table 2. Parameter values from linear mixed effects models testing for differences in occupancy.

The mean value of logit-transformed occupancy is given for cattails in 2005, and then other rows of the table give the difference (in logit-transformed mean occupancy) from this value for the groups indicated.

doi:10.1371/journal.pone.0096980.t002

Table 3. ANOVA-style results of linear mixed effects models testing for differences in the proportion of colonized sites where occupancy for breeding ceased per year.

Fixed Effects:	SS	DF	MS	F	P	h ²
Substrate	2.93	5	0.59	2.82	0.019	0.11
Error	23.07	111	0.21			

Random effects were: Year (Intercept) variance = 3.8×10^{-13} , standard deviation = 6.2×10^{-7} , from 117 observations in 6 groups (years). Effect size is given as the proportion of variance explained by explanatory variables, partial eta-squared (h^2) = $(SS_{\text{effect}})/(SS_{\text{effect}} + SS_{\text{error}})$.
doi:10.1371/journal.pone.0096980.t003

associated with them, so the product of the number of breeding birds multiplied by 2/3 (0.67) provides an estimate of the number of nests constructed. The number of young fledged divided by the estimate of the number of nests constructed yields an estimate of the number of young fledged per nest (RS).

Average reproductive success (RS) combines the numbers of offspring in successful nests with zero values that come from failed nests. Nests may fail entirely because of physical conditions (destruction during high winds, extreme temperatures, etc.) as well as predation [9]. It is therefore useful to separately consider rates of nest failure from reproduction in nests that were successful. To this end Hamilton calculated the reproductive rate for the subset of nests that were successful up to 7–9 days old, termed RSS (reproductive success of successful nests).

Because of differences in timing and observers we initially analyzed the two datasets separately. However, both visual plots and individual *lmer* models failed to find differences between the datasets, and so here we report a combined analysis. We used linear mixed effects models with colony identity as a random factor to allow for repeated measurements from individual colonies. Year, substrate and collector identity (Hamilton or RJM) were factors with fixed effects, and we also assessed year by substrate interactions but found no significant ($P < 0.1$) effects for such interactions and do not report these results further. Collector identity (and interactions with other factors) also produced an increase in the AICc value of the model indicating that a simpler model without this variable was preferred and we therefore do not report this effect further.

Analyses of Colonies in Different Substrates and Colony Size

We used Dataset 3 and specifically records from 1980 through 2011. We summarized the proportion of records in each breeding substrate per decade and average colony size (number of birds ln-

transformed) by decade (1980–1989, 1990–1999, 2000–2009, and 2010–11). Recent colony sizes were calculated using $\ln(\text{birds})$ per colony from 2000 to 2011 inclusive.

Recent colony sizes and reproductive success (RS) estimates from either Datasets 1 or 2 were used to estimate the total predicted production of chicks (to day 8) for average size colonies in each of the common substrates. To give an idea of variation in chick production per spring breeding per colony in each substrate we calculated a standard deviation: Standard deviations of the numbers of chicks produced were calculated as $x \cdot \sqrt{(s_1^2 + s_2^2)}$, where x is the estimated number of chicks produced for a particular substrate, s_1 is the proportional standard deviation for colony size (standard deviation of colony size/mean colony size), and s_2 is the proportional standard deviation for reproductive success in the same substrate. Lastly, to allow for the fact that not all sites are occupied in all years we multiplied chick production by occupancy to calculate chick production across an average site of each substrate. A measure of variation could not easily be calculated for this measure but the standard deviation would likely encompass zero values (no chicks produced) for all substrates because variation in RS, colony size, and occupancy are all relatively large.

Results

Occupancy, Cessation of Use, Colonization and Longevity of Colonies

Average proportional occupancy of breeding sites varied widely across sites and substrates (Figure 1A). Average breeding site occupancy was significantly lower for triticale and mustard growing as a weed within grain fields, than for other breeding substrates with sufficient sample sizes (cattails, blackberry, bulrush, nettles, thistle and willow). Cattails, blackberry, bulrush, nettles, thistle and willow were similar (at $P > 0.1$) to one-another in their levels of site occupancy (Figure 1A for differences and Tables 1, 2

Table 4. Parameter values from linear mixed effects models testing for differences in the proportion of colonized sites where occupancy for breeding ceased per year.

Random effects were: Year (Intercept) variance = 0.004, standard deviation = 0.066, from 227 observations in 6 groups (years). Effect size is given as the proportion of variance explained by explanatory variables, partial eta-squared ($h^2 = (SS_{\text{effect}})/(SS_{\text{effect}} + SS_{\text{error}})$).
doi:10.1371/journal.pone.0096980.t005

for statistics). Nettle sites had higher than average occupancy, and showed significantly higher occupancy than other substrates except willows (Figure 1A and Tables 1, 2).

The rate of cessation of breeding at sites that were used for breeding in previous years was generally frequent, with an average of 66% of sites per year ceasing to be occupied by breeding birds. This rate was significantly higher for triticale fields (83% of sites per year) than for cattail sites (49%; Figure 1B; Tables 3, 4). Data on cessation of use of breeding sites were sparse for blackberry, bulrush, mustard, nettle and willow sites (Figure 1B), which might account for a lack of any statistical differences (at $P < 0.1$) in the frequency of cessation of use of sites in these substrates compared to other substrates. Although with a small sample size it is noteworthy that like triticale sites, mustard sites showed a high average rate of extinction (100%). This likely reflects either that annual crops were not planted in the same place each year or that weeds in such fields were removed by herbicide application, forcing extinction through a lack of habitat in the form of both the crop itself and mustard as a weed within such crops.

For the six substrates with calculable rates at which they ceased to be used for breeding, these rates were strongly negatively correlated with occupancy (Pearson's $r = -0.87$, $P < 0.025$ in a 1-tailed test). The overall pattern is that the two temporary habitats, triticale and mustard, showed lower occupancy (Figure 1A) and higher observed rates of cessation of use (Figure 1B) than other types of breeding site. This likely reflects habitat loss either through herbicide use on weeds that Tricolored Blackbirds frequently nest in (e.g., mustard) or because of crop rotations. The two substrates for which rates of cessation of use could not be calculated (because $n < 5$) were nettles and willows, both of which showed very high occupancy (Figure 1A) and thus experienced very few cessations of use.

Colonization rates were generally low, with only 21.1% of sites per year being colonized each year. *LMER* models showed no

significant difference (at $P < 0.1$) for any substrate or overall (Tables 5, 6). Across the full suite of sites for which we had occupancy data the low colonization rates (21%/year) relative to cessation rates (66% sites/year) could either reflect a declining (nonequilibrium) metapopulation or that colonizations are under-recorded.

Analysis of the numbers of years for which sites remained in use by breeding colonies using survival analysis revealed that the slope of survivorship versus age of colonies declined with colony age (scale parameter = 0.436, Table 7). Hence colonies that were occupied for more than 1 year were less likely to cease being occupied during their second year than their first year (Figure 2). Continued use of sites in cattail marshes was more likely than for triticale sites (Figure 2, Table 7). This accords with the high per year cessation-of-use rates of triticale colonies compared to cattail marsh colonies (Figure 1B, Tables 3, 4). Survivorship slope declining less sharply in older colonies can most clearly be seen in cattail colonies (Figure 2), whereas triticale colonies frequently ceased to be used after one year, and sample sizes were small because there were few uncensored records for blackberry and thistle colonies.

Reproductive Success

Reproductive success (RS) varied substantially among nesting substrates, and for habitats with at least 5 RS values substrate accounted for 59% of the variation in RS values (Tables 8, 9). Himalayan blackberry colonies had a greater average reproductive success than marshes, grain fields, and thistle habitats (Tables 8, 9; Figure 3A). The sample size for RS estimates from nettles was low (Figure 3A) and statistically there was no difference from other substrates (Tables 8, 9), but RS values were high and grouped together with blackberry. There were only 4 RS estimates from colonies in willows and the RS values were low and seemed similar to thistle, marsh and grain field colonies. The analysis reported in

Table 6. Parameter values from linear mixed effects models testing for differences in the proportion of vacant sites colonized per year.

difference in mean	Bulrush	-1.08	1.09	-0.99	0.32
difference in mean	Thistle	0.27	0.57	0.48	0.63
difference in mean	triticale	-0.10	0.37	-0.27	0.79

The mean value of logit-transformed proportion colonized is given for cattails, and then other rows of the table give the difference (in logit-transformed mean proportion colonized) from this value for the groups indicated.

doi:10.1371/journal.pone.0096980.t006

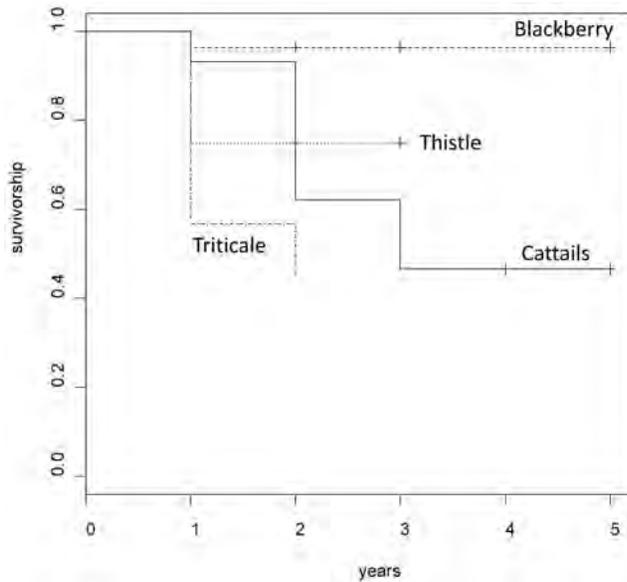

Figure 2. Survivorship for breeding colonies in different substrates. The vertical crosses (plus symbols) indicate that datapoints were constrained by censoring of the data. Note that for Blackberry there was only one non-censored event and so the survivorship values are limited by sample size and are likely not reliable. doi:10.1371/journal.pone.0096980.g002

Tables 8, 9 did not find any significant ($P < 0.1$) effects of observer (Hamilton or Meese) or year on RS values and so the above results represent a compilation of the datasets. Colony size (estimated number of birds) did not have any statistical effects on RS in the linear mixed effects models, nor did colony area (square meters) in the Meese data (and was not collected for the Hamilton data).

Reproductive success results in part from complete failure of nests, from sampled nests in which eggs were never laid, and in part from reduced numbers of chicks in nests that survive to the time of recording (day 7–9). Figure 3C shows that a low proportion of nests was successful at rearing young in marsh habitats compared to those in Himalayan blackberry and grain field sites. Stinging nettle sites appeared intermediate and variable (likely because of small sample sizes; Figure 3C). Interestingly nesting substrate accounted for only 15% of variance in RSS compared to the 54% in RS, indicating that nesting substrate had a more predictable effect on whether nests failed or succeeded in raising some chicks rather than on the numbers of chicks produced. As with RS, RSS was relatively high for Himalayan blackberry colonies (Tables 10, 11, Figure 3B). Grain fields had lower RSS than Himalayan blackberry colonies, and nettle colonies had higher RSS than Himalayan blackberry colonies (and grain fields;

Tables 10, 11, Figure 3B). Marsh colonies had lower reproductive success than Himalayan blackberry colonies but significance was marginal ($pMCMC = 0.056$; Tables 10, 11), reflecting small sample size for RSS from marshes. RSS for marsh colonies was similar to that from grain field colonies (Figure 3B).

Frequencies of Colonies in Different Substrates and Colony Size

Figure 4A shows that colonies were most frequent in marsh habitats (cattails and bulrush) followed by blackberries and thistles. Records in grain fields (primarily triticale but also mustard within triticale) have grown steadily to represent 8.6% of colonies in 2010–2011. The proportion of records grew through time for both nettles (reaching 10.2% of records in 2010–11) and thistle (12.7% of records in 2010–11). Conversely the proportion of records in marsh habitats declined steadily through time (Figure 4A), from 51.7% in the 1980’s to 33% in 2010–11. With the exception of thistle colonies, the average size (number of birds) of colonies in common substrates was smaller in 2010–11 than in previous decades (Figure 4B). The decline was most dramatic for grain crops (Figure 4B). For the period 2000 to 2011 inclusive, representing recent records (without putting too much emphasis on 2010–11) Figure 4C shows average colony sizes. Grain field colonies were by far the largest on average size, with a mean of 995 birds. Other colonies on average had 312 birds in blackberry, 290 for thistle (and milk thistle, *Silybum marianum*), 224 birds for nettle, 215 birds in marsh substrates and the few willow sites were smallest of all (135 birds).

Predictions of the numbers of chicks that would have been produced by average size colonies were in general highly variable, reflecting that both the RS estimates and colony size estimates were also variable. Putting together RS estimates and average (2000–2011) colony sizes leads to the prediction that blackberry and grain field colonies produced the most chicks on average (Figure 4D). This was followed by stinging nettle colonies and then thistle colonies (Figure 4D). Marsh sites produced smaller numbers of chicks on average but they were still about twice as productive as willow sites (Figure 4D). Incorporating occupancy into our analysis across the years shows that nettle sites were the most productive (with a mean of 221 chicks per site per year; Figure 4D) because they have high occupancy, followed by blackberry sites (174 chicks/site/year). (An average grain field in an average year produced 65 chicks, but this figure is not very relevant because grain fields are generally not conserved from year to year). Thistle sites produced an average of 44 birds/site/year, and surprisingly marsh sites produced an average of only 34 birds/sites/year reflecting that their occupancy was low. The few willow sites produced an average of 26 birds per year. Clearly conserving triticale (grain) fields when they are occupied is especially valuable and this is possible because the habitat is not permanent. Apart

Table 7. Results of parametric survival analysis for breeding colonies using a Weibull hazards function.

Parameter type	Group	Parameter	SE	z	p
Mean	Cattails	1.355	0.169	8.03	0.001
difference in mean	blackberry	0.582	0.476	1.22	0.21
difference in mean	Thistles	-0.334	0.301	-1.11	0.27
difference in mean	Triticale	-0.805	0.202	-3.99	0.001

The model was significantly preferred over an intercept-only model (Chi-squared = 22.44 with 3 degrees of freedom, $p < 0.001$). Weibull scale parameter = 0.436. The mean value of survival is given for cattails, and then other rows of the table give the difference from this value for the groups indicated. doi:10.1371/journal.pone.0096980.t007

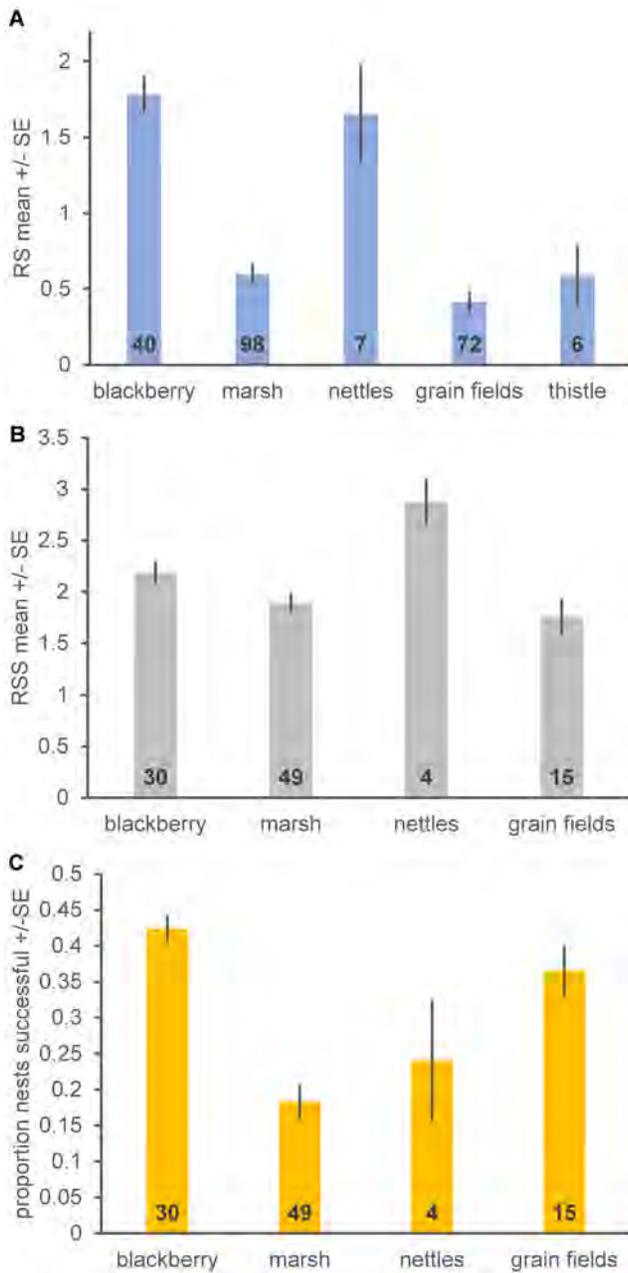

Figure 3. Reproductive success estimates for different breeding substrates. Estimates of **A**, reproductive success (RS), defined as the average number of chicks per nest at c. 8 days after the first egg hatched, **B** reproductive success of nests that were successful in rearing some young to day 8 (RSS), and **C** the proportion of nests that were successful in rearing some young to 7–9 days-old. Data in **A** come from Hamilton and RJM, and those in **B** and **C** come from Hamilton. Bars indicate standard errors. Numbers inside the base of bars indicate sample sizes (colonies \times years, reflecting that these data include some repeated measurements).
doi:10.1371/journal.pone.0096980.g003

from this, considering occupancy leads to the prediction that average nettle sites are disproportionately important in chick production, as are blackberry sites, whereas thistle sites are less important and marsh sites are close to least important of the nesting substrates commonly used by Tricolored Blackbirds.

Discussion

Our analyses demonstrate a simple direct method for combining data on breeding site occupancy, breeding population sizes and reproductive success to calculate the net metric for the value of different habitats for reproduction. In our case because we had time series of occupancy values for each site, we calculated time-averaged values for reproductive success, but such calculations could also be made using one-time (snapshot) estimates of occupancy, abundance and reproduction. Such direct calculations avoid making additional assumptions about survival (outside of the breeding season) and dispersal that would be required to apply a source-sink model (e.g., [21]) to species where we have data only on breeding populations. We believe that such calculations would also benefit studies of other imperiled bird species, as well as other taxa where we can readily obtain data only on breeding success and breeding populations because individuals are more widely dispersed when not breeding. It is surprising that previously (as far as we can determine) such an index has not been described. Our calculations assume that there is turnover of occupancy in sites, as is usually the case in fragmented populations and metapopulations [20].

Calculation of the average number of offspring produced per site in an average year provides a method of assessing the conservation value of different breeding substrates (Figure 4D). An assessment of the components making up this number, like that in Table 12, helps us understand multiple components of the value of colonies, in particular breeding substrates, average breeding colony size, occupancy, nest failure rates, and numbers of young surviving to a given point in time. It is useful to consider each substrate in turn, which we do below from highest to lowest time-averaged total estimated number of chicks produced for an average colony.

We showed the following for Tricolored Blackbirds: (1) The frequency of occupancy and site extinction (cessation of use) varied substantially among different nesting substrates, but we found no differences in rates of site recolonization by nesting substrate. (2) As predicted by different frequencies of extinction (cessation of use), the duration of occupancy varied among nesting substrates. (3) Reproductive success showed substantial differences among nesting substrates. (4) Statewide average sizes of breeding colonies in different substrates and frequency of occurrence in different substrates (number of sites) changed through time. The pattern was generally with traditional marsh sites being used less frequently and supporting smaller colonies relative to colonies in native nettles and invasive thistles. Himalayan blackberry colonies are fairly typical in size, occupancy and longevity, and occur with a typical frequency. However Hamilton's data indicate that these colonies have a low failure rate and a higher reproductive success and lower rates of nest failure than other breeding substrates (Figure 3). Consequently long-term breeding productivity of an average blackberry site is expected to be high (Figure 4D). This accords with the findings of Cook and Toft [15], who recorded higher reproductive success for nests in Himalayan blackberry than in other substrates. Unfortunately, Himalayan blackberry is a high risk nonnative invasive species [34] and so it cannot be planted as a component of many federally-funded conservation programs and is frequently removed or attempted to be removed [35]. Himalayan blackberry is problematic because of competition with native plant species, reducing soil moisture and as a potential fire hazard [34]. As Cook and Toft [15] point out there is a conflict between this invasive weed and habitat for Tricolored Blackbirds.

Table 8. ANOVA-style results for linear mixed effects model analyses of reproductive success (RS) for both the Hamilton and Meese datasets.

Fixed Effects:	SS	DF	MS	F	p	h ²
Substrate	58.3	4	14.6	31.6	<0.001	0.59
Error	98.8	214	0.46			

The analysis was limited to breeding substrates with at least 5 measurements. Collector identity and year of collection were removed in model simplification and are not reported further. Effect size is given as the proportion of variance explained by explanatory variables, partial eta-squared ($h^2 = (SS_{\text{effect}})/(SS_{\text{effect}} + SS_{\text{error}})$). Random effects were: Colony identity (intercept) variance = 0.136, standard deviation = 0.368, from 219 observations in 138 groups (colony identities). doi:10.1371/journal.pone.0096980.t008

Stinging nettle sites had high occupancy, longevity and reproductive success, and low rates of failure. Consequently nettle sites on average have high long-term breeding productivity (Figure 4D). Stinging nettle sites are however infrequent in occurrence (Figure 4A). Previous studies of reproductive success have lacked sufficient data to evaluate nettle sites. Stinging nettles are native and could be planted to provide breeding substrate for Tricolored Blackbirds but require a reliable supply of fresh water before and during the tricolor's breeding season so may be limited as a conservation tool due to water scarcity.

Marsh colonies (cattails and bulrushes) are the most frequent colony type yet are average compared to other colony types in all aspects measured, including occupancy, longevity, size, reproductive success, and rate of nest failure. The lack of any more positive aspects to marsh sites relative to other colony types makes the net breeding productivity of an average site relatively low (Figure 4D), and consequently their conservation value for Tricolored Blackbirds is more limited than blackberry and nettle sites. Cook and Toft [15] found similar results. Tricolored blackbirds prefer marshes containing vegetation that is young, lush, and rapidly growing, and will avoid older cattail and bulrush marshes containing much thatch and many lodged, dead stems. Hence, marsh management consisting of actions designed to remove old, dead stems and encourage regrowth of new vegetation is needed to promote the use of marsh habitats. In most cases, annual burning is required to rejuvenate marshes and to provide the conditions preferred by breeding tricolors. Water levels are also critical to reducing predator access, as raccoons (*Procyon lotor*), the tricolor's most serious predator in freshwater marshes, prefer to wade than to swim, and typically will not cross deep channels around the perimeter of cattail stands. To this end, the management of marshes for Tricolored Blackbirds by private duck clubs is a potentially important component of a comprehensive conservation strategy since Tricolored Blackbirds and a host of wetland-

dependent species may benefit from the springtime availability of water.

Cereal grain fields, including triticale, wheat, and mustard (*Brassica* spp.) growing as a weed within such fields, have since the 1980's held by far the largest colonies (Figure 4C) but have relatively low net reproductive success because of a high rate of colony destruction through harvest (Table 12; Figures 3, 4D). Triticale colonies are frequently destroyed through harvest because the crop ripens before the young fledge and farmers harvest their fields when the seed heads reach maturity [14]. The fact that grain field occupancy is low (even replanted sites are frequently not reused; Figure 1A) and reproductive success is moderate means that a more dynamic conservation strategy is needed (and used) for cereal grain crops; temporary large breeding colonies in grain crops are best targeted when they are present. Cook and Toft [15] also found that colonies in triticale crops that were not harvested had relatively high reproductive success (mean RSS = 1.0), but not as high as the larger dataset used here (mean RSS = 1.76; Figure 3B). Overall the findings for triticale crops accord with both the recommendations of the Tricolored Blackbird Working Group [16] and the use of federal funds to encourage farmers to volunteer to delay harvest of triticale crops containing Tricolored Blackbird breeding colonies. It is not clear that a more permanent preservation of repeatedly planted sites are especially valuable for Tricolored Blackbird conservation because they have a low occupancy by breeding colonies through time. While we recognize that birds breeding in farmers' fields contains great inherent risks, given the relatively large number of birds that breed in grain fields adjacent to dairies and the absence of nearby alternative nesting substrates, it is essential as a core component of a comprehensive conservation strategy that all of these colonies be protected until the young have fledged. In the longer term, additional protected breeding substrates must be provided to give birds secure nesting habitats while ensuring the farmer's right to harvest his crop.

Table 9. Parameter values from linear mixed effects model analyses of reproductive success (RS) for both the Hamilton and Meese datasets.

Mean	Blackberry	1.78	0.12	15.2	0.0001
difference in mean	Marsh	-1.16	0.14	-8.25	0.0001
difference in mean	Nettles	-0.10	0.29	-0.34	0.66
difference in mean	Grain fields	-1.32	0.15	-8.46	0.0001
difference in mean	Thistle	-1.19	0.30	-3.93	0.0001

The analysis was limited to breeding substrates with at least 5 measurements. P-values ("pMCMC") were obtained using Markov-chain Monte Carlo sampling using the function pvals.fnc from R library language [32]. Collector identity and year of collection were removed in model simplification and are not reported further. The mean value of reproductive success is given for marsh habitat, and then other rows of the table give the difference from this value for the groups indicated. doi:10.1371/journal.pone.0096980.t009

Table 10. ANOVA-style results for linear mixed effects model analyses of reproductive success of nests that were successful in rearing at least one chick to day 8 after first egg hatch (RSS) for the Hamilton dataset.

Fixed Effects:	SS	DF	MS	F	p	h ²
Substrate	5.53	3	1.84	4.56	0.005	0.15
Error	37.6	93	0.40			

The analysis was limited to breeding substrates with at least 5 measurements. Effect size is given as the proportion of variance explained by explanatory variables, partial eta-squared ($h^2 = (SS_{\text{effect}})/(SS_{\text{effect}} + SS_{\text{error}})$). Random effects were: Colony identity (intercept) variance = 0.006, standard deviation = 0.08, from 97 observations in 74 groups (colony identities).

doi:10.1371/journal.pone.0096980.t010

Colonies in thistle (e.g., bull thistle, *Cirsium vulgare* and milk thistle, *Silybum marianum*) substrates are relatively infrequent but are typical in occupancy, longevity, reproductive success (but data on failure rates are lacking), and size; consequently they have a typical net long-term productivity per site that is similar to that for grain fields despite the much smaller colony size in thistle sites. In one year (2010) the largest known colony was in milk thistle and had an estimated 83000 birds, which also illustrates that year-to-year variation is high. Again there is the problem that both of these plant species are invasive, although the impacts of milk thistle are limited [34]. Hence a conservation strategy preserving sites and maintaining vegetation type would likely be effective for thistle and milk thistle sites, but nettle substrate is both native and more valuable. Lastly, although data were sparse for willow sites, colonies were small and infrequent, making their net breeding productivity relatively low and consequently their conservation value also low.

A question that arises from our analyses is what is the mechanism (or mechanisms) by which nesting substrate influences reproductive success. Meese [5] showed a clear correlation between insect abundance (food) in habitats around nesting colonies and RS of those colonies in the same year, and only colonies with abundant insects were successful at rearing some young. Meese's analysis produced a correlation between ranked values of 0.74, and hence accounted for 54% of the variation in ranked RS values. It is possible that nesting substrates reflect neighborhood insect abundances, although other effects are also possible. In our analyses breeding substrate accounted for 54% of variation in RS (the same as insects in Meese's study [5]). More importantly, breeding substrate accounted for only 15% of variation in RSS (reproductive success of successful nests), which is consistent either with nesting substrate having greater predictive ability for whether nests succeed or fail, rather than in the number of chicks that produced, or with there being a threshold effect such that RS is more likely to become zero in certain breeding

substrates. Beedy, and Beedy and Hamilton [9,14] report that the basic requirements for successful breeding are nesting substrates that are protected by virtue of being flooded, or possess thorny or spiny leaves or stems, and that occur in proximity to foraging habitats. Other studies have reported colony failures because of both predation (e.g., [5,9,17,36,37]), loss of standing water in marsh sites (which also may increase predation, (e.g., [38])) harvest of grain crops (above), and habitat destruction (e.g., [39]). Hence we expect that breeding substrate could have a direct role on colonies by reducing rates of predation. Large losses from colonies have been reported due to predation by Black-crowned Night-herons (*Nycticorax nycticorax*), Cattle Egrets (*Bubulcus ibis*), White-faced Ibis (*Plegadis chihi*), Common Ravens (*Corvus corax*), Coyotes (*Canis latrans*) [5,9,17,36,27]. Avian predators can access nests even in flooded habitats, whereas terrestrial predators can more easily access dried out marshes or terrestrial habitats. Thorny and spiny terrestrial habitats and nests sufficiently far above the ground (e.g., 3-m above the ground in willows [9]) may offer some protection from most predators. The degree to which different habitats differ in predation rates needs more systematic study (as also suggested by [9]). In the central coast of California numbers of some predatory herons and egrets have increased since 1991 [40], and although data are sparse for the Central Valley of California (the area containing most Tricolored Blackbirds), some species have increased nationally (see references in [40]). Beyond the obvious effect of harvesting of colonies in grain fields, the relative extent of disturbance in different habitats requires further evaluation. The kinds of effects are exemplified by Meese [39] who reported a Himalayan blackberry colony that was defoliated causing the birds to abandon the site, and two milk thistle colonies that were destroyed by cutting. Weintraub [17] also reported that some more terrestrial sites (Tamarisk and mesquite) were only used when they were flooded, and hence flooding of sites and conditions more generally might affect site at the time of habitat selection, prior to nesting.

Table 11. Parameter values from linear mixed effects model analyses of reproductive success of nests that were successful in rearing at least one chick to day 8 after first egg hatch (RSS) for the Hamilton dataset.

Parameter type	Group	Parameter	SE	t	pMCMC
Mean	Blackberry	2.19	0.12	18.681	0.0001
difference in mean	Marsh	-0.29	0.15	-1.958	0.056
difference in mean	Nettles	0.69	0.34	2.035	0.046
difference in mean	Grain fields	-0.43	0.20	-2.124	0.038

The analysis was limited to breeding substrates with at least 5 measurements. The mean value of RSS is given for marsh habitat, and then other rows of the table give the difference from this value for the groups indicated. P-values ("pMCMC") were obtained using Markov-chain Monte Carlo sampling using the function pvals.fnc from R library language [32].

doi:10.1371/journal.pone.0096980.t011

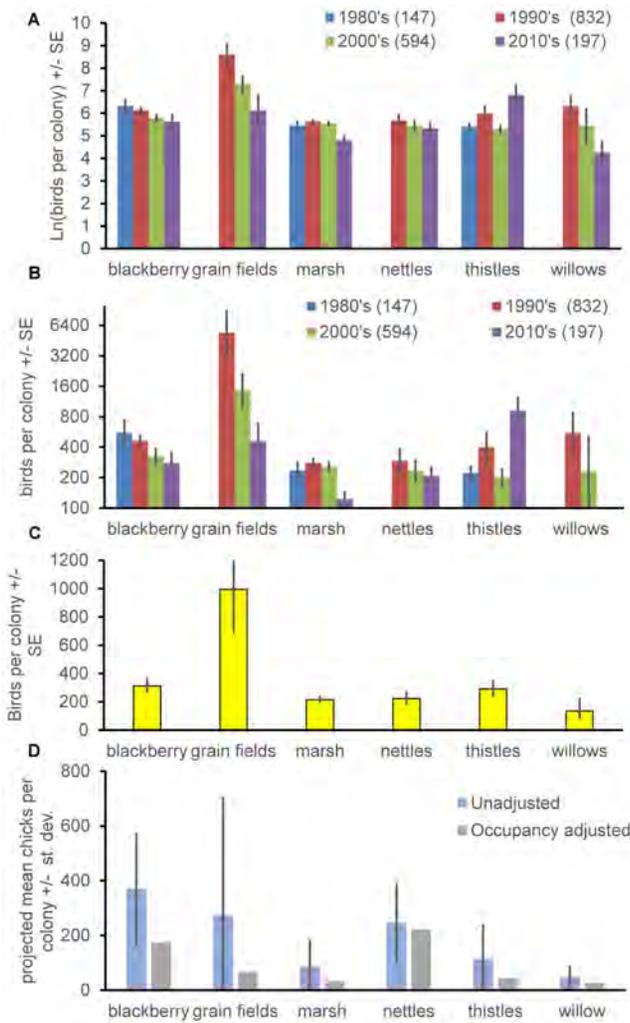

Figure 4. Frequency of colonies, colony size and projected net chick production per colony. **A.** Proportion of colonies in different substrate types by decade, with total sample sizes in parentheses. **B.** Size of colonies in different substrates by decade (color key same as in a). **C.** Size of recent (2000–2011) colonies. **D** Projected number of chicks produced per colony of average size using reproductive success estimates from Figure 3A and also the same estimates adjusted for the fact that an average site is not occupied in every year (using analyses in Figure 1A). In B and C error bars show ± 1 SE to facilitate comparison, whereas in D error bars are ± 1 standard deviation to give an idea of variation. Error bars (standard deviations) are not readily calculable for the occupancy-adjusted projected chicks per colony but likely overlap zero because they represent the summation of at least 3 sources of error (compared to 2 for the other two estimates in D). doi:10.1371/journal.pone.0096980.g004

Our results in conjunction with Meese’s [5] study of food availability in areas surrounding breeding sites indicate that we need to disentangle the effects of nesting substrate, habitats available within the foraging area of breeding Tricolored Blackbirds, and food availability. All three of these things may be correlated or they may be independent. They may also not be mutually exclusive. The problem of analyzing the foraging habitats is made difficult by birds traveling up to 5 to 9km from their nesting sites [5,14,41,42], but as Hamilton and Meese [43] point out, only a small fraction of the total possible area may be suitable foraging habitat. Beedy [9] also suggested investigation of foraging habitat availability near colonies, and habitat selection. Investi-

Table 12. Summary of the differences between colonies in different substrates.

Substrate	Occupancy	Colony longevity	RS	RSS	Frequency of failure	Frequency of colony type	Frequency of substrate	Colony size 2000–2011	Predicted long-term average site productivity
Himalayan blackberry	0	0	+	0	-	0	0	0	+
Marsh	0	0	0	0	0	+	0	0	-
Nettles	+	+	+	+	-	-	0	0	+
Grain fields	-	-	-	0	+	-	+	+	0
Thistle	0	0	0	0?	0?	0/-	0	0	0
Willows	0/+?	+?	0?	0?	0?	-	-	-	-

Colony longevity was inferred from a mixture of survival analyses and extinction analyses. + indicates above average, 0 indicates average, and - indicates below average. A question mark indicates that sample sizes were especially small. doi:10.1371/journal.pone.0096980.t012

gating habitat selection mechanisms and relative use of different substrates is particularly difficult but it may be that year-to-year variation in the availability of different habitats would provide the best evidence of (correlative) shifts in habitat use, perhaps in conjunction with potential driving variables like rainfall (e.g., [17]).

The suggested conservation strategies for Tricolored Blackbirds of providing alternative habitats and luring birds from grain fields [9] are consistent with our findings of the use and reproduction of different habitats. However, stinging nettle sites seem like the most widely used native habitat type that is productive and may represent the best opportunity for native habitat creation, conservation and restoration. The management of cattail marshes, as the most frequently used marsh type, needs more research linking marsh state to nest success and predation, and may represent a realizable habitat management strategy because protected lands often contain wetland areas. In the short term the voluntary payment of farmers to encourage them to delay harvest of grain crops (triticale) for silage needs to be continued and other strategies of alleviating pressures such as water restrictions on dairy farms that regularly support Tricolored Blackbird merit investigation by management agencies.

The lack of balance between cessation of use (“extinction”) and colonization of breeding sites 66% sites/year vs. 21% sites/year reflects that Meese’s fieldwork took place during 2005–2011 and that 2007 onwards was a period when reproductive success was chronically low [5]. Population sampling has been more thorough than ever and so these data are unlikely to represent changes in sampling effort. Statewide surveys suggested populations declined by 35% between 2008 and 2011 [44,45], and declines in average colony size are apparent over a longer period in Figure 4B. Both colony sizes and declines in occupancy during 2005–2011 are consistent with a metapopulation that is in steep decline. However,

the timespan is short and it remains to be determined whether the 2014 survey (and beyond) will show sustained declines. Neither total abundances nor colony sizes were correlated with rate of (re)colonization of sites or probability of cessation of use of sites for breeding (or reproductive success, RS). In this way the system does have the feedbacks expected of a typical metapopulation [4], which might reflect the species being in decline during 2005–2011: our analyses looked at these factors in conjunction with nesting substrate types so heterogeneity in substrates is unlikely to mask such a pattern.

Future studies should attempt to (1) estimate rates of predation from site to site and between substrate types, which is made complicated by the large number of sites needed; (2) understand whether nesting substrate type is linked to landscape composition and food availability, or whether these are independent drivers of reproductive success; (3) evaluate whether marsh management for Tricolored Blackbirds results in predictable increases in RS, abundance and occupancy; and (4) investigate the potential for habitat creation and restoration involving stinging nettles. There is an urgent need to also ascertain whether the species is continuing in sharp decline across all habitat types and to discover the causes of this decline beyond those identified here. Climate, agricultural changes, and land-use changes all merit investigation as potential causes.

efforts. To that end, we are more broadly marketing this issue to a wider audience with interest in conserving this species.

We hope you enjoy this issue, but more importantly, we hope it spurs you to action on behalf of the Tricolored Blackbird. Your support of the Central Valley Bird Club has helped prepare this issue of the Bulletin. There are many other meaningful contributions that you can make: assisting with ongoing species surveys, financially supporting ongoing conservation efforts, advocating on behalf of the species, publicizing the plight of the species and gaining public support, joining action groups that are identifying and implementing conservation projects... the list goes on. Find a way to help.

Note from Editor:

This issue was made possible through the dedication and hard work by many people. I particularly thank species experts Drs. Robert (Bob) Meese and Edward C. (Ted) Beedy who authored many papers and reviewed others. I also offer thanks to Lowell Young for his encouragement in preparing this volume and his dedication to Tricolored Blackbird conservation. Finally a huge thanks to Layout Editor, Frances Oliver; Photo Editor, Dan Brown; and proof-reader Dan Kopp for their substantial and critical efforts in bring this issue to press.

Daniel A. Airola

Efforts to Assess the Status of the Tricolored Blackbird from 1931 to 2014

Robert J. Meese, Department of Environmental Science & Policy, University of California, One Shields Avenue, Davis, CA 95616;
rjmeese@ucdavis.edu

The Tricolored Blackbird (*Agelaius tricolor*; hereafter, also “tricolor”), is unique to California. Among its many salient traits, the tricolor is colonial, and often nests in large groups that place heavy demands upon the local biota. Globally, colonial species are believed to be highly vulnerable (Terborgh 1974), and many have become conservation priorities. The tricolor is among these, as it has over the past century suffered a steep population decline due to reductions in its native breeding and foraging habitats and several other factors (Beedy and Hamilton 1997). More recently, elevated rates of mortality of eggs and chicks have resulted from the destruction of breeding colonies during the harvest of their grain field nesting substrates (Meese 2009), and an unknown number of adults is shot in autumn when in mixed flocks foraging in ripening rice with red-winged and other blackbird species (USDA 2013, Meese unpub. data).

In December 2014 the tricolor was given emergency protection under the California Endangered Species Act as a result of its steep and accelerating population decline (Meese 2014). A petition for listing under the federal Endangered Species Act also has been submitted recently.

It is inherently difficult to assemble enough information on rare species to enable robust evidence-based recovery efforts. In some ways, tricolors pose particular problems in that they breed in a rather small number of large, somewhat ephemeral colonies that, over time, blink on and off across the landscape (Holyoak et al. 2014). As a result, classic random sampling is likely to miss even larger colonies, or to produce population estimates of unknown reliability. On the other hand, the future of the species may rest on the success or failure of a fairly small number of large and conspicuous colonies which are intensively monitored. Thus, the species’ unusual biology makes it a unique study subject, but at the same time provides special opportunities to demonstrate that science can greatly improve conservation outcomes.

In order to address these biology-induced sampling problems and to monitor the status of the species, since the 1990’s the primary means to estimate the number of tricolors in California has been the triennial Tricolored Blackbird Statewide Survey (Hamilton 2000; Holyoak et al. 2014). The purpose of this report is to review and evaluate efforts to document the status of the species, to contrast prior efforts to those of the past three Tricolored

Blackbird Statewide Surveys, and to examine the most recent trends in abundance and distribution. It excludes consideration of synthetic works (e.g., Graves et al. 2013, Holyoak et al. 2014).

METHODS

I reviewed the scientific literature and other published and unpublished reports beginning with Neff (1937) until mid-2014 to summarize and characterize efforts to determine the status and estimate the size of the Tricolored Blackbird population in California. I used the comprehensive reports of the 2008, 2011, and 2014 Tricolored Blackbird Statewide Surveys, along with the standardized methods and data management support provided by the Tricolored Blackbird Portal (<http://tricolor.ice.ucdavis.edu>), to compare the results of these three Statewide Surveys and to contrast these with prior efforts to assess the conservation status of the species.

I also present results by “bioregions”—large parts of the state that are relatively ecologically homogeneous and distinct, to assess regional differences (Figure 1). Previous reports (Kelsey 2008, Kyle and Kelsey 2011) have also recognized bioregions, but their boundaries were somewhat different than those recognized here. I divided the state into five bioregions that include the majority of the breeding distribution of the Tricolored Blackbird:

1. Southern California: the entire region south of the Transverse Range; includes southern Kern County, and all of Ventura, Los Angeles, San Bernardino, Orange, Riverside, San Diego, and Imperial counties.
2. San Joaquin Valley: the portions of northern Kern, Tulare, Fresno, Madera, and Stanislaus counties below 100 m elevation and all of Kings, Merced, and San Joaquin counties.
3. Central Coast: Alameda, Santa Clara, Santa Cruz, San Benito, Monterey, San Luis Obispo, and Santa Barbara counties.
4. Central Sierra Foothills: portions of Placer, El Dorado, Amador, Calaveras, and Stanislaus counties between 100-500 m elevation.
5. Sacramento Valley: Sacramento, Yolo, Sutter, Yuba, Colusa, Glenn, and portions of Butte and Tehama counties below 100 m elevation.

The Sacramento Valley is included in the analysis of bioregions although tricolors are itinerant breeders and most birds arrive to breed in this portion of their range only after having first bred in the San Joaquin Valley (Hamilton 1998, Meese unpub. data). Thus, the Statewide Survey, which occurs in the second half of April, provides an estimate of the number of tricolors in the Sacramento Valley at this time but does not provide an estimate of the total number of birds that breed there. Similarly, the Modoc Plateau is not included in this analysis because birds breed in this part of California after April, so are

not recorded during the Statewide Survey, the results of which form the data sets upon which this analysis is based.

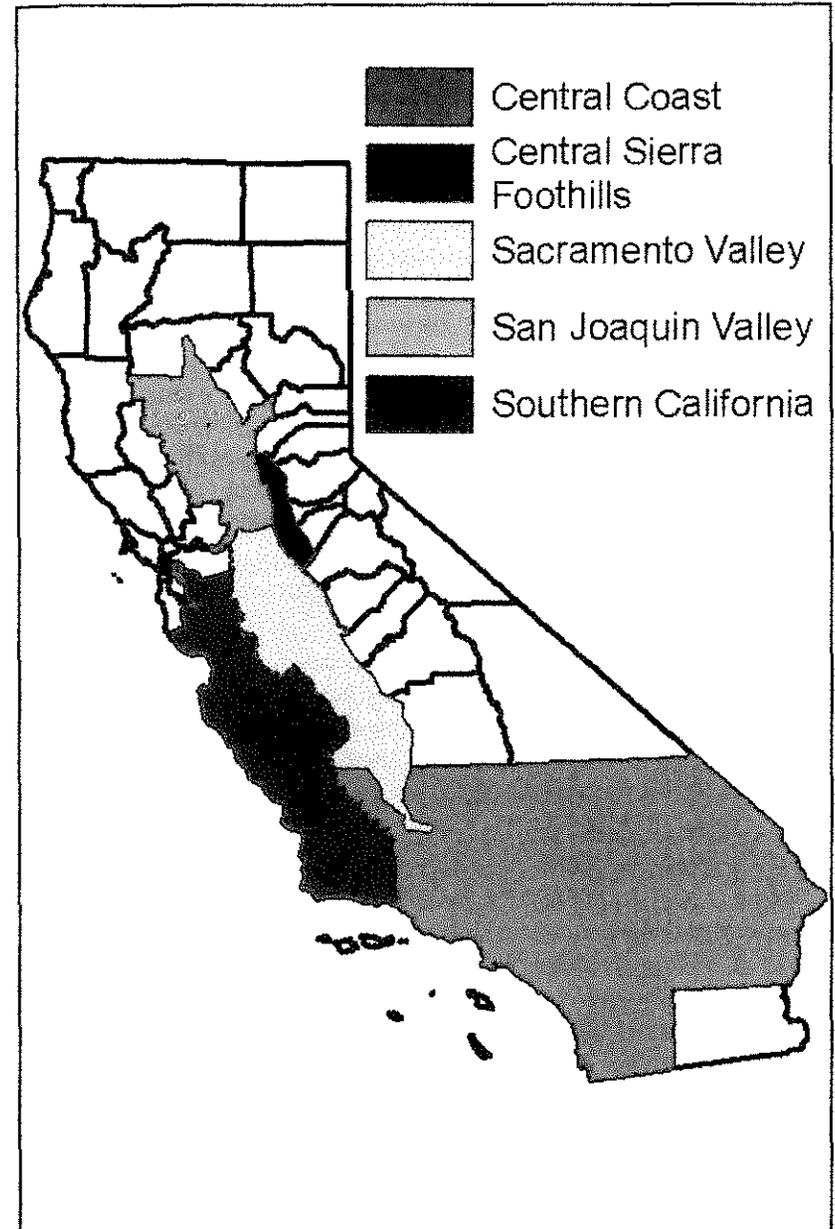

Figure 1. Bioregions used in this paper to discuss Tricolored Blackbird Status in California

RESULTS

Neff (1937) was the first to attempt to assess the status of the Tricolored Blackbird in California. Neff's work was stimulated by anecdotal observations of absences of tricolors from locations where they had previously been common and focused on nest counts in primarily very large colonies during the breeding season and on visual counts of roosting birds at a few locations in the non-breeding season. Neff's (1937) work, conducted from 1931 until 1936, did not attempt to provide a comprehensive survey of the entire range of the species because "such a survey was humanly impossible", and he did not attempt to estimate the number of birds in a brief interval of time. He concluded that the species had likely undergone a serious population decline in response to widespread habitat losses associated with the drainage and filling-in of marshes in the early 20th century. This, he believed, was followed by a population increase due to the development of irrigated agriculture and he found that the species was still quite common in many areas. Although Neff (1937) did not attempt to estimate the total number of birds in California, he provided what he described as a conservative estimate of 491,000 nests within 46 colonies in only eight counties in 1934, which would be about 736,500 birds (assuming that each male breeds, on average, with two females; Beedy and Hamilton 1999).

DeHaven et al. (1975) were the next to attempt to survey a large portion of the tricolor's breeding range. They surveyed much the same region as did Neff and his collaborators over three decades earlier. Their work, conducted from 1969 to 1972, emphasized the Central Valley, although in 1971 they attempted to survey the entire breeding range. Although they, too, studied colonies throughout the breeding season, they concluded that the number of tricolors had declined by at least 50% in the 35 years since Neff's work.

The concept of a Statewide Survey, an effort to estimate the total number of breeding birds in the entire state, was developed by Edward C. (Ted) Beedy and William J. Hamilton III in 1993 (Beedy, pers. comm., Beedy and Hamilton 1997) in response to previous, more limited surveys that suggested an on-going decline in abundance. The Statewide Survey was proposed as a voluntary effort with numerous participants that was centrally coordinated, and conducted within a 3-day interval every three years beginning in 1994. Statewide Surveys were conducted in 1994, 1997, 2000, and 2005, but due to differences in methodology, duration, level of effort, geographic completeness, inadequate data management, and incomplete documentation, the results of these surveys are not directly comparable (Hamilton 2000).

Table 1. Comparison of the first four statewide surveys. Sources: Beedy and Hamilton 1997, Hamilton 2000, Hamilton 2000, EDAW 2005
Sources: Beedy and Hamilton 1997, Hamilton 2000, EDAW 2005

Year	Duration	Participants	Counties		Occupied Sites		Birds Observed	Comments
			Surveyed	Not Surveyed	Identified	Not Identified		
1994	Not reported (3 days?)	68	32	Not reported	28	369,359	follow-up survey results included	
1997	Not reported (3 days?)	55	34	Not reported	71	237,928	follow-up survey results included	
2000	4 days	81	33	Not reported	71	162,000	pre-survey workshop held	
2005	3 days	65	24	Not reported	121	257,802	No report submitted	

The Statewide Survey methodology was revised in 2008 by: 1) adding county coordinators to transfer the coordination of the participants from the statewide to the county level, 2) providing training sessions for survey participants, and 3) developing and deploying a web-based Tricolored Blackbird Portal. A level of survey coordination at the county level was added to improve colony detection and geographic completeness by taking greater advantage of local knowledge (Hamilton 2000), and to share the burden of the coordination of a statewide effort among several individuals. In many cases, county coordinators were environmental consultants with extensive local experience with the species and a large pool of qualified persons from which to draw to serve as survey participants.

The Tricolored Blackbird Portal was developed to:

- enhance the management of existing data on colony locations and observations of birds at breeding colonies and in non-breeding aggregations,
- improve communication by providing controlled vocabularies that enabled Portal users to standardize on colony location and nesting substrate names,
- enhance citizen participation by providing online data entry capabilities for records of colony locations and observations of birds (including support for the Statewide Surveys),
- provide reliable natural history information,
- provide access to numerous reports and publications, and
- provide news and links to news reports.

The Portal was developed as a secure, public resource and is password-protected: a user account is required to enter records so as to reduce spam and unwanted spurious records. A small staff of content managers with extensive Tricolored Blackbird and data management experience edits records and assures quality control.

All of the Statewide Surveys since 2008 (i.e. 2008, 2011, and 2014) have used the three levels of coordination (statewide coordinator, county coordinator, participant), are more thoroughly standardized by data entry via the Portal, and are more completely documented by comprehensive reports, so the results of these three surveys are more directly comparable than are those from previous surveys. Table 2 provides a comparison of the results of the three most recent Statewide Surveys.

The results of the three most recent Statewide Surveys showed a rapid decline in abundance, from just under 395,000 birds to 145,000 birds in 6 years, a decline of 63% (Meese 2014). The rate of decline appears to be increasing: from 2008 to 2011 the number of tricolors dropped by 35%, from

395,000 to 258,000 birds (Kyle and Kelsey 2011), but from 2011 to 2014 the number of birds dropped by 44%, from 258,000 to 145,000 birds (Figure 2).

Table 2. Comparison of 2008, 2011, and 2014 Statewide Surveys.
Sources: Kelsey 2008, Kyle and Kelsey 2011, Meese 2014

Year	Duration (days)	Participants	Counties Surveyed	Sites Surveyed	Occupied Sites Identified	Statewide Population Estimate
2008	3	155	38	361	155	394,858
2011	3	100	29	608	138	258,000
2014	3	143	41	802	143	145,000

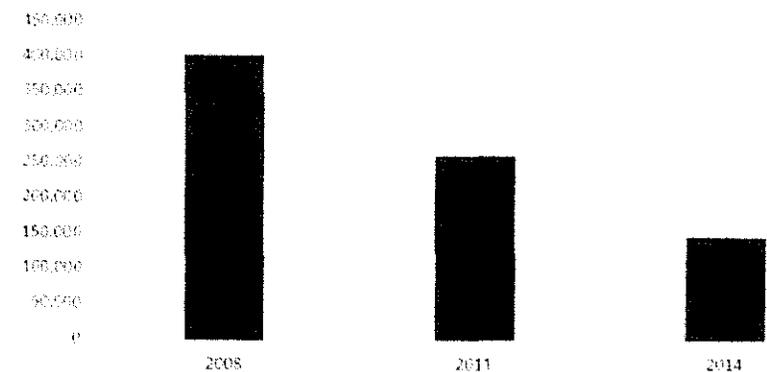

Figure 2. Estimates of the number of Tricolored Blackbirds in California in 2008, 2011, and 2014.

The decline in the statewide estimate of the number of birds occurred despite a rapid increase in knowledge of where the birds breed, as data entry via the Tricolored Blackbird Portal has allowed 77 different Portal users to enter 249 new colony location records since 2008 (Figure 3).

The 2014 Statewide Survey was the most comprehensive: 802 known locations were surveyed versus only 361 locations surveyed in 2008 (Table 2). Hence, the recorded decline cannot be attributed to a decline in the thoroughness of the surveys.

New Tricolored Blackbird Colony Locations Documented from 2005-2014

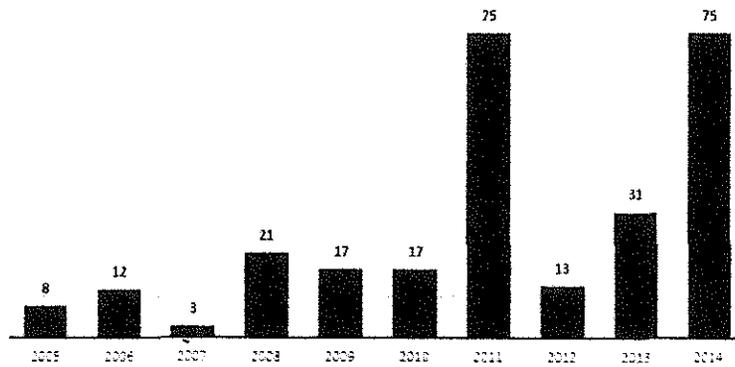

Figure 3. Number of previously unreported Tricolored Blackbird colony locations reported each year from 2005-2014.

Associated with the decline in the number of birds was a dramatic decline in the sizes of the largest colonies (Figure 4).

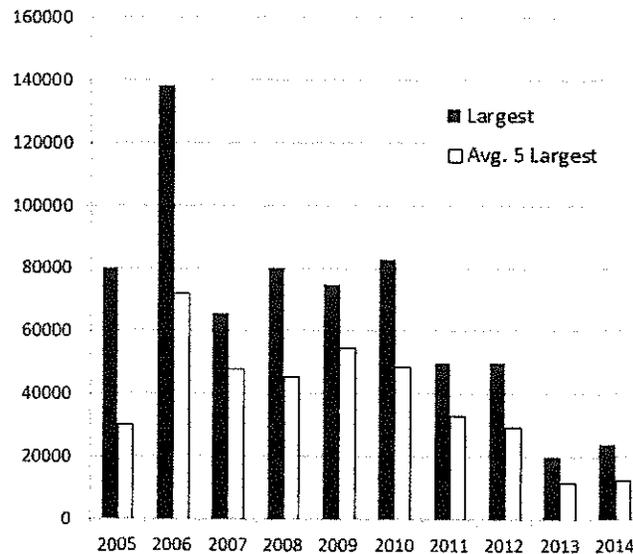

Figure 4. Ten year trend in the sizes of the largest Tricolored Blackbird colonies and averages of the five largest colonies.

The rate and intensity of the decline between 2008 and 2014 varied among bioregions. The Central Coast had the greatest proportionate decline, dropping 91%, from 7,014 birds in 2008 to 652 birds in 2014. The San Joaquin Valley had the second highest proportionate decline, dropping 78% from 340,703 birds in 2008 to 73,482 birds in 2014. The number of birds in southern California increased by 126%, from 5,487 birds in 2008 to 12,386 birds in 2014, due primarily to a single large colony of 5,000 breeding birds in Los Angeles County (Meese 2014). The number of birds in the Central Sierra Foothills also increased, from 22,586 birds in 2008 to 28,281 birds in 2014. Figure 5 summarizes the results for the three most recent Statewide Surveys by bioregion.

2008-2014 Population Trends by Bioregion

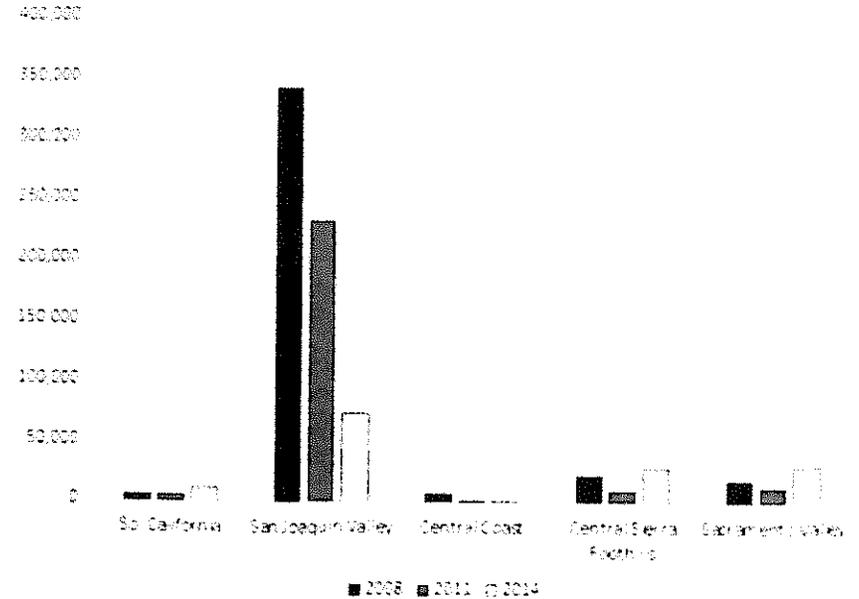

Figure 5. Results of 2008, 2011, and 2014 Statewide Surveys by Bioregion.

DISCUSSION

Early efforts to determine the status of the Tricolored Blackbird depended upon the work of a small number of individuals who tried to survey an immense geographic area and, due to logistical and time constraints, had to focus on locations concentrated in the Sacramento Valley (Neff 1937,

DeHaven et al. 1975). Neither Neff (1937) nor DeHaven et al. (1975) attempted to estimate the statewide population of the species but rather attempted to survey breeding birds during the entire breeding season. DeHaven et al. (1975) surveyed the region studied by Neff (1937) to try to determine whether the species had changed in abundance in this portion of its range. They found far fewer colonies and far fewer birds at the largest colonies than did Neff (1937) and concluded that the number of tricolors in the Sacramento Valley had declined by more than 50% in about 35 years.

Efforts to estimate the statewide population of tricolors began in 1994 with work coordinated by Beedy and Hamilton (1997) and continue to this day. Unlike previous efforts to assess the status of the species, Statewide Surveys were conducted in 3-day intervals, from Friday to Sunday, in late April. Non-breeding birds tend to be highly mobile and difficult to find and thus to count, so the Statewide Survey was designed to be conducted in the second half of April, when the maximum number of birds are breeding (Beedy and Hamilton 1999), and are thus more reliably found and easier to count. Conducting a Statewide Survey during a 3-day interval minimizes the risk of double-counting birds that have moved following first breeding attempts (Hamilton 1998). Increasing the number of persons surveying allows a much larger geographical area to be covered and enables a statewide estimate of the number of birds.

Although the 1994 Statewide Survey included only 32 counties and found only 28 occupied sites, the estimate of the number of birds seen exceed 369,000 (Hamilton et al. 1995). The 2014 Statewide Survey covered 41 counties and found birds at 143 locations yet the estimate of the number of birds in California dropped to 145,000 (Meese 2014). Thus, despite substantial increases in geographical coverage and in knowledge of where the birds nest, the estimate of the number of birds seen dropped by 61%. In the 2008-2014 interval, when the Statewide Surveys were far more directly comparable due to more standardized methodology, the estimate of the number of tricolors dropped by 63%, from 395,000 to 145,000. Unfortunately, given the differences in methods, level of effort, data management, and data documentation, it is not possible to directly compare the results of the Statewide Surveys from 1994 to those of 2014, but the small number of colonies identified and the relatively large number of birds observed in 1994 compared to 2014 suggests a serious statewide reduction in abundance during this 20 year interval, and that the extent of the decline would be greater than that estimated if the 1994 survey had been as complete as was that of 2014.

The number of birds seen during the three most recent Statewide Surveys differed greatly by bioregion, with the largest number of birds seen in all three surveys concentrated in the San Joaquin Valley (Figure 5), where the

majority of breeding birds have been seen since the 1980s (Hamilton et al. 1995). A comparable survey of breeding birds in the Sacramento Valley would best occur in early June, when most of the birds have finished breeding in the San Joaquin Valley and moved north to breed again (Hamilton 1998, Beedy and Hamilton 1999, Meese unpub. data). As the tricolors that breed in the Sacramento Valley are in most cases the same birds that bred earlier in the San Joaquin Valley (Hamilton 1998, Meese unpub. data), any reduction in abundance documented in April in the San Joaquin Valley would be expected to be mirrored by a reduction in abundance of breeding birds in the Sacramento Valley the following June.

Because the vast majority of breeding birds occur in the San Joaquin Valley, the sharp drop in abundance documented there is of particular concern, as efforts to restore the species will depend disproportionately upon the results of breeding efforts at the largest colonies. Recent research has shown that reproductive success is positively correlated with both colony size and insect abundance (Meese 2013), and the results of the three most recent Statewide Surveys showed a sharp drop in total abundance and size of the largest colonies. This period coincided with a period of chronically low reproductive success (Meese 2013). A lack of insects along with the destruction of breeding colonies adjacent to dairies by the harvest of their nesting substrates (Meese 2009) are believed to be the two most important causes for the recent population decline.

There are several reasons why insect abundances may be insufficient to support breeding by the colonial and insectivorous Tricolored Blackbird. The widespread and on-going conversion of native habitats to dairies, orchards, vineyards, rice, and other forms of agriculture (Beedy and Hamilton 1997) and the use of effective and persistent insecticides (Hallmann et al. 2014) may have created unsuitable breeding conditions in much of the core area of the species' range. The relatively small number of birds that have recently bred outside of the San Joaquin Valley is insufficient to sustain a population of 700,000 birds, the suggested population target for the recovery of the species (Meese et al. 2015a). The apparent unsuitability of much of the San Joaquin Valley to support breeding by the species suggests that future conservation actions will have to occur in strategically chosen areas of the Central Valley that have previously or may be managed to support breeding by relatively large numbers of birds. The conservation effort will require both secure, permanent nesting habitats surrounded by secure, productive, foraging habitats that may provide the insect abundance that is associated with relatively high reproductive success (Meese 2013, Meese et al. 2015a). The rapid decline in the sizes of the largest colonies (Figure 4) complicates conservation planning and reduces the options available to stem the decline because even effective conservation actions will be expected to benefit a smaller number of breeding birds.

The conservation of breeding colonies in grain fields adjacent to dairies may be ensured by the recent listing of the Tricolored Blackbird as endangered under the California Endangered Species Act (CESA). Any loss of Tricolored Blackbird eggs or nestlings would be considered "take" and is prohibited under CESA, except with explicit permit approval. Recent voluntary efforts to conserve Tricolored Blackbird breeding colonies adjacent to dairies, by compensating farmers for their costs associated with delaying the harvest of their occupied grain fields, have been only partially successful (e.g., Meese 2009, Meese 2014). Effectively conserving the efforts of all breeding birds, and especially the largest colonies, which are usually situated in grain fields (Beedy and Hamilton 1999, Kelsey 2008), will be essential if the species is to recover. A far more robust education and outreach component must be developed and implemented with industry participation (see Arthur 2015), and intensive surveys and monitoring of "silage colonies" must occur annually. These silage colony conservation measures, however, are temporary emergency reactions to an on-going conflict, and a permanent solution will require the provision of alternative nesting substrates in the San Joaquin Valley and southern California that create safe, secure breeding conditions.

The triennial Tricolored Blackbird Statewide Survey has for 20 years played a prominent role in efforts to monitor the health of tricolors in California. Recent improvements in methodology and the addition of the Tricolored Blackbird Portal have rapidly increased our knowledge of where the birds breed by providing a mechanism for concerned citizens to become actively engaged in research and monitoring efforts. The resulting increase in the number of persons looking for and reporting breeding colony locations and observations of (occupied and unoccupied) breeding colony locations has aided efforts to monitor the health of the species.

The Tricolored Blackbird is increasingly conservation-dependent, and future monitoring efforts should expand beyond a triennial statewide population estimate to include the: 1) annual monitoring of the results of breeding efforts in a variety of habitats and bioregions, 2) effects of relative insect abundance on reproductive success, and 3) results of specific conservation actions. A useful addition to the triennial Statewide Survey would be an annual effort to estimate the population size through a statistically valid sample (see Meese et al. 2015b). This monitoring tool would provide an annual population estimate with a much smaller number of volunteers and require surveys of only a sample of the total number of colony locations each year. An annual sample survey would provide an additional means to monitor the health of the population and supplement more intensive efforts to monitor the results of tricolor breeding, thereby helping to more thoroughly document the status of California's blackbird.

The Tricolored Blackbird (*Agelaius tricolor*) is a medium-sized passerine that nests in the largest colonies of any North American landbird since the extinction of the passenger pigeon (*Ectopistes migratorius*) over 100 years ago (Beedy and Hamilton 1999). The species has a restricted range that occurs almost exclusively within California, with only a few hundred birds scattered in small groups in Oregon, Washington, Nevada, and northwestern Baja California, Mexico (Beedy and Hamilton 1999). Tricolored Blackbirds are itinerant breeders (i.e., breed more than once per year in different locations) and use a wide variety of nesting substrates (Hamilton 1998), many of which are ephemeral. They are also insect dependent during the breeding season, and reproductive success is strongly correlated with relative insect abundance (Meese 2013). Researchers have noted for decades that Tricolored Blackbird's insect prey are highly variable in space and time; Payne (1969), for example, described the species as a grasshopper follower because they are preferred food items, and high grasshopper abundance is often associated with high reproductive success (Payne 1969, Meese 2013). Thus, the species' basic reproductive strategy is tied to rather infrequent periods of relatively high insect abundance in some locations followed by much longer periods of range-wide relatively low insect abundance and poor reproductive success. Of course, anthropogenic factors such as habitat loss and insecticide use may be at least partly responsible for these patterns (Hallman et al. 2014, Airola et al. 2014).

The Tricolored Blackbird was formerly considered to be one of the most abundant land birds in California (Beedy and Hamilton 1999), and it is likely that 2-3 million birds remained into the 1930s (estimated by extrapolation of Neff 1937, see Meese 2015). The alarming decline in abundance, especially in the past decade, to only 145,000 birds in 2014 (Meese 2014) led to an emergency listing of the species as endangered under the California Endangered Species Act (CESA) in December 2014 (State of California 2014).

State of California
Department of Fish and Wildlife

Memorandum

Date: October 2, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Petition from the Center for Biological Diversity to list the Tricolored Blackbird as Endangered under the California Endangered Species Act**

The Department of Fish and Wildlife (Department) prepared the attached petition evaluation report in response to a petition, dated August 19, 2015, received by the Fish and Game Commission (Commission) on August 19, 2015 (Petition) from the Center for Biological Diversity to list the Tricolored blackbird (*Agelaius tricolor*) as an endangered species under the California Endangered Species Act (CESA). (See generally Fish and Game code §2073.5, subd. (a); Cal Code Regs., title 14, §670.1, subd. (d)(1).)

In accordance with CESA, the attached petition evaluation report delineates the categories of information required in a petition, evaluates the sufficiency of the information in the Petition, and incorporates additional relevant information that the Department possessed or received during the review period. Based upon the information contained in the Petition, the Department has determined that there is sufficient information to indicate that the petitioned action may be warranted. The Department recommends that the Petition be accepted.

If you have any questions or need additional information, please contact Dan Yparraguirre, Deputy Director of Wildlife and Fisheries Division at (916) 653-4673 or Eric Loft, Chief of Wildlife Branch at (916) 445-3555.

**EVALUATION OF PETITION FROM CENTER FOR BIOLOGICAL DIVERSITY TO LIST THE
TRICOLORED BLACKBIRD (*Agelaius tricolor*) AS ENDANGERED**

CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

EXECUTIVE SUMMARY

On October 8, 2014, the Center for Biological Diversity (Petitioner) submitted a petition (2014 Petition) seeking action by the California Fish and Game Commission (Commission) to list the tricolored blackbird (*Agelaius tricolor*) as endangered pursuant to the California Endangered Species Act (CESA) (Cal. Reg. Notice Register 2014, No. 44-Z, p. 1861; see also Cal. Code Regs., tit. 14, § 670.1, subd. (a); Fish & G. Code, § 2072.3). The Commission received the 2014 Petition on October 8, 2014 and referred it to the California Department of Fish and Wildlife (Department) for an initial evaluation on October 15, 2014. At its December 3, 2014 meeting in Van Nuys, California, the Commission voted to take emergency action to add tricolored blackbird to the list of endangered species pursuant to Fish and Game Code section 2076.5, with the related regulation as approved by the Office of Administrative Law taking effect for an initial term of six months beginning on December 29, 2014 (Cal. Reg. Notice Register 2015, No. 2-Z, p. 91).

At its meeting in Mammoth Lakes on June 11, 2015, the Commission voted to reject Petitioner's October 2014 petition. On June 30, 2015 the emergency regulation adopted in December 2014 expired by operation of law. On August 5, 2015, at its meeting in Fortuna, the Commission heard a request from Petitioner to reconsider its June action. On August 19, 2015, Petitioner submitted a new petition (Petition) seeking action by the Commission to list the tricolored blackbird as an endangered species pursuant to CESA (Cal. Reg. Notice Register 2015, No. 36-Z, p. 1514). The Commission received the Petition on August 19, 2015 and referred it to the Department for an initial evaluation on August 20, 2015.

This report presents the Department's initial scientific evaluation of the Petition as required by Fish and Game Code section 2073.5, with evaluation of the new information presented in the August 2015 Petition included as an addendum. (See also Cal. Code Regs., tit. 14, § 670.1, subd. (d).) Consistent with that authority, this report evaluates the scientific sufficiency of the Petition on its face and in relation to other relevant information the Department possesses or that it received during its review. To support the review, the Department gathered and reviewed the information referenced in the submitted Petition to the best of its ability. Not all references were available to the Department. In addition to the face value, and the material referenced in the Petition, the Department also considered other relevant information in its possession related to the tricolored blackbird populations. All sources of information considered by the Department in preparing this report, including those referenced in the Petition, are identified in the References Section. The Department's recommendation as to whether to make tricolored blackbird a candidate for listing under CESA is based on an assessment of whether the scientific information in the Petition is sufficient under the criteria prescribed by CESA to consider listing tricolored blackbird as endangered.

In completing its Petition Evaluation, the Department has determined there is sufficient scientific information to indicate that the petitioned action may be warranted. Therefore, the Department recommends that the Commission accept the Petition for further consideration under CESA. Such action by the Commission would convey candidacy protections to the tricolored blackbird pursuant to Fish and Game Code section 2074.2(a)(2), making adoption of an emergency regulation unnecessary.

Summary of Department's Evaluation of the Petition

A petition to list or delist a species under CESA must include information pursuant to Fish and Game Code section 2072.3 as follows:

- population trend;
- range;
- distribution;
- abundance;
- life history of a species;
- factors affecting the ability of the population to survive and reproduce;
- degree and immediacy of the threat;
- impact of existing management efforts, suggestions for future management;
- availability of and sources of information;
- habitat necessary for a species survival;
- detailed distribution map.

The Department finds that the Petition provides adequate information in the categories required by CESA and that the petitioned action may be warranted.

This report summarizes the Department's evaluation of the Petition and other available information. It follows the outline and summarizes relevant portions of the Department's 2004 evaluation of the petition to list the tricolored blackbird, which is incorporated by reference (Gustafson and Steele 2004).

The Department believes that the petitioned action may be warranted based on the degree and immediacy of the threats faced by the species which are addressed by the Petition, as follows:

- 1) Historical and continuing loss of nesting substrate, including wetlands, Himalayan blackberry (*Rubus discolor*) patches, upland weedy vegetation, and marsh vegetation in reservoirs and ponds.
- 2) Historical and continuing loss of uplands used for foraging.
- 3) Declines in tricolored blackbird populations in the past 80 years, including ongoing declines documented since 2008.
- 4) Significant, large-scale reproductive failures in tricolored blackbird colonies nesting in agricultural areas of the San Joaquin and Sacramento valleys.

5) Limited, inconsistent, and sometimes ineffective protection of colonies nesting in agricultural settings.

6) Ineffectiveness of existing regulatory mechanisms to protect tricolored blackbird breeding habitat and nesting colonies on privately-owned land.

7) Predation by the black-crowned night heron (*Nycticorax nycticorax*), cattle egret (*Bubulcus ibis*), common raven (*Corvus corax*), coyote (*Canis latrans*), and other predators, especially in areas in which predator populations may be artificially high due to concentrated food sources.

INTRODUCTION

Candidacy Evaluation

CESA sets forth a two-step process for listing a species as endangered. First, the Commission determines whether a species is a candidate for listing by determining whether “the petition provides sufficient information to indicate that the petitioned action may be warranted.” (Fish & Game Code, § 2074.2, subd. (a)(2).) Within 10 days of receipt of a petition, the Commission must refer the petition to the Department for evaluation (Fish & Game Code, § 2073.) The Commission must also publish notice of receipt of the petition in the California Regulatory Notice Register. (Fish & Game Code, § 2073.3.) Within 90 days of receipt of the petition, the Department must evaluate the petition on its face and in relation to other relevant scientific information and submit to the Commission a written evaluation report with one of the following recommendations:

- Based upon the information contained in the petition, there is not sufficient information to indicate that the petitioned action may be warranted, and the petition should be rejected; or
- Based upon the information contained in the petition, there is sufficient information to indicate that the petitioned action may be warranted, and the petition should be accepted and considered.

(Fish & Game Code, § 2073.5, subd. (a)(1).)

If the petition is accepted for consideration, the second step requires the Commission to determine, after a year-long “scientific-based review of the subject species,” whether listing as endangered is or is not actually warranted. (Fish & Game Code, § 2075.5.)

In *Center for Biological Diversity v. California Fish and Game Commission* (2008) 166 Cal.App.4th 597, the California Court of Appeals addressed the parameters of the Commission’s discretion in its application of the threshold candidacy test. The court began its discussion by describing the candidacy test previously set forth in *Natural Resources Defense Council v. California Fish and Game Commission* (1994) 28 Cal.App.4th 1104, 1114:

As we explained in *Natural Resources Defense Council* [citation], “the term ‘sufficient information’ in section 2074.2 means that amount of information, when considered with the Department’s written report and the comments received, that would lead a reasonable person to conclude the petitioned action may be warranted.” The phrase

“may be warranted” “is appropriately characterized as a ‘substantial possibility that listing could occur.’” [citation] “Substantial possibility,” in turn, means something more than the one-sided “reasonable possibility” test for an environmental impact report but does not require that listing be more likely than not.

(*Center for Biological Diversity*, at pp. 609-10.) The court acknowledged that “the Commission is the finder of fact in the first instance in evaluating the information in the record.” (*Id.* at p. 611.) However, the court clarified:

[T]he standard, at this threshold in the listing process, requires only that a substantial possibility of listing could be found by an objective, reasonable person. The Commission is not free to choose between conflicting inferences on subordinate issues and thereafter rely upon those choices in assessing how a reasonable person would view the listing decision. Its decision turns not on rationally based doubt about listing, but on the absence of any substantial possibility that the species could be listed after the requisite review of the status of the species by the Department[.]

(*Ibid.*)

Petition History

State Petitions Prior to 2014

In 1991, based on information indicating that the tricolored blackbird’s breeding population had fallen to about 35,000 adults in the late 1980s, the Yolo chapter of the National Audubon Society submitted a petition to the Commission, to list the species as Endangered. After reviewing the document and other available information, the Department determined that the petitioned action might be warranted and recommended to the Commission that it accept and consider the petition. In March 1992, the Commission voted to accept the petition and designated the tricolored blackbird as a candidate for State listing. Researchers working during the 1992 breeding season discovered that the population might exceed 300,000 adults. The Yolo Audubon Society withdrew the petition based on the new population data. The Commission allowed the petition to be withdrawn, but urged the Department to work with interested persons and groups to develop conservation measures for the tricolored blackbird. The species was again petitioned to be listed under CESA in 2004. The petition evaluation report by the Department (Gustafson and Steele 2004) stated there was sufficient information to indicate the petitioned action may be warranted; the Commission voted to reject the petition (Fish and Game Commission meeting, Feb. 3, 2005).

Federal Petitions

In the late 1970s, the USFWS identified the tricolored blackbird as a candidate for federal listing. However, in the early 1990s, the USFWS eliminated its list of candidate species. In 1988, the USFWS contracted for a compilation of all historical information on distribution and abundance of the tricolored blackbird, resulting in the work of Beedy *et al.* (1991). In 1989, the USFWS modified two long-standing depredation orders, to prohibit killing the tricolored blackbird without a federal permit. The USFWS has

also provided funds for tricolored blackbird survey efforts in several years beginning in 1993. In 2006, the USFWS in response to a listing petition issued a 90-day finding that listing the tricolored blackbird was not warranted. In 2008, the USFWS updated its Birds of Conservation Concern 2008 report, identifying “species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act of 1973” (USFWS 2008). The tricolored blackbird was included on two Bird Conservation Region lists (9, 32), the USFWS Region 8 list (California and Nevada) and the National list. On February 3, 2015, the Center for Biological Diversity submitted a petition to the USFWS to list the tricolored blackbird as an endangered species under the federal endangered species act and to designate critical habitat concurrent with listing.

INFORMATION PROVIDED IN THE PETITION AND ADDITIONAL INFORMATION GATHERED BY THE DEPARTMENT OF FISH AND WILDLIFE

Population Trend (termed “Population Status and Trend” in the Petition, beginning on page 6)

The Petition states that based on extensive historical and recent statewide surveys, the tricolored blackbird “has experienced and is continuing to experience a precipitous population decline.” The Petition includes data from the various statewide surveys through the 2014 survey. Several major studies as well as smaller studies and summaries, beginning in the 1930s, have documented numbers and breeding colonies of the tricolored blackbird (Neff 1937, DeHaven *et al.* 1975a, Hosea 1986, Beedy *et al.* 1991, Hamilton *et al.* 1992, Hamilton 1993, Hamilton *et al.* 1995, Beedy and Hamilton 1997, Hamilton *et al.* 1999, Hamilton 2000, DeHaven 2000a, Humple and Churchwell 2002, Hamilton 2004, Green and Edson 2004, Cook and Toft 2005, Kelsey 2008, Meese 2009a, Meese 2010, Kyle and Kelsey 2011, Meese 2011, and Meese 2014). As noted in the Petition, survey effort, methods, coverage, and participants have varied over the years. Thus, it is difficult to compare total number of birds observed or population estimates across many of the survey years.

The Petition describes a decline in numbers of the tricolored blackbird since the 1930s, particularly for the Central Valley of California. Early research on the tricolored blackbird was carried out by Neff and colleagues in the 1930s (Neff 1937). Over a period of six years (1931-1936), Neff surveyed tricolored blackbird colonies across California and suggested that the species numbered in the millions. Neff located several breeding colonies of more than 100,000 nests in the Sacramento Valley, with the largest composed of greater than 200,000 nests (corresponding to approximately 300,000 adult tricolored blackbirds). Breeding colonies were located throughout the Central Valley and in a few additional locations in California and southern Oregon; however, Neff’s surveys focused on the Sacramento Valley in most years. An effort to cover the entire known range of the species was attempted by Neff in only one year (1932), with most areas outside the Sacramento Valley covered incidentally as “cooperators drove up or down the State in the performance of routine duties”. The highest concentration of colonies and breeding birds were located in the Sacramento Valley; the degree to which this was the result of increased effort there is not known. Based on his somewhat geographically limited efforts, Neff (1937)

reported nesting birds in 26 California counties in the period of 1931-36. Working alone in 1934, Neff (1937) observed an estimated 491,250 nests, almost all of which were in the Sacramento Valley. As reported in the Petition, Beedy and Hamilton (1997) interpreted this to represent about 736,500 breeding adults. The presence of birds in the San Joaquin Valley and southern California was noted in the same year, but no effort was made to estimate numbers. Neff's work in the 1930s, as interpreted by Hamilton *et al.* (1995), yielded an estimated maximum annual abundance of over 1,100,000 adult tricolored blackbirds in the Central Valley.

The Petition states that a history of market hunting and massive loss of native marshland habitat had drastically reduced the population of tricolored blackbirds by the mid-twentieth century. However, Neff (1937) concluded: "Destruction of the birds by man, of nesting sites through drainage or reclamation, of nests by predators or by the elements, and other factors, have played their part. All combined, however, they have made only fractional inroads on this species during the period covered by this report [1931-1936]". Neff (1937) was not convinced that the population size in the 1930s was less than that during "pioneer times". Being that the next comprehensive effort to survey tricolored blackbirds did not occur until the 1970s (DeHaven *et al.* 1975a), it is not known to what degree the population had been reduced by the mid-twentieth century. However, the estimate by Hamilton *et al.* (1995) of 1,100,000 tricolored blackbirds in the 1930s is subject to high uncertainty and the Department acknowledges that because of the relatively limited effort during the surveys of the 1930s, the number of birds present at that time could have been much higher. Also, there is evidence that the species had experienced declines in a large portion of its range in southern California, even by the 1930s (see discussion of distribution and abundance below).

From 1969-1972, DeHaven *et al.* (1975a) attempted to survey the entire range of the tricolored blackbird to document the distribution of the species and to compare estimates of abundance to those provided by Neff (1937). The surveys were carried out by a few individuals surveying vast areas by road, and were limited to one or two drives through each county where tricolored blackbirds were known to occur in California and southern Oregon. Still, the search effort was at least as extensive as that carried out by Neff in the 1930s, and included the benefit of improved transportation and an increased number of roads. In many counties the survey consisted of driving county roads with little knowledge of historical colony sites, but this was an improvement over much of the effort of the 1930s, when counties were considered covered if visited incidentally to other activities. Despite a greater search effort, all measures of abundance indicated a decline: number of colonies detected declined from 256 to 164; non-breeding birds encountered declined from >50,000 in a single year to <15,000 over four years; maximum colony size declined from hundreds of thousands to tens of thousands; number of birds observed per year within the study period declined from about 375,000 per year to about 133,000 per year (DeHaven *et al.* 1975a). Although no population estimate could be obtained from these surveys, the authors suggested that the population may have declined by more than 50% in 35 years. The distribution of colonies was similar to that in Neff (1937). The Petition states that DeHaven *et al.* (1975a) concluded that the downward trajectory of the population was continuing in the 1970s, however DeHaven *et al.* (1975a) expressed uncertainty about this, and recommended further research to determine whether the decline they observed was ongoing.

Since 1994, ten tricolored blackbird surveys have been conducted. However, as mentioned above, the survey effort, methods, coverage, and participants have varied (Kelsey 2008, Meese 2014) making it difficult to compare total population estimates across many of the survey years. Because of this, in evaluating the 2004 petition the Department used the largest detected colony size in any given year as an indicator of population status. This was based on the assumption that the largest colonies are most likely to be detected and largest colony size is correlated with total population size (Gustafson and Steele 2004). The Department also evaluated Christmas Bird Count data to evaluate trends in the non-breeding season. Based on these sources of data, the Department found an apparent downward trend in the tricolored blackbird's breeding population from the 1930s to the 1970s, and again from the 1970s until 2004. At that time, the Department concluded that the extent of the decline between 1994 and 2004 was not clear.

Of the ten annual surveys conducted since 1994, two groups of survey years have been reported to be most comparable across years (years 1994, 1997, 2000; and years 2008, 2011, 2014) (Beedy and Hamilton 1997, Hamilton et al. 2000, Kyle and Kelsey 2011, Meese 2014). The degree to which these two groups of survey years are comparable to each other is not clear, although differences in methodology and effort between the groups suggest caution is warranted in making comparisons. Hamilton (2000) reported that statewide survey efforts in 1994, 1997, and 2000 followed similar methods in order to locate and survey as many colonies as possible. At the time, these three surveys had used the most consistent methods to date and focused the survey on a short time period in order to avoid double counting of birds. Compared to the surveys of the 1930s and 1970s, these surveys employed many more volunteer surveyors in order to cover as much of the state and known colonies as possible. Hamilton (2000) reported that "Serious amateur and professional birders located most of all birds recorded". Most large (>10,000 birds) and many smaller colonies reported during these survey years were revisited by tricolored blackbird experts. That said, inconsistencies in effort still occurred with the 1997 survey using fewer observers to visit fewer sites in fewer counties than the 1994 survey, and the 2000 survey using more observers to visit more sites than the other two survey years, but searching in fewer counties. These inconsistencies led the Department to conclude that the extent of decline during the period was unclear. Hamilton (2000) however, concluded:

"The central conclusion of the Census and survey is that tricolors [tricolored blackbirds] are continuing to decline precipitously in numbers, from millions in the 1930s (Neff 1937) to an estimated...162,000 in this account for 2000. The conclusion that tricolor numbers are plummeting is based not only upon these data, but also on the collective experience of local experts throughout California who have observed tricolors over long intervals."

"...the method of the Census and the survey, to reinvestigate all known breeding places and to search for new ones, has become an increasingly complete assessment of Tricolored Blackbird distribution and abundance. The 2000 Census probably located a greater proportion of the entire population than did censuses in previous years."

Based on their analysis of annual results from statewide surveys, Cook and Toft (2005) reported that the tricolored blackbird population had declined by approximately 56% between 1994 and 2000. They also

determined that colony sizes were smaller on average in 2000 than in 1994, which they attributed to a declining overall population for the species.

It is possible that the size of the largest colony does not have a strong correlation with population size, especially over long periods of time when the population has shifted breeding distribution and choice of primary nesting substrate for large colonies (e.g. use of agricultural crops, particularly triticale (*Triticale hexaploide*) fields beginning sometime after the 1970s). The average of the largest several colonies (three, five, and ten have been reported in the literature) might be a better correlate to population size, but it is important to compare colony size only for sites that are estimated during the same time period each year. Colony size can vary across the breeding season and therefore using different dates would likely obscure the relationship. In reports available to the Department, it is often unclear which data have been used to develop estimates of average colony sizes; this warrants additional work to evaluate trends presented by Hamilton (2000), Cook and Toft (2005), and those included in the Petition for the period of 1994-2000.

Following the 2000 survey, triennial statewide surveys were reestablished in 2005. However, a rigorous and consistent methodology has been used only since 2008 (see Kelsey 2008, Kyle and Kelsey 2011, Meese 2014). These recent surveys employ hundreds of volunteers over a three day period in an attempt to visit and estimate numbers of tricolored blackbirds at all known historical and current colony sites. The effort in each county was coordinated by a county coordinator in 2008 and 2014, with a statewide coordinator overseeing the entire effort in all years. In each of the three most recent survey years (2008, 2011, and 2014), volunteers have been provided with training in tricolored blackbird identification, estimation of colony size, use of maps on online tools, and a standard survey protocol. Many of the participants, especially those coordinating county efforts, have been knowledgeable observers with experience participating in multiple survey years. The Department acknowledges that the lack of error estimation in the census method makes it difficult to assess the accuracy of results for any given year, however the increase in knowledge in recent years on historical and current colony sites, along with consistent methodology and increased participation and effort has likely resulted in an increased ability to detect a downward trend over the past six year period. The statewide survey protocol is available at <http://tricolor.ice.ucdavis.edu/content/2014-statewide-survey>.

In the most recent years, the number of birds observed on statewide surveys declined 63% from 395,000 birds in 2008 to about 145,000 birds in 2014. In this same time period, maximum colony size has declined from 80,000 to less than 30,000 birds (Kelsey 2008, Kyle and Kelsey 2011, Meese 2014). Although not a statistical estimate of population size, the census provides an index of population size by attempting to visit all known sites, including new sites that are established by colony movement. This effort to visit all known sites, along with a continual increase in knowledge about historical and current colony sites has resulted in an increase in survey effort with each statewide survey. For example, more counties were surveyed in 2014 than on any previous survey and the number of observers participating on the 2014 survey (143) was exceeded on only one previous survey (155 observers in 2008). Perhaps most importantly, the number of colony sites visited in 2014 far exceeded any other survey, with a large increase in sites visited each survey year since 2008 (Figure 1); this reflects not only a sharp increase in

knowledge of colony sites, but also an enormous effort to visit as many as possible during the count period. The number of birds observed has declined despite the increase in effort.

Small breeding colonies are likely missed during each survey, especially in areas where small colonies might occur distant from any known colony site, and therefore are not located within the focused search area. Because tricolored blackbird colonies are extremely conspicuous leading up to and throughout most of the nesting cycle, most large colonies that would contribute substantially to the overall statewide estimate are likely to be observed during the three day search window. Given the concentration of birds in relatively few large colonies and within a few well known and well surveyed portions of their range (especially the San Joaquin Valley), Kelsey (2008) concluded that “it is unlikely that large numbers of Tricolored Blackbirds go undetected during the statewide surveys”. Additionally, in areas of the state where most of the population breeds early in the nesting season (San Joaquin Valley), extensive pre-survey scouting occurs in an attempt to locate colonies, both for survey purposes and to initiate colony protection efforts where colonies occur on agricultural fields. Even if a colony site is not visible from a road, large colonies can be detected and identified by the species’ diagnostic feeding flights as they move between the colony location and foraging habitat. The density of roads may limit observation of some portion of the landscape; this is a limitation common to all survey years.

The Department finds the Petitioner submitted sufficient information to demonstrate or create a reasonable inference that tricolored blackbirds have experienced historic declines and may continue to do so.

Range and Distribution (beginning on page 17)

The Petition provides a description of the tricolored blackbird’s range. The Petition also provides information on the species’ distribution throughout portions of its range and states that historical distribution and population abundance of tricolored blackbirds prior to widespread loss of their native wetland and grassland habitats are unknown..

The Petition provides the following information regarding the tricolored blackbird range. The Petition characterizes the geographic range of the tricolored blackbird as “largely restricted to southernmost Oregon and the Modoc Plateau of northeastern California south through the lowlands of California west of the Sierra Nevada to northwestern Baja California” with rare reports of tricolored blackbird from Nevada and Washington. Overall, the range of the tricolored blackbird has not appreciably changed since the mid-1930s (Meese *et al.* 2014). The Petition states that the tricolored blackbird has been found from sea level up to 4,200 feet (1280 meters) at Klamath Lake. Grinnell and Miller (1944) included a record of 4,400 feet on the “South Fork of the Pit River” in Modoc County.

Grinnell and Miller (1944) wrote that the tricolored blackbird is “resident within [California], but partly migratory within Sacramento-San Joaquin drainage system; all populations are in some degree nomadic and in fall and winter normally leave the immediate vicinity of the nesting colonies”. DeHaven *et al.* (1975a) reported that 78% of colonies located between 1968 and 1972 were in the Central Valley. Counties where most colonies were found in a single season during this time period were Sacramento, Merced, Stanislaus, Glenn, and Colusa. According to Beedy (2008), since 1980, active breeding colonies

have been observed in 46 California counties. Colonies are typically largest in the Central Valley and are patchily distributed throughout but particularly in the Coast Ranges and on the coastal slope.

In all statewide surveys conducted since 1994, the majority ($\geq 90\%$ in all years but 1997) of the population has occurred in the Central Valley counties during the April breeding season, with much of the population and the largest colonies in agricultural fields (see below).

During the winter, the tricolored blackbird withdraws from those portions of its summer range in California outside of the Central Valley, from Santa Barbara County, and from eastern San Diego County (Meese *et al.* 2014). Although the tricolored blackbird is a year-round resident of the remainder of its summer range in California, “it largely withdraws in winter from [the southern] San Joaquin Valley and [northern] Sacramento Valley ([becoming] rare in Sacramento Valley north of Sacramento Co.), concentrating in and around Sacramento-San Joaquin River Delta and coastal areas, including Monterey and Marin Cos. [*sic*]. Small flocks may appear at other coastal locations from Sonoma Co. south to San Diego County and sporadically north to Del Norte Co.” (Unitt 2004, Meese *et al.* 2014). This is consistent with the winter distribution reported by Grinnell and Miller (1944): “Many individuals move northwestward in San Joaquin Valley and south in Sacramento Valley to form concentrations in the delta [of the Sacramento and San Joaquin rivers] regions and in vicinities of Suisun, San Pablo, and San Francisco bays”. Wintering flocks numbering 12,000-14,000 assemble near dairies on Point Reyes Peninsula, Marin Co., by mid-October. Some individuals also winter in central and [southern] San Joaquin Valley (Meese *et al.* 2014).

The Petition presents evidence that tricolored blackbirds have declined or disappeared from portions of their range including portions of the Central Valley where the species was once abundant. The species no longer occurs at many historical sites in coastal southern California, including Los Angeles and San Diego where the tricolored blackbird was once described as the most abundant species. Additional assessment of distributional changes and shifts in centers of abundance is warranted.

While the Department finds minor inconsistencies in the Petition’s assessment of Range and Distribution, the Department nonetheless concludes that Petitioners have submitted sufficient information to demonstrate or create a reasonable inference that the tricolored blackbird has experienced a reduction in distribution in a portion of its range in California and may continue to do so.

Abundance (termed “Population Status and Trends” in the Petition, beginning on page 6 and “Abundance” in the Petition, beginning on page 23)

Grinnell and Miller (1944) described the status of the tricolored blackbird as “common to abundant locally” but noted a general decrease in southern California. Dawson (1923) reported the species as “locally abundant...in the San Diegan district...” The species was considered “not rare” in Santa Barbara County, abundant near Los Angeles, and the most abundant species near San Diego (Cooper 1870, Baird 1870 and Baird *et al.* 1874 in Beedy 2008). Neff (1937), in the first major work on the tricolored blackbird, did not estimate the overall breeding population in the Central Valley. However, in just eight counties in 1934, he estimated the abundance of tricolored blackbirds in California at 252 colonies, many of which were quite large, and that there were more than 700,000 adults per year. Orians (1961a)

reported that, in 1959 and 1960, there were four tricolored blackbird colonies larger than 100,000 adults. All were in the rice-growing area in Colusa and Yolo counties. By the late 1970s, the tricolored blackbird was characterized as a local resident in the southern California coastal district and the Antelope Valley, generally common where they occurred (Garrett and Dunn 1981). Meese (2014) documented 12,386 birds for the southern California region as compared to fewer than 6,000 in 2011 as reported by Kyle and Kelsey (2011).

The largest reported colony in the 1970s was one in Colusa County comprising an estimated 30,000 adults (Beedy and Hayworth 1992). DeHaven *et al.* (1975a) located 168 breeding colonies, about 78% of which were in the Central Valley. In the 1980s, the largest reported colony was one at Kesterson Reservoir in 1986, with an estimated 47,000 adults (Beedy and Hayworth 1992). Beedy *et al.* (1991) stated that the “average [tricolored blackbird] colony size has declined dramatically since the 1930s”. In 1994, Hamilton *et al.* (1995) found that the largest colony, at San Luis National Wildlife Refuge (NWR), numbered about 105,000 adult tricolored blackbirds. In 1997, Beedy and Hamilton (1997) reported the largest colony to contain about 80,000 adults. By 2000, surveyors found that the largest colony comprised about 30,000 birds (Hamilton 2000). Since 2008, the population estimate declined 63% from 395,000 birds in 2008 to about 145,000 birds in 2014 (Kelsey 2008, Kyle and Kelsey 2011).

The Petitioner has described many relevant sources of information on historical and recent abundance to adequately describe much of the historical and recent work on population abundance. As discussed in the population trends section, issues of comparability across survey years and the degree to which surveys produce accurate rangewide population estimates warrant further evaluation.

Life History (in the Petition, beginning on page 25)

The Department found the Petition provided sufficient information to demonstrate or create a reasonable inference that some tricolored blackbird life history traits render them particularly vulnerable to natural and anthropogenic threats. Additional information is provided by the Department under the select subheadings, as follows.

Taxonomy and Genetics

The tricolored blackbird is a species in the avian family Icteridae (blackbirds, cowbirds, grackles, meadowlarks, and orioles). No subspecies are recognized (AOU 1957).

Although Berg *et al.* (2010) found no significant population structuring between southern and northern California populations of tricolored blackbirds, they found higher allelic diversity in the southern population. This suggests the southern population is an important genetic reservoir for the species.

Habitat Requirements

According to Grinnell and Miller (1944), tricolored blackbird habitat in the nesting season was found in the “vicinity of fresh water, especially marshy areas. The most favored sites for colonies are heavy growths of cattails and tules, but even when these are available, other vegetation may be resorted to for

nesting: sedges, nettles, willows, thistles, mustard, blackberry, wild rose, foxtail grass, barley, etc.” Meese *et al.* 2014 summarized tricolored blackbird breeding habitat requirements as a nesting substrate that is relatively impenetrable or is flooded, is adjacent to water, and is within a few kilometers of foraging areas such as rangeland, alfalfa or cut hay, or irrigated pasture, with adequate insect prey. Tricolored blackbird nesting in cereal crops and dairy silage was not known until after the 1970s.

In winter, tricolored blackbirds often congregate with other species of icterids and European starlings (*Sturnus vulgaris*) that forage in grasslands, agricultural fields with low-growing vegetation, and at dairies and feedlots (Beedy 2008, Meese *et al.* 2014). Meese *et al.* (2014) wrote that the tricolored blackbird’s preferred winter roosting sites included “cattail and bulrush marshes near suitable foraging areas in pasturelands, recently cultivated croplands, and livestock feedstores”.

Colonial Breeding

The tricolored blackbird is the most highly colonial of North American passerine birds (Neff 1937, Lack and Emlen 1939, Meese *et al.* 2014). Bent (1958) found that the tricolored blackbird “nests in enormous, most densely populated colonies, the nests being placed more closely together than in any other colonies of marsh-nesting blackbirds”. Grinnell and Miller (1944) stated that “one essential would seem to be provision at the site of the colony for a large number of individuals. Nests apparently must be close together and pairs usually [must be] in excess of 50 in order to meet the instinctive requirements of the species”. Meese *et al.* (2014) wrote that the status of the tricolored blackbird is of concern, “because its population has declined and its colonial nesting behavior makes it vulnerable to nesting failures affecting thousands of nests at a single colony”.

Breeding and Post-Breeding Behavior

The tricolored blackbird is highly nomadic (Neff 1937, 1942; DeHaven and Neff 1973). A flock of tricolored blackbirds can appear in an area in which it has been absent for months and begin to form a nesting colony (Orians 1961b). Orians (1961a) interpreted fluctuations in numbers of tricolored blackbirds during the breeding season to be responses to local abundance of insects. Hamilton (1998) suggested that these fluctuations are due to “itinerant breeding”, describing the possibility that “variable local abundance between years is the result of itinerant breeding movements during the breeding season after predators, agricultural operations, and adverse weather destroyed colonies”. Itinerant breeding applies to those individuals “nesting at more than one geographic location in the same year” (Hamilton 1993). A noted pattern is for individuals to move northward after their first nesting efforts in the San Joaquin Valley and in Sacramento County into the Sacramento Valley, northeastern California, and southern Oregon (Beedy and Hamilton 1997). In the spring, the tricolored blackbird vacates its wintering areas and arrives at nesting locations in Sacramento County and the San Joaquin Valley in the period from early March to early April (DeHaven *et al.* 1975b). In the Sacramento Valley, the largest colonies are formed during May and early June (Meese *et al.* 2014). In southern California, the tricolored blackbird may nest anytime throughout April and June (Unitt 2004). Orians (1960) reported successful autumnal breeding in the tricolored blackbird in colonies in the Sacramento Valley. Payne (1969) believed that autumnal nesting was related to rainfall and abundance of insect food

and/or abundance of rice. Hamilton *et al.* (1995) reported tricolored blackbirds breeding in August 1993 “along the Marin coast”. DeHaven *et al.* (1975b) found that the tricolored blackbird exhibits a major postbreeding-season movement into the Sacramento Valley. In winter, tricolored blackbird numbers decline in the Sacramento Valley and increase in the delta of the Sacramento and San Joaquin rivers (Neff 1937, Orians 1961b, DeHaven *et al.* 1975b). Nonbreeding flocks can consist of only tricolored blackbirds in either mixed-sex or single-sex groups, or they can be tricolored blackbirds mixed with the red-winged blackbird (*Agelaius phoeniceus*), Brewer’s blackbird (*Euphagus cyanocephalus*), and European starling, and other species (Meese *et al.* 2014).

Factors Affecting Ability of Population to Survive and Reproduce (in the Petition, beginning on page 36)

The Petition addresses the loss of nesting and foraging habitat throughout the breeding distribution of the species including the destruction of native wetland and suitable upland breeding habitats, and nesting colony destruction by agricultural activities during the breeding season that results in direct mortality of nestlings. The Petition also describes early market-hunting and poisoning of tricolored blackbirds and provides information on predation and on mortality due to contaminants. The Petition also lists causes of mortality such as exposure to inclement weather, predation (under Life History section in the Petition, page 30), starvation of young, and possible removal of live young from nests by female tricolored blackbirds. The Petition also asserts that “the Tricolored Blackbird is not protected by existing regulatory mechanisms”.

Habitat Loss

Neff (1937), observing that “the destruction of [tricolored blackbird] nesting habitats by man is of most importance”, cited “reclamation and drainage” as key factors in the loss of many favorable sites, along with “dredging or cleaning of reservoirs, marshes, and canals in order to destroy the growths of cattails and tules”. Subsequent workers have documented or commented upon habitat loss continuing through the present (Beedy *et al.* 1991, Hamilton 1993, Hamilton *et al.* 1999, Meese *et al.* 2014, DeHaven 2000a, Humple and Churchwell 2002, Beedy 2008). In the year 2000, DeHaven (2000a) observed widespread habitat loss due to urban expansion and agricultural conversions relative to the 1970s when he and others conducted tricolored blackbird research. Survey participants in recent years continue to document changes in the landscape at or around tricolored blackbird colony sites, with both nesting and foraging habitat being removed or converted to other uses. Meese *et al.* (2014) stated that the “greatest effects of human activity [affecting the tricolored blackbird] are related to habitat loss and alteration”. The Department believes breeding and foraging habitat loss represents a threat to tricolored blackbird populations.

Agricultural Activities

The Petition describes the use of grain silage fields for nesting by tricolored blackbirds and the fact that normal harvesting activities typically coincide with the breeding season. Harvesting of fields that contain nesting colonies results in nest destruction and direct tricolored blackbird mortality. Table 4 and Figure 4

in the Petition summarize at least some of the losses of colonies due to harvesting thought to have occurred between 1993 and 2013. Entire tricolored blackbird colonies (up to thousands of nests) in cereal crops and silage have been destroyed by harvesting and plowing of agricultural lands (Meese *et al.* 2014). The Department believes that harvesting of fields containing tricolored blackbird colonies continues to occur and is a threat to tricolored blackbird populations.

Low Reproductive Success

Meese (2013) found widespread reproductive failures at tricolored blackbird colonies in the Central Valley from 2006 to 2011. Relatively high reproductive success was observed only when nearby foraging areas supported high insect abundance, suggesting that many tricolored blackbird colonies may be food limited. Cook and Toft (2005) noted that between 1992 and 2003, “Reproductive success was significantly higher in upland non-native vegetation (primarily Himalayan blackberry *Rubus discolor*) than in native emergent cattail *Typha* spp. and bulrush *Scirpus* spp. marshes”, and concluded that low reproductive success had contributed to recent declines.

Predation

Various workers provided evidence for predation on tricolored blackbirds, their eggs or nestlings by gopher snake (*Pituophis catenifer*), king snake (*Lampropeltis* sp.), black-crowned night-heron, Cooper’s hawk (*Accipiter cooperii*), Swainson’s hawk (*Buteo swainsoni*), merlin (*Falco columbarius*), burrowing owl (*Athene cunicularia*), northern harrier (*Circus cyaneus*), barn owl (*Tyto alba*), short-eared owl (*Asio flammeus*), yellow-billed magpie (*Pica nuttalli*), American crow (*Corvus brachyrhynchos*), coyote, wolf (*Canis lupus*), gray fox (*Urocyon cinereoargenteus*), and possibly mink (*Mustela vison*) and raccoon (*Procyon lotor*), and feral domestic cat (*Felis catus*), showing that predation on breeding tricolored blackbirds by a diverse set of predators has occurred throughout the historical record (Mailliard 1900, Neff 1937, Payne 1969, Beedy and Hamilton 1997, Meese *et al.* 2014). Beedy and Hamilton (1997) reported that more recently, black-crowned night-herons have eliminated all or most nests at several freshwater marsh breeding colonies. Meese (2012) described the increasing pressure on tricolored blackbird colonies by cattle egrets. The Department believes that predation poses a threat to the success of some tricolored blackbird nesting colonies and that the type of nesting substrate can influence vulnerability to predation. Predation is a natural occurrence, but there has been a steady increase in population sizes of several major avian predators in California (black-crowned night heron, cattle egret, American crow, and common raven) over the last 40 years (Sauer *et al.* 2008 as cited in Kelsey 2008). The Department recognizes that small areas of native vegetation are especially vulnerable to predation, especially if they are near sites at which predator populations are at artificially-high levels due to the availability of augmented food sources from human activities. The drastic reduction in extent of spring and summer wetlands in California may have also concentrated predator populations in the remaining wetlands more than was true historically (Cook and Toft 2005).

Agricultural Contaminants

The Petition provides a summary of pesticide use in Sacramento, San Joaquin, Merced, Fresno, and Tulare counties under the heading Poisons and Contaminants (beginning page 45); information provided in the Petition is from year 2002 California Department of Pesticide Regulation data. Much of the discussion previously appeared in the 2004 petition to the State to list the tricolored blackbird (CBD 2004). The Department's earlier evaluation of the information (Gustafson and Steele 2004) is relevant and excerpted below:

“The loss of Tricolor [tricolored blackbird] breeding effort due to application of herbicides at colony sites has been documented (Hosea 1986, Hamilton *et al.* 1995, Beedy and Hamilton 1999). Hosea (1986) reported that two colonies in Colusa and Sacramento counties near rice fields were oversprayed during aerial application of herbicides resulting in the poisoning of almost all the nestlings. However, Hamilton *et al.* (1995) stated, “Despite the limited evidence that Tricolored Blackbirds are suffering some mortality as a result of patterns of chemical use in agricultural areas, poisons do not appear to be inducing a serious population problem for Tricolored Blackbirds”.

The petition does not analyze the data available in the pesticide-use reporting database of the California Department of Pesticide Regulation. The database contains types and quantities of pesticides applied to crops utilized by the Tricolor. The petition does not evaluate pesticide-use patterns in relation to historical locations of Tricolor nesting colonies. Instead, the petition's focus is on individual pesticides that have high use rates or that are toxic to birds. The assessment is not representative of the risk posed by pesticides to the Tricolor. The majority of the pesticides cited in Table 5 of the petition are not expected to have a significant impact on the species. The use of the following chemicals listed in the petition, if they are applied as required, may not pose a significant risk to the Tricolor: methyl bromide, metam-sodium, aluminum phosphide, oryzalin copper sulfate, chlorophacinone, diphacinone, strychnine, zinc phosphide, and petroleum oil.

The petition, citing Beedy and Hayworth (1992), describes the effects of possible selenium toxicosis on a Tricolor colony. Hamilton (2000) knew of “no evidence that toxic contaminants have adversely affected” the Tricolor since the work of Beedy and Hayworth (1992). Beedy and Hayworth (1992), working in the Central Valley in 1987, compared the reproductive success of the Tricolor colony at Kesterson Reservoir in Merced County, which had a history of selenium contamination, with the success at four other colonies. Although Beedy and Hayworth (1992) noted nesting failure at colonies in addition to the one at Kesterson, they concluded that “further research is needed to determine whether the nesting failures observed were isolated phenomena or indicative of a more widespread general decline of this species”. The deformities observed in Tricolor chicks in the nesting colonies at Kesterson, which have been attributed to selenium, occurred in the 1980s prior to the cleanup of the area and prior to cessation of the use of selenium-laden agricultural drain water to maintain the wetlands at Kesterson. Since that

time, no impact of contaminants such as selenium on Tricolor nesting success has been documented.

The petition reports that a biologist observed a colony sprayed by mosquito abatement operators in Kern County and that all sprayed eggs failed to hatch. The Department does not know whether any eggs from this colony were tested to determine a cause for the failure to hatch. We also are unaware of whether the spraying equipment disturbed the colony to the extent that adult birds abandoned their nests. In any case, we do not know whether application of mosquito larvicides or adulticides poses a direct threat to the Tricolor. The potential impact of these chemicals on other invertebrates that make up much of the food sources of Tricolors is apparently not known. In addition, the physical disturbance resulting from applications of mosquito-control pesticides in the immediate vicinity of a nesting colony may result in the abandonment of the colony. The Tricolor is quite sensitive to disturbance during certain phases of the breeding cycle and will readily abandon an established colony, even with young in the nests. Additional impacts to the Tricolor could result from increased spraying and physical disturbance activities undertaken to control the spread of the West Nile virus.

Among the pesticides discussed in the petition is phosmet, a chemical said by the petition to be “highly toxic” in red-winged blackbirds. Phosmet is one of the organophosphate insecticides, which are moderately to highly toxic to birds. In California, the primary application of phosmet is in orchards and vineyards. The flocking behavior, choice of nesting habitat, and typical choice of feeding areas appears to minimize the risk of exposure to the Tricolor of agricultural applications of these insecticides during the nesting season. Because the Tricolor forages in mixed-species flocks with the European starling and other species of blackbirds in the non-breeding season, and because these flocks forage at dairies and/or feed lots, the Tricolor may be exposed to avicides intended to control nuisance and depredating flocks of blackbirds.

Due to the lack of specific information on the effect of agricultural contaminants, the Department cannot judge whether these chemicals pose a local or population-level threat to the Tricolor. This is an area requiring more attention.”

Weather Events

The Petition includes a section entitled Storms and Droughts (beginning page 44). Hamilton *et al.* (1995) stated that high mortality of tricolored blackbird nestlings can result from severe or prolonged storms and that some observed reproductive failure may be the result of chilling of adult and nestling tricolors. Also, “some adult female mortality at nests appears to have been induced by cold and rainy weather” (Hamilton *et al.* 1995). A recent exercise by Department staff to evaluate drought risk for 358 special status taxa (species or subspecies that are listed under the federal Endangered Species Act or CESA, proposed or candidates for listing, fully protected species, or species of special concern) found the tricolored blackbird to be among those at most risk due to the ongoing drought.

Disease

The Petition includes a section on “Disease or Predation” (page 42). The Petition does not discuss any known or potential disease issues for the species. Meese *et al.* (2014) stated that no diseases have been reported for the tricolored blackbird but that in some years many nestlings have mites. Avian pox is prevalent in tricolored blackbirds in the Sacramento Valley, much less so in the San Joaquin Valley (Meese *et al.* 2014). Nationwide, blackbirds, orioles and grackles including the tricolored blackbird have been confirmed as being susceptible to West Nile Virus (WNV; www.cdc.gov/westnile/resources/pdfs/Bird%20Species%201999-2012.pdf). Adult tricolored blackbirds tested positive for WNV antibodies in 2009 but did not show symptoms of the disease (Meese *et al.* 2014). The impact of disease and parasites on breeding or wintering tricolored blackbirds is unknown. The Department recognizes the potential for these factors to significantly affect local populations of this highly-social species.

Competition from Other Species

The Department is aware that the great-tailed grackle (*Quiscalus mexicanus*) has experienced a population expansion in California, a phenomenon which ultimately could negatively influence success of tricolored blackbird. Meese *et al.* (2014) reported that grackles may be aggressive towards nesting tricolored blackbirds but did not consider the impacts severe. White-faced ibis (*Plegadis chihi*) may destroy tricolored blackbird nests when in the process of constructing their own nests. Additionally, they are known to prey on eggs of the tricolored blackbird (Meese *et al.* 2014). Marsh wren (*Cistothorus palustris*) may destroy eggs in tricolored blackbird nests if the nest is in proximity to its own nest (Meese *et al.* 2014).

Brood Parasitism

The Petition does not include information about impacts of brood parasitism on the tricolored blackbird. The brown-headed cowbird (*Molothrus ater*) is known to rarely parasitize nests of tricolored blackbirds (Meese *et al.* 2014). The Department does not consider brood parasitism to be a major threat to the tricolored blackbird.

Killing of Blackbirds to Protect Crops

Meese (2009, 2014) discussed shooting of blackbirds to protect agricultural crops as a potential threat to the tricolored blackbird. The Petition discusses the historical lethal control of blackbirds to protect crops and considers historical poisoning and shooting of tricolored blackbirds to have contributed to the long-term decline of the species. The Petition states that continued killing of blackbirds to protect ripening rice in the Sacramento Valley is a known but unquantified source of mortality. The Department agrees that an unknown number of tricolored blackbirds are likely killed each year due to activities that are implemented to protect agricultural crops. Meese (2009) reported on the shooting of two tricolored blackbirds by a rice farmer in Butte County. A depredation order under the federal Migratory Bird Treaty Act allows for the control of several species of blackbirds and corvids in agricultural situations without a permit from the U.S. Fish and Wildlife Service (USFWS) (when birds are causing serious injuries to

agricultural or horticultural crops or to livestock feed;50 CFR 21.43). Although tricolored blackbird is not covered by the depredation order, it is possible that misidentification of tricolored blackbirds when they occur in mixed flocks in the fall and winter leads to unintentional mortality of the species. The number of tricolored blackbirds killed annually is unknown. Landowners are required to report on activities and on the number of birds captured or killed under the depredation order, and a recent revision to the depredation order requires expanded reporting on non-target species (50 CFR 21.43, Nov 5, 2014). This may lead to an increase in knowledge upon which an assessment of impacts to non-target species, including tricolored blackbird, can be based.

While the Department disagrees with portions of the Petitioner's assessment of the factors affecting the tricolored blackbird's ability to survive and reproduce, the Department nonetheless concludes that the Petitioner has submitted sufficient information to demonstrate or create a reasonable inference that tricolored blackbirds are subject to numerous threats that may have the potential to adversely affect their ability to maintain self-sustaining populations within California.

Degree and Immediacy of Threat (termed "Degree and Immediacy of Threat and Request for Emergency Action" in the Petition, beginning on page 49; also covered, in part, under the heading "Factors Affecting the Ability to Survive and Reproduce", in the Petition, beginning on page 36)

The Petition provides adequate information regarding degree and immediacy of threat under two headings as indicated above. The Department finds the following key factors pose serious threats to the tricolored blackbird:

Breeding Habitat Loss and Fragmentation: The Department believes that habitat loss and fragmentation have resulted in a decline in the population of the tricolored blackbird since the 1930s, and continues to affect the species. DeHaven (2000a) stated that, "as measured by their breeding abundance, Tricolored Blackbirds have experienced a long-term population decline which continues today. Much of this decline stems from losses of breeding habitat to urban expansion and changes in agricultural land uses. Conversions of pasturelands, both irrigated and non-irrigated, and hay crops (alfalfa and others) to vineyards and orchards has been, and will likely continue to be, one of the most damaging forms of land-use change [to the tricolored blackbird]. Because of the severe losses of habitat, which are likely irreversible, there is little likelihood that any historic population level - or indeed, even a more recent level can ever be restored and maintained". Nesting substrate at known breeding colony sites continues to be lost on a regular basis; statewide survey participants regularly report on loss of nesting substrate when visiting historical breeding locations.

Loss of Upland Foraging Habitat: Because of their colonial breeding nature, foraging habitats that support highly productive insect populations are required for successful reproduction. For much of the year, adult tricolored blackbirds feed mainly on grains and other plant seeds (Crase and DeHaven 1978). However, females require large amounts of insect prey for egg production and both sexes provision young with insects during at least the first nine days of development (Crase and DeHaven 1977). Colonies consisting of many thousands of birds require an immense amount of insect prey during short

windows of time, putting a large burden on the landscape surrounding the colony. Habitats that can support high insect production include grasslands, pasture, and certain agricultural crops. These land cover types are regularly converted to incompatible land cover types such as orchards, vineyards, and urban development as agricultural practices evolve and cities continue to expand in the Central Valley. With regular loss of breeding substrate and foraging habitat, the co-occurrence of these essential habitat requirements across the landscape becomes less and less common, resulting in limited places where tricolored blackbirds can successfully breed.

The Department was not able to thoroughly examine information on conversion of suitable breeding and foraging habitat to unsuitable land cover types. The degree to which urbanization and conversion of compatible agricultural land to incompatible crop types continues to impact the species has not been assessed. This area requires additional review and analysis.

Loss of Reproduction to Triticale Harvest: The Department believes that the use by the tricolored blackbird of agricultural fields, where reproduction often fails due to human activities and to increased predation, may be contributing to the population decline. When other habitat is unavailable, agricultural fields may provide attractive alternative habitats for breeding and/or foraging. DeHaven (2000b) wrote, “Today, a new phenomenon – [tricolored blackbird] nesting in grain silage fields of dairies – has emerged. Unfortunately, such fields are often subject to harvest (done in relation to moisture content of the forage) while nesting tricolored blackbirds are still present. This may cause both nest destruction and direct mortality”. The tricolored blackbird experiences “losses [of reproductive effort] to crop-harvesting activities and insufficient insect food and suffer habitat losses to land conversions from rangeland to vineyards, orchards, other agricultural crops and urban development” (Meese *et al.* 2014). In the 2000 survey, Hamilton (2000) found that over 90% of all tricolored blackbird observed foraging activity was on private property. Hamilton (2003) wrote that his “measurements of reproductive success (mean number of fledglings per successful nest, per colony) reveal huge population sinks that may be depleting tricolor numbers. Massive reproductive failures in the agricultural fields of the San Joaquin Valley in particular suggest that the reproductive potential of this species may be swamped by losses to agricultural harvesting practices. This relationship is exacerbated by the attractiveness of productive agricultural habitats to breeding tricolors despite repeated reproductive failures”. Cook and Toft (2005) found that reproductive success varied among nesting substrates and that significantly more offspring were fledged per nest in non-native Himalayan blackberry and that many occupied sites have been lost in recent years. They concluded that silage colonies, when not destroyed by harvest, fledge more young per nest than do native marsh habitat and that this recruitment could be considerable and play a large role in stabilizing the population.

Of the nesting substrates used by tricolored blackbirds, triticale is unique in that it is available in abundance each year in the San Joaquin Valley, and in recent years, many of the largest colonies have occurred on triticale fields. The increase in dairies in the San Joaquin Valley and the associated expansion of triticale fields may have contributed to a shift in the center of population abundance from the Sacramento Valley to the San Joaquin Valley over the last few decades. The breeding season corresponds to the period of harvest for the triticale crop, and many colonies are disturbed each year due to the harvest of the nesting substrate before the nesting cycle is completed. Harvesting destroys

the nests and any eggs or young present in the nests, often resulting in zero productivity for the nesting effort. Fifty percent of the breeding tricolored blackbirds detected in California in 2008 were observed nesting in triticale fields during the 2008 statewide survey (Kelsey 2008).

Low Reproductive Success: Recent research has shown that most of the larger tricolored blackbird colonies in the Central Valley exhibited chronically low reproductive success from 2006 to 2011 (Meese 2013), even at sites not harvested during the breeding period. Incidental observations in 2012 and 2013 suggest that this trend has continued. Meese (2013) linked reproductive success at Central Valley colonies to relative abundance of insect prey at foraging sites. Insect prey availability may be suppressed by drought, changes in surrounding vegetation, or by application of pesticides. Regardless of cause, low insect abundance near colonies in the Central Valley appears to have resulted in very little reproductive output from the largest colonies in the state, at least in recent years. The limited reproduction at the largest colonies over a seven year period has likely resulted in an age structure skewed toward older adults. The maximum life span observed in tricolored blackbirds is 12 years (Meese *et al.* 2014), and much of the current population may be approaching or exceeding the average life span.

Predation: The Department believes that predation is a threat to the success of some tricolored blackbird nesting colonies. Small areas of native vegetation are recognized to be especially vulnerable to predation, especially if they are near sites at which predator populations are at artificially-high levels due to the availability of augmented food sources from human activities.

While the Department disagrees with portions of the Petitioner's assessment of the relative degree and immediacy of threats to the tricolored blackbird, the Department nonetheless concludes that the Petitioner has submitted sufficient information to demonstrate or create a reasonable inference that the threats tricolored blackbirds are subject to have the potential to adversely affect their ability to maintain self-sustaining populations within California.

Impact of Existing Management Efforts (in the Petition, beginning on page 50)

The Petition presents information on existing efforts as well as past attempts to manage or conserve the tricolored blackbird.

Silage Buy-outs and harvest delays

The Petition states that the existing but intermittent practice by the USFWS and the Department, to purchase agricultural crops in which the tricolored blackbird is nesting, is not adequate to prevent the loss of tricolored blackbird colonies. The USFWS has contributed funding for crop payment in several years. The first such purchases were in 1993 and 1994, preserving several large colonies in Fresno, Kings, and Tulare counties. Earlier, in 1992, interested persons intervened to prevent destruction of tricolored blackbird colonies by agricultural operators. Hamilton *et al.* (1995) calculated that interventions in 1992, 1993, and 1994 may have been responsible "for the presence of over 75,000 adult Tricolored Blackbirds in 1995 [which had been nestlings in the three previous years], about 25% of the known population". One or both of the wildlife agencies and/or the Natural Resources Conservation Service (through the

Delayed Silage Harvest EQIP program in 2012-2014) have contributed to crop purchases/harvest delay in each year from 1999 through 2014. In 2004, silage purchases by the Department and USFWS protected three colonies totaling over 100,000 adult tricolored blackbirds. From 2005-2009, silage buy-out and/or harvest delay contributed to the productivity of the species, varying annually. During this time period, 11 breeding colonies consisting of 546,000 birds subsequently produced 396,025 young through this process (Meese 2009b).

DeHaven (2000a) questioned the biological value (to the tricolored blackbird) of having State and federal agencies pay dairies to delay or forgo silage harvesting in fields in which the tricolored blackbird is nesting. DeHaven (2000b) commented that providing monetary payments to dairies “sets an undesirable precedent”. He recommended that tricolored blackbirds be lured away from nesting in grain and silage fields through “making key San Joaquin Valley dairy silage fields less attractive to breeding tricolored blackbirds; and providing alternative, low-risk nesting substrates in these areas” (DeHaven 2000b).

Tricolored Blackbird Working Group

Following the 1991 petition to list the tricolored blackbird under CESA, the Department committed to participation on a multi-stakeholder working group to plan for and implement conservation actions. This resulted in the first of many statewide surveys, the first silage buyout to protect a breeding colony, and ongoing research. However, the working group made limited progress in developing comprehensive conservation measures for the tricolored blackbird and eventually dissolved in the mid-1990s. In 1997, a status update and management guidelines for the tricolored blackbird was completed as per Department and USFWS guidance (see Beedy and Hamilton 1997). The species was again petitioned to be listed under CESA in 2004. The petition evaluation report by the Department stated there was sufficient information to indicate the petitioned action may be warranted; the Commission voted to reject the petition (Fish and Game Commission meeting, Feb. 3, 2005). A new multi-stakeholder Tricolored Blackbird Working Group was formed in 2005 and the group released a conservation plan in 2007 detailing the conservation and management, research and monitoring, data management, and education and outreach goals for the species (TBWG 2007). Working group members, including the Department, signed a Memorandum of Understanding (agreeing to implement the actions in the conservation plan. Most of the goals and objectives in the plan are still relevant today. Progress toward meeting objectives by Department, USFWS, and partners on the working group have focused on expanding knowledge through research and protecting large breeding colonies that are threatened by harvest of triticale fields. New information gathered during many years of research can inform the modification of specific tasks, but the broader goals in the conservation plan remain relevant. The tricolored blackbird has been a high priority California Species of Special Concern since the list was revised in 2008 and the Department has continued to pursue conservation actions for the species.

Among the conservation and management goals in the 2007 Conservation Plan for the Tricolored Blackbird, the goal to “*Protect silage-nesting tricolors until sufficient, permanent breeding habitat is available to maintain viable self-sustaining populations*” is considered to be a near-term need until adequate natural habitats can be protected or restored and tricolored blackbirds are no longer

dependent on silage crops. With the declining population and the continued use of triticale by large colonies, this goal remains a high priority. The state and federal governments have provided funding to implement voluntary efforts to compensate willing farmers for delaying harvest until after the breeding season. These efforts have resulted in the protection of several large colonies, but colonies continue to be lost to harvest. Although protection of breeding colonies does not represent a permanent solution to the loss of colonies to harvest, it has resulted in the protection of hundreds of thousands of nests. Without these protective measures, the population likely would have experienced even more dramatic declines in recent years.

The long-term goal to “*Protect, create, restore, and manage habitats needed to support viable, self-sustaining populations of tricolors*” is considered to be of highest priority for species conservation (N. Clipperton, pers. comm., based on priority setting exercise at May, 2014 Tricolored Blackbird Working Group meeting). Some progress has been made on implementing this goal, including an assessment of opportunities for enhancing habitat on Department-owned lands, incorporating the needs of multiple species, including tricolored blackbirds, into habitat incentive programs for private lands, and management of wetland habitat on Department and National Wildlife Refuge lands to benefit nesting tricolored blackbirds. Until more extensive habitat restoration and protection of both nesting substrate and high quality foraging habitat can be achieved, the population will likely remain small and ongoing efforts to protect colonies on agricultural fields will likely need to be continued.

Species of Special Concern

The Department issued the first Bird Species of Special Concern in California report in 1978 (Remsen 1978). Although the tricolored blackbird was not included on the special concern list, it was recommended for further study to determine whether the decline of the tricolored blackbird noted by DeHaven *et al.* (1975a) was continuing. After further decline of population numbers in the 1980s, the Department added the tricolored blackbird to its list of Bird Species of Special Concern in 1990. The most recent revision of the list found the tricolored blackbird merited inclusion in the highest conservation category (Shuford and Gardali 2008).

While the Department questions portions of the Petitioner’s assessment of the impacts of existing management efforts, the Department nonetheless concludes that the Petitioner has submitted sufficient information to demonstrate or create a reasonable inference that those management efforts may not be adequate to maintain self-sustaining populations in California.

Suggestions for Future Management (in the Petition termed “Recommended Management and Recovery Actions”, beginning on page 54)

The Petition contains specific suggestions for the future management of the tricolored blackbird (Beedy 2014, Meese 2014). The Department believes these recommendations and others (e.g., Beedy and Hamilton 1997, Hamilton *et al.* 1999, DeHaven 2000a, DeHaven 2000b, Hamilton 2003, TBWG 2007, Beedy 2008) should be carefully considered, evaluated for efficacy and prioritized for implementation.

The Tricolored Blackbird Conservation Plan (TBWG 2007) included many of the following management and research recommendations:

1. Incorporate population and habitat conservation actions for the Tricolored Blackbird in habitat conservation plans, natural community conservation plans, and other multispecies conservation plans and in ongoing private land agricultural and conservation easement programs.
2. Restore habitat by promoting the growth of secure nesting substrates (e.g., nettles, thistles, and other naturally armored native plants) near productive foraging habitats to increase the potential carrying capacity for this species. Restored nesting habitats should be situated on protected public and private lands, especially in agricultural areas of the Central Valley and surrounding foothills.
3. On refuges and other public lands that support Tricolored Blackbird colonies in irrigated pastures, manage irrigation to permit a sequential flooding regime in adjacent land parcels at the time they are breeding to enhance insect productivity. Incorporate carefully managed grazing of these parcels to maintain an average vegetation height of 15 cm to provide optimal Tricolored Blackbird foraging habitat.
4. Lure nesting Tricolored Blackbirds, when possible, away from dairies and other agricultural operations to secure habitats where they are more likely to succeed; where colonies establish, defer harvest of grain and silage crops, if feasible, until after the breeding season.
5. Investigate predator-prey relationships, especially the ongoing effects of black-crowned night-herons and coyotes and the responses of individuals and colonies to predators.
6. Perform demographic research to determine whether reproductive success of freshwater marsh colonies varies with respect to wetland size and spatial relationships with other wetlands.
7. Analyze depletion of food resources by blackbirds near breeding colonies and quantify the extent and character of foraging habitats near colonies.
8. Evaluate habitat selection mechanisms and the relative value of alternative foraging habitats to breeding birds.
9. Use banding and radiotelemetry to measure adult and juvenile dispersal from several colonies.
10. Evaluate the distribution, resource utilization, and survival of wintering birds.

Finally, spatial analyses to estimate losses in nesting substrate or foraging habitat have not been conducted. Data have not been systematically collected, but incidental observations during species surveys are available and could inform an analysis of recent changes in extent and distribution of nesting substrate. Agriculture land use data for the Central Valley could be used to estimate changes in foraging habitat over time (e.g. DWR land use data; <http://www.water.ca.gov/landwateruse/lusrvymain.cfm>).

Habitat Necessary for Survival (“Kind of Habitat Necessary for Survival” in the Petition, beginning on page 30)

The Petition describes the existing situation in which the tricolored blackbird nests in native vegetation, introduced vegetation, and crops. For successful breeding, tricolored blackbirds require nesting substrate, a water source, and an extremely abundant insect food source in proximity to the breeding colony. Historically, tricolored blackbirds nested in natural wetlands of the Central Valley and in a few

native upland plant species; early declines in the population most likely resulted from declines in this natural habitat. As extensive wetlands and other native substrates were lost, tricolored blackbirds expanded use to alternative nest substrates, including nonnative upland plants such as Himalayan blackberry, milk thistle (*Silybum marianum*), and the agricultural crop triticale, which is grown as a food source for dairy cattle. Historically, most colonies were in freshwater marshes. Meese *et al.* (2014) wrote that, historically, “almost 93% of 252 breeding colonies observed in the Sacramento Valley, from 1931 to 1936, were in freshwater marshes dominated by cattails (*Typha* spp.) or bulrushes (*Schoenoplectus* spp.); remaining colonies were in willows (*Salix* spp.), blackberries (*Rubus* spp.), thistles (*Cirsium* and *Centaurea* spp.), and nettles (*Urtica* sp). By the 1970s, DeHaven *et al.* (1975a) found that only 53% of colonies in the Sacramento and San Joaquin valleys were in cattails and bulrushes. Since at least the 1970s, the breeding habitat of the tricolored blackbird has included upland and agricultural areas (DeHaven *et al.* 1975a, Beedy *et al.* 1991). Hamilton (2003), citing Kreissman (1991 - not examined), wrote that “most Central Valley grasslands are now gone, lost to cattle rangeland, irrigated crops (pasture, row crops, orchards, rice , grapes) and development. Modern tricolor habitats are agricultural land, especially rice and nearby duck club cattail and bulrush marshes, dairies and their associated hay fields and cattle rangeland wherever there is suitable nesting habitat and water”. Hamilton (2003) stated that “Tricolored blackbird colony sites require nesting substrates offering protection from predation. These include emergent marsh vegetation (cattails, *Typha latifolia*, less frequently *T. angustifolia*), bulrushes (*Schoenoplectus californicus*, *S. acutus*) and Himalayan blackberries (*Rubus discolor*) thickets, thistle, and nettles. Tricolored blackbirds do not settle in grain, hay, silage, or cut-feed fields before grain forms seed awns or spiny or prickly weeds develop in them. We assume that grain fields are identified as spiny vegetation by tricolors”.

The Department concludes that the Petitioner has submitted sufficient information to describe the habitat needs for tricolored blackbird.

Distribution Map

The distribution map included in the Petition on page 61 contains a sufficient illustration of the California breeding and winter ranges of the tricolored blackbird. The Department further recommends assessment and incorporation of other existing data sets (e.g., eBird, California Natural Diversity Database, Christmas Bird Count, Breeding Bird Survey) which may have additional tricolored blackbird records into the distribution map.

Availability and Sources of Information (in the Petition, beginning on page 57)

The Petition includes most of the major references on the tricolored blackbird.

CONCLUSIONS

The tricolored blackbird is the most colonial land bird in North America and nearly is endemic to California, with more than 99% of the total breeding population in the State. As a colonial breeder, the tricolored blackbird nests in a small number of larger colonies comprising a significant proportion of the population. The concentration of a high proportion of the total population at a few sites increases the

risk of a catastrophic effect on the species as a whole, due to nesting failure in, or destruction of, a single large colony.

At least three major factors have operated, and continue to operate, to reduce the population of the tricolored blackbird. These major threats to the tricolored blackbird are as follows:

Loss and Fragmentation of Habitat: This factor appears to be the most serious one threatening the tricolored blackbird. The availability of suitable nesting and foraging habitat, including food resources, appears to limit the population. Local declines across the range of this species over time apparently have cumulatively resulted in the decline in tricolored blackbird numbers since the 1930s. The loss of habitat continues, both in the Central Valley and in southern California. As the amount of habitat is reduced through human activities, the tricolored blackbird population likely will continue to decline.

Agricultural Operations: The shift in breeding habitat use by the tricolored blackbird from native habitats to silage and grain fields makes these colonies vulnerable to destruction during crop harvest. Nest abandonment also can result from the disturbance of nearby human activities.

Predation: Predators attack colonies of any size but are especially effective in reducing or eliminating the reproductive effort of small colonies in remnant native vegetation such as cattails. Predation can have a significant effect on the reproductive success of tricolored blackbird breeding colonies.

Having reviewed and evaluated relevant information, including the material referenced in the Petition and other information in the Department's possession, the Department believes there is sufficient scientific information available at this time to indicate that the petitioned action may be warranted. (See Fish & G. Code, § 2073.5, subd. (a)(2); Cal. Code Regs. tit. 14, § 670.1, subd. (d).)

Addendum to the California Department of Fish and Wildlife March 2015 evaluation of the petition from the Center for Biological Diversity to list the Tricolored Blackbird (*Agelaius tricolor*) as endangered under the California Endangered Species Act

October 2, 2015

A petition from the Center for Biological Diversity (CBD) to list the Tricolored Blackbird as endangered under the California Endangered Species Act was submitted to the California Fish and Game Commission (Commission) on August 19, 2015. The petition is largely the same as the petition submitted to the Commission by CBD on October 8, 2014, with the addition of an addendum composed of two new relevant studies on the Tricolored Blackbird. Of these studies, the addendum made the following statement, “Holyoak et al. (2014) analyzed declines in breeding success of the Tricolored Blackbird and Meese (2015) reviews and evaluates efforts to document the status of the Tricolored Blackbird since 1931”.

This addendum to the California Department of Fish and Wildlife’s (Department) evaluation of the petition discusses these references, along with additional references and information that the Department has received since the previous petition evaluation of March 2015. This new information is presented as addenda to selected sections of the petition evaluation, with a short summary on each section. The review of the new information does not change the Department’s previous recommendation. The Department has determined there is sufficient information to indicate that the petitioned action may be warranted, and the petition should be accepted and considered.

Population Trend

Graves et al. (2013) performed the first statistical evaluation of trends in the average size of Tricolored Blackbird colonies using data that was compiled from a variety of sources from 1907-2009. Average colony size, rather than total abundance, was used as the metric to evaluate trends in order to account for the effects of sampling effort on total abundance counts. Graves et al. (2013) found a significant decline in the average colony size from 1935-1975, with the average colony size declining by more than 60% during this time period. Despite large amounts of data on colony sizes from the 1980s onward, no significant decline was detected in average colony size from 1980-2009. The finding of a decline from 1935-1975 supports the conclusion in the petition that a large population decline occurred between the 1930s and 1970s. The second finding is counter to reports of declines in the literature which are cited in the petition for portions of the 1980-2009 time period (e.g. Beedy et al. 1991, Hamilton 2000, Meese 2014). However, the statistical evaluation conducted by Graves et al. (2013) used data only through 2009, and so does not include much of the time period during which a recent population decline has been asserted (2008-2014).

The trends in average colony size are interpreted by Graves et al. (2013) to reflect changes in the total population size, which requires important assumptions. First, the various levels of sampling effort over the years 1907-2009 have been sufficient to produce estimates of average colony size that are reflective of all colonies across the range of the species in a given year. Second, the average colony size is related

to the total population size of the Tricolored Blackbird. The first assumption is difficult to evaluate for data collected using a variety of approaches over a very long time period with unknown levels of precision, although Graves et al. (2013) provided some support for the assumption in that average colony size was not strongly related to the total number of sites sampled. The second assumption is often made in reports of Tricolored Blackbird population trends, but the Department is not aware of a thorough evaluation of the assumption. There is reason to question the second assumption, at least over a long time period during which the species has possibly shifted its center of abundance during the breeding season from the Sacramento to the San Joaquin Valley, and began making use of a novel and abundant nesting substrate (triticale and other grain crops) which have supported extremely large colonies (40 times larger than colonies in other habitats during the last 20 years; Graves et al. 2013). Therefore, it is not surprising that a decline in average colony size would not be detected during the 1980-2009 time period, regardless of any trend in the total population size.

Holyoak et al. (2014) found a rapid decline in breeding site occupancy using data collected from 2005-2011. This is a period during which statewide surveys indicated a decline in total population abundance. Occupancy rates are a balance between rates of site colonization (establishment of new colony sites or recolonization of existing but recently unoccupied sites) and the rate at which colony sites cease being used. Holyoak et al. (2014) found that use ceased at 66% of existing sites each year, compared with 21% of sites being colonized. This is consistent with a declining population, but Holyoak et al. (2014) acknowledged that a reduction in occupancy could also result from an under-recording of site colonizations.

Meese (2015) discusses many of the same studies on population status that were included in the petition and discussed in the Department's petition evaluation. Meese (2015) emphasized the same two groups of statewide surveys that were considered in the Department's petition evaluation (1994, 1997, and 2000; 2008, 2011, and 2014), although Meese also discussed the 2005 statewide survey with the earlier group of survey years. The Department's petition evaluation did not discuss the 2005 survey effort because no report was produced describing the survey and its results; there does not appear to be any record of the amount of effort or scope of the 2005 survey (e.g. number of participants, number of sites visited, type of training provided) because the only record is a spreadsheet of occupied sites with estimates of colony size. The petition states that "surveys conducted in 1994, 1997, and 2000 were similar enough in scope and effort to enable the detection of a significant downward trend", which is supported by statements by the researcher who helped lead these surveys (Hamilton 2000). In contrast, Meese (2015) states that the results of these surveys are not directly comparable because of differences in methodology, level of effort, geographic completeness, and differences in data management and documentation. Meese (2015) contrasts these inconsistencies with the more consistent methods used during surveys of 2008, 2011, and 2014. As stated in the Department's petition evaluation, a fuller assessment of the available data from all survey years would be conducted during a status review to determine the degree to which each survey can inform the status of the Tricolored Blackbird.

Meese (2015) also presented regional trends in populations for recent years. The San Joaquin Valley experienced the second largest estimated proportional decline, declining 78% from 2008-2014. The San Joaquin Valley also had by far the largest decline in total number of Tricolored Blackbirds observed,

dropping by more than 260,000 birds over this time period. Numbers of birds observed in other regions varied, with modest net increases observed in three regions during the 2008-2014 time period. The total net increase observed in these three regions was less than 19,000 birds.

Summary: These additional studies have demonstrated that average colony size has declined since the 1930s, that breeding site occupancy has declined from 2005-2011, that large declines have recently occurred in the center of breeding abundance in the San Joaquin Valley, and have provided additional support for a statewide population decline since 2008. These studies collectively support the Department's previous conclusion that the Tricolored Blackbird population has experienced a long-term decline and that declines may have continued in recent years.

Response to selected public comments on population trend data received by the Commission

The Department is aware of disagreement expressed to the Commission through public comment regarding interpretation of existing survey data. Selected comments on this topic are summarized below, followed by responses.

Comment: While declines in numbers have been recorded in some areas of the state, increases have been recorded in other areas.

Although it is true that trends in abundance do not indicate recent declines in all regions of the state, as discussed above, a large decline was observed in the center of abundance for the species in the San Joaquin Valley, with an estimated decline of more than 260,000 Tricolored Blackbirds in this region from 2008-2014. A net decline of more than 6,000 birds was observed in one additional region. Modest net increases in three regions of the state do not offset these declines, with a total increase in those regions of less than 19,000 birds.

Comment: The Department failed to report that throughout the survey area the number of sites occupied by the Tricolored Blackbird in 2008, 2011, and 2014 were similar.

It is true that the number of occupied sites during the last three statewide surveys has been relatively stable, and the Department did not report this information in the March 2015 petition evaluation. However, this was observed despite the fact that there was a substantial increase in the number of sites visited during each successive survey in order to locate as many occupied sites as possible. While the number of sites surveyed increased, this did not result in an increase in the number of occupied sites observed as would be expected. A historical relationship between number of occupied sites and number of sites surveyed is supported by the number of occupied sites observed (≤ 71) during statewide surveys conducted in 1994, 1997, and 2000 when the total number of sites visited did not exceed 206, compared to a larger number of occupied sites observed (138-155) during recent surveys as the number of sites surveyed increased from 361 to 802 (Meese 2015). While the number of occupied sites remained relatively stable during the most recent three statewide surveys, the average size of colonies declined dramatically over this period, reflecting a decrease in the total number of birds observed in all known occupied sites. Reporting the number of occupied sites alone, without considering the number of birds at each site, does not provide an assessment of population trend.

Comment: The Department dismissed pre-2008 abundance data and focused on a purported decline in census numbers from 2008-2014.

The Department's petition evaluation discussed the major efforts to assess the status of the Tricolored Blackbird in the 1930s and the 1970s. The Department also stated that ten Tricolored Blackbird surveys had been conducted since 1994, while also pointing out that methodology, including survey effort, geographic coverage, and number of participants, had varied across surveys making it difficult to directly compare results from many of the survey years. The Department pointed out that two groups of survey years are generally described as being most consistent and therefore more comparable among years (1994, 1997, and 2000; 2008, 2011, and 2014), while also acknowledging some inconsistencies between the earlier group of survey years. The Department did not dismiss data from surveys conducted pre-2008, but rather evaluated the data to determine whether the available data suggest that a decline had occurred, and whether a decline may be ongoing. The Department concludes that there is enough information to indicate that a population decline has occurred and may be ongoing, and to warrant a fuller assessment of the available data from all survey years during a status review.

Comment: Statewide surveys have covered only a portion of the range of the species and exclude large areas known to be occupied. Siskiyou and Imperial counties were provided as examples of areas of the species breeding range that was overlooked.

While true that attempts at a complete census of the Tricolored Blackbird population in California during statewide surveys has not and cannot be fully achieved, the 2008-2014 surveys included coverage of most of the range and thorough coverage of those areas that have always supported the majority of the Tricolored Blackbird breeding population. Although the results of the statewide surveys can therefore not be interpreted as the total number of Tricolored Blackbirds in the state, the consistent effort and thorough coverage allows for a reasonable index of abundance with which to track trends in the population. In statewide surveys in which Siskiyou County was included, it has held only 0-0.2% of the total estimate of birds observed. The Department is not aware of any confirmed breeding records for Imperial County. The Department found that the recent statewide surveys have sampled a large portion of the range, and found no evidence suggesting that large areas of the range supporting a large portion of the population have been excluded from recent statewide surveys.

Comment: Fifty years of survey data indicate that overall Tricolored Blackbird numbers have been relatively stable.

This conclusion was reached through an invalid comparison of data collected over long time periods using dramatically different approaches and covering highly variable portions of the Tricolored Blackbird breeding range. Data from surveys conducted in many years from 1969-2014 were plotted on a single graph and used to suggest a conclusion that the Tricolored Blackbird population has been relatively stable over the past 50 years. This presentation of data and conclusion fails to acknowledge the variability in survey approaches and areas covered. Examples of data discussed in public comment and displayed graphically to support the conclusion of long-term population stability include:

- Surveys conducted by DeHaven et al. (1975) from 1969-1972 which were conducted by a small number of individuals and included limited coverage of the range of the species.

- Surveys conducted in the 1980s that consisted of intensive observation at only seven colonies, and irregular trips to only seven counties to search for breeding colonies.
- A survey conducted in 1999 which was stated to be incomplete by the researcher who helped organize the survey.
- A survey conducted in 2001 which followed a completely different method than other statewide surveys (e.g. only 48 sites were surveyed and sites were visited throughout the breeding season instead of being restricted to narrow time period).
- A survey conducted in 2004 in which only colony sites were visited that had historically supported more than 2,000 birds, only sites in the Central Valley were visited, and for which no training was provided.

Due to the high variability in the methods and scope of these surveys, the resulting number of Tricolored Blackbirds observed in each year cannot be expected to collectively represent an accurate trend in the population size over the last 50 years. Therefore, the conclusion reached by the commenter is not supported by these data. As stated above, a fuller assessment of the available data from all survey years is warranted, and the Department would carry out this assessment during a status review.

Comment: Estimation of the number of Tricolored Blackbirds at breeding colonies is subject to large margins of error.

It is true that the estimates of colony sizes collected during statewide surveys are subject to some amount of error, and that the census approach used for statewide surveys has not provided an estimate of that error. The potential for error in colony size estimation has been acknowledged by those that developed survey protocols, and the protocols have incorporated measures that attempt to limit the error in estimation. These measures include training provided to survey participants, use of the same survey participants from year to year when possible, and estimation at large colonies by species experts with experience estimating the size of large colonies. This said, the error at each colony site and the overall error in each census number are unknown, and ongoing efforts to develop a statistical sampling scheme for monitoring the Tricolored Blackbird population will incorporate methods to produce error estimates (Meese et al. 2015). Nevertheless, the results of statewide surveys conducted between 2008 and 2014 provide the best available information with which to evaluate population trend in recent years.

Comment: The Department's statement that a rigorous and consistent methodology has been used since 2008 is false. This comment states that the survey protocol was altered between 2011 and 2014, that precise locations were not recorded at all sites surveyed, and that the requirement to survey each site for at least 15 minutes was not met.

Modifications to the survey protocol prior to the 2014 statewide survey were intended to provide additional background information and to clarify survey requirements. No substantial changes to the methods were made. The request that each site be visited for at least 15 minutes was one of the changes made prior to the 2014 survey. This change was added considering that novice observers might not be aware that breeding colonies can sometimes be less conspicuous (i.e. during incubation) and to ensure sufficient observation time to determine whether a site is occupied. In practice, this requirement

was often unnecessary because colony sites are often very near public roads or nesting habitat may no longer be present, allowing for a quick assessment of site occupancy. Regardless, survey times of less than 15 minutes at a site are not inconsistent with pre-2014 survey years. The criticism that site locations were not recorded at all sites is incorrect. All colony sites included in the statewide survey occur at known locations and coordinates for the locations are included in the Tricolored Blackbird data portal. Minor modifications to the survey protocol document were made between 2011 and 2014 and these modifications were not reported in the Department's March 2015 petition evaluation; however, these modifications did not result in an inconsistent survey approach.

Comment: The Department's statement that the number of colony sites visited in 2014 far exceeds any other survey is inaccurate because of invalid colony sites.

The commenter suggests that many of the sites surveyed have never been occupied by Tricolored Blackbird breeding colonies. This is not accurate; all colony sites in the Tricolored Blackbird portal have supported colonies. The suggestion that all sites added to a survey must be occupied during that survey year in order to qualify as a valid breeding site indicates a misunderstanding of the statewide survey and of the Tricolored Blackbird's dynamic breeding behavior.

The commenter points out a number of instances where historical Tricolored Blackbird colony sites are reported to no longer support suitable nesting habitat and uses these observations to suggest that the increase in number of sites visited from 2008-2014 (361-802 sites) does not represent a true increase in survey effort. In every statewide survey, a number of colony sites have been discovered that do not support suitable habitat, reflecting the ongoing conversion of breeding habitat. In many cases, a site might be unsuitable in a given year but may become suitable again in subsequent years (e.g. through regrowth of marsh vegetation or reestablishment of blackberry copses or weedy fields). The protocol for the statewide survey has continued to ensure as complete a census as possible by attempting to visit all sites that historically supported Tricolored Blackbird colonies. There are many sites that have been permanently converted through urban development or more intensive agricultural practices, and future database and survey protocol updates will need to determine how to deal with cases of permanent habitat loss. Regardless, the increase in number of sites visited does represent a more thorough search of the Tricolored Blackbird range in surveys conducted from 2008-2014. A closer evaluation of sites included in statewide surveys would be conducted by the Department during a status review.

Life History

Habitat Requirements

Holyoak et al. (2014) modeled occupancy rates in the most common nesting habitat types in recent years (2006-2011) and considered data on abundance, reproductive success, and frequency of use for each nesting habitat type to determine the net contribution of different nesting habitats to the Tricolored Blackbird population over time. Holyoak et al. (2014) found differences in occupancy rates across nesting habitat types, as well as in each of the factors that may influence average reproductive output (total predicted production of young for an average size colony in each habitat type) resulting in variation in the importance of habitats to Tricolored Blackbird reproduction. Four nesting habitat types

had sufficient sample size to make strong conclusions about average reproductive output, including Himalayan blackberry, nettles, marsh, and grain fields. Himalayan blackberry and nettle colonies exhibited higher than average reproductive output. High overall reproductive output for nettle colonies is a little unexpected given that there are very few colonies, which are of average size, in this nesting substrate. However, high rates of occupancy and reproductive success result in high overall reproductive output for nettle colonies. Himalayan Blackberry colonies exhibit average occupancy rates and size, but high reproductive success and the large number of colonies in this nesting substrate (second most frequent colony type after marshes) lead to high overall reproductive output. Grain field colonies exhibit average overall reproductive output, despite having low occupancy rates, low reproductive success, and a small number of colonies on grain fields each year; the very large size of grain field colonies increases the overall reproductive output. Of the four nesting habitat types assessed, marshes remain the most common nesting habitat used by breeding Tricolored Blackbird colonies in recent years. Despite this, average levels of occupancy, reproductive success, and size of marsh colonies have led to the lowest overall contribution to reproductive output among the four nesting habitat types.

Summary: The modeling work by Holyoak et al. (2014) provides valuable new information on the relative contribution of different breeding habitats to reproductive output, but does not consider the potential contribution of foraging habitat to reproductive success or occupancy. It is possible that nesting substrates reflect differences in foraging landscapes and insect abundance, which has been shown to influence reproductive success of Tricolored Blackbird colonies (Meese 2013). For example, Himalayan blackberry or nettle colonies may occur predominantly in areas that support high quality foraging habitat such as grasslands or pastures, which may contribute to the observed high reproductive output for these nesting habitat types. These possible relationships have not been fully explored.

Factors Affecting Ability of Population to Survive and Reproduce

Habitat Loss

The petition presents information on a long-term decline in California's native grasslands and several sources of anecdotal observations on foraging habitat loss. Citing Beedy and Hamilton (1997), the petition states that "native perennial grasslands—prime tricolor foraging habitat—have been reduced by more than 99% in the Central Valley and surrounding foothills". The degree to which this historical conversion of native grasslands to an agricultural landscape and non-native grasslands has impacted Tricolored Blackbirds is unclear. Richard DeHaven, the lead researcher on Tricolored Blackbird research conducted in the 1970s, participated in the statewide survey of 2000 and after surveying areas that he had surveyed 30 years prior stated that "[e]vidence of habitat loss, from urban expansion and agricultural conversions from such high-value (for Tricolors) uses as livestock forage production, to low- or no-value uses such as vineyards and orchards, was widespread" (DeHaven 2000). The petition states that conversions of pastures and grasslands to vineyards in the Central Valley has resulted in the recent loss of several large colonies and the elimination of extensive areas of suitable foraging habitat, but no quantification of this loss was provided. In addition to losses of foraging habitat, displacement of

colonies due to losses of breeding habitat at formerly occupied colony sites are reported regularly and several of these reports were included in the petition.

Two recent papers provide quantitative assessments of change in potential foraging habitat for Tricolored Blackbird during recent decades. Soulard and Wilson (2015) used Landsat satellite data to analyze land-use and land-cover change in the Central Valley from 2000-2010. This analysis was used to extend existing land-based monitoring to produce land change estimates from 1973-2010. Four dominant land classes included in the analysis were agriculture, grassland/shrubland, developed, and wetland. The largest trends in recent years from 2000-2010 were in the grassland/shrubland (decreasing trend) and developed (increasing trend) land cover classes. During this 10 year period, an estimated ~69,200 acres of grassland/shrubland were lost and ~90,500 acres of developed land were gained in the Central Valley. Most of this change occurred before 2007 when the global economic downturn slowed the rate of development. The agriculture land class experienced both increases (with inverse influence on grassland/shrubland) and decreases (loss to development) while experiencing a smaller net decline.

Over the larger time period from 1973-2010, Soulard and Wilson (2015) reported a grassland/shrubland decline of 22% (~476,900 acres), due mainly to increases in agriculture and development. However, losses of agriculture to development resulted in relatively little net change in area of agriculture in the Central Valley from 1973-2010.

Cameron et al. (2014) analyzed time series land cover data from the California Farmlands Mapping and Monitoring Program collected between 1984 and 2008 to evaluate rangeland habitat (grassland, shrubland, and woodland) conversion throughout California. About 483,000 acres of rangelands were converted during this time period, with urban and rural development and conversion to more intensive agricultural uses accounting for most (~89%) of the rangeland loss. The San Joaquin Valley region, which in recent decades has been the center of abundance for breeding Tricolored Blackbirds, experienced the largest amount of rangeland conversion.

Summary: These more recent quantitative assessments of loss since the 1970s and 1980s show an overall decline in habitat for Tricolored Blackbirds in recent decades, with declines continuing into recent years. Additional information on the type of agricultural crops that have replaced grasslands and rangelands, types and extent of conversions between agricultural crops in the Central Valley landscape over time, and a more focused assessment of change adjacent to known Tricolored Blackbird breeding colony sites, would provide a more complete idea of the effect on Tricolored Blackbird foraging habitat.

November 12, 2015

Mr. Sonke Mastrup
Executive Director
California Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Mr. Mastrup:

It has come to our attention that as of October 8, 2015, the California Fish and Game Commission formally accepted the Center for Biological Diversity's petition to list the Tricolored Blackbird, as well as the California Department of Fish and Wildlife's petition evaluation. It is further understood that the Commission will vote on whether or not to advance the species to candidacy status at the December 9-10th Commission meeting.

Conaway Ranch Preservation Group (CPG) questions the conservation benefits associated with the potential listing of the Tricolored Blackbird under the Endangered Species Act. Specifically, CPG is concerned by the absence of functional, long-term solutions for the rice community in Northern California. Currently, the proposed conservation solutions do not provide regulatory assurances for private landowners who are actively contributing momentous conservation benefits to the species.

Additionally, CPG is equally concerned about the potential for costly regulatory requirements associated with the listing, and their direct impact on private landowners.

CPG has distinguished itself as a conscientious and energetic pioneer in Tricolored Blackbird conservation leadership. Throughout the past 20 years, current and former ownership entities have implemented programs to attract and maintain wildlife resources while also balancing an effective farming operation.

Cooperative partnerships between CPG, the Wildlife Conservation Board, and the California Department of Fish and Wildlife resulted in the creation of an innovative conservation solution in the form of a 224.22-acre Tricolored Blackbird Agricultural Conservation Easement.

Conaway Ranch has an extensive history of working with scientist such as Dr. Robert Meese, State and Federal Agencies, non-profit organizations, and farmers to create practical, on-the-ground Tricolored Blackbird conservation practices that have provided significant biological benefits to the species. In fact, as many as 57,000 breeding adult Tricolored Blackbirds have been observed nesting on the Easement area.

Listing the Tricolored Blackbird within the state/federal process has the potential to create limitations for agricultural management opportunities, as well as increase production costs. Most importantly- listing the species without adequate regulatory assurances provides negative incentives for private landowners to actively manage lands for Tricolored Blackbird conservation.

Thank you for your attention to this matter.

Robert Thomas
Operations Manager
Conaway Ranch Preservation Group, L.L.C.

Re: Petition to List Tricolored Blackbird

Dear President Baylis:

The Santa Lucia Conservancy of Carmel, California supports listing the tricolored blackbirds (*Agelaius tricolor*) as a California endangered species and urges the Commission to trust the published science and vote to protect the species this year.

I am the Senior Wildlife Ecologist for the Santa Lucia Conservancy, a non-profit land trust responsible for the conservation and management of the 20,000 acre Santa Lucia Preserve in Carmel Valley, Ca. Historically a cattle ranch, the Preserve has several stock ponds used by nesting tricolored blackbirds each spring, and 5,000 acres of grasslands and oak savannas used by the birds throughout the year. In 2012 we began a long term research project banding our local nesting tricolored blackbirds. In addition to monitoring and banding we also began habitat improvement projects at both the nesting sites and across our grasslands. Despite these landscape level habitat restoration efforts we continue to see concerning declines in the number of birds returning to nest each year (Figure 1).

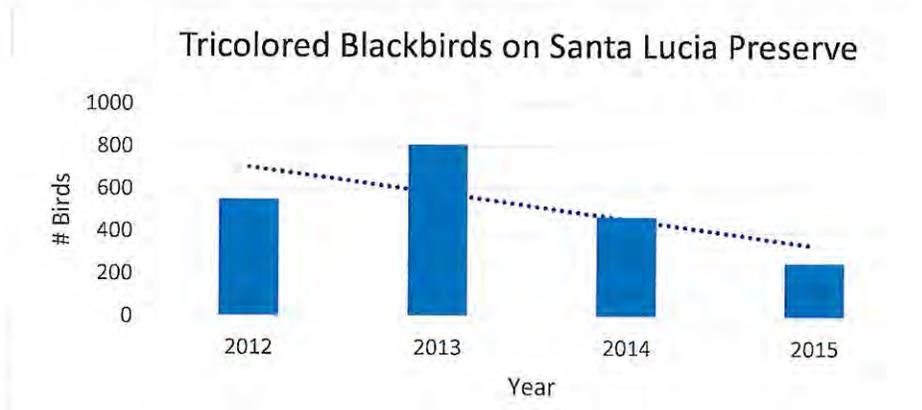

Figure 1. Count results from annual monitoring of colonial nesting on the Santa Lucia Preserve with negative population trend indicated.

The observed decline in our study population is consistent with the 91% decline reported across the Central Coast of California over the last 6 years [1]. Unfortunately, limited research has been conducted on the ecology and year round habitat requirements of the tricolored blackbird in this region. Even in the Central Valley, where most of the tricolored blackbird research has been conducted, little is known about the bird's habitat and resource requirements outside of the nesting season. Lacking this basic ecological understanding of the year-round needs of this species, the conservation community is poorly prepared to address the precipitous state-wide decline [1] without strong support, both legally and financially, by the State of California.

Across the known range of tricolored blackbirds, habitat loss by conversion to cultivated agriculture and development continues to threaten the species [2]. Within this calendar year we witnessed prime rangelands in northern Monterey County go from leased grazing lands to cultivated strawberry fields with wildlife hazing practices reported by neighbors (Figure 2).

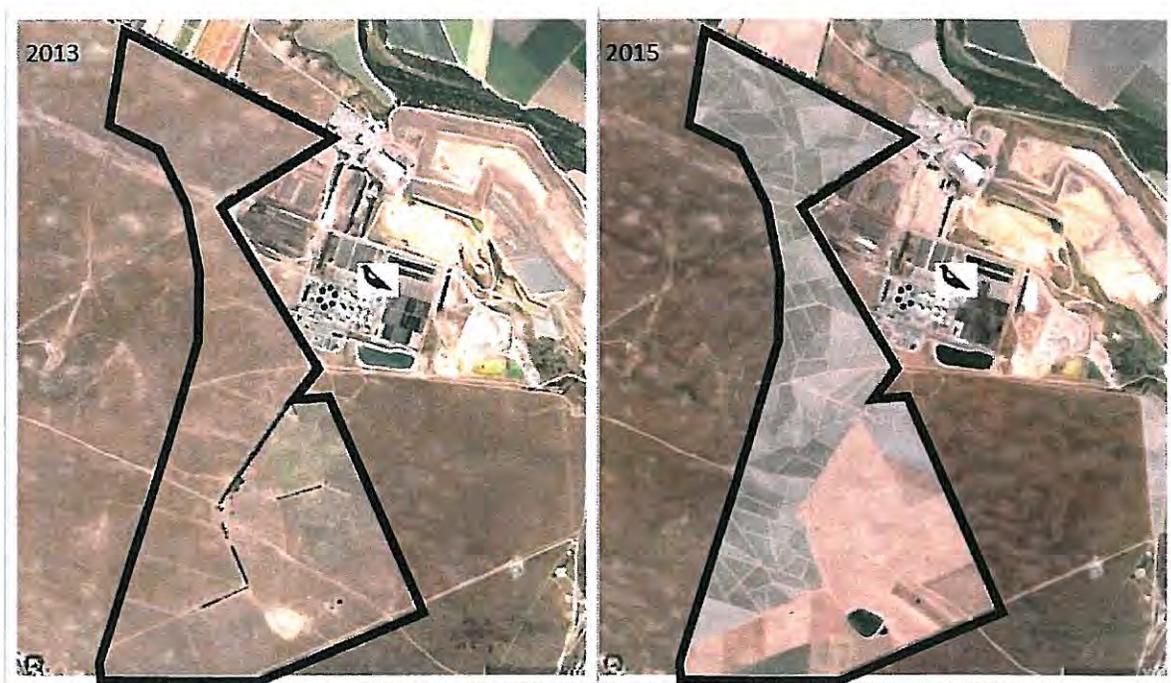

Figure 2. Habitat conversion. Google Earth image of rangelands recently converted (outlined area) to cultivated strawberry fields in Monterey County. Images are from 2013 (left) and 2015 (right), strawberry fields planted spring of 2015.

The site above was habitat regularly used by tricolored blackbirds in the non-breeding months, with the adjacent Monterey Regional Water Pollution Control Agency's treatment plant and the Monterey County waste disposal site providing additional resources for foraging. Since the conversion of the above acreage this past spring few tricolored blackbirds have been seen in the area. In the fall and early winter of 2014 tricolors were documented in mixed blackbird flocks of hundreds of birds at this site. Their occurrence was so regular that we had intended to begin fall/winter trapping at the water treatment plant this year, 2015. On recent site visits, the overall flocking blackbird population using this area is dramatically decreased, suggesting that the habitat conversion and wildlife hazing efforts

by strawberry cultivators may have discouraged the birds from using the area. The maximum count on any visit this year has been 20 tricolors, and the most recent visits have had no tricolored blackbird observations.

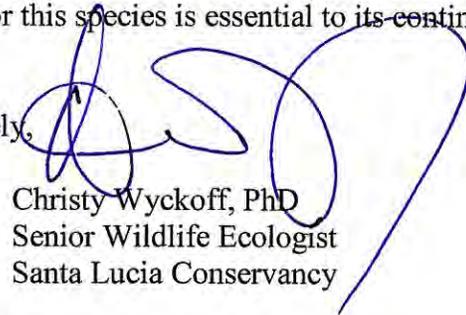

In addition to pressure from habitat loss, tricolored blackbirds are also negatively affected by the draconian landscape management techniques associated with a decade of aggressive food safety production requirements [3]. Since the 2006 spinach-associated *E. coli* O157 outbreak, growers have been under pressure to remove any habitat features that may attract wildlife, including ponds, edge habitat and riparian buffers. Additionally, toxicants, acoustic hazing and depredation permits are used to disperse and/or eliminate flocking birds and terrestrial mammals [4]. The habitat destruction, hazing, and lethal removal techniques are indiscriminant, likely resulting in unintentional take of protected species such as tricolored blackbirds. Recent studies have shown that this aggressive effort has not only been ineffective at improving food safety, but may also be making the issue of pathogens in the environment worse [5]. This issue plays out across the state and is largely unrecognized in the conservation discussion for tricolored blackbirds.

While the above information is based on observations and a small sample size, they are supported by the larger body of literature on tricolored blackbirds. As a species, tricolors are a challenge to comprehensively study and observe due to the multi-habitat requirements they demonstrate (nesting and foraging habitats differ as well as non-nesting season habitat requirements) and the migratory nature of their nesting behaviors (as reviewed by Graves et al. [6]). Additionally, in the non-nesting season they are routinely found in mixed flocks making estimates of the species difficult.

The Dairy Cares letter [7] submitted to you May 28th, 2015, tries to make a case that there is uncertainty about the long term trends of this species. However, uncertainty implies there is conflicting data suggesting either population declines or increases. On the contrary, there is no data suggesting overall population increases within the past 10 years. In the absence of data capable of supporting the population growth across the state, it is irresponsible to ignore the existing data, consistently indicating the population is in a very serious decline.

Legal protection through State listing will not only increase resources available to both the conservation and research communities to identify these essential habitats, but a protected species status will also help land owners, like the Conservancy, who may be willing to conserve valuable landscapes such as nesting habitat and wintering rangelands for species conservation. Despite being protected by the Migratory Bird Act and considered a non-game species of management concern by the state, the existing data clearly indicates the tricolored blackbird is on a trajectory to extinction. The Commission's prompt action to begin the listing process for this species is essential to its continued survival.

Sincerely,

Christy Wyckoff, PhD
Senior Wildlife Ecologist
Santa Lucia Conservancy

BIRDING — EDUCATION — CITIZEN SCIENCE — HABITAT CONSERVATION

November 12, 2015

California Fish and Game Commission
P.O. Box 944209
Sacramento, CA 94244-2090

Dear California Fish and Game Commission:

Napa-Solano Audubon Society strongly supports the listing of the Tricolored Blackbird (*Agelaius tricolor*) under the federal Endangered Species Act (ESA). A few small colonies are struggling to survive in our counties, and our members are actively doing what they can to assist these populations by restoring habitat and monitoring the health of the population, but without support, our efforts will be for naught.

Due to habitat loss, we only have 5% of the original population left, and each year we are losing more and more. I fear that unless additional action is taken now, this bird will quickly become extinct. Please find the attached signed letters from our membership showing our Chapter's support for listing the Tri-colored Blackbird onto the California Endangered and Threatened Species list.

Sincerely,

Wendy Schackwitz, President
Napa-Solano Audubon Society

November 10, 2015

Dear California Fish and Game Commission,

I am writing to encourage the Fish and Game Commission to advance the Tricolored Blackbird as a candidate for protection under the California Endangered Species Act.

A survey conducted last year by UC Davis with the support of Audubon California and the California Department of Fish & Wildlife counted 145,000 Tricolored Blackbirds remaining in California, down from 260,000 in 2011. This 44 percent drop in population led to the emergency listing in December 2014. While recent partnerships between Audubon California, agricultural groups, and government agencies like the Natural Resources Conservation Service are working to save Tricolored Blackbird colonies, it is clear that further help is needed to save the species from extinction. We must maintain full protections for this species and consider it a candidate for listing under regular California Endangered Species Act procedures.

Thank you so much for allowing me to speak in support of the possible listing of the Tricolored Blackbird.

Sincerely,

A survey conducted last year by UC Davis with the support of Audubon California and the California Department of Fish & Wildlife counted 145,000 Tricolored Blackbirds remaining in California, down from 260,000 in 2011. This 44 percent drop in population led to the emergency listing in December 2014. While recent partnerships between Audubon California, agricultural groups, and government agencies like the Natural Resources Conservation Service are working to save Tricolored Blackbird colonies, it is clear that further help is needed to save the species from extinction. We must maintain full protections for this species and consider it a candidate for listing under regular California Endangered Species Act procedures.

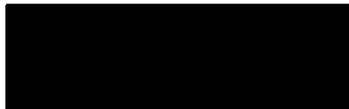

Thank you so much for allowing me to speak in support of the possible listing of the Tricolored Blackbird.

Sincerely,

RE: Tricolored Blackbird Candidacy. December 10, 2015 Agenda Item 31.

Dear Commissioners:

Audubon California writes on behalf of its members to urge the California Fish & Game Commission to provide full protections for the Tricolored Blackbird by making the species a candidate for listing under the California Endangered Species Act and initiating a scientific review by the California Department of Fish and Wildlife. This letter is offered in addition to Audubon's previously-submitted letters and public testimony in support of increased conservation of the Tricolored Blackbird.

Accepting the petition would initiate a year-long scientific-based review of the species by the Department. At the end of that year, the Commission would then consider the available scientific evidence, the Department's recommendation, and the input of stakeholders to make a final determination as to whether or not the species ought to be listed. The threshold to accept a petition and advance a species to candidacy is low.

Audubon California understands that listing a species demands a further commitment from the Department and can impose significant responsibilities on some private landowners. We do not advocate for this listing lightly and only do so after decades of other efforts that have not stemmed the species' decline. The listing does not represent an end to collaborative efforts, including partnerships with the agricultural industry and members of the Tricolored Blackbird Working Group, which are more necessary than ever if the species is to remain viable.

For this reason and those listed below, the Commission should follow the Department's recommendation and advance the species to candidacy. Such action would be consistent with previous Commission rulings, would allow the Department to complete a year-long scientific review, and would provide the Commission with an opportunity to review all evidence so that the Commission can make an informed, final determination regarding this species. It would be a decision that demonstrates the Commission's commitment to relying on clear, transparent processes and the best available science.

Tricolored Blackbird Population Decline

Nearly ninety percent of Tricolored Blackbirds are located in California with smaller breeding colonies occurring in Nevada, Oregon, Washington, and Baja California (Beedy and Hamilton 1999). Tricolored Blackbirds are the last North American landbird that breeds in large colonies. The Passenger Pigeon and the Carolina Parakeet are two colonial North American bird species that, notably, were lost to extinction due to human activities. Tricolored Blackbirds nest predominantly in California's Central Valley, historically in native wetlands, but more recently in agricultural fields due to lack of available natural habitat. This combination of narrow geographic range and highly colonial breeding make Tricolored Blackbirds particularly susceptible to disturbance and habitat loss. In the 2014 statewide survey 64 percent of the population was contained in just ten large colonies, making the loss of even one colony's reproductive output cause for concern. Over 95 percent of the species' historic habitat, wetlands in the Central Valley, have been replaced with agriculture or urbanization (Central Valley Joint Venture 2006). As a result of this large-scale habitat loss and ongoing mortality, Tricolored Blackbirds have declined significantly in the last 80 years.

Once numbering in the millions (Hamilton et al. 1995; Neff 1937), the Tricolored Blackbird population has declined to approximately 145,000 birds according to the 2014 statewide survey (Meese 2014). The triennial survey was developed and employed to track the Tricolored Blackbird population abundance and distribution. The most extensive and replicable surveys – conducted in 2008, 2011, and 2014 – show a steep decline in Tricolored Blackbird abundance. The Tricolored Blackbird population declined by 64 percent between 2008 and 2014, despite an increase in the number of sites surveyed (Meese 2014). Additionally, Graves et al. (2013) identified a 63 percent decline in mean breeding colony size from 1935 to 1975.

The Commission has been made aware of disparate interpretations of the data and criticism of survey methods. However, by any measure, the species has suffered very significant declines from its historic numbers and recent losses are a source of immense concern for the species' continued viability.

Both the Commission's Emergency Listing Findings and the Department's Petition Evaluation Support Making Tricolored Blackbird a Candidate for Endangered Species Listing

At its December 3, 2014 meeting in Van Nuys, California, the Commission voted to take emergency action to list the Tricolored Blackbird as an endangered species pursuant to Fish and Game Code section 2076.5. The Commission determined a biological emergency existed that justified their immediate action to list the Tricolored Blackbird as endangered under CESA based on the following findings of fact:

1. Rapid population decline despite increased survey effort.
2. Diminishing colony size.
3. Habitat destruction particularly in the San Joaquin Valley.

4. Voluntary programs were ineffective to eliminate mortality because not all farmers with tricolored blackbird colonies on their lands elected to participate.
5. Other potential threats exist from insecticide use that diminishes Tricolored Blackbird's insect food source and mortality from shooting of blackbirds on rice fields in early fall.
6. Listing provides needed protections and will direct agency focus towards Tricolored Blackbird recovery.

(Commission Statement of Proposed Emergency Regulatory Action, at 1-2)

After more than five months of reviewing all available information, the Department determined that listing "may be warranted" and recommended that the Commission advance the Tricolored Blackbird as a candidate species and initiate the one-year scientific review period. The Department came to this recommendation after preparing a petition evaluation in response to the petition submitted to the Commission by the Center for Biological Diversity on October 8, 2014 and again on August 19, 2015. Their evaluation, in accordance with CESA, "delineat[ed] the categories of information required in the petition, evaluat[ed] the sufficiency of information in the petition, and incorporate[ed] additional relevant information that the Department possessed or received during the review period" (Memorandum from Charlton H. Bonham, May 13, 2015). The Department is to be commended for taking a deliberative approach that followed established procedures and law.

The Department determined that the petitioned action may be warranted based on the degree and immediacy of the threats faced by the species, including:

1. Historical and continuing loss of nesting substrate, including wetlands, Himalayan blackberry (*Rubus discolor*) patches, upland weedy vegetation, and marsh vegetation in reservoirs and ponds.
2. Historical and continuing loss of uplands used for foraging.
3. Declines in tricolored blackbird populations in the past 80 years, including ongoing declines documented since 2008.
4. Significant, large-scale reproductive failures in tricolored blackbird colonies nesting in agricultural areas of the San Joaquin and Sacramento valleys.
5. Limited, inconsistent, and sometimes ineffective protection of colonies nesting in agricultural settings.
6. Ineffectiveness of existing regulatory mechanisms to protect tricolored blackbird breeding habitat and nesting colonies on privately-owned land.
7. Predation by the black-crowned night heron (*Nycticorax nycticorax*), cattle egret (*Bubulcus ibis*), common raven (*Corvus corax*), coyote (*Canis latrans*), and other predators, especially in areas in which predator populations may be artificially high due to concentrated food sources.

(CDFW Evaluation of the Petition, at 2)

The Department provided an objective scientific analysis and recommendation in its petition evaluation consistent with the consensus of researchers. When the Commission voted not to

move the Tricolored Blackbird to candidacy at its June 2015 meeting it did not make any findings that contravened the Department's evaluation.

Uninterrupted Protections for Tricolored Blackbirds Are Needed

As discussed above, the Commission contravened its own prior findings and the recommendation of the Department when it failed to find that listing may be warranted at its June meeting. Moreover, the Commission appeared to undervalue the protections provided by CESA, which this year alone prevented the unnecessary destruction of two sizeable colonies. If the Commission's mission is truly to safeguard California's fish and wildlife for future generations, then it must act to follow the best available science that the species warrants a one-year review and then consideration for full listing.

The goal of Audubon California, along with the researchers, agencies, conservation organizations and industry groups in the Tricolored Blackbird Working Group, is population recovery. Listing is a tool to protect vulnerable breeding colonies and direct agency efforts towards providing safe, long-term habitat. Audubon and our partners remain committed to collaboration to achieve recovery. Please give the Department an opportunity to fully review the scientific information on this species to recommend whether or not full listing is needed. This would also give the Commission the opportunity to consider full information on the species and input from a wide range of stakeholders.

Thank you for consideration of our comments. If you would like to discuss this matter further, please do not hesitate to contact me at (916) 737-5707 or via email at mlynes@audubon.org.

Respectfully submitted,

Michael Lynes
Director of Public Policy
Audubon California

Mr. Sonke Mastrup
1416 Ninth Street, Room 1320
Sacramento, CA 95814

Dear Mr. Mastrup,

I am writing to encourage the Fish and Game Commission to advance the Tricolored Blackbird as a candidate for protection under the California Endangered Species Act.

A survey conducted last year by UC Davis with the support of Audubon California and the California Department of Fish & Wildlife counted 145,000 Tricolored Blackbirds remaining in California, down from 260,000 in 2011. This 44 percent drop in population led to the emergency listing in December 2014. While recent partnerships between Audubon California, agricultural groups, and government agencies like the Natural Resources Conservation Service are working to save Tricolored Blackbird colonies, it is clear that further help is needed to save the species from extinction. We must maintain full protections for this species and consider it a candidate for listing under regular California Endangered Species Act procedures.

Thank you so much for allowing me to speak in support of the possible listing of the Tricolored Blackbird.

Sincerely,

Dr. Mayu Toner

Sacramento, CA 95814
E-mail: fgc@fgc.ca.gov

Re: Agenda Item 31, Fish and Game Commission December 2015 Meeting

Dear President Baylis:

This letter is prepared and submitted on behalf of Dairy Cares, a coalition of California's dairy producer and processor organizations, including the state's largest producer trade associations (Western United Dairymen, California Dairy Campaign, Milk Producers Council, and California Farm Bureau Federation) and the largest milk processing companies and cooperatives (including California Dairies, Inc., Dairy Farmers of America-Western Area Council, Hilmar Cheese Company, and Land O'Lakes, Inc.) and other affiliates, such as California Cattlemen's Association. Formed in 2001, Dairy Cares is dedicated to promoting the long-term sustainability of California dairies. The coalition represents California's more than 1,500 dairy farms. We are writing to provide supplemental information to the Commission in response to the Department of Fish and Wildlife's October 2, 2015 addendum to its March 2015 petition evaluation regarding the petition submitted by the Center for Biological Diversity to list the tricolored blackbird (*Agelaius tricolor*) as an endangered species.

Dairy Cares appreciates the willingness of the Department to prepare an addendum to its evaluation, which we commented on previously (Dairy Cares 2015b). The prior evaluation was deficient in a number of respects, most importantly, because of the Department's uncritical acceptance of unsubstantiated statements made by the petitioner. While we appreciate that at the 90-day evaluation stage the Department does not (and cannot realistically) conduct the same level of probing analysis that occurs during the 12-month status review of a candidate, we contend the Department is obliged to conduct at least passing review of the available data and analyses in order to determine whether the petitioned action may be warranted. The gate-keeping function played by the Department and Commission at the candidate stage should not be taken lightly, as a decision to make a species a candidate for listing automatically triggers substantial regulatory restrictions that have real costs.

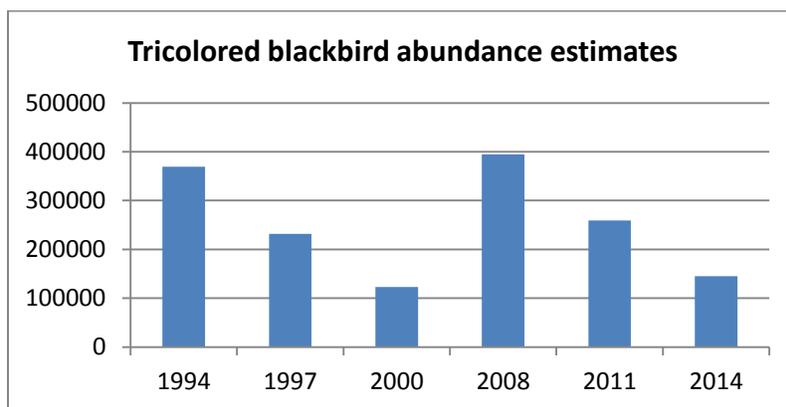

Because the Department focused on eight issues in its response to public comments, which constitutes the core of the Department's addendum, we address the eight Department responses below:

(1) We appreciate that the Department acknowledges that "trends in abundance do not indicate recent declines in all regions of the state." Unfortunately, the Department does not include any supporting citations for the assertions made in its first response. As a consequence, it is difficult to confirm those assertions. We consulted Meese (2014), which reports the 2008, 2011, and 2014 data in summary form. The Department asserts that the total estimate of tricolored blackbirds for three regions of the state that showed increases was "less than 19,000 birds." But Table 5 in Meese (2014, page 10) indicates that the (total) estimate of tricolored blackbird numbers in the Sacramento and Sierra Nevada foothill counties (a single region) increased from 22,586 in 2008 to 54,151 in 2014, for a total increase of 31,565 birds. Therefore, as the Department acknowledges, increases in the tricolored blackbird survey returns in certain parts of the State have occurred during the same period as substantial decreases in tricolored blackbird survey returns in other parts of the State. And, in at least the case of the Sierra foothill counties, the increase reported includes newly discovered colony sites and is larger than the total increase for three regions reported by the Department.

(2) We appreciate the acknowledgement by the Department that it did not report the number of occupied sites during the last three surveys, but we are concerned that the Department did not expressly acknowledge that this information is pertinent as an indicator of a population's status and trend. In addition, we agree with the Department that it is appropriate to report the number of occupied sites identified together with the number of sites visited that can be occupied – that is, sites that have the constituent elements of habitat that are necessary to support tricolored blackbird nesting and reproduction. But the petitioner and Department improperly reported the total number of sites visited rather than the total number of sites visited that actually can support the tricolored blackbird. They included many dozens of sites that lack essential habitat attributes and cannot be occupied by blackbirds. We also agree with the Department that it is appropriate to report the number of occupied sites identified together with estimated number of target organisms at each site. But, again, the petitioner and the Department did not report the number of occupied sites identified at all, much less report that information together with the estimated number of target organisms at each site. In the event the Department in the future does report data in this manner, it is important to note that the estimated number of target organisms at each site, the "size of colonies" as referred to by the Department, must be reported with margins of error consistent with standard practice in population biology.

Two essential factors that contribute to demographic stability or change in tricolored blackbirds, hence are of immediate concern to conservation planners, are the number of birds and the distribution of those birds across available habitat. That the number of sites that were occupied by tricolored blackbirds was relatively stable in the three triennial survey years is important in the evaluation of the bird's status. If the number of tricolored blackbirds declined at occupied sites across those three years, it is important to establish whether those birds are lost from the population or have moved outside of the sample frame. The petitioner and the Department have assumed that the whole decline represents birds lost from the population.

(3) The Department included a single graphic in its entire 34-page petition evaluation. That graphic presented only three data points: a single population size estimate for each of years 2008, 2011, and 2014. Even if it presented only the six data points described by the Department as being “most consistent and therefore more comparable among years,” the implications of the graphic would be dramatically different: rather than a precipitous, monotonic decline, it shows that the tricolored blackbird has (in the recent past) witnessed a measured abundance in 2000 that was lower than that in 2014, and recovered to its greatest census estimate in the past five decades eight years later. The table below is based on data from Meese (2014) and Kyle and Kelsey (2011).

The exclusion of all pre-2008 demographic information from the Department graphic can be expected to result in a skewed interpretation of the data, because 2008 represents the highest abundance estimate of tricolored blackbirds on record since the late 1960s. In fact, the abundance estimate for 2008 is in the same range as average abundance estimates for the 1930s that were generated by DeHaven and his colleagues (1975, see page 178) and by Beedy and his colleagues (1991, see page 13), both using Neff’s data. In light of Neff’s (1937, see page 65) insightful observation that “[e]stimates of the population are notoriously inaccurate, and are subject to wide variation,” the average annual 1930s data and the 2008 estimate can only be viewed as functionally equivalent.

(4) The Department acknowledges that the 2008, 2011, and 2014 “statewide surveys” do not represent attempts to conduct a complete census for the tricolored blackbird. That said and although the Department suggests that the 2008, 2011, and 2014 surveys reflect “consistent effort and thorough coverage,” the Department itself argues in the evaluation and addendum that there has not been consistent effort and thorough coverage. For example, the Department (2015a, page 8) stated in its evaluation: “the number of colony sites visited in 2014 far exceeded any other survey, with a large increase in sites visited each survey year since 2008.” While there can be no doubt that the number of colony sites visited in 2014 is inflated, the Department’s contention regarding consistent effort and thorough coverage runs counter to its own position that much greater effort was undertaken in 2014 than in 2008 and 2011.

The more recent tricolored blackbird surveys purposefully focus on Central Valley counties that historically supported numerous larger colonies. Coastal, sub-coastal, foothill, and southern colonies, including numerous colonies that utilize Himalayan blackberry as nesting

substrates, are apparently under-sampled. With respect to Siskiyou and Imperial Counties, the Department can have no confidence in its position regarding the presence of the species because no surveys whatsoever were conducted. We have not conducted an exhaustive search for data, but identified readily a portal that records sightings and that has reports of tricolored blackbird sightings in Imperial County (see http://www.inaturalist.org/observations?page=1&taxon_id=9743). Our point in referencing those counties was simply that past surveys have not included the full range of the bird. We made the point (Dairy Cares 2015a, page 15) in response to the bald assertion in the petition that “the entire global population” of tricolored blackbirds is less than half the size of a single colony that was reported in 1934.

(5) The great majority of long-term data sets regarding species trends (across all species) suffer from the shortcomings the Department has described in its response. Nonetheless, regulators and conservation planners rely on those longitudinal data sets to inform their understanding of relative abundance over time. Furthermore, it is important to note that researchers who carried out several of the pre-2008 surveys have explained that greater effort was made in certain years in order to obtain results that could more closely estimate the range-wide abundance of the blackbird. For example, DeHaven et al. (1975) attempted to sample the entire range of the species in 1971. They describe attempting to sample “the entire breeding range (excluding Baja California) by driving more than 8,000 miles and visiting most of the reported breeding areas (Table 1) from San Diego through southern Oregon.” Likewise, Beedy and Hamilton (1997, page 13) describe a 1997 survey by the Department of Fish and Game as an “intensive survey effort throughout California.” These intensive, statewide survey efforts yielded abundance estimates of 108,000 and 233,000, respectively (rounded to the nearest thousand), as compared to the 2014 estimate of 145,000 birds. Dairy Cares (2015a, pp.4-7) documented the differences in survey efforts pre-2008 in detail.

The Department contests the conclusion that “the Tricolored Blackbird population has been relatively stable over the past 50 years.” Dairy Cares (2015a, page 3) agrees with the Department that data on trend are unreliable, and even went so far as to state that “reported survey results – even those that were gathered over the past 20 years – are insufficient to allow one to draw inferences about population trends.” **But the petitioner and the Department simultaneously (i) invoke the historical trend data to draw the conclusion that there have been historical declines in abundance and (ii) dismiss invocation of the same trend data by Dairy Cares to suggest that the population appears to be relatively stable.** Compare the Department of Fish and Wildlife (2015a, page 9) – “the Petitioner submitted sufficient information to demonstrate or create a reasonable inference that tricolored blackbirds have experienced historic declines and may continue to do so” – with Department of Fish and Wildlife (2015b, page 5) – the “number of Tricolored Blackbirds observed in each year cannot be expected to collectively represent an accurate trend in the population size over the last 50 years.” This disparate treatment is concerning.

(6) We appreciate that the Department acknowledges that data are reported – including the data from the 2008, 2011, and 2014 surveys – without any estimate of the error associated with the data, and that “the error at each colony site and the overall error in each census number are unknown.” Together with the examples provided of very large margins of error reported by the surveyors themselves (for example, Dairy Cares 2015a, pages 7-8,

documenting that a site where the surveyor estimated the size of the colony to be between 5,000 and 12,000 and then stated that the actual number of birds “could easily be three times higher”), these statements strongly support the position of Dairy Cares that the survey results are subject to large margins of error. The Department has provided no countervailing information.

Furthermore, the Department does not contest Dairy Cares’ assertion that neither the petitioner nor the Department even attempted to catalog the types of error associated with the data reported in the surveys. A statistically valid census reports sampling error. Absent any effort whatsoever to assess sampling error, the Department’s statement that the 2008, 2011, and 2014 surveys provide the best available scientific information lacks reliable empirical support.

(7) We appreciate that the Department acknowledges that the survey protocol was not consistent across the years 2008, 2011, and 2014. Having done so, the Department argues that the changes were not substantial. We disagree. For example, we contend that the change with respect to the duration of surveys is, in fact, substantial. The 2011 protocol includes multiple statements that collectively indicate that as a matter of protocol minimal time may be spent at sites, particularly when the species is not readily apparent. For example, the 2011 protocol (pages 2-3) states “the time spent at one colony site is at the expense of visiting more areas and documenting additional colonies,” and “[d]o not spend too much time at small colonies where you can estimate the number of birds quickly,” and sites where the species was not seen in the past decade “most likely will only need to be driven by to confirm if habitat exists or not.” In contrast, the 2014 protocol (page 3) states “[i]t is recommended you spend at least 15 minutes at each location,” cautioning that locations that appear unoccupied may indeed be occupied. Furthermore, each of the quoted statements above from the 2011 protocol does not appear in the 2014 protocol.

There are other changes to the protocol as well. For example, the 2014 protocol states (page 2) that “colonies can be surveyed from 50-100 meters outside the boundaries of the vegetation in which the birds are nesting.” The 2011 protocol includes more vague guidance, stating (page 2) instead “colonies can be surveyed from just outside the boundaries of the vegetation in which the birds are nesting.” The level of specificity in survey protocols is purposeful. It assures that prevailing professional practices are followed and that the level of survey effort is consistent across sites spatially and temporally.

The purpose of a survey protocol is to “ensure that the collection and analysis of data are consistent, reliable, repeatable, and appropriate to address the intended objective” (U.S. Fish and Wildlife Service 2013). The protocol changed across the most recent three surveys, just as it changed across earlier surveys described in prior submissions by Dairy Cares. The change in protocols is not fatal to efforts to compare data gathered across survey years, but it does provide a basis for exercising caution when making such comparisons. As troubling as the unacknowledged change in protocols is the fact that data gathered inconsistent with one or more protocols were included in the survey results. For example, 350 of the 802 survey entries in 2014 reported survey durations under the minimum recommended time of 15 minutes, including over 140 survey entries one minute or less in duration. Likewise, though the 2014 protocol states that the survey period occurred “from April 18th to 20th and only observations

made during this interval will be reported as part of the 2014 survey,” 50 survey entries in 2014 reported results of surveys done outside that time period.

(8) We appreciate that if the tricolored blackbird were designated a candidate for listing, the Department would conduct a more probing review of the data presented in the petition. As we have explained more fully elsewhere, we believe that even a cursory review suggests problems with both the tricolored blackbird data and the interpretation of those data. Even assuming the Department were to conduct a more detailed review, we are concerned that the Department’s response might continue to reflect a misunderstanding of the concept of habitat. Specifically, the Department suggests that habitat is a static concept, both temporally and spatially. In fact, it is dynamic. The extent and quality of habitat for any given species changes as a consequence of forces that affect its environment. The fact that a specific geographic location has at one time supported the species does not mean that it is appropriate to classify it as a “colony site” and habitat for the species in perpetuity.

The claim that survey effort is increasing based on addition of survey sites in the more recent triennial surveys can only be properly made if the sites being added actually constitute viable habitat for the tricolored blackbird. The fact that sites at some point in the past may have supported habitat does not mean that including them in a summed accounting of contemporary colony sites is appropriate. Many sites included in 2014 should not be included in a reported measure of survey effort as habitat. For example, at one site, included in 2014 but not 2011 or 2008, no blackbirds were present. The last recorded presence of blackbirds at the location was in 1935. See <http://tricolor.ice.ucdavis.edu/content/urncatalogicetrbladd-1353> (describing site as “not suitable habitat” and “riparian forest”). Similarly, at one site, included in 2014 and 2011 but not 2008, no blackbirds were present. The last recorded presence of blackbirds at the location was in 1988. See <http://tricolor.ice.ucdavis.edu/content/urncatalogicetrbladd-1649> (describing site as: “Historical location. Nesting habitat eliminated in 1990s. Unsuitable for nesting by tricolors.”). It appears that the survey effort is inflated due to the inclusion of many sites improperly included. *E.g.*, <http://tricolor.ice.ucdavis.edu/content/urncatalogicetrbladd-1165> (site included in 2014 but not 2011 or 2008 at which the surveyor noted “little or no nesting habitat present” and which was last known to be occupied in 1994). To our knowledge, the extent of this unsubstantiated reporting has not been disclosed to, or evaluated by, the Department.

In conclusion, we contend that the petition both misrepresents and misinterprets the standing scientific information regarding the status and trend of the tricolored blackbird. We also believe that the Department’s evaluation and addendum arrive at a “may be warranted” recommendation without having conducted a sufficiently careful review of the petition. That said, we appreciate the Department’s willingness to consider and respond to our input, and we intend continue to work with the Department to address the needs of the tricolored blackbird.

Very truly yours,

Paul S. Weiland
of Nossaman LLP

Petition Evaluation

Tricolored Blackbird

Fish and Game Commission Meeting

December 10, 2015

Wildlife Branch

Department petition evaluation of March 2015

- Recommended that the petitioned action may be warranted

Department presentation at June 2015 Commission meeting

- Tricolored Blackbird listing history
- Life history
- Range and distribution
- Population abundance
- Threats

Addendum to Department petition evaluation

- Address new studies and additional information
- Three topics: Population Trend, Life History, and Habitat Loss

Population Trend

Additional studies considered in the addendum demonstrate:

- Average breeding colony size has declined since the 1930s (Graves et al. 2013)
- Breeding site occupancy rate declined from 2005-2011 (Holyoak et al. 2014)
- Large population declines have occurred in the center of breeding abundance in the San Joaquin Valley (Meese 2015)
 - 78% decline in abundance from 2008-2014
 - Regional decline of >260,000 birds

Life History

Reproductive output varies by nesting habitat type

- Himalayan blackberry and nettle colonies have high reproductive output
- Grain field colonies exhibit average reproductive output
 - despite containing the largest colonies
- Wetland colonies exhibit the lowest overall contribution to reproductive output
 - despite remaining the most common nesting habitat used

Loss of Foraging Habitat

Two recent studies provide quantitative assessments of potential foraging habitat loss:

- Grassland/shrubland in the Central Valley portion of the Tricolored Blackbird range declined by 22% (~476,900 acres) from 1973-2010 (Soulard and Wilson 2015)
- 483,000 acres of rangelands in California were converted from 1984-2008 (Cameron et al. 2014)
 - The San Joaquin Valley experienced the largest amount of conversion

Department Recommendation

The Department finds that the petitioned action may be warranted and recommends that the Commission accept the Petition for further consideration

2015 Proposed Freshwater Sport Fishing Regulations Changes

**Fish and Game Commission Meeting
December 10, 2015
Stafford Lehr
Fisheries Branch**

Overview

- Revise snagging definition
- Add new landlocked salmon definition
- Change contest drawing dates for black bass
- Allow fishing at Red Bluff Diversion Dam
- Impose sturgeon fishing closure at yolo bypass
- General clean-up

Questions / Thank You

**STATE OF CALIFORNIA
NATURAL RESOURCES AGENCY
DEPARTMENT OF FISH AND WILDLIFE
NEGATIVE DECLARATION
FOR
PROPOSED AMENDMENTS
TO
FRESHWATER SPORT FISHING REGULATIONS
TITLE 14, CALIFORNIA CODE OF REGULATIONS**

Prepared by:

**California Department of Fish and Wildlife
Fisheries Branch**

**This Report Has Been Prepared Pursuant to the
California Environmental Quality Act of 1970
State of California
Natural Resources Agency
Department of Fish and Wildlife**

**INITIAL STUDY AND NEGATIVE DECLARATION
FOR
PROPOSED AMENDMENTS
TO
FRESHWATER SPORT FISHING REGULATIONS
TITLE 14, CALIFORNIA CODE OF REGULATIONS**

The Project

The Department of Fish and Wildlife proposes to amend a variety of freshwater sport fishing regulations as set forth in Title 14 of the California Code of Regulations. As compared to existing regulations, the proposed project would amend regulations for snagging, landlocked salmon, San Francisco and San Pablo Bays, and Solano Lake. The proposed regulatory changes are needed for clarification purposes to reduce public confusion and improve regulatory enforcement. Additionally, the proposed project will add a new fishing restriction to protect sturgeon and increase fishing opportunities on the Sacramento River.

The Findings

The project will have a less than significant impact on biological resources, greenhouse gas emissions, recreation, and transportation/traffic. The project will have no impact to aesthetics, agriculture and forest resources, air quality, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, and utilities and service systems.

Basis of the Findings

Based on the initial study, the Department finds that implementing the proposed project will have a less than significant to no impact on the environment. Therefore, a negative declaration is filed pursuant to the California Environmental Quality Act, Public Resource Code Section 21080 (c2).

This proposed negative declaration consists of the following:

- Introduction – Project Description and Background Information on the Proposed Amendments to Freshwater Sport Fishing Regulations
- Initial Study Environmental Checklist Form
- Explanation of the Response to the Initial Study Environmental Checklist Form

**PROJECT DESCRIPTION AND BACKGROUND INFORMATION
FOR
PROPOSED AMENDMENTS
TO
FRESHWATER SPORT FISHING REGULATIONS
TITLE 14, CALIFORNIA CODE OF REGULATIONS**

Introduction

Annually, the Department of Fish and Wildlife (Department) recommends sport fishing regulations to the Fish and Game Commission (Commission). Both the Department and the Commission have the authority to regulate fisheries (Fish and Game Code, Section 1700) in addition to the Department's public trust responsibility to protect and conserve California's natural resources.

Project goals and objectives

The goal of this project is to amend selected freshwater sport fishing regulations in furtherance of the Department's mission to manage California's diverse fisheries resources for their ecological value, their use and for the public's enjoyment.

Fish and Game Code, Section 1700 declares the state's policy is to encourage the conservation, maintenance and utilization of California's aquatic resources. This section includes the following objectives:

1. Maintain sufficient populations of all aquatic species to ensure their continued existence.
2. Maintain sufficient resources to support a reasonable sport use.
3. Manage using best available science and public input.

Background

Annually, the Department considers amendments to sport fishing regulations. Recommendations for changes come from Department staff, the public, the Commission, Fish and Game Advisory Commissions, and local governments. Recommendations are evaluated within the appropriate Department Region and by the statewide Fisheries Management Committee. If the proposed regulation change passes evaluation, the Department prepares a regulation change recommendation for the Commission to consider. Through a series of Commission meetings, the public has the opportunity to comment on the proposed regulation change. At the end of this public process, the Commission may add, amend, or repeal regulations related to the proposed regulation change. The Commission most recently adopted amendments to the sport fishing regulations in December 2014.

Project Location

Sport fishing addressed by this environmental document occurs in the inland waters of California. The inland waters of California are divided into seven sport fishing districts,

the North Coast, North Central, South Central, Southern, Valley, Sierra, and Colorado River districts. These districts are shown in the map below.

CALIFORNIA SPORT FISHING DISTRICTS

Schedule

If adopted by the Commission and approved by the Office of Administrative Law, the proposed regulatory amendments described below will go into effect March 1, 2016.

Project Description

The proposed project includes both Department and public recommendations for amendments to freshwater sport fishing regulations set forth in Title 14 of the California Code of Regulations (CCR). The proposed amendments would modify existing sport fishing regulations as follows:

Snagging Definition

Subsection 2.00(b) would be amended to further define snagging. The current snagging definition states that it is illegal to impale a fish in any part of its body **other than the mouth**. This makes it legal for anyone to keep a fish that has been hooked on the outside of the mouth, such as a hook that enters from the lower jaw into the mouth or nose into the mouth. The proposal is to reword the definition to say **other than inside the mouth**. Subsections 2.00(b) and (c), and Section 1.05 will need to be amended for consistency.

Proposal: Amend Section 1.05, Angling, and subsections 2.00(b) and (c), Fishing Methods - General

Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth.

Landlocked Salmon Definition

Current regulations are inconsistent in their treatment of landlocked salmon. Kokanee salmon (*Oncorhynchus nerka*) are included in the definition of "Trout," while stocked, landlocked Chinook salmon are included in the definition of "Salmon," which also includes anadromous forms of salmon. Scientific evidence, including life history variation and behavioral differences, suggests the need for differing management strategies for these species. They should be separately defined and addressed in the freshwater sport fishing regulations. In addition, these new species definitions need to have associated bag and possession limits.

Proposal: Amend Section 1.86, Trout, and Section 7.00, District General Regulations; Add sections 1.57 and 5.41, Landlocked Salmon

This proposal creates a new definition for landlocked salmon which will include kokanee and landlocked Chinook salmon. The daily bag limit will be 5 fish and the possession limit will be 10 fish in a new Section 5.41 and not contained in Section 7.00.

Amend the District General Regulations to revise the references to "trout and salmon" to just "trout." Amend the daily bag and possession limits to reference the total number of trout or landlocked salmon in combination. This change is proposed to reduce public confusion with landlocked salmon versus anadromous salmon that are allowed only in the Section 7.50 Special Regulations since the General District Regulations has the take of anadromous salmon closed statewide.

Reptile Regulation Correction

A numbering error has been identified in Section 5.60, specifically subsections (b)(10) through (b)(14). The regulation incorrectly reads, "Species No. 9-13 have a limit of twenty-five (25) in the aggregate." It should read, "Species in subsections (10) through (14) have a limit of twenty-five (25) in the aggregate." Correcting the numbering mistake will alleviate confusion amongst sport fisherman and wildlife officers.

Proposal: Amend subsection (b) of Section 5.60, Reptiles

Correct the numbering errors in this section to reduce public confusion and enforcement issues.

Sturgeon Fishing Closure and Snagging Revision

Green sturgeon and white sturgeon (subadults and adults) are often stranded for long periods in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir. Some of those fish escape when environmental conditions change but others are rescued or succumb. Through catch-and-release, legal harvest, and poaching, anglers could take both species when stranded. The legal fishery on stranded fish is not sporting, reduces the benefit of rescue efforts, and reduces population spawning potential. Because green sturgeon is a threatened species and white sturgeon is a substantial management concern, addressing this issue is relatively urgent. Therefore, the Department is proposing to prohibit the take and possession of sturgeon in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir at any time.

Current regulations in subsection (d) of Section 5.80 state that a sturgeon must voluntarily take the bait or lure *in* its mouth. This language is proposed to be revised to read *inside* its mouth, to be consistent with proposed revisions to the snagging definition in Section 2.00.

Proposal: Add subsection (j) to Section 5.80, White Sturgeon and amend subsection (d) Methods of take.

Prohibit fishing for sturgeon in the Yolo Bypass Flood Control System to protect green and white sturgeon; Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth for alignment with the proposed snagging definition changes to Section 2.00.

Green Sturgeon Revision for Brevity

Take and possession of green sturgeon is prohibited by law. Section 5.81, Green Sturgeon, subsection (d) designates a special fishing closure for sturgeon in the Sierra and Valley District. This special fishing closure is also provided under Section 5.80, White Sturgeon. Because fishing for green sturgeon is prohibited statewide, this regulation is not needed in the regulations for Green Sturgeon.

Proposal: Amend Section 5.81, Green Sturgeon, to remove subsection (d).

Improves clarity and eliminates unnecessary regulatory language regarding the special sturgeon closure for sturgeon in the Sierra and Valley District.

Red Bluff Diversion Dam

Current regulations restrict fishing from 500 feet upstream to 150 feet below Red Bluff Diversion Dam (RBDD). RBDD is no longer operated as an irrigation diversion so the current restrictions about fishing near a dam are no longer needed. Boaters, recreationists, and fish are free to pass up and downstream of the area at will. The angling public is very interested in fishing in the immediate vicinity of the RBDD now that it is no longer in operation and the Sacramento River is not impounded by its gates. The proposal is to allow shore and boat angling above and below RBDD on the Sacramento River.

Proposal: Amend Special Fishing Regulations subsection 7.50(b)(156.5), Sacramento River

Remove the current fishing restriction above and below RBDD on the Sacramento River to increase angling opportunities in Tehama County.

Solano Lake

The proposal is to add Solano Lake to Section 7.50, Alphabetical List of Waters with Special Fishing Regulations. The original intent was for Solano Lake to be included in the Putah Creek special fishing regulations. That regulation applies to the stream reach from Solano Lake to Monticello Dam and does not include Solano Lake. Therefore, a new subsection needs to be added to Section 7.50.

Proposal: Add subsection (b)(180.6), Solano Lake, to Section 7.50 Special Fishing Regulations

Add a new regulation for Solano Lake to the Special Fishing Regulations. The daily bag and possession limit will be 0 (zero).

San Francisco and San Pablo Bays Clarification

Currently there are three sections dealing with the Ocean and San Francisco Bay District which describe regulations in different manners causing confusion for anglers and making enforcement of the regulations more difficult:

- Section 27.00 defines the Ocean and San Francisco Bay District as waters of the open coast and includes San Francisco and San Pablo Bays *“plus all their tidal bays, tidal portions of their rivers and streams, sloughs and estuaries”* between the Golden Gate Bridge and the Carquinez Bridge.
- Section 1.53 defines inland waters as all fresh, brackish and inland saline waters of the state, including lagoons and tidewaters upstream from the mouths of coastal rivers and streams. Inland waters exclude the waters of San Francisco and San Pablo Bays downstream from the Carquinez Bridge, the tidal portions of rivers and streams flowing into San Francisco *and San Pablo Bays*, and the waters of Elkhorn Slough, west of Elkhorn Road between Castroville and Watsonville.

- Subsection 28.65(a) (which describes gear restrictions for fin fish) defines the area as San Francisco and San Pablo Bays between the Golden Gate Bridge and the west Carquinez Bridge, where only one line with not more than three hooks may be used.

The different definitions of the same geographic area cause confusion as to applicable method of take as well as which set of regulations apply to the waters being fished.

An angler is allowed to use any number of hooks and lines in ocean waters (Section 28.65). In Inland waters only one closely attended line with no more than three hooks may be used (Section 2.00). Under the current regulations, a person could argue that tidal portions of the Napa River were not Inland Waters and since subsection 28.65(a) did not include the tidal portions of river flowing into San Francisco and San Pablo Bays. Under this interpretation, they could use any number of lines and hooks to fish in the Napa River. This would restrict waters of San Francisco and San Pablo Bays to one line, then allow unlimited lines in the Napa River waters which were tidally influenced even though all inland waters are restricted to one line.

In addition, fishing regulations for Ocean Waters defined in Section 27.00 are different from Inland Waters as defined in Section 1.53. Since tidal influence cannot easily be determined, it is almost impossible to know which set of regulations apply in the tidally influenced waters. For instance is an undersized sturgeon caught in the Napa River a violation of Section 5.80 or Section 27.90?

To simplify the regulations and make these sections consistent, all three sections must use the same reference.

The proposal is to amend sections 27.00 and 1.53 to align with subsection 28.65(a) and remove the reference to tidal bays and tidal portions of rivers and streams from these two sections. As a result, inland waters will now include the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays which will be subject to the gear restrictions for inland waters where only one closely attended rod and line with no more than three hooks may be used.

Proposal: Amend Section 1.53, Inland Waters, and Section 27.00, Ocean and San Francisco Bay Definition

Amend the two regulations that define the San Francisco and San Pablo Bays to be consistent, reducing public confusion and enforcement issues. Remove capitalized text before the note which is a printing error.

Fishing Contest Draw Dates

The current wording of subsection 230(b)(1)(A) designates specific dates for a drawing that is conducted annually by Department personnel to allocate Type A fishing contest permits in a fair manner. Dates are the second Friday of July for bodies of water north of the Tehachapi Mountains and the third Friday of July for waters south of the Tehachapi Mountains.

Specific designation of these dates can conflict with major fishing-related events that contest sponsors often need to attend (e.g., International Convention of Allied Sport fishing Trade – ICAST). Sponsors who must attend the ICAST show—an international conference of fishing gear manufacturers, media, and many others—cannot simultaneously attend the contest drawing, hindering the conflict resolution process for which the drawing is held.

The Department is proposing to amend the regulations to state that the contest drawings will be conducted in July and the dates will be determined by Department staff.

Proposal: Amend subsection (b)(1)(A) of Section 230, Issuance of Permits for Contests Offering Prizes for the Taking of Game Fish

Amend the regulations to change the current contest drawing dates to unspecified dates in July which will be determined by Department staff.

Minor Editorial Corrections for Clarity

Additional minor corrections are proposed to correct typographical errors and to improve regulation clarity.

ENVIRONMENTAL CHECKLIST FORM

1. Project Title:
Proposed Amendments to Freshwater Sport Fishing Regulations, Title 14, California Code of Regulations
2. Lead Agency Name and Address:
California Department of Fish and Wildlife
Fisheries Branch
830 S Street
Sacramento, CA 95811
3. Contact Person and Phone Number:
Karen Mitchell, (916) 445-0826
4. Project Location:
Inland waters of the State of California
5. Project Sponsor's Name and Address:
California Department of Fish and Wildlife
Fisheries Branch
830 S Street
Sacramento, CA 95811
6. General Plan designation:
N/A (statewide)
7. Zoning:
N/A (statewide)
8. Description of Project:
Amend selected freshwater sport fishing regulations to maintain consistency with the Department's mission to manage California's diverse fisheries resources for their ecological value, their use and for the public's enjoyment.
9. Surrounding land uses and setting:
N/A
10. Other Public Agencies Whose Approval Is Required:
None

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

<input type="checkbox"/>	Aesthetics	<input type="checkbox"/>	Agriculture and Forestry	<input type="checkbox"/>	Air Quality
<input type="checkbox"/>	Biological Resources	<input type="checkbox"/>	Cultural Resources	<input type="checkbox"/>	Geology/Soils
<input type="checkbox"/>	Greenhouse Gas Emissions	<input type="checkbox"/>	Hazards and Hazardous Materials	<input type="checkbox"/>	Hydrology/Water Quality
<input type="checkbox"/>	Land Use/Planning	<input type="checkbox"/>	Mineral Resources	<input type="checkbox"/>	Noise
<input type="checkbox"/>	Population/Housing	<input type="checkbox"/>	Public Services	<input type="checkbox"/>	Recreation
<input type="checkbox"/>	Transportation/Traffic	<input type="checkbox"/>	Utilities/Service Systems	<input type="checkbox"/>	Mandatory Findings of Significance

This project will not have a "Potential Significant Impact" on any of the environmental factors listed above; therefore, no boxes are checked.

DETERMINATION:

On the basis of this initial evaluation:

<input checked="" type="checkbox"/>	I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
<input type="checkbox"/>	I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
<input type="checkbox"/>	I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
<input type="checkbox"/>	I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
<input type="checkbox"/>	I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION , including revisions or mitigation

measures that are imposed upon the proposed project, nothing further is required.

Stafford Lehr, Chief, Fisheries Branch

10/26/15

Date

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
I. AESTHETICS: Would the project:				
a) Have a substantial adverse effect on a scenic vista	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
II. AGRICULTURE AND FOREST RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and the forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>III. AIR QUALITY: Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:</p>				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
IV. BIOLOGICAL RESOURCES: Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
V. CULTURAL RESOURCES: Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VI. GEOLOGY AND SOILS: Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
ii) Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VII. GREENHOUSE GAS EMISSIONS:				
Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VIII. HAZARDS AND HAZARDOUS MATERIALS: Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
IX. HYDROLOGY AND WATER QUALITY: Would the project:				
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
result of the failure of a levee or dam?				
j) Inundation by seiche, tsunami, or mudflow	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
X. LAND USE AND PLANNING: Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XI. MINERAL RESOURCES: Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XII. NOISE: Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XIII. POPULATION AND HOUSING:				
Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XIV. PUBLIC SERVICES:				

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XV. RECREATION:				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XVI. TRANSPORTATION/TRAFFIC:				
Would the project:				
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable congestion	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?				
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XVII. UTILITIES AND SERVICE SYSTEMS: Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in a determination by the	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?				
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XVIII. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

EXPLANATION OF RESPONSES TO INITIAL STUDY ENVIRONMENTAL CHECKLIST

I. AESTHETICS

- a) The project will not have an adverse effect on a scenic vista. Such an impact will not occur because the project will not involve any construction, land alteration, or modification of any buildings or structures.
- b) The project will not damage scenic resources such as trees, rock outcroppings, and historic buildings. Such an impact will not occur because the project will not involve any construction, land alteration, or modification of any buildings or structures.
- c) The project will not substantially degrade the existing visual character or quality of the work sites and their surroundings. Such an impact will not occur because the project will not involve any construction, land alteration, or modification of any buildings or structures.
- d) The project will not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Anglers will drive vehicles to and from the Sacramento River near the Red Bluff Diversion Dam during the year-round angling season. Some of this traffic may occasionally occur before sunrise or after sunset. However, this transient traffic is in a sparsely populated area and will not constitute a new source of substantial light or glare that will affect day or nighttime views in the area.

II. AGRICULTURE RESOURCES

- a) The project will not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Resources Agency, to non-agricultural use. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- b) The project will not conflict with existing zoning for agricultural use or a Williamson Act contract. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- c) The project will not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timber zoned Timberland Production. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- d) There will be no loss of forest land and the project will not result in the conversion of forest land to non-forest use. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.

- e) The project will not involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use. Such an impact will not occur because the project will not involve any construction, land alternation, or land use changes.

III. AIR QUALITY

- a) The project will not conflict with or obstruct implementation of the applicable air quality plan. Such an impact will not occur because the project will not involve any construction, land alternation, or land use changes.
- b) The project will not violate any air quality standard or contribute substantially to an existing or projected air quality violation. Such an impact will not occur because the project will not involve any construction, land alternation, or land use changes.
- c) The project will not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors). Such an impact will not occur because the project involves no ongoing sources of air pollution.
- d) The project will not expose sensitive receptors to substantial pollutant concentrations. Such an impact will not occur because the project will not increase pollutant concentrations.
- e) The project will not create objectionable odors affecting a substantial number of people.

IV. BIOLOGICAL RESOURCES

- a) The project will not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status in local or regional plans, policies, or regulations, or by the CDFW, National Marine Fisheries Service (NMFS) or U. S. Fish and Wildlife Service (USFWS).

The proposal to open the section of the Sacramento River above and below the Red Bluff Diversion Dam to shore and boat angling will not directly or indirectly affect candidate, sensitive, or special-status species. The project would open up approximately 650 feet, less than one-eighth of a mile, of the Sacramento River to shore and boat angling year-round. Although state and federally-listed Central Valley steelhead and winter-run Chinook salmon use this section of river during their adult spawning migration and during juvenile emigration to the ocean, existing sport fishing regulations prohibit take of these species.

- b) The project will not have an adverse effect on any riparian habitat or other sensitive natural communities identified in local or regional plans, policies and regulations, or by the CDFW or the USFWS. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- c) The project will not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- d) The project will not substantially interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- e) The project will not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. Such an impact will not occur because the project will not result in any construction, land alteration, or land use changes.
- f) The project will not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.

V. CULTURAL RESOURCES

- a) The project will not cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5. There is no ground disturbing work and thus no potential to affect historical resources.
- b) The project will not cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5. There is no ground disturbing work and thus no potential to affect archaeological resources.
- c) The project will not directly or indirectly destroy any unique paleontological resources or sites, or unique geologic features. There is no ground disturbing work and thus no potential to affect paleontological resources.
- c) The project will not disturb any human remains, including those interred outside of formal cemeteries. There is no ground disturbing work and thus no potential to affect human remains.

VI. GEOLOGY AND SOILS

- a i) The project will not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area, or based on other substantial evidence of a known fault. Such an impact will not occur because the project will not involve ground disturbing work.
- a ii) The project will not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Such an impact will not occur because the project will not involve ground disturbing work.
- a iii) The project will not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Such an impact will not occur because the project will not involve ground disturbing work.
- a iv) The project will not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. Such an impact will not occur because the project will not involve ground disturbing work.
- b) The project will not result in substantial soil erosion or the loss of topsoil. Such an impact will not occur because the project will not involve ground disturbing work.
- c) The project will not be located on a geologic unit or soil that unstable, or that would become unstable and potentially result in on- or off- site landslides, lateral spreading, subsidence, liquefaction, or collapse. Such an impact will not occur because the project will not involve ground disturbing work.
- d) The project will not be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property. Such an impact will not occur because the project will not involve ground disturbing work.
- e) The project will not create any sources of waste water requiring a septic system

VII. GREENHOUSE GAS EMISSIONS

- a. The project will not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment. The project will not involve any construction, land alternation, or land use changes. Vehicles that use fuel will be used to access the Sacramento River near the Red Bluff Diversion Dam during the year-round angling season, and their internal combustion engines will produce some emissions. However, only approximately 650 feet of river would be open to shore and boat angling and only the east side of the river is accessible by the public.

As a result, the number of additional angler trips will most likely be low. Thus, the impact of greenhouse gas (GHG) emissions produced by the use of vehicles will be negligible.

- b. The project will not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHG. The impacts of GHG produced by the use of vehicles to and from the Sacramento River during the angling season will be negligible.

VIII. HAZARDS AND HAZARDOUS MATERIALS

- a) The project will not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The project will not involve the transport, use, or disposal of hazardous materials.
- b) The project will not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. The project will not involve the transport, use, or disposal of hazardous materials.
- c) The project will not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. The project will not involve the transport, use, or disposal of hazardous materials.
- d) The project will not be located on any site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5.
- e) The project will not be located within an airport land use plan area.
- f) The project will not be located within the vicinity of a private airstrip.
- g) The project will not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. The project will not involve any construction, land alteration, or land use changes.
- h) The project will not expose people or structures to a significant risk of loss, injury, or death involving wild land fires. The project will not involve any construction, land alteration, or land use changes.

IX. HYDROLOGY AND WATER QUALITY

- a) The project will not violate any water quality standards or waste discharge requirements. The project will not involve any construction, land alteration, water use, or water discharge.

- b) The project will not substantially deplete groundwater supplies or interfere substantially with groundwater recharge. The project will not involve any construction, land alteration, or groundwater use.
- c) The project will not substantially alter the existing drainage pattern of the work sites in a manner that would result in substantial erosion or siltation on- or off-site because the project will not involve any construction or land alteration.
- d) The project will not substantially alter the existing drainage pattern of the work sites, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site because the project will not involve any construction or land alteration.
- e) The project will not create or contribute runoff water that would exceed the capacity of existing or planned storm-water drainage systems, or provide substantial additional sources of polluted runoff because the project will not involve any construction or land alteration.
- f) The project will not substantially degrade water quality. The project will not involve any construction or land alteration, and thus will not have any adverse impacts on water quality.
- g) The project will not place housing within a 100-year flood hazard area as mapped on any flood hazard delineation map. No housing will be created as part of this project.
- h) The project will not place within a 100-year flood hazard area structures which would significantly impede or redirect flood flows. No new structures will be associated with this project.
- i) The project will not expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam. The project will not involve any construction, land alteration, or land use changes.
- j) The project will not expose people or structures to a significant risk of inundation by seiche, tsunami, or mudflow. The project will not involve any construction, land alteration, or land use changes.

X. LAND USE AND PLANNING

- a) The project will not physically divide an established community. The project will not involve any construction, land alteration, or land use changes.

- b) The project does not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect. The project will not involve any construction, land alteration, or land use changes.
- c) The project will not conflict with any Habitat Conservation or Natural Community Conservation plan. The project will not involve any construction, land alteration, or land use changes.

XI. MINERAL RESOURCES

- a) The project will not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.
- b) The project will not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. Such an impact will not occur because the project will not involve any construction, land alteration, or land use changes.

XII. NOISE

- a) The project will not result in exposure of persons to, or generation of noise levels in excess of, standards established in the local general plan or noise ordinance, or applicable standards of other agencies. The project will not involve construction or physical alteration of land, and its implementation will not generate noise levels in excess of agency standards.
- b) The project will not result in exposure of persons to, or generation of, excessive ground-borne vibration or ground-borne noise levels. The project will not involve construction or physical alteration of land.
- c) The project will not result in a substantial permanent increase in ambient noise levels in the project vicinity. The project will not involve construction or physical alteration of land, or the creation of any permanent noise sources.
- d) The project will not result in a substantial temporary, or periodic, increase in ambient noise levels in the project vicinity above levels existing without the project. The project will not involve construction or physical alteration of land.
- e) The project will not be located within an airport use plan or within two miles of a public airport or public use airport.
- f) The project will not be located within the vicinity of a private airstrip.

XIII. POPULATION AND HOUSING

- a) The project will not induce substantial population growth in an area, either directly or indirectly. Such an impact will not occur because the project will not construct any new homes, businesses, roads, or other human infrastructure.
- b) The project will not displace any existing housing and will not necessitate the construction of replacement housing elsewhere.
- c) The project will not displace any people and will not necessitate the construction of replacement housing elsewhere.

XIV. PUBLIC SERVICES

- a) The project will not have any significant environmental impacts associated with new or physically altered governmental facilities. The project will not involve any construction, land alteration, or land use changes.

XV. RECREATION

- a) The increase of the use of existing neighborhood and regional parks, or other recreational facilities will be less than significant due to project implementation. The project will open approximately 650 feet of the Sacramento River to shore and boat angling during the year-round angling season. The Forest Service owns a boat ramp and campground up and downstream of Red Bluff Diver Dam on the east side which is currently open to the public. Also, the public already is allowed to walk, swim, walk dogs, etc. in these areas, just not fish in them legally. The number of additional anglers that may take advantage of the new recreational angling opportunity on the Sacramento River is unknown. However, because only 650 feet, less than one-eighth of a mile, of additional shoreline and river would be accessible, an increase in use of existing recreational facilities would be minimal. Thus, the project will not produce a significant amount of recreation.
- b) The project will not involve any construction, land alternation, or land use changes. There will be no construction or expansion of recreational facilities.

XVI. TRANSPORTATION/TRAFFIC

- a) The project may increase transportation to the Sacramento River near the Red Bluff Diversion Dam due to the addition of 650 feet of river and shoreline (on the east bank of the river only) available to anglers during the year-round angling season; however, the project will have a less than significant impact on any applicable plans, ordinances or policies that establish measures of effectiveness for the performance of the circulation systems. The number of anglers that may take advantage of the new recreational angling opportunity on the Sacramento River during the year-round angling season is unknown, but because only 650 feet of additional river and

shoreline would be accessible, angling pressure would most likely be minimal and sporadic. Thus, the project will not produce a significant amount of traffic.

- b) The project will not conflict, either individually or cumulatively, with any applicable congestion program established by the county congestion management agency for designated roads or highways. Such an impact will not occur because the section of the Sacramento River proposed to open to angling will not result in a significant amount of traffic in the project area.
- c) The project will not result in any change in air traffic patterns.
- d) The project will not alter terrestrial features or is incompatible with uses of equipment.
- e) The project will not result in inadequate emergency access. The project does not involve construction.
- f) The project will not significantly affect parking capacity or demand for parking.

XVII. UTILITIES AND SERVICE SYSTEMS

- a) The project will not produce wastewater.
- b) The project will not require, or result in the construction of, new water or wastewater treatment facilities or expansion of existing facilities. Such an impact will not occur because the project will not produce wastewater.
- c) The project will not require or result in the construction of new storm water drainage facilities or expansion of existing facilities.
- d) The project will have sufficient water supplies available to serve the project from existing entitlements and resources.
- e) The project will not produce wastewater.
- f) The project will not generate solid waste requiring disposal in a landfill.
- g) The project will not create solid waste. Thus, the project will be in compliance with federal, state, and local statutes related to solid waste.

XVIII. MANDATORY FINDINGS OF SIGNIFICANCE

- a) The project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered

plant or animal, or eliminate important examples of the major periods of California history or prehistory. The project is consistent with the Department's mission to manage California's diverse fisheries resources for their ecological value, their use and for the public's enjoyment.

- b) The project does not have adverse impacts that are individually limited, but cumulatively considerable. Cumulative adverse impacts will not occur because there are no potential adverse impacts due to project implementation.
- c) The project does not have environmental effects that will cause substantial adverse effects on humans, either directly or indirectly. The project will not involve any construction, land alteration, or the creation of new infrastructure.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Amend Sections 1.05, 1.53, 1.86, 7.00, 27.00, Subsections 2.00(b) and 2.00(c), 5.60(b),
7.50(b)(156.5) and 230(b)(1)(A); Add Sections 1.57 and 5.41, Subsections 5.80(j), and
7.50(b)(180.6); and Remove Subsection 5.81(d),
Title 14, California Code of Regulations
Re: Freshwater Sport Fishing Regulations

I. Date of Initial Statement of Reasons: May 20, 2015

II. Dates and Locations of Scheduled Hearings:

- | | | |
|-------------------------|-----------|-------------------|
| (a) Notice Hearing: | Date: | August 5, 2015 |
| | Location: | Fortuna |
| (b) Discussion Hearing: | Date: | October 8, 2015 |
| | Location: | Los Angeles |
| (c) Adoption Hearing: | Date: | December 10, 2015 |
| | Location: | San Diego |

III. Description of Regulatory Action:

- (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

This Department proposal combines Department and public requests for changes to Title 14, California Code of Regulations (CCR), for the 2015 Sport Fishing Regulations Review Cycle. This proposal will clarify regulations for snagging, landlocked salmon, San Francisco and San Pablo Bays, Solano Lake, and reptiles. The proposed regulatory changes are needed to reduce public confusion and improve regulatory enforcement. Additionally, this proposal will add a new fishing restriction to protect sturgeon, and increase fishing opportunities on the Sacramento River.

The Department is proposing the following changes to current regulations:

Snagging Definition

Subsection 2.00(b) would be amended to further define snagging. The current snagging definition states that it is illegal to impale a fish in any part of its body **other than the mouth**. This makes it legal for anyone to keep a fish that has been hooked on the outside of the mouth, such as a hook that enters from the

lower jaw into the mouth or nose into the mouth. The proposal is to reword the definition to say **other than inside the mouth**. Subsections 2.00(b) and (c), and Section 1.05 will need to be amended for consistency.

Proposal: Amend Section 1.05, Angling, and subsections 2.00(b) and (c), Fishing Methods - General

Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth.

Landlocked Salmon Definition

Current regulations are inconsistent in their treatment of landlocked salmon. Kokanee salmon (*Oncorhynchus nerka*) are included in the definition of "Trout," while stocked, landlocked Chinook salmon are included in the definition of "Salmon," which also includes anadromous forms of salmon. Scientific evidence, including life history variation and behavioral differences, suggests the need for differing management strategies for these species. They should be separately defined and addressed in the freshwater sport fishing regulations. In addition, these new species definitions need to have associated bag and possession limits.

Proposal: Amend Section 1.86, Trout, and Section 7.00, District General Regulations; Add sections 1.57 and 5.41, Landlocked Salmon

This proposal creates a new definition for landlocked salmon which will include kokanee and landlocked Chinook salmon. The daily bag limit will be 5 fish and the possession limit will be 10 fish in a new Section 5.41 and not contained in Section 7.00.

Amend the District General Regulations to revise the references to "trout and salmon" to just "trout." Amend the daily bag and possession limits to reference the total number of trout or landlocked salmon in combination. This change is proposed to reduce public confusion with landlocked salmon versus anadromous salmon that are allowed only in the Section 7.50 Special Regulations since the General District Regulations has the take of anadromous salmon closed statewide.

Reptile Regulation Correction

A numbering error has been identified in Section 5.60, specifically subsections (b)(10) through (b)(14). The regulation incorrectly reads, "Species No. 9-13 have a limit of twenty-five (25) in the aggregate." It should read, "Species in subsections (10) through (14) have a limit of twenty-five (25) in the aggregate." Correcting the numbering mistake will alleviate confusion amongst sport fisherman and wildlife officers.

Proposal: Amend subsection (b) of Section 5.60, Reptiles

Correct the numbering errors in this section to reduce public confusion and enforcement issues.

Sturgeon Fishing Closure and Snagging Revision

Green sturgeon and white sturgeon (subadults and adults) are often stranded for long periods in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir. Some of those fish escape when environmental conditions change but others are rescued or succumb. Through catch-and-release, legal harvest, and poaching, anglers could take both species when stranded. The legal fishery on stranded fish is not sporting, reduces the benefit of rescue efforts, and reduces population spawning potential. Because green sturgeon is a threatened species and white sturgeon is a substantial management concern, addressing this issue is relatively urgent. Therefore, the Department is proposing to prohibit the take and possession of sturgeon in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir at any time.

Current regulations in subsection (d) of Section 5.80 state that a sturgeon must voluntarily take the bait or lure *in* its mouth. This language is proposed to be revised to read *inside* its mouth, to be consistent with proposed revisions to the snagging definition in Section 2.00.

Proposal: Add subsection (j) to Section 5.80, White Sturgeon and amend subsection (d) Methods of take.

Prohibit fishing for sturgeon in the Yolo Bypass Flood Control System to protect green and white sturgeon; Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth for alignment with the proposed snagging definition changes to Section 2.00.

Green Sturgeon Revision for Brevity

Take and possession of green sturgeon is prohibited by law. Section 5.81, Green Sturgeon, subsection (d) designates a special fishing closure for sturgeon in the Sierra and Valley District. This special fishing closure is also provided under Section 5.80, White Sturgeon. Because fishing for green sturgeon is prohibited statewide, this regulation is not needed in the regulations for Green Sturgeon.

Proposal: Amend Section 5.81, Green Sturgeon, to remove subsection (d).

Improves clarity and eliminates unnecessary regulatory language regarding the special sturgeon closure for sturgeon in the Sierra and Valley District.

Red Bluff Diversion Dam

Current regulations restrict fishing from 500 feet upstream to 150 feet below Red Bluff Diversion Dam (RBDD). RBDD is no longer operated as an irrigation diversion so the current restrictions about fishing near a dam are no longer needed. Boaters, recreationists, and fish are free to pass up and downstream of the area at will. The angling public is very interested in fishing in the immediate vicinity of the RBDD now that it is no longer in operation and the Sacramento River is not impounded by its gates. The proposal is to allow shore and boat angling above and below RBDD on the Sacramento River.

Proposal: Amend Special Fishing Regulations subsection 7.50(b)(156.5), Sacramento River

Remove the current fishing restriction above and below RBDD on the Sacramento River to increase angling opportunities in Tehama County.

Solano Lake

The proposal is to add Solano Lake to Section 7.50, *Alphabetical List of Waters with Special Fishing Regulations*. The original intent was for Solano Lake to be included in the Putah Creek special fishing regulations. That regulation applies to the stream reach from Solano Lake to Monticello Dam and does not include Solano Lake. Therefore, a new subsection needs to be added to Section 7.50.

Proposal: Add subsection (b)(180.6), Solano Lake, to Section 7.50 Special Fishing Regulations

Add a new regulation for Solano Lake to the Special Fishing Regulations. The daily bag and possession limit will be 0 (zero).

San Francisco and San Pablo Bays Clarification

Currently there are three sections dealing with the Ocean and San Francisco Bay District which describe regulations in different manners causing confusion for anglers and making enforcement of the regulations more difficult:

- Section 27.00 defines the Ocean and San Francisco Bay District as waters of the open coast and includes San Francisco and San Pablo Bays *“plus all their tidal bays, tidal portions of their rivers and streams, sloughs and estuaries”* between the Golden Gate Bridge and the Carquinez Bridge.
- Section 1.53 defines inland waters as all fresh, brackish and inland saline waters of the state, including lagoons and tidewaters upstream from the mouths of coastal rivers and streams. *Inland waters exclude the waters of San Francisco and San Pablo Bays downstream from the Carquinez*

Bridge, the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays, and the waters of Elkhorn Slough, west of Elkhorn Road between Castroville and Watsonville.

- Subsection 28.65(a) (which describes gear restrictions for fin fish) defines the area as San Francisco and San Pablo Bays between the Golden Gate Bridge and the west Carquinez Bridge, where only one line with not more than three hooks may be used.

The different definitions of the same geographic area cause confusion as to applicable method of take as well as which set of regulations apply to the waters being fished.

An angler is allowed to use any number of hooks and lines in ocean waters (Section 28.65). In Inland waters only one closely attended line with no more than three hooks may be used (Section 2.00). Under the current regulations, a person could argue that tidal portions of the Napa River were not Inland Waters and since subsection 28.65(a) did not include the tidal portions of river flowing into San Francisco and San Pablo Bays. Under this interpretation, they could use any number of lines and hooks to fish in the Napa River. This would restrict waters of San Francisco and San Pablo Bays to one line, then allow unlimited lines in the Napa River waters which were tidally influenced even though all inland waters are restricted to one line.

In addition, fishing regulations for Ocean Waters defined in Section 27.00 are different from Inland Waters as defined in Section 1.53. Since tidal influence cannot easily be determined, it is almost impossible to know which set of regulations apply in the tidally influenced waters. For instance is an undersized sturgeon caught in the Napa River a violation of Section 5.80 or Section 27.90?

To simplify the regulations and make these sections consistent, all three sections must use the same reference.

The proposal is to amend sections 27.00 and 1.53 to align with subsection 28.65(a) and remove the reference to tidal bays and tidal portions of rivers and streams from these two sections. As a result, inland waters will now include the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays which will be subject to the gear restrictions for inland waters where only one closely attended rod and line with no more than three hooks may be used.

Proposal: Amend Section 1.53, Inland Waters, and Section 27.00, Ocean and San Francisco Bay Definition

Amend the two regulations that define the San Francisco and San Pablo Bays to be consistent, reducing public confusion and enforcement issues. Remove

capitalized text before the note which is a printing error.

Fishing Contest Draw Dates

The current wording of subsection 230(b)(1)(A) designates specific dates for a drawing that is conducted annually by Department personnel to allocate Type A fishing contest permits in a fair manner. Dates are the second Friday of July for bodies of water north of the Tehachapi Mountains and the third Friday of July for waters south of the Tehachapi Mountains.

Specific designation of these dates can conflict with major fishing-related events that contest sponsors often need to attend (e.g., International Convention of Allied Sport fishing Trade – ICAST). Sponsors who must attend the ICAST show—an international conference of fishing gear manufacturers, media, and many others—cannot simultaneously attend the contest drawing, hindering the conflict resolution process for which the drawing is held.

The Department is proposing to amend the regulations to state that the contest drawings will be conducted in July and the dates will be determined by Department staff.

Proposal: Amend subsection (b)(1)(A) of Section 230, Issuance of Permits for Contests Offering Prizes for the Taking of Game Fish

Amend the regulations to change the current contest drawing dates to unspecified dates in July which will be determined by Department staff.

Minor Editorial Corrections for Clarity

In addition to the above proposals, minor editorial corrections are proposed to correct typographical errors and to improve regulation clarity.

Benefits of the Proposed Regulations

It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the state for the benefit of all the citizens of the State. In addition, it is the policy of this state to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based trout and salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of trout and salmon to ensure their continued existence.

The benefits of the proposed regulations are concurrence with Federal law, sustainable management of California's trout and salmon resources, and promotion of businesses that rely on recreational sport fishing in California.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 215, 220, 240, 315, 316.5, and 2003, Fish and Game Code.

Reference: Sections 200, 205, 206, 215, 220 and 316.5, Fish and Game Code.

- (c) Specific Technology or Equipment Required by Regulatory Change:

None.

- (d) Identification of Reports or Documents Supporting Regulation Change:

None.

- (e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are scheduled prior to the notice publication. The 45-day public notice comment period provides adequate time for review of the proposed changes.

IV. Description of Reasonable Alternatives to Regulatory Action:

- (a) Alternatives to Regulation Change:

No alternatives were identified.

- (b) No Change Alternative:

The no change alternative would leave existing regulations in place.

- (c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action is not anticipated to have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states because the expected impact of the proposed regulations on the amount of fishing activity is anticipated to be minimal relative to recreational angling effort statewide.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The expected impact of the proposed regulations on the amount of fishing activity is anticipated to be minimal relative to recreational angling effort statewide. Therefore the Commission does not anticipate any impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing business or the expansion of businesses in California.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon and trout sport fishery encourages consumption of a nutritious food.

The Commission does not anticipate any non-monetary benefits to worker safety.

The Commission anticipates benefits to the environment by the sustainable management of California's sport fishing resources.

(c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

(e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

The proposed regulations will revise and update inland sport fishing regulations starting in 2016. Currently, the seasons, size limits, and bag and possession limits for sport fishing are periodically reviewed by the Department of Fish and Wildlife and the Commission. This set of amendments will clarify regulations for snagging, landlocked salmon, San Francisco and San Pablo Bay, Solano Lake, and reptiles, to reduce public confusion and improve regulatory enforcement. Additionally, this proposal will add a new fishing restriction to protect sturgeon, and increase fishing opportunities on the Sacramento River.

Inland sport fishing regulation's affected parties include recreational anglers, commercial passenger fishing vessels and a variety of businesses that support anglers. The economic impact of regulatory changes for sport fisheries are estimated by tracking resulting changes in fishing effort, angler trips and length of stay in the fishery areas. Distance traveled affects gas and other travel

expenditures. Day trips and overnight trips involve different levels of spending for gas, food and accommodations at area businesses as well as different levels of sales tax impacts. Direct expenditures ripple through the economy, as receiving businesses buy intermediate goods from suppliers that then spend that revenue again. Business spending on wages is received by workers who then spend that income, some of which goes to local businesses. Recreational fisheries spending, thus multiplies throughout the economy with the indirect and induced effects of the initial direct expenditure.

The adoption of scientifically-based regulations provides for the maintenance of sufficient populations of inland sport fish to ensure their continued existence and future sport fishing opportunities that in turn support businesses related to the fishery economy.

The most recent 2011 U.S. Fish and Wildlife national survey of fishing, hunting, and wildlife associated recreation for California reports about 1.35 million resident and nonresident inland sport fish anglers contributed about \$1.2 billion in trip and equipment expenditures to the State's economy. Adding the indirect and induced effects of this \$1.2 billion direct revenue contribution the total economic benefit to California's economy is estimated to be about \$2.03 billion. This corresponds with about \$960 million in total wages to Californians and about 16,000 jobs in the State annually.

This regulatory action may impact businesses that provide services to sport fishermen but these effects are anticipated to range from none to small positive impacts, depending on the regulations ultimately adopted by the Commission. Sport fishing business owners, boat owners, tackle store owners, boat manufacturers, vendors of food, bait, fuel and lodging, and others that provide goods or services to those that sport fish in California may be positively affected to some degree from increases to business that may result under the range of proposed regulations. These anticipated impacts may vary by geographic location. Additionally, economic impacts to these same businesses may result from a number of factors unrelated to the proposed changes to inland sport fishing regulations, including weather, fuel prices, and success rates in other recreational fisheries that compete for angler trips.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

The cumulative effects of the changes statewide are estimated to be neutral to job elimination and potentially positive to job creation in California. No significant changes in fishing effort and sport fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

(b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

The cumulative effects of the changes statewide are expected to be neutral to business elimination and have potentially positive impacts to the creation of businesses in California. No significant changes in fishing effort and sport fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

The cumulative effects of the changes statewide are expected to be neutral to positive to the expansion of businesses currently doing business in California. No significant changes in fishing effort and inland sport fishing expenditures to businesses are expected as a direct result of the proposed regulation changes.

(d) Benefits of the Regulation to the Health and Welfare of California Residents:

The Commission anticipates benefits to the health and welfare of California residents. Trout and salmon are a nutritious food source and increasing inland sport fishery opportunities encourages consumption of this nutritious food. Sport fishing also contributes to increased mental health of its practitioners as fishing is a hobby and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California's environment by younger generations, the future stewards of California's natural resources.

(e) Benefits of the Regulation to Worker Safety:

The proposed regulations are not anticipated to impact worker safety conditions.

(f) Benefits of the Regulation to the State's Environment:

It is the policy of the state to encourage the conservation, maintenance, and utilization of the living resources of the inland waters under the jurisdiction and influence of the state for the benefit of all its citizens and to promote the development of local California fisheries. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use, taking into consideration the necessity of regulating

individual sport fishery bag limits in the quantity that is sufficient to provide a satisfying sport. Adoption of scientifically-based inland trout and salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of trout and salmon to ensure their continued existence.

Informative Digest/Policy Statement Overview

This Department proposal combines Department and public requests for changes to Title 14, California Code of Regulations (CCR), for the 2015 Freshwater Sport Fishing Regulations Review Cycle. This proposal will clarify regulations for snagging, landlocked salmon, San Francisco and San Pablo Bays, Solano Lake, and reptiles, to reduce public confusion and improve regulatory enforcement. Additionally, this proposal will add a new fishing restriction to protect sturgeon, and increase fishing opportunities on the Sacramento River.

The Department is proposing the following changes to current regulations:

Snagging Definition

Subsection 2.00(b) would be amended to further define snagging. Currently, the snagging definition states that it is illegal to impale a fish in any part of its body **other than the mouth**. This makes it legal for anyone to keep a fish that has been hooked on the outside of the mouth, such as a hook that enters from the lower jaw into the mouth or nose into the mouth. The proposal is to reword the definition to say **other than inside the mouth**. Subsections 2.00(b) and (c), and Section 1.05 will need to be amended for consistency.

Proposal: Amend Section 1.05, Angling, and subsections (b) and (c) of Section 2.00, Fishing Methods - General

Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth.

Landlocked Salmon Definition

Current regulations incorporate kokanee (*Oncorhynchus nerka*) into the definition of "Trout," and stocked, landlocked Chinook salmon into the definition of "Salmon," which includes anadromous forms of salmon. Scientific evidence, including life history variation and behavioral differences, suggests the need for differing management strategies for these species. They should be separately defined and addressed in the freshwater sport fishing regulations. In addition, these new species definitions need to have associated bag and possession limits.

Proposal: Amend Section 1.86, Trout; Section 7.00, District General Regulations; add, sections 1.57 and 5.41, Landlocked Salmon

Create a new definition for landlocked salmon which will include kokanee and landlocked Chinook salmon. New daily bag and possession limits for landlocked salmon are proposed in a new Section 5.41. The new bag limit will be 5 fish and the possession limit will be 10 fish.

Amend the District General Regulations in Section 7.00 to revise the references to trout and salmon to just trout except for daily bag and possession limits which means the total number of trout or landlocked salmon in combination. This change is proposed to reduce public confusion with landlocked salmon versus anadromous salmon that are allowed only in the Section 7.50 Special Regulations since the General District Regulations has the take of anadromous salmon closed statewide.

Reptile Regulation Correction

A numbering error has been identified in Section 5.60, specifically subsections (b)10 through (b)14. The regulation incorrectly reads, "Species No. 9-13 have a limit of twenty-five (25) in the aggregate." It should read, "Species No. 10-14 have a limit of twenty-five (25) in the aggregate." Correcting the numbering mistake will alleviate confusion amongst sport fisherman and wildlife officers.

Proposal: Amend subsection (b) of Section 5.60, Reptiles

Correct the numbering errors in this section to reduce public confusion and enforcement issues.

Sturgeon Fishing Closure

Green sturgeon and white sturgeon (subadults and adults) are often stranded for long periods in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir. Some of those fish escape when environmental conditions change but others are rescued or succumb. Through catch-and-release, legal harvest, and poaching, anglers could take both species when stranded. The legal fishery on stranded fish is not sporting, reduces the benefit of rescue efforts, and reduces population spawning potential. Because green sturgeon is a threatened species and white sturgeon is a substantial management concern, addressing this issue is relatively urgent. Therefore, the Department is proposing to prohibit the take and possession of sturgeon in the Yolo Bypass as well as the Toe Drain and Tule Canal upstream of Lisbon Weir at any time.

Current regulations in subsection (d) of Section 5.80 state that a sturgeon must voluntarily take the bait or lure *in* its mouth. This language is proposed to be revised to read *inside* its mouth, to be consistent with proposed revisions to the snagging definition in Section 2.00.

Proposal: Add subsection (j) to Section 5.80 and amend subsection (d), White Sturgeon, Methods of take.

Prohibit fishing for sturgeon in the Yolo Bypass Flood Control System to protect green and white sturgeon.

Amend the regulations to clarify that it is illegal to take a fish not hooked on the inside of the mouth for alignment with the proposed snagging definition changes to Section 2.00.

Green Sturgeon Revision for Brevity

Take and possession of green sturgeon is prohibited by law. Section 5.81, Green Sturgeon, subsection (d) designates a special fishing closure for sturgeon in the Sierra and Valley District. This special fishing closure is also provided under Section 5.80, White Sturgeon. Because fishing for green sturgeon is prohibited, this regulation is not needed in the regulations for Green Sturgeon.

Proposal: Remove subsection (d) from Section 5.81, Green Sturgeon.

Fishing for green sturgeon is prohibited. Therefore, the special fishing closure regulation for sturgeon is not need in Section 5.81.

Red Bluff Diversion Dam

Current regulations restrict fishing from 500 feet upstream to 150 feet below Red Bluff Diversion Dam (RBDD). RBDD is no longer operated as an irrigation diversion so the current restrictions about fishing near a dam are no longer needed. Boaters, and recreationists, and fish are free to pass up and downstream of the area at will. The angling public is very interested in angling in the immediate vicinity of the RBDD now that it is no longer in operation and the Sacramento River is not impounded by its gates. The proposal is to allow shore and boat angling above and below RBDD on the Sacramento River.

Proposal: Amend Special Fishing Regulations subsection (b)(156.5), Sacramento River

Remove the current fishing restriction above and below RBDD on the Sacramento River to increase angling opportunities in Tehama County.

Solano Lake

The proposal is to add Solano Lake to Section 7.50, *Alphabetical List of Waters with Special Fishing Regulations*. The original intent was for Solano Lake to be included in the Putah Creek special fishing regulations. That regulation applies to the stream reach from Solano Lake to Monticello Dam and does not include Solano Lake. Therefore, a new subsection needs to be added to Section 7.50.

Proposal: Add subsection (b)(180.6), Solano Lake, to the Special Fishing Regulations

Add a new regulation for Solano Lake to the Special Fishing Regulations. The daily bag and possession limit will be 0 (zero).

San Francisco and San Pablo Bays Clarification

Currently there are three sections dealing with the Ocean and San Francisco Bay District which describe regulations in different manners causing confusion for anglers and making enforcement of the regulations more difficult:

- Section 27.00 defines the Ocean and San Francisco Bay District as waters of the

open coast and includes San Francisco and San Pablo Bays *“plus all their tidal bays, tidal portions of their rivers and streams, sloughs and estuaries”* between the Golden Gate Bridge and the Carquinez Bridge.

- Section 1.53 defines inland waters as all fresh, brackish and inland saline waters of the state, including lagoons and tidewaters upstream from the mouths of coastal rivers and streams. Inland waters exclude the waters of San Francisco and San Pablo Bays downstream from the Carquinez Bridge, the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays, and the waters of Elkhorn Slough, west of Elkhorn Road between Castroville and Watsonville.
- Section 28.65(a) (which describes gear restrictions for fin fish). Defines the area as San Francisco and San Pablo Bays between the Golden Gate Bridge and the west Carquinez Bridge, where only one line with not more than three hooks may be used.

The different definitions of the same geographic area cause confusion as to applicable method of take as well as which set of regulations apply to the waters being fished.

An angler is allowed to use any number of hooks and lines in the ocean waters (Section 28.65). In Inland waters only one closely attended line with no more than three hooks may be used (Section 2.00). Under current regulations, a person could argue that tidal portions of the Napa River were not Inland Waters and since Section 28.65(a) did not include the tidal portions of river flowing into San Francisco and San Pablo Bays. Under this interpretation, they could use any number of lines and hooks to fish in the Napa River. This would restrict waters of San Francisco and San Pablo Bay to one line, then allow unlimited lines in the Napa River waters which were tidally influenced even though all inland waters are restricted to one line.

In addition, fishing regulations for Ocean Waters defined in Section 27.00 are different from Inland Waters as defined in Section 1.53. Since tidal influence cannot easily be determined, it is almost impossible to know which set of regulations apply in the tidally influenced waters. For instance is an undersized sturgeon caught in the Napa River a violation of section 5.80 or Section 27.90?

To simplify the regulations and make all of the regulations consistent, all three sections must use the same reference.

The proposal is to amend sections 27.00 and 1.53 to align with Section 28.65(a) and remove the reference to tidal bays and tidal portions of rivers and streams from these two sections. As a result, inland waters will now include the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays which will be subject to the

gear restrictions for inland waters where only one closely attended rod and line with no more than three hooks may be used.

Proposal: Amend Section 1.53, Inland Waters, and Section 27.00, Ocean and San Francisco Bay Definition

Amend the two regulations that define the San Francisco and San Pablo Bays to be consistent, reducing public confusion and enforcement issues. Remove capitalized text before the note which is a printing error.

Fishing Contest Draw Dates

The current wording of subsection 230(b)(1)(A) designates specific dates for a drawing that is conducted annually by Department personnel to allocate Type A fishing contest permits in a fair manner. Dates are the second Friday of July for bodies of water north of the Tehachapi Mountains and the third Friday of July for waters south of the Tehachapi Mountains.

Specific designation of these dates can conflict with major fishing-related events that contest sponsors often need to attend (e.g., International Convention of Allied Sport fishing Trade – ICAST). Sponsors who must attend the ICAST show—an international conference of fishing gear manufacturers, media, and many others—cannot simultaneously attend the contest drawing, hindering the conflict resolution process for which the drawing is held.

The Department is proposing to amend the regulations to state that the contest drawings will be conducted in July and the dates will be determined by Department staff.

Proposal: Amend subsection (b)(1)(A) of Section 230, Issuance of Permits for Contests Offering Prizes for the Taking of Game Fish

Amend the regulations to change the current contest drawing dates to unspecified dates in July which will be determined by Department staff.

Minor Editorial Corrections for Clarity

Additional editorial corrections are proposed to correct typographical errors and to improve regulation clarity.

Benefits of the Proposed Regulations

It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the state for the benefit of all the citizens of the State. In addition, it is the policy of this state to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the State. The

objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based trout and salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of trout and salmon to ensure their continued existence.

The benefits of the proposed regulations are concurrence with Federal law, sustainable management of California's trout and salmon resources, and promotion of businesses that rely on recreational sport fishing in California.

Regulatory Language

Section 1.05, Title 14, CCR, is amended as follows:

§ 1.05. Angling.

~~To~~ Angling means take of fish by hook and line with the line held in the hand, or with the line attached to a pole or rod held in the hand or closely attended in such manner that the fish voluntarily takes the bait or lure ~~in~~ inside its mouth.

Note: Authority cited: Sections 200, 202, 205, 210, 219 and 220, Fish and Game Code.
Reference: Sections 2, 15, ~~200-202, 203.1, 205-210 and 215-222~~ 200, 202, 205, 206, 215 and 220, Fish and Game Code

Section 1.53, Title 14, CCR, is amended as follows:

§ 1.53. Inland Waters.

Inland waters are all the fresh, brackish and inland saline waters of the state, including lagoons and tidewaters upstream from the mouths of coastal rivers and streams. Inland waters exclude the waters of San Francisco and San Pablo bays downstream from the west Carquinez Bridge, ~~the tidal portions of rivers and streams flowing into San Francisco and San Pablo Bays~~, and the waters of Elkhorn Slough, west of Elkhorn Road between Castroville and Watsonville. Also see Section 27.00.

Note: Authority cited: Sections 200, 202, 205, 215 and 220, Fish and Game Code.
Reference: Sections 200, 202, 205, 206, 215 and 220, Fish and Game Code.

Section 1.57, Title 14, CCR, is added as follows:

§ 1.57. Landlocked Salmon.

Landlocked salmon includes kokanee and landlocked Chinook salmon.

Note: Authority cited: Sections 200, 202, 205, 210, 219 and 220, Fish and Game Code.
Reference: Sections 200, 202, 205, 210, 215, and 220, Fish and Game Code.

Section 1.86, Title 14, CCR, is amended as follows:

§ 1.86. Trout.

~~Includes~~ Trout includes all trouts, chars, steelhead, ~~kokanee salmon~~ and grayling.

Note: Authority cited: Sections 200, 202, 205, 210, 219 and 220, Fish and Game Code.
Reference: Sections ~~200-202, 203.1, 205-210, 215-222 and 1725-1728~~ 200, 202, 205, 210, 215, 220, 1725, 1726, 1726.4, 1727, and 1728, Fish and Game Code.

Section 2.00, Title 14, CCR, is amended as follows:

§ 2.00. Fishing Methods - General.

(a) Except as otherwise authorized, all fish may be taken only by angling with one closely attended rod and line or one hand line with not more than three hooks nor more than three artificial lures (each lure may have three hooks attached) attached thereto. Anglers in possession of a valid two-rod stamp and anglers under 16 years of age may use up to two rods in inland waters which regulations provide for the taking of fish by angling, except those waters in which only artificial lures or barbless hooks may be used. See District Trout, Salmon and Special regulations for exceptions.

(b) Snagging is prohibited. Snagging is defined as impaling or attempting to impale a fish in any part of its body other than inside the mouth by use of a hook, hooks, gaff, or other mechanical implement. This definition does not include activities otherwise authorized under these regulations for the lawful use of a gaff, bow and arrow, or spear.

(c) It is unlawful to kill, or retain in possession any fish which has not voluntarily taken the bait or artificial lure ~~in~~inside its mouth. Any fish not taken pursuant to these regulations, shall be released immediately back into the water.

Note: Authority cited: Sections 200, 202, 205, 219, 220 and 7194.4, Fish and Game Code. Reference: Sections 200, 202, 206, 220 and 7149.4, Fish and Game Code.

Section 5.41, Title 14, CCR, is added as follows:

§ 5.41. Landlocked Salmon.

(a) Open season: All year.

(b) Daily bag limit: Five.

(c) Possession limit: Ten.

(d) Size limit: None.

Note: Authority cited: Sections 200, 202, 205, 210, 219 and 220, Fish and Game Code. Reference: Sections 200, 202, 205, 210, 215, and 220, Fish and Game Code.

Section 5.60, Title 14, CCR, is amended as follows:

§ 5.60. Reptiles.

(a) Only the following reptiles may be taken under the authority of a sportfishing license, subject to the restrictions in this section. No sportfishing license is required for the sport take of any rattlesnake, but bag and possession limits do apply. No reptiles shall be taken from ecological reserves designated by the commission in Section 630 or from state parks, or national parks or monuments.

(b) Limit: The limit for each of the species listed below is two, unless otherwise provided. Limit, as used in this section, means daily bag and possession limit.

(1) Painted turtle (*Chrysemys picta*): Limit: No limit.

(2) Slider Turtle (*Pseudemys (Trachemys) scripta*): Limit: No limit.

(3) Spiny softshell turtle (*Trionyx (Apalone) spiniferus (spinifera)*): Limit: No limit.

- (4) Western banded gecko (*Coleonyx variegatus*), except San Diego banded gecko (*Coleonyx variegatus abbotti*): See Special Closure (f)(1)
- (5) Desert iguana (*Dipsosaurus dorsalis*)
- (6) Chuckwalla (*Sauromalus obesus (ater)*)
- (7) Zebra-tailed lizard (*Callisaurus draconoides*)
- (8) Desert spiny lizard (*Sceloporus magister*)
- (9) Granite spiny lizard (*Sceloporus orcutti*)
- (10) Western fence lizard (*Sceloporus occidentalis*): Limit: Species No. ~~9-13~~10-14 have a limit of twenty-five (25) in the aggregate
- (11) Sagebrush lizard (*Sceloporus graciosus*): Limit: Species No. ~~9-13~~10-14 have a limit of twenty-five (25) in the aggregate
- (12) Side-blotched lizard (*Uta stansburiana*): Limit: Species No. ~~9-13~~10-14 have a limit of twenty-five (25) in the aggregate
- (13) Western skink (*Eumeces skiltonianus*): Limit: Species No. ~~9-13~~10-14 have a limit of twenty-five (25) in the aggregate
- (14) Desert night lizard (*Xantusia vigilis*), except *Xantusia vigilis sierrae*: See Special Closure (f)(2): Limit: Species No. ~~9-13~~in subsections (10) through (14) have a limit of twenty-five (25) in the aggregate
- (15) Long-tailed brush lizard (*Urosaurus graciosus*)
- (16) Tree lizard (*Urosaurus ornatus*)
- (17) Small-scaled lizard (*Urosaurus microscutatus*)
- (18) Desert horned lizard (*Phrynosoma platyrhinos*)
- (19) Short-horned lizard (*Phrynosoma douglassii*)
- (20) Great basin collared lizard (*Crotaphytus bicinctores*)
- (21) Banded rock lizard (*Petrosaurus mearnsi*)
- (22) Baja California collared lizard (*Crotaphytus vestigum*)
- (23) Long-nosed leopard lizard (*Gambelia wislizenii*)
- (24) Gilbert's skink (*Eumeces (Plestion) gilberti*)
- (25) Western whiptail (*Cnemidophorus (Apidoscelis) tigris*)
- (26) Southern alligator lizard (*Elgaria multicarinata*)
- (27) Northern alligator lizard (*Elgaria coerulea*)
- (28) Rubber boa (*Charina bottae*), **except** southern rubber boa (*Charina bottae umbratica*): See Special Closure (f)(3)
- (29) Rosy boa (*Lichanura trivirgata*)
- (30) Ringneck snake (*Diadophis punctatus*), except *Diadophis punctatus regalis*: See Special Closure (f)(4)
- (31) Sharp-tailed snakes (*Contia* spp.)
- (32) Spotted leaf-nosed snake (*Phyllorhynchus decurtatus*)
- (33) Racer (*Coluber constrictor*)
- (34) Coachwhip (*Masticophis (Coluber) flagellum*), **except** San Joaquin Coachwhip (*Masticophis flagellum ruddocki*): See Special Closure (f)(5)
- (35) Striped whipsnake (*Masticophis (Coluber) taeniatus*)
- (36) California whipsnake (striped racer) (*Masticophis (Coluber) lateralis*), except Alameda whipsnake (*Masticophis lateralis euryxanthus*): See Special Closure (f)(6)
- (37) Western (Desert) patch-nosed snake (*Salvadora hexalepis*), except *Salvadora*

- hexalepis virgultea*: See Special Closure (f)(7)
- (38) Glossy snake (*Arizona elegans*), except *Arizona elegans occidentalis*: See Special Closure (f)(8)
- (39) Gopher snake (*Pituophis melanoleucus*): Limit: Four (4)
- (40) Common kingsnake (*Lampropeltis getula*): Limit: Four (4)
- (41) California mountain kingsnake (*Lampropeltis zonata*), **except** San Diego mountain kingsnake (*Lampropeltis zonata pulchra*) and San Bernardino mountain kingsnake (*Lampropeltis zonata parvirubra*): Limit: One (1). See Special Closure: (f)(9)
- (42) Long-nosed snake (*Rhinocheilus lecontei*)
- (43) Common garter snake (*Thamnophis sirtalis*), **except** San Francisco garter snake (*Thamnophis sirtalis tetrataenia*) and South Coast garter snake (*Thamnophis sirtalis* sp.): See Special Closure (f)(10)
- (44) Terrestrial garter snake (*Thamnophis elegans*)
- (45) Western aquatic (Sierra) garter snake (*Thamnophis couchii*)
- (46) Pacific coast aquatic garter snake (*Thamnophis atratus*)
- (47) Northwestern garter snake (*Thamnophis ordinoides*)
- (48) Checkered garter snake (*Thamnophis marcianus*)
- (49) Variable ground snake (*Sonora semiannulata*)
- (50) Western shovel-nosed snake (*Chionactis occipitalis*)
- (51) California (Western) black-headed snake (*Tantilla planiceps*)
- (52) Southwestern (Smith's) black-headed snake (*Tantilla hobartsmithi*)
- (53) Lyre snakes (*Trimorphodon biscutatus*)
- (54) Night snakes (*Hypsiglena* spp.)
- (55) Western blind snake (Southwestern threadsnake) (*Leptotyphlops (Rena) humilis*)
- (56) Western diamondback rattlesnake (*Crotalus atrox*)
- (57) Mojave rattlesnake (*Crotalus scutulatus*)
- (58) Western rattlesnakes (*Crotalus viridus (oreganus)* spp.)
- (59) Speckled rattlesnake (*Crotalus mitchelli*)
- (60) Sidewinders (*Crotalus cerastes* spp.)
- (61) Panamint rattlesnake (*Crotalus stephensi*)
- (62) Red diamond rattlesnake (*Crotalus ruber*): Limit: Zero (0)
- (c) Open season: All year.
- (d) Hours: Reptiles may be taken at any time of day or night.
- (e) Methods of take:
- (1) Reptiles may be taken only by hand, except as provided in subsections (e)(2) and (3) below, or by the following hand-operated devices:
- (A) Lizard nooses.
- (B) Snake tongs.
- (C) Snake hooks.
- (2) Rattlesnakes may be taken by any method.
- (3) Turtles may be taken by hook and line. Fishing methods described in Section 2.00 apply to the take of spiny softshell turtles, slider turtles and painted turtles.
- (4) It is unlawful to use any method or means of collecting that involves breaking apart of rocks, granite flakes, logs or other shelters in or under which reptiles may be found.
- (f) Special Closures:

- (1) No geckos (*Coleonyx variegatus*) may be taken in San Diego County south and west of Highway 79 to its junction with County Road S-2, and south and west of County Road S-2 to the eastern San Diego County border.
- (2) No rubber boas (*Charina bottae* or *Charina umbratica*) may be taken in Kern, Los Angeles, Riverside and San Bernardino counties.
- (3) No night lizards (*Xantusia vigilis*) may be taken in Kern County.
- (4) No ringneck snakes (*Diadophis punctatus*) may be taken in San Bernardino or Inyo counties.
- (5) No coachwhips (*Masticophis (Coluber) flagellum*) may be taken in the following counties: Alameda, Contra Costa, Fresno, Kern, Kings, Merced, Monterey, San Benito, San Joaquin, San Luis Obispo, Santa Barbara, Stanislaus, Tulare.
- (6) No California whipsnakes (striped racer) (*Masticophis (Coluber) lateralis*) may be taken in Alameda and Contra Costa counties.
- (7) No Western (desert) patch-nosed snakes (*Salvadora hexalepis*) may be taken in the following counties: Los Angeles, Orange, Riverside, San Bernardino, San Diego, San Luis Obispo, Santa Barbara and Ventura.
- (8) No glossy snakes (*Arizona elegans*) may be taken in the following counties: Alameda, Fresno, Imperial (west of Hwy 111), Kern, Los Angeles, Riverside (southwest of Hwy 111 and I-10), San Benito, San Bernardino (West of I-215 and Hwy 138), San Diego, San Joaquin, San Luis Obispo, Santa Barbara, Santa Clara and Tulare.
- (9) No California mountain kingsnakes (*Lampropeltis zonata*) may be taken in Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties.
- (10) No common garter snakes (*Thamnophis sirtalis*) may be taken in Los Angeles, Orange, Riverside, San Diego, and Ventura counties.

Note: Authority cited: Sections 200, 202, 205, 210, 219 and 220, Fish and Game Code.
 Reference: Sections 200, 201, 202, 203.1, 205 and 220, Fish and Game Code.

Section 5.80, Title 14, CCR, is amended as follows:

§ 5.80. White Sturgeon.

- (a) Open season: All year, except for closures listed under special regulations.
- (b) Daily and annual bag limit: One fish per day. Three fish per year statewide.
- (c) Size limit: No fish less than 40 inches fork length or greater than 60 inches fork length may be taken or possessed.
- (d) Methods of take: Only one single point, single shank, barbless hook may be used on a line when taking sturgeon. The sturgeon must voluntarily take the bait or lure inside its mouth. No sturgeon may be taken by trolling, snagging or by the use of firearms. Sturgeon may not be gaffed, nor shall any person use any type of firearm or snare to take any sturgeon.
 For the purposes of this section, a snare is a flexible loop made from any material that can be tightened like a noose around any part of the fish.
- (e) Removal from water. Any sturgeon greater than 68 inches fork length may not be removed from the water and shall be released immediately.
- (f) Report card required: Any person fishing for or taking sturgeon shall have in their

possession a nontransferable Sturgeon Fishing Report Card issued by the department and shall adhere to all reporting and tagging requirements for sturgeon defined in Sections 1.74 and 5.79, Title 14, CCR.

(g) Special North Coast District Sturgeon Closure (Humboldt, Del Norte, Trinity and Siskiyou cos.). It is unlawful to take any sturgeon in the North Coast District at any time.

(h) For regulations on take and possession of sturgeon in ocean waters as defined in Section 27.00, see Sections 27.90, 27.91, and 27.95.

(i) Special Sierra and Valley District Sturgeon Closure from January 1 to December 31 (Shasta, Tehama, Butte and Glenn cos.).

(1) Sacramento River from Keswick Dam to the Highway 162 Bridge.

(A) It is unlawful to take any sturgeon.

(B) It is unlawful to use wire leaders.

(C) It is unlawful to use lamprey or any type of shrimp as bait.

(j) Special Yolo Bypass Flood Control System Sturgeon Closure. It is unlawful to take any sturgeon in the Yolo Bypass, Toe Drain Canal, and Tule Canal upstream of Lisbon Weir at any time.

Note: Authority cited: Sections 200, 202, 205 and 220, Fish and Game Code.

Reference: Sections 200, 205 and 206, Fish and Game Code.

Section 5.81, Title 14, CCR, is amended as follows:

§ 5.81. Green Sturgeon.

(a) Green sturgeon may not be taken or possessed.

(b) Green sturgeon may not be removed from the water and shall be released immediately.

(c) Green sturgeon taken and released incidentally to white sturgeon fishing shall be reported on a Sturgeon Fishing Report Card issued by the department, in accordance with procedures defined in Sections 1.74 and 5.79, Title 14, CCR.

~~(d) Special Sierra and Valley District Sturgeon Closure from January 1 to December 31 (Shasta, Tehama and Glenn cos.).~~

~~(1) Sacramento River from Keswick Dam to the Highway 162 Bridge.~~

~~(A) It is unlawful to take any sturgeon.~~

~~(B) It is unlawful to use wire leaders.~~

~~(C) It is unlawful to use lamprey or any type of shrimp as bait.~~

Note: Authority cited: Sections 200, 202, 205 and 220, Fish and Game Code.

Reference: Sections 200, 205 and 206, Fish and Game Code.

Section 7.00, Title 14, CCR, is amended as follows:

§ 7.00. District General Regulations.

Unless otherwise provided, waters shown as open to trout ~~and salmon~~ fishing in subsections (a) through (g) below, are open to fishing for other species. Gear restrictions listed in this section apply to the take of all species of fish unless otherwise

noted. Every body of water listed in subsections (a) through (g) of Section 7.00 (below) is closed to all fishing, except during the open season as shown. Unless otherwise provided, waters closed to trout ~~and salmon~~ fishing are closed to fishing for all other species, except that these closures do not apply to fishing for amphibians (see Section 5.05), freshwater clams (see Section 5.20), crayfish (see Section 5.35), and lamprey (see Section 5.40), using legal fishing methods other than hook-and-line fishing, and saltwater clams, crabs, ghost shrimp, and blue mud shrimp (see Ocean Regulations Booklet Sections 29.20 to 29.87). Crabs may only be taken using hoop nets or by hand, and Dungeness crab may only be taken within the North Coast District and Sonoma and Mendocino counties.

Daily bag and possession limits, unless otherwise provided, mean the total number of trout ~~and/or landlocked~~ salmon in combination. Unless otherwise provided, no more than one daily bag limit may be possessed. Coho (silver) salmon may not be taken in any of the waters of the State, except in Lake Oroville and Oroville-Thermalito Complex (Diversion Pool, Forebay, and Afterbay) and the Feather River from the Diversion Pool Dam to the Fish Barrier Dam. Incidentally hooked Coho (silver) salmon, except those in Lake Oroville and Oroville-Thermalito Complex (Diversion Pool, Forebay, and Afterbay) and the Feather River from the Diversion Pool Dam to the Fish Barrier Dam, must be immediately released unharmed to the waters where they are hooked. In waters where the bag limit for trout ~~or salmon~~ is zero, fish for which the bag limit is zero must be released unharmed, and should not be removed from the water.

These waters may also be subject to restrictions on fishing methods and gear (sections 2.00 through 2.45), fishing hours (section 3.00), and the use of bait (sections 4.00 through 4.30).

[Subsections (a) through (g) remain unchanged]

*Hatchery trout or steelhead have a healed adipose fin clip (adipose fin is absent). Unless otherwise provided, all other trout and steelhead must be immediately released. Wild trout or steelhead are those not showing a healed adipose fin clip (adipose fin present).

Note: Authority cited: Sections 200, 202, 205, 220 and 240, Fish and Game Code.

Reference: Sections 200, 205 and 206, Fish and Game Code.

§7.50. Alphabetical List of Waters with Special Fishing Regulations.

Subsection (b)(156.5) of Section 7.50, Title 14, CCR, is amended as follows:

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag and Possession Limit</i>
-----------------------------	---	--

(156.5) Sacramento River and tributaries below Keswick Dam (Butte, Colusa, Contra Costa, Glenn, Sacramento, Solano, Sutter, Tehama and Yolo Cos.).	Also see Sierra District General Regulations (See Section 7.00(b)).	
(A) Sacramento River from Keswick Dam to 650 feet below Keswick Dam.	Closed to all fishing all year.	
(B) Sacramento River: 1. from 650 feet below Keswick Dam to the Highway 44 bridge.	Closed to all fishing from April 24 through July 31.	
	August 1 through December 31. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
2. from the Highway 44 bridge to the Deschutes Road bridge.	All year. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
(C) Sacramento River from the Deschutes Road bridge to 500 feet upstream from the Red Bluff Diversion Dam.	Jan. 1 through July 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	Aug. 1 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2 Chinook salmon 4 Chinook salmon in possession

	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
(D) Sacramento River from 500 feet upstream from Red Bluff Diversion Dam to 150 feet below the Lower Red Bluff (Sycamore) Boat Ramp.	Closed to all fishing all year.	
(E) Sacramento River from 150 feet below the Lower Red Bluff (Sycamore) Boat Ramp to the Red Bluff Diversion Dam to the Hwy 113 bridge near Knights Landing. Note: It is unlawful to take fish 0-250 feet downstream from the overflow side of the Moulton, Colusa and Tisdale Weirs.	Jan. 1 through July 15.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	July 16 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2 Chinook salmon 4 Chinook salmon in possession
	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

(FE) Sacramento River from the Hwy 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160). Note: It is unlawful to take fish 0-250 feet downstream from the overflow side of the Fremont and Sacramento Weirs.	Jan. 1 through July 15.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	July 16 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2 Chinook salmon 4 Chinook salmon in possession
	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

Subsection (b)(180.6) is added to Section 7.50, Title 14, CCR, as follows:

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag and Possession Limit</i>
<u>(180.6) Solano Lake (Solano County).</u>	<u>All year. Only artificial lures and barbless hooks may be used.</u>	<u>0</u>

* Wild Chinook salmon are those not showing a healed adipose fin clip and not showing a healed left ventral fin clip.

**Hatchery trout or steelhead are those showing a healed adipose fin clip (adipose fin is absent). Unless otherwise provided, all other trout and steelhead must be immediately released. Wild trout or steelhead are those not showing a healed adipose fin clip (adipose fin is present).

Note: Authority cited: Sections 200, 202, 205, 215, 220, 240, 315 and 316.5, Fish and Game Code. Reference: Sections 200, 202, 205, 206, 215 and 316.5, Fish and Game Code.

Section 27.00, Title 14, CCR, is amended as follows:

§ 27.00. Definition.

The Ocean and San Francisco Bay District consists of the open seas adjacent to the coast and islands or in the waters of those open or enclosed bays contiguous to the ocean, and including San Francisco and San Pablo bays ~~plus all their tidal bays, tidal portions of their rivers and streams, sloughs and estuaries between Golden Gate Bridge and the west Carquinez Bridge, and the waters of Elkhorn Slough, west of Elkhorn Road between Castroville and Watsonville.~~ Also see Section 1.53.

~~FIN FISH - MINIMUM SIZE LIMITS, BAG AND POSSESSION LIMITS AND SEASONS~~

Note: Authority cited: Sections 200, 202, 205, 215 and 220, Fish and Game Code.

Reference: Sections 200, 202, 205, 206, 215 and 220, Fish and Game Code.

Section 230, Title 14, CCR, is amended as follows:

§ 230. Issuance of Permits for Contests Offering Prizes for the Taking of Game Fish.

[No changes to subsection (a)]

(b) Issuance of Permits.

(1) Revocable permits to conduct fishing contests (including tournaments, derbies or tagged fish contests) may be issued by the department to any person (as defined by section 67, Fish and Game Code) authorizing the permittee to offer prizes or other inducements for the taking of game fish. The department shall issue such permits if it determines the proposed contest(s) would not be detrimental to the resource. For the purposes of this section, game fish are defined as the following: white sturgeon and green sturgeon; American shad; salmon and trout -all species; goldfish; common carp; hardhead; Sacramento squawfish; western sucker; catfish and bullheads -all species; striped bass; white bass; black bass and sunfish -all species; tilapia -all species; sargo; bairdiella; and orangemouth corvina. Procedures for issuing event permits for black bass fishing contests are specified in subsections (A) through (D), below:

(A) A random drawing will be conducted by department personnel to issue Type A permits for black bass fishing contests during July of the year preceding the contest date. ~~Drawings will be conducted the second Friday of July for bodies of water north of the Tehachapi Mountains and the third Friday of July for waters south of the Tehachapi Mountains.~~ Dates will be determined by departmental staff. Applications will not be accepted prior to July 1 of the year preceding the calendar year in which a contest is proposed.

(B) Applicants may submit a completed application(s) (including appropriate fees) to the appropriate department office (see Section 230(b)(2)) or attend the random drawings in person. Applications received prior to the random drawings must be prioritized by the applicant and if not, will be drawn in chronological order based on the contest date. Prior to the drawing, a random number will be assigned to each applicant in attendance and to each group of applications submitted by an individual not in attendance. A series

of random drawings of the assigned numbers will be conducted by department personnel and one application accepted for each number drawn. Only one application shall be accepted from each applicant during each consecutive round of the drawing process. Rounds of drawings will be conducted until all applications have been accepted, or there are no more available dates for a given body of water, whichever occurs first.

(C) Immediately following the drawing(s), the fees for all successful applications not already submitted must be paid to the department.

(D) Permits for applications received after the drawings will be issued in chronological order of receipt, subject to availability.

(2) Application shall be made on a standard form provided by the department (APPLICATION FOR PERMIT TO OFFER PRIZES FOR TAKING GAME FISH, FG 775 (Rev. 11/98)), which is incorporated by reference herein), and shall include the name of the sponsor, if any, and the name and address of the applicant, the telephone number where the applicant can be reached, and for each contest: the location and date of the event, total value of the prizes, and expected number of participants. The application must be signed by the applicant. Applications for Type B contests should be submitted to the regional office (see map and addresses of Regional offices attached to application form FG 775 (Rev. 11/98)) nearest to the applicant. Applications for Type A permits must be submitted to the department regional office for the region where the contest(s) is proposed.

(3) The application shall be submitted to the department at least 30 days prior to the proposed contest(s).

(4) Applications will not be accepted prior to July 1 of the year preceding the calendar year in which any contest is proposed.

(5) The department will consider requests for adjustments to approved Type A contest dates, if such requests are received by the issuing regional office not later than 30 days prior to the contest date to be changed.

(6) Permits are not transferable.

(7) Event and Annual Permits.

(A) An Event Permit will be issued for each Type A contest (see subsection 230(a)(1)).

(B) An Annual Permit will be issued on a calendar year basis to cover all Type B Contests (see subsection 230(a)(2)) proposed for that year.

(8) Cost of permit: See subsection 699(b) of these regulations for the fee for this permit.

[No changes to subsections (c) through (h)]

Note: Authority: Sections 1050 and 2003, Fish and Game Code.

Reference: Sections 711, 713, 1050 and 2003, Fish and Game Code.

Subject: December Sportfish PreAdopt Assesement
Date: Monday, November 23, 2015 11:02:51 AM

Hi Sonke:

There are no significant comments or any additional changes for the December adoption of the proposed amendments to Sections 1.05, 1.53, 1.57, 1.86, 2.00, 5.41, 5.60, 5.80, 5.81, 7.00, 7.50, 8.00, 27.00, and 230, Title 14, California Code of Regulations, Re: Freshwater Sport Fishing Regulations.

This e-mail is instead of a Preadopt statement or memo pursuant to RU procedures.

Scott

Scott Barrow
CDFW Regulations Unit
Scott.Barrow@wildlife.ca.gov
(916) 653-1902 office

Every Californian should conserve water. Find out how at:

SaveOurWater.com · Drought.CA.gov

recommend specific bag and possession limits to the Commission during a scheduled teleconference call on April 18, 2016.

The new regulations for the American, Feather, and Sacramento rivers may:

- (1) allow for additional harvest of salmon if low instream flow conditions persist due to the existing drought to reduce impacts to spawning habitat; and
- (2) increase or decrease the current salmon bag and possession limits based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season.

Proposed Regulations

Because the PFMC/NMFS recommendations are not known at this time, a range (shown in brackets in the text below) of bag and possession limits is indicated where it is desirable to continue salmon fishing in the American, Feather and Sacramento rivers. The open seasons and proposed range of bag and possession limits for Central Valley fall-run Chinook salmon stocks are as follows:

American River, subsection 7.50(b)(5)

- (A) From Nimbus Dam to the Hazel Avenue bridge.

July 16 through December 31 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (B) From Hazel Avenue bridge to the USGS gauging station cable crossing near Nimbus Hatchery.

July 16 through August 15 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (C) From the USGS gauging station cable crossing near Nimbus Hatchery to the SMUD power line crossing the southwest boundary of Ancil Hoffman Park.

July 16 through December 31 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (D) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park to the Jibboom Street bridge.

July 16 through October 31 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (E) From the Jibboom Street bridge to the mouth.

July 16 through December 16 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

Feather River, subsection 7.50(b)(68)

- (D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to the Live Oak boat ramp.

July 16 through October 15 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (E) From the Live Oak boat ramp to the mouth.

July 16 through December 16 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

Sacramento River below Keswick Dam, subsection 7.50(b)(156.5)

- (C) From Deschutes Road bridge to the Red Bluff Diversion Dam.

August 1 through December 16 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (E) From the Red Bluff Diversion Dam to the Highway 113 bridge.

July 16 through December 16 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

- (F) From the Highway 113 bridge to the Carquinez Bridge.

July 16 through December 16 with a bag limit of [0-4] Chinook salmon and a possession limit of [0-8] Chinook salmon.

As set forth in Fish and Game Code Section 1700, it is “the policy of the state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the oceans and other waters under the jurisdiction and influence of the state. This policy shall include [as applicable to inland fisheries] all of the following objectives:

(a) The maintenance of sufficient populations of all species of aquatic organisms to insure their continued existence.

(c) The maintenance of a sufficient resource to support a reasonable sport use, where a species is the object of sport fishing, taking into consideration the necessity of regulating individual sport fishery bag limits to the quantity that is sufficient to provide a satisfying sport.

(e) The management, on a basis of adequate scientific information promptly promulgated for public scrutiny, of the fisheries under the state’s jurisdiction,

and the participation in the management of other fisheries in which California fishermen are engaged, with the objective of maximizing the sustained harvest.”

Adoption of scientifically-based Central Valley salmon bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence. The benefits of the proposed regulations are in concurrence with federal law, sustainable management of Central Valley salmon resources, and promotion of businesses that rely on Central Valley salmon sport fishing.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 215, 220, 240, 315 and 316.5, Fish and Game Code.

Reference: Sections 200, 202, 205, 206, 215 and 316.5, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change: None.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are being held prior to the notice publication. The 45-day comment period provides adequate time for review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

Feather River Recommendations

The Department has received several recommendations from the public to allow fishing for fall-run Chinook salmon in the low-flow section of the lower Feather River (Fish Barrier Dam to the Afterbay Outfall), a section which is currently closed to all fishing all year. The Department has also received requests for the salmon season on the lower Feather River to begin on May 2 instead of July 16.

Department Response

Fishing was closed just above the Afterbay Outfall in 2009 during the Central Valley salmon stock collapse. Since then data have suggested that the low flow section (Fish Barrier Dam to the Afterbay Outfall) of the river is the primary holding habitat for listed spring-run Chinook salmon and for the spring-run broodstock at the Feather River Hatchery. Maintaining the closure in that section provides protection for these fish and is consistent with existing regulations on other river systems. The existing regulations provide for fishing opportunities from the Afterbay Outfall downstream starting in July. Data suggest early arriving

fall-run Chinook salmon tend to congregate in the Afterbay Outfall as there is a large input of water and it is a deep holding pool. Across most years the current open section of river and length of the season provide ample angling opportunities without taxing Feather River stocks. Although in some years the Department sees more fish returning to the hatchery than are required to meet production goals, highly variable smolt to adult survival and ocean harvest make this difficult to predict and adjust for in the fishing regulations. For these reasons, and to protect listed spring-run Chinook salmon, the Department rejects the recommendation to allow fishing for fall-run Chinook salmon in the low flow section of the lower Feather River, or to allow the salmon season to begin on May 2.

No Change Alternative:

The no change alternative would leave existing regulations in place.

(b) Consideration of Alternatives:

The Commission has rejected the no-change alternative because it is state policy to maintain consistency with federal and international law related to fisheries management, and the proposed regulations will allow the state to harmonize its bag and possession limits with NMFS' regulations.

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed changes are necessary

for the continued preservation of the resource and therefore the prevention of adverse economic impacts.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission does not anticipate any impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing businesses or the expansion of businesses in California. The minor variations in the bag and possession limits as may be established in the regulations are, by themselves, unlikely to impact business.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon sport fishery encourages consumption of a nutritious food. The Commission anticipates benefits to the environment by the sustainable management of California's salmon resources.

The Commission does not anticipate any non-monetary benefits to worker safety.

- (c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

- (e) Nondiscretionary Costs/Savings to Local Agencies: None.

- (f) Programs Mandated on Local Agencies or School Districts: None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code: None.

- (h) Effect on Housing Costs: None.

II. Economic Impact Assessment

- (a) Creation or Elimination of Jobs, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California

The Commission does not anticipate any substantial impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing

businesses, or the expansion of businesses in California, that provide services to inland sport fishermen from the proposed regulations. The proposed changes in subsections 7.50(b)(5), (b)(68), and (b)(156.5) affect the bag and possession limits for Chinook salmon in the American, Feather, and Sacramento rivers. These minor variations in the bag and possession limits as may be established in the regulations are, by themselves, unlikely to stimulate the creation of new businesses or cause the elimination of existing businesses. The number of fishing trips and the economic contributions from them are expected to remain more or less the same.

(b) Benefits of the Regulation

As set forth in Section 1700, Fish and Game Code, it is “the policy of the state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the oceans and other waters under the jurisdiction and influence of the state.”

In accordance with this policy, adoption of scientifically-based inland salmon seasons and bag and possession limits provides for the maintenance of sufficient populations of trout and salmon to ensure their continued existence.

(c) Health and Welfare of California Residents

The Commission anticipates benefits to the health and welfare of California residents. Salmon is a nutritious food source and providing inland sport fishery opportunities encourages consumption of this nutritious food. Sport fishing also contributes to increased mental health of its practitioners as fishing is a hobby and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California’s environment by younger generations, the future stewards of California’s natural resources.

(d) Benefits to Worker Safety

The Commission does not anticipate any benefits to worker safety from the proposed regulations because inland sport fishing does not impact working conditions.

Informative Digest

Policy Statement Overview

The current, 2015, sport fishing regulations allow for salmon fishing in the American, Feather and Sacramento rivers. The Department of Fish and Wildlife (Department) is recommending new Chinook salmon bag and possession limits in the American, Feather, and Sacramento rivers for the 2016 season.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The PFMC will develop the annual Pacific coast ocean salmon fisheries regulatory options for public review at its March 2016 meeting and develop the final PFMC regulatory recommendations for adoption by NMFS at its April 2016 meeting.

Based on the action taken by NMFS and the recommendation of the Department, the Commission will adopt bag and possession limits for the American, Feather, and Sacramento rivers which will:

- (1) allow for additional harvest of salmon if low instream flow conditions persist due to the existing drought to reduce impacts to spawning habitat; and
- (2) increase or decrease the current salmon bag and possession limits based on the PFMC salmon abundance estimates and recommendations for ocean harvest for the coming season.

Benefits of the regulations

As set forth in Fish and Game Code Section 1700 it is “the policy of the state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and other waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state and to promote the development of local fisheries and distant-water fisheries based in California in harmony with international law respecting fishing and the conservation of the living resources of the oceans and other waters under the jurisdiction and influence of the state.

Adoption of scientifically-based Central Valley salmon bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence. The benefits of the proposed regulations are in concurrence with Federal law, sustainable management of the Central Valley salmon resources, and promotion of businesses that rely on Central Valley salmon sport fishing.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State and Federal Regulations

Section 20, Article IV, of the State Constitution specifies that the Legislature may delegate to the Fish and Game Commission such powers relating to the protection and propagation of fish and game as the Legislature sees fit. The Legislature has delegated to the Commission the power to regulate recreational fishing in waters of the state (Fish & Game Code, §§ 200, 202, 205). The Commission has reviewed its own regulations and finds that the proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Commission has searched the California Code of Regulations and finds no other state agency regulations pertaining to recreational fishing seasons, bag and possession limits. Further, the Commission has determined that the proposed regulations are neither incompatible nor inconsistent with existing federal regulations.

Regulatory Language

Section 7.50, Title 14, CCR is amended to read as follows:

§ 7.50. Alphabetical List of Waters with Special Fishing Regulations.

... [No changes to subsections (a) through (b)(4)]

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag and Possession Limit</i>
(5) American River (Sacramento Co.)		
(A) From Nimbus Dam to the Hazel Avenue bridge piers.	Jan. 1 through July 15.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	July 16 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook Salmon 4[0-8] Chinook salmon in possession

<p>(B) From Hazel Avenue bridge piers to the U.S. Geological Survey gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site.</p>	<p>Jan. 1 through July 15. Only barbless hooks may be used.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>
	<p>July 16 through Aug. 15. Only barbless hooks may be used.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2<u>[0-4]</u> Chinook salmon 4<u>[0-8]</u> Chinook salmon in possession</p>
<p>(C) From the U.S. Geological Survey gauging station cable crossing about 300 yards downstream from the Nimbus Hatchery fish rack site to the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park.</p>	<p>Jan. 1 through July 15. Only barbless hooks may be used.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>

	July 16 through Oct. 31. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession
(D) From the SMUD power line crossing at the southwest boundary of Ancil Hoffman Park downstream to the Jibboom Street bridge.	Jan. 1 through July 15.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	July 16 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession

(C) From the Jibboom Street bridge to the mouth.	Jan. 1 through July 15.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	July 16 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2 <u>[0-4]</u> Chinook salmon 4 <u>[0-8]</u> Chinook salmon in possession
	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

... [No changes to subsections (b)(6) through (b)(67)]

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag and Possession Limit</i>
(68) Feather River below Fish Barrier Dam (Butte, Sutter and Yuba cos.).		
(A) From Fish Barrier Dam to Table Mountain bicycle bridge in Oroville.	Closed to all fishing all year	
(B) From Table Mountain bicycle bridge to Highway 70 bridge.	Jan. 1 through July 15. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
(C) From Highway 70 bridge to the unimproved boat ramp above the Thermalito Afterbay Outfall.	All year.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

<p>(D) From the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp.</p>	<p>Jan. 1 through July 15.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>
	<p>July 16 through Oct. 15.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession</p>
	<p>Oct. 16 through Dec. 31.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>
<p>(E) From 200 yards above Live Oak boat ramp to the mouth. For purposes of this regulation, the lower boundary is defined as a straight line drawn from the peninsula point on the west bank to the Verona Marine boat ramp.</p>	<p>Jan. 1 through July 15.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>

	July 16 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession
	Dec. 17 to Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

... [No changes to subsections (b)(68.1) through (b)(156)]

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag and Possession Limit</i>
(156.5) Sacramento River and tributaries below Keswick Dam (Butte, Colusa, Contra Costa, Glenn, Sacramento, Solano, Sutter, Tehama and Yolo cos.).	Also see Sierra District General Regulations (See Section 7.00(b)).	
(A) Sacramento River from Keswick Dam to 650 feet below Keswick Dam.	Closed to all fishing all year.	
(B) Sacramento River: 1. from 650 feet below Keswick Dam to the Highway 44 bridge.	Closed to all fishing from April 24 through July 31.	

	August 1 through December 31. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
2. from the Highway 44 bridge to the Deschutes Road bridge.	All year. Only barbless hooks may be used.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
(C) Sacramento River from the Deschutes Road bridge to 500 feet upstream from Red Bluff Diversion Dam.	Jan. 1 through July 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
	Aug. 1 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession
	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession
(D) Sacramento River from 500 feet upstream from Red Bluff Diversion Dam to 150 feet below the Lower Red Bluff (Sycamore) Boat Ramp.	Closed to all fishing all year.	

<p>(E) Sacramento River from 150 feet below the Lower Red Bluff (Sycamore) Boat Ramp to the Hwy 113 bridge near Knights Landing. Note: It is unlawful to take fish 0-250 feet downstream from the overflow side of the Moulton, Colusa and Tisdale Weirs.</p>	<p>Jan. 1 through July 15.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>
	<p>July 16 through Dec. 16.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession</p>
	<p>Dec. 17 through Dec. 31.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>
<p>(F) Sacramento River from the Hwy 113 bridge near Knights Landing to the Carquinez Bridge (includes Suisun Bay, Grizzly Bay and all tributary sloughs west of Highway 160). Note: It is unlawful to take fish 0-250 feet downstream from the overflow side of the Fremont and Sacramento Weirs.</p>	<p>Jan. 1 through July 15.</p>	<p>2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession</p>

	July 16 through Dec. 16.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession 2[0-4] Chinook salmon 4[0-8] Chinook salmon in possession
	Dec. 17 through Dec. 31.	2 hatchery trout or hatchery steelhead** 4 hatchery trout or hatchery steelhead** in possession

... [No changes subsections 7.50(b)(157) through (b)(212)]

* Wild Chinook salmon are those not showing a healed adipose fin clip and not showing a healed left ventral fin clip.

**Hatchery trout or steelhead in anadromous waters are those showing a healed adipose fin clip (adipose fin is absent). Unless otherwise provided, all other trout and steelhead must be immediately released. Wild trout or steelhead are those not showing a healed adipose fin clip (adipose fin is present).

Note: Authority cited: Sections 200, 202, 205, 215, 220, 240, 315 and 316.5, Fish and Game Code. Reference: Sections 200, 202, 205, 215 and 316.5, Fish and Game Code.

2016 Central Valley Salmon Sport Fishing Regulatory Options

**Fish and Game Commission Meeting
December 10, 2015
Stafford Lehr
Fisheries Branch**

Overview

- Current fall-run Chinook salmon bag and possession limits
 - Lower American, Feather, and Sacramento rivers
- Proposed range of fall-run Chinook salmon bag and possession limits
 - Lower American, Feather, and Sacramento rivers
 - Justification for potential changes

2015 Central Valley Salmon Bag and Possession Limits

- Lower American River
 - 2/4 fish daily bag and possession limit
- Feather River
 - 2/4 fish daily bag and possession limit
- Sacramento River
 - 2/4 fish daily bag and possession limit

2016 Proposed Central Valley Salmon Bag and Possession Limits

- Lower American River
 - Daily bag limit: 0-4 fish; Possession limit: 0-8 fish
- Feather River
 - Daily bag limit: 0-4 fish; Possession limit: 0-8 fish
- Sacramento River
 - Daily bag limit: 0-4 fish; Possession limit: 0-8 fish

Justification

- Allow additional harvest of salmon to reduce impacts on spawning habitat if needed
- Increase or decrease allowable harvest of salmon based on PFMC abundance estimates

State of California
Department of Fish and Wildlife

Memorandum

Date: November 18, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting
Re: Request for Notice Authorization to Amend Subsection (b)(91.1) of Section
7.50, Title 14, CCR, Klamath River Basin Sport Fishing Regulations**

Please find attached the ISOR package for the 2016 Klamath basin sport fishing regulations. As in the past, specific bag and possession limits for Klamath basin adult fall-run Chinook salmon will be adopted after federal (Pacific Fishery Management Council) review of west coast salmon stocks and fishery allocations have been proposed.

If you have any questions or need additional information, please contact Stafford Lehr, Chief, Fisheries Branch, by telephone at (916) 327-8840 or by e-mail at Stafford.Lehr@wildlife.ca.gov. The public notice should identify Senior Environmental Scientist, Wade Sinnen as the Department's point of contact for this rulemaking. Mr. Sinnen can be reached by telephone at (707) 822-5119 or by e-mail at Wade.Sinnen@wildlife.ca.gov.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Amend Subsection (b)(91.1) of Section 7.50
Title 14, California Code of Regulations
Re: Klamath River Sport Fishing Regulations

- I. Date of Initial Statement of Reasons: September 9, 2015

- II. Dates and Locations of Scheduled Hearings:
 - (a) Notice Hearing: Date: December 10, 2015
Location: San Diego

 - (b) Discussion Hearing: Date: February 11, 2016
Location: Sacramento

 - (c) Adoption Hearing: Date: April 18, 2016
Location: Teleconference

- III. Description of Regulatory Action:
 - (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

The Klamath River System, which consists of the Klamath River and Trinity River basins, is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.

Two tribal entities within the Klamath River System, the Hoopa Valley Tribe and the Yurok Tribe, maintain fishing rights for ceremonial,

subsistence and commercial fisheries that are managed consistent with federal fishery management goals. Tribal fishing regulations are promulgated by the Hoopa and Yurok tribes.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2016 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations. KRSC harvest will be monitored on the Lower Klamath River in 2016 and ensuing years by creel survey.

KRFC Allocation Management

The PFMC 2015 allocation for the Klamath River System recreational harvest was 14,133 adult KRFC. Preseason stock projections of 2016 adult KRFC abundance will not be available from the PFMC until March 2016. The 2016 basin allocation will be recommended by the PFMC in April 2016 and presented to the Commission for adoption prior to its April 2016 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommends the Commission consider an allocation range of 0 – 67,600 adult KRFC in the Klamath River Basin for the river recreational fishery. This recommended range encompasses the historical range of the Klamath River Basin allocations and allows the PFMC and Commission to make adjustments during the 2016 regulatory cycle.

The Commission may modify the KRFC in-river recreational salmon harvest allocation which is normally 15 percent of the non-tribal PFMC harvest allocation. Commission modifications need to meet biological and fishery allocation goals specified in law or established in the PFMC Salmon Fishery Management Plan otherwise harvest opportunities may be reduced in the California ocean fisheries.

The annual KRFC in-river harvest allocation is split into 4 geographic areas with subquotas assigned to each. They are as follows:

1. for the main stem Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the recreational fishery allocation;
2. for the main stem Klamath River from downstream of the Highway 96 bridge at Weitchpec to the mouth -- 50 percent of the recreational fishery allocation;
3. for the Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the recreational fishery allocation; and
4. for the Trinity River downstream from the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the recreational fishery allocation.

The spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total Klamath River Basin quota has been taken downstream of the Highway 101 bridge.

These geographic areas are based upon the historical distribution of angler effort and ensure equitable harvest of adult KRFC in the upper Klamath River and Trinity River. The subquota system requires the Department to monitor angler harvest of adult KRFC in each geographic area. All areas will be monitored on a real time basis except for the following:

Klamath River upstream of Weitchpec and the Trinity River: Due to funding and personnel reductions, the Department will be unable to deploy adequate personnel to conduct harvest monitoring in the Klamath River upstream of Weitchpec and in the Trinity River for the 2016 season. The Department has reviewed salmon harvest and run-timing data for these areas. Based on this review, the Department has developed a Harvest Predictor Model (HPM) which incorporates historic creel survey data from the Klamath River downstream of Iron Gate Dam to the confluence with the Pacific Ocean and the Trinity River downstream of Lewiston Dam to the confluence with the Klamath River. The HPM is driven by the positive relationship between KRFC harvested in the Lower and Upper Klamath River and the Trinity River. The HPM will be used by the Department to

implement fishing closures to ensure that anglers do not exceed established subquota targets.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The Department presently differentiates the two stocks by the following dates:

Klamath River

1. January 1 through August 14 - General Season KRSC.
For purposes of clarity, daily bag and possession limits apply to that section of the Klamath River downstream of the Highway 96 bridge at Weitchpec to the mouth.
2. August 15 to December 31 - KRFC quota management.

Trinity River

1. January 1 through August 31 – General Season KRSC.
For purposes of clarity, daily bag and possession limits apply to that section of the Trinity River downstream of the Old Lewiston Bridge to the confluence with the South Fork Trinity River.
2. September 1 through December 31 – KRFC quota management.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

Proposed Changes

No changes are proposed for the general (KRSC) opening and closing season dates, and bag, possession and size limits.

The Department is not proposing any changes to the spit area or modification of the Blue Creek closure area until additional scientific information is gathered.

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2016 Klamath River Basin quota is adopted. As in previous years, no retention of adult KRFC salmon is proposed for the following areas, once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31
3. Bag Limit - [0-4] Chinook salmon – of which no more than [0-4] fish over 22 inches total length may be retained until the subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0–12] fish over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

It is the policy of this State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of this State to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

The benefits of the proposed regulations are conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 215, 220, 240, 315 and 316.5, Fish and Game Code.

Reference: Sections 200, 202, 205, 215 and 316.5, Fish and Game Code.

- (c) Specific Technology or Equipment Required by Regulatory Change:

None.

- (d) Identification of Reports or Documents Supporting Regulation Change:

In-River Sport Fishing Economics Technical Report, National Oceanographic and Atmospheric Administration, National Marine Fisheries Service, September 2011.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are being held prior to the notice publication. The 45-day comment period provides adequate time for review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

- i. The use of more liberal regulations for bag limits, possession limits and fishing methods. For KRFC salmon, more liberal regulations would be less desirable than those proposed because they could create risk of an intense fishery reaching or exceeding the quota in a very short time. Reaching the quota in a very short time could be damaging to the local economy. Exceeding the allowable harvest could be damaging to the KRFC salmon stocks.
- ii. Reopen the main stem Klamath River near the confluence of Blue Creek to fishing. On April 17, 2015, the Commission adopted regulations to close the main stem Klamath River near the confluence of Blue Creek between June 15 and December 31 to reduce catch and release mortality in a thermal refuge area and protect late-fall-run Chinook salmon holding prior to entering Blue Creek. Several public requests to reopen this area to fishing have been received; however, at its June 11, 2015 meeting, the Commission directed the Department to work with the Yurok Tribe on a study to evaluate catch and release angling in the vicinity of Blue Creek. The Department will report back to the Commission once the study is completed.

(b) No Change Alternative:

The No Change Alternative would leave the current 2015 regulations in place and would not conform to the PFMC Klamath River Basin quota for 2016. The change is necessary to continue appropriate harvest rates and an equitable distribution of the harvestable surplus.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are projected to have minor impact on the net revenues to local businesses servicing sport fishermen. If the 2016 KRFC quota is reduced, visitor spending may correspondingly be reduced and in the absence of the emergence of alternative visitor activities, the drop in spending could induce business contraction. However, this will not likely affect the ability of California businesses to compete with businesses in other states. The preservation of Klamath River salmon stocks is necessary for the success of lower and upper Klamath River Basin businesses which provide goods and services related to fishing. The proposed changes are necessary for the continued preservation of the resource and therefore the prevention of adverse economic impacts.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The proposed regulations range from no fishing of KRFC salmon in 2015; to a normal Klamath River Basin salmon season. The Commission anticipates some impact on the creation or elimination of jobs in California. The potential employment impacts range from 0 to 23 jobs which are not expected to create, eliminate or expand businesses in California. The Commission anticipates impacts on the creation, elimination or expansion of businesses in California ranging from no impact to reduced revenues to approximately 30 businesses that serve sport fishing activities. However, the possibility of growth of businesses to serve substitute activities exists. Adverse impacts to jobs and/or businesses would be less if fishing of grilse KRFC salmon is permitted than under a complete closure to all fishing. The impacted businesses are generally small businesses

employing few individuals and, like all small businesses, are subject to failure for a variety of causes. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, consequently promoting the long-term viability of these same small businesses.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon sport fishery encourages a healthy outdoor activity and the consumption of a nutritious food.

The Commission anticipates benefits to the environment by the sustainable management of California's salmon resources.

The Commission does not anticipate any benefits to worker safety because the proposed action does not affect working conditions.

(c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

(e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

The regulatory amendments of subsections of Section 7.50 under consideration will set the 2016 Klamath River Basin salmon sport fishing regulations to conform to the PFMC fall-run Chinook allocation guidelines. The Klamath River Basin is anticipated to be open for sport salmon fishing at levels similar to the 2015 quotas; however the possibility of marine fishery area closures still exists. Ocean closures may in turn result in PFMC recommendations for Klamath River Basin sport salmon fishery closures for the take of adult salmon. Adverse or positive impacts to jobs and businesses will depend on the 2016 KRFC allocation ultimately adopted by the PFMC and the specific regulations promulgated by the Commission.

KRFC QUOTA MANAGEMENT

The proposed regulations present a range from 100 percent of last year's Klamath River Basin salmon season to 0 percent or no salmon fishing on adult Chinook salmon (greater than 22 inches) in 2016. Under all scenarios sport fishing will be allowed for grilse fall-run Chinook salmon (2 year-old salmon 22 inches or less) regardless of PFMC regulations, thus any adverse impacts to businesses would be less severe than under a complete closure of fishing.

Three projections are evaluated here are as follows: 100 percent of the 2015 Klamath River Basin catch limit; 50 percent of the 2015 basin catch limit; and 0 percent of the 2015 basin catch limit.

(a) Effects of the Regulation on the Creation or Elimination of Jobs Within the State:

Projection 1. 100 percent of the 2015 catch limit: The Commission does not anticipate any adverse impacts on the creation or elimination of jobs, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Based on a 2011 NMFS report on In-River Sport Fishing Economics of the Klamath River, under a normal season non-resident Klamath River sport salmon anglers contribute about \$2,037,424 (2013\$) in total economic output to California businesses. This revenue supports about 35 jobs in the State.

An assumption of the NMFS report is that increases in expenditures by resident anglers associated with expanded fishing opportunities would be accommodated by reduced expenditures on other locally purchased goods and services – with no net change in local economic activity. For non-resident anglers, however, increases in local expenditures associated with increases in local fishing opportunities would be accomplished by diverting money that they would otherwise spend outside the local area. Thus the economic impact analysis focuses on non-resident angler expenditures, which represent 'new money' whose injection serves to stimulate the local economy.

The NMFS study excluded the Trinity River, the largest tributary to the Klamath. The Trinity River is allocated 33 percent of the Klamath River Basin fall-run Chinook salmon total allocation. Using the Trinity allocation as a measure of angler effort, and thus impacts on associated businesses that support anglers, the total non-resident angler contribution to the entire Klamath River Basin (including the Trinity River) is estimated to be \$2,709,774 (2013\$) in total economic output. This revenue, again using a 33 percent increase to account for the Trinity River, provides an estimated total of 47 jobs in the State (assuming that personnel costs also rise with inflation). This is a conservative estimate of total economic impact as it counts only non-resident angler expenditures. Non-resident average expenditures are estimated to be \$106.43 (2013\$) per angler day (for lodging, food, gasoline, fishing gear, boat fuel, and guide fees) based on a NMFS sponsored survey. Resident average expenditures per angler day are estimated to be 60 percent less (markedly reduced lodging, gasoline and food expenditures) which yields an estimate of \$42.60 per angler day. Resident anglers comprise about 36 percent of Klamath River Basin anglers.

Projection 2. 50 percent of the 2015 catch limit: The Commission anticipates some impact on the creation or elimination of jobs. A 50 percent catch reduction will likely reduce visitor spending by slightly less than 50 percent, given price elasticities of demand for salmon fishing activity of less than one. As the “price” of fishing per unit catch increases the demand for fishing trips declines by a lesser extent, particularly in the short-run. While difficult to predict, job losses associated with a 50 percent reduction in the catch limit are expected to be less than half of the estimated total jobs supported by angler visits (i.e. fewer than 23 jobs).

Projection 3. 0 percent of the 2015 catch limit: In the event of fisheries closures in some or all Klamath River Basin areas, the Commission anticipates less than 50 percent reduction in fishery-related jobs. As mentioned earlier, sport fishing for grilse fall-run Chinook salmon (2-year-old salmon less than 22 inches) will still be allowed, thus lessening any job losses. A closure on the take of adult Chinook salmon was instituted in 2006 and only grilse salmon could be legally harvested that year. The effect of the 2006 closure, as measured by angler days on the Klamath River, resulted in an approximate 50 percent drop in angler days, compared to the 2000- 2005 average (12,000 angler days vs. 23,300 angler days). Job creation or elimination tends to lag in adjustment to changes in consumer demand. Thus, the potential impacts of a closure on the take of adult Chinook are estimated to result in the loss of fewer than 23 jobs.

- (b) Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses Within the State:

Projection 1: 100 percent of the 2015 catch limit: The Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2. 50 percent of the 2015 catch limit: The Commission anticipates a decline in visits to the fishery areas of less than 50 percent. This may result in some decline in business activity, but the Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses directly related to fishing activities. However, with less effort being expended on fishing, the possibility of substitute activities and the growth of businesses to serve those activities exists.

Projection 3. 0 percent of the 2015 catch limit: In the event of fisheries closures in some or all Klamath River Basin areas, the Commission anticipates a decline in regional spending and thus reduced revenues to the approximately 30 businesses that serve sport fishing activities with unknown impacts on the creation of new business or the elimination of existing businesses. However adverse impacts will be mitigated by the continued opportunity to harvest grilse salmon. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, consequently, the long-term viability of these same small businesses.

(c) Effects of the Regulation on the Expansion of Businesses Currently Doing Business Within the State:

Projection 1. 100 percent of the 2015 catch limit: The Commission does not anticipate any impacts on the expansion of businesses in California as the quotas would not increase effort nor increase the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2. 50 percent of the 2015 catch limit: The Commission does not anticipate any impacts on the expansion of businesses in California. Decreases in expenditures by resident anglers associated with reduced fishing opportunities may be offset by increased expenditures on other locally purchased goods and services – with no net change in local economic activity. For non-resident anglers, however, decreases in local expenditures associated with decreases in local fishing opportunities may result in increases in other expenditures outside the Klamath River Basin area.

Projection 3. 0 percent of the 2015 catch limit: In the event of fisheries closures in some or all Klamath River Basin areas, the Commission does not anticipate any expansion of businesses in California. Decreases in expenditures by anglers associated with reduced fishing opportunities may be partially offset by increased expenditures on other locally purchased

goods and services as visitors fish for grilse salmon or substitute salmon fishing with other recreational pursuits.

(d) Benefits of the Regulation to the State's Environment:

Under all projections, the Commission anticipates benefits to the environment in the sustainable management of Klamath River Basin salmon resources. It is the policy of this State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of this State to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

(e) Benefits of the Regulation to the Health and Welfare of California Residents:

Under all projections, the Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a Klamath River Basin sport salmon fishery encourages a healthy outdoor activity and the consumption of a nutritious food. Salmon sport fishing also contributes to increased mental health of its practitioners as fishing is a hobby and form of relaxation for many. Salmon sport fishing also provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of California's natural resources.

(f) Benefits of the Regulation to Worker Safety:

Under all projections, the Commission does not anticipate benefits to worker safety because the proposed regulations will not impact working conditions.

(g) Other Benefits of the Regulation:

Concurrence with Federal Law: California's sport fishing regulations need to conform to the new Federal regulations to achieve optimum yield in California. The PFMC annually reviews the status of west coast salmon populations. As part of that process, it recommends west coast adult salmon fisheries regulations aimed at meeting biological and fishery allocation goals specified in law or established in the Salmon Fishery

Management Plan. These recommendations coordinate west coast management of sport and commercial ocean salmon fisheries off the coasts of Washington, Oregon, and California and California inland sport salmon fisheries. These recommendations are subsequently implemented as ocean fishing regulations by the NMFS and as sport salmon regulations for State marine and inland waters by the Commission.

Informative Digest/Policy Statement Overview

The Klamath River System, which consists of the Klamath River and Trinity River basins, is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2016 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations.

KRFC Allocation Management

The PFMC 2015 allocation for the Klamath River System recreational harvest was 14,133 adult KRFC. Preseason stock projections of 2016 adult KRFC abundance will not be available from the PFMC until March 2016. The 2016 Klamath River Basin

allocation will be recommended by the PFMC in April 2016 and presented to the Commission for adoption prior to its April 2016 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommends the Commission consider an allocation range of 0 – 67,600 adult KRFC in the Klamath River Basin for the in-river recreational fishery.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

Proposed Changes

No changes are proposed for the general (KRSC) opening and closing season dates, and bag, possession and size limits.

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2016 Klamath River Basin quota is adopted. As in previous years, no retention of adult KRFC salmon is proposed for the following areas, once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31
3. Bag Limit - [0-4] Chinook salmon of which no more than [0-4] fish over 22 inches total length may be retained until the subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0–12] fish over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

The benefits of the proposed regulations are in conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (Sections 200, 202, 205, 315, and 316.5, Fish and Game

Code). Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of Chinook salmon in the Lower Klamath River Basin.

Regulatory Language

Subsection (b)(91.1) of Section 7.50 is amended to read:

(91.1) Anadromous Waters of the Klamath River Downstream of Iron Gate Dam (Lower Klamath River Basin). The regulations in this subsection apply only to waters of the Klamath River system which are accessible to anadromous salmonids. They do not apply to waters of the Klamath River which are inaccessible to anadromous salmon and trout, for example, portions of the Klamath River system upstream of Iron Gate Dam, portions of the Trinity River system upstream of Lewiston Dam, and the Shasta River and tributaries upstream of Dwinneel Dam. Fishing in these waters is governed by the General Regulations for non-anadromous waters of the North Coast District (see Section 7.00(a)(4)).

(A) Hook and Weight Restrictions.

1. Only barbless hooks may be used. (For definitions regarding legal hook types, hook gaps and rigging see Chapter 2, Article 1, Section 2.10.)
2. During closures to the take of adult salmon, anglers ~~shall~~may not remove any adult Chinook salmon from the water by any means, such as by dragging the fish on shore or using a net.

(B) General Area Closures.

1. No fishing is allowed within 750 feet of any Department of Fish and Wildlife fish-counting weir.
2. No fishing is allowed from the Ishi Pishi Road bridge upstream to and including Ishi Pishi Falls from August 15 through December 31. EXCEPTION: members of the Karuk Indian Tribe listed on the current Karuk Tribal Roll may fish at Ishi Pishi Falls using hand-held dip nets.
3. No fishing is allowed from September 15 through December 31 in the Klamath River within 500 feet of the mouths of the Salmon, the Shasta and the Scott rivers and Blue Creek.
4. No fishing is allowed from June 15 through September 14 in the Klamath River from 500 feet above the mouth of Blue Creek to 1/2 mile downstream of the mouth of Blue Creek.

(C) Klamath River Basin Possession Limits.

1. Trout Possession Limits.

- a. The brown trout possession limit is 10 brown trout.
- b. The hatchery trout or hatchery steelhead possession limits are as follows:
 - (i) Klamath River - 4 hatchery trout or hatchery steelhead.
 - (ii) Trinity River - 4 hatchery trout or hatchery steelhead.

2. Chinook Salmon Possession Limits.

- a. Klamath River downstream of the Highway 96 bridge at Weitchpec from January 1 to August 14 and the Trinity River downstream of the Old Lewiston Bridge to the confluence of the South Fork Trinity River from January 1 to August 31: 2 Chinook salmon.
- b. Klamath River from August 15 to December 31 and Trinity River from September 1 to December 31: ~~9 Chinook salmon. No more than 6 Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.~~ [0-12] Chinook salmon. No more than [0-12] Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

(D) Klamath River Basin Chinook Salmon Quotas.

The Klamath River fall Chinook salmon take is regulated using quotas. Accounting of the tribal and non-tribal harvest is closely monitored from August 15 through December 31 each year. These quota areas are noted in subsection (b)(91.1)(E) with “Fall Run Quota” in the *Open Season and Special Regulations* column.

1. Quota for Entire Basin.

The ~~2015~~2016 Klamath River Basin quota is ~~44,133~~[0-67,600] Klamath River fall Chinook salmon over 22 inches total length. The department shall inform the commission, and the public via the news media, prior to any implementation of restrictions triggered by the quotas. (NOTE: A department status report on progress toward the quotas for the various river sections is updated weekly, and available at 1-800-564-6479.)

2. Subquota Percentages.

a. The subquota for the Klamath River upstream of the Highway 96 bridge at Weitchpec and the Trinity River is 50% of the total Klamath River Basin quota.

(i) The subquota for the Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec is 17% of the total Klamath River Basin quota.

(ii) The subquota for the Trinity River main stem downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat is 16.5% of the total Klamath River Basin quota.

(iii) The subquota for the Trinity River main stem downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River is 16.5% of the total Klamath River Basin quota.

b. The subquota for the Lower Klamath River downstream of the Highway 96 bridge at Weitchpec is 50% of the total Klamath River Basin quota.

(i) The Spit Area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) will close when 15% of the total Klamath River Basin quota is taken downstream of the Highway 101 bridge.

(E) Klamath River Basin Open Seasons and Bag Limits.

All anadromous waters of the Klamath River Basin are closed to all fishing for all year except those areas listed in the following table. Bag limits are for trout and Chinook salmon in combination unless otherwise specified.

<i>Body of Water</i>	<i>Open Season and Special Regulations</i>	<i>Daily Bag Limit</i>
1. Bogus Creek and tributaries.	Fourth Saturday in May through August 31. Only artificial lures with barbless hooks may be used.	2 hatchery trout or hatchery steelhead**
2. Klamath River main stem from 3,500 feet downstream of Iron Gate Dam to the mouth.		

<p>a. Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec.</p>	<p>January 1 to August 14.</p>	<p>0 Chinook salmon 2 hatchery trout or hatchery steelhead**</p>
	<p>Fall Run Quota 2,403<u>[0-11,492]</u> Chinook Salmon August 15 to December 31, 2015<u>2016</u>.</p>	<p>3<u>[0-4]</u> Chinook salmon - no more than 2<u>[0-4]</u> fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 2 hatchery trout or hatchery steelhead**</p>
	<p>Fall Run Quota Exception: Chinook salmon over 22 inches total length may be retained from 3,500 feet downstream of Iron Gate Dam to the Interstate 5 bridge when the department determines that the adult fall-run Chinook salmon spawning escapement at Iron Gate Hatchery exceeds 8,000 fish. Daily bag and possession limits specified for fall-run Chinook salmon apply during this exception.</p>	
<p>b. Klamath River downstream of the Highway 96 bridge at Weitchpec.</p>	<p>January 1 to August 14.</p>	<p>2 Chinook salmon 2 hatchery trout or hatchery steelhead**</p>

	Fall Run Quota 7,067 <u>[0-33,800]</u> Chinook Salmon August 15 to December 31, 2015 <u>2016</u> .	3 <u>[0-4]</u> Chinook salmon - no more than 2 <u>[0-4]</u> fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 2 hatchery trout or hatchery steelhead**
	<p>Fall Run Quota Exception: Spit Area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth). This area will be closed to all fishing after 15% of the Total Klamath River Basin Quota has been taken. All legally caught Chinook salmon must be retained. Once the adult (greater than 22 inches) component of the total daily bag limit has been retained anglers must cease fishing in the spit area.</p> <p><u>All legally caught Chinook salmon must be retained. Once the adult (greater than 22 inches) component of the total daily bag limit has been retained anglers must cease fishing in the spit area.</u></p>	
3. Salmon River main stem, main stem of North Fork downstream of Sawyer's Bar bridge, and main stem of South Fork downstream of the confluence of the East Fork of the South Fork.	November 1 through February 28.	2 hatchery trout or hatchery steelhead**
4. Scott River main stem downstream of the Fort Jones-Greenview bridge to the confluence with the Klamath River.	Fourth Saturday in May through February 28.	2 hatchery trout or hatchery steelhead**
5. Shasta River main stem downstream of the Interstate 5 bridge north of Yreka to the confluence with the Klamath River.	Fourth Saturday in May through August 31 and November 16 through February 28.	2 hatchery trout or hatchery steelhead**

6. Trinity River and tributaries.		
a. Trinity River main stem from 250 feet downstream of Lewiston Dam to the Old Lewiston Bridge.	April 1 through September 15. Only artificial flies with barbless hooks may be used.	2 hatchery trout or hatchery steelhead**
b. Trinity River main stem downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat.	January 1 to August 31.	2 Chinook salmon 5 brown trout 2 hatchery trout or hatchery steelhead**
	Fall Run Quota 2,332 <u>[0-11,154]</u> Chinook Salmon September 1 through December 31, 2015 <u>2016</u> .	3 <u>[0-4]</u> Chinook salmon - no more than 2 <u>[0-4]</u> fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 5 brown trout 2 hatchery trout or hatchery steelhead**
	Fall Run Quota Exception: Chinook salmon over 22 inches total length may be retained downstream of the Old Lewiston Bridge to the mouth of Indian Creek when the department determines that the adult fall-run Chinook salmon spawning escapement at Trinity River Hatchery exceeds 4,800 fish. Daily bag and possession limits specified for fall-run Chinook salmon apply during this exception.	
c. Trinity River main stem downstream of the Highway 299 West bridge at Cedar Flat to the Denny Road bridge at Hawkins Bar.	January 1 through August 31.	2 Chinook salmon 5 brown trout 2 hatchery trout or hatchery steelhead**
	September 1 through December 31.	Closed to all fishing.

<p>d. New River main stem downstream of the confluence of the East Fork to the confluence with the Trinity River.</p>	<p>September 15 through November 15. Only artificial lures with barbless hooks may be used.</p>	<p>2 hatchery trout or hatchery steelhead**</p>
<p>e. Trinity River main stem downstream of the Denny Road bridge at Hawkins Bar to the mouth of the South Fork Trinity River.</p>	<p>January 1 to August 31.</p>	<p>2 Chinook salmon 5 brown trout 2 hatchery trout or hatchery steelhead**</p>
	<p>Fall Run Quota 2,334<u>[0-11,154]</u> Chinook Salmon September 1 through December 31, 2015<u>2016</u>. This is the cumulative quota for subsections 6.e. and 6.f. of this table.</p>	<p>3<u>[0-4]</u> Chinook salmon - no more than 2<u>[0-4]</u> fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 5 brown trout 2 hatchery trout or hatchery steelhead**</p>
<p>f. Trinity River main stem downstream of the mouth of the South Fork Trinity River to the confluence with the Klamath River.</p>	<p>January 1 to August 31.</p>	<p>0 Chinook salmon 5 brown trout 2 hatchery trout or hatchery steelhead**</p>

	Fall Run Quota 2,334 [0-11,154] Chinook Salmon September 1 through December 31, 2015 2016. This is the cumulative quota for subsections 6.e. and 6.f. of this table.	3[0-4] Chinook salmon - no more than 2[0-4] fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 5 brown trout 2 hatchery trout or hatchery steelhead**
g. Hayfork Creek main stem downstream of the Highway 3 bridge in Hayfork to the confluence with the South Fork Trinity River.	November 1 through March 31. Only artificial lures with barbless hooks may be used.	2 hatchery trout or hatchery steelhead**
h. South Fork Trinity River downstream of the confluence with the East Fork of the South Fork Trinity River to the South Fork Trinity River bridge at Hyampom.	November 1 through March 31. Only artificial lures with barbless hooks may be used.	2 hatchery trout or hatchery steelhead**
i. South Fork Trinity River downstream of the South Fork Trinity River bridge at Hyampom to the confluence with the Trinity River.	November 1 through March 31.	0 Chinook salmon 2 hatchery trout or hatchery steelhead**

* Wild Chinook salmon are those not showing a healed adipose fin clip and not showing a healed left ventral fin clip. **Hatchery trout or steelhead in anadromous waters are those showing a healed adipose fin clip (adipose fin is absent). Unless otherwise provided, all other trout and steelhead must be immediately released. Wild trout or steelhead are those not showing a healed adipose fin clip (adipose fin is present). Overview

- Map of Klamath Basin
- 2015 Klamath Basin Chinook salmon angling regulations
- New regulations for 2015
- 2016 Klamath Basin proposed regulatory options

Map of the Klamath Basin
Showing sub-quota areas
and creel sampling areas (1
and 2) in lower Klamath River

2015 Klamath Basin Angling Regulations

- Season: Aug. 15 – Dec. 31 (Klamath River)
- Season: Sept. 1 – Dec. 31 (Trinity River)
- Bag limit: 3 fish, no more than 2 adults > 22 inches
- Possession limit: 9 fish, no more than 6 adults > 22 inches
- Basin Quota: 14,133 adult Chinook salmon
- Spit Area Sub-quota: 2,120 adult Chinook salmon

New Regulations for 2015

- Spit Area
 - All legally caught adult salmon must be retained
 - Anglers must leave spit area once adult daily bag is met
- Blue Creek
 - Closure of the main stem Klamath River near the confluence of Blue Creek between June 15 and December 31

2016 Klamath Basin Angling Regulatory Options

- Klamath Basin quota range: 0-67,000 fish > 22 inches
- Bag limit range: 0-4 fish > 22 inches
- Possession limit range: 0-12 fish > 22 inches
- Season: Aug. 15 – Dec. 31 (Klamath River)
- Season: Sept. 1 – Dec. 31 (Trinity River)

Re: Lower Klamath River Fishing Regulations – Blue Creek Closure

To Whom It May Concern,

Enclosed please find the Del Norte County Board of Supervisors' Petition to Repeal or in the Alternative Amend Title 14(b)(91.1)(B)(3) and (4) of Section 7.50 of the California Code of Regulations (Blue Creek Closure).

As all of our previous correspondence has gone unaccredited, we are sending this package via certified mail with the hope that it will be received and acknowledged.

Sincerely,

Elizabeth Cable
Interim County Counsel

Petition to Repeal or in the Alternative Amend Title 14 (b)(91.1)(B)(3) and (4) of Section 7.50 of the California Code of Regulations (Blue Creek Closure)

California Fish and Game Commission
1416 Ninth Street, Suite 1320
Sacramento, CA 95814
FGC@fgc.ca.gov

Requested by:

County of Del Norte
David Finigan, Chair of the Board of Supervisors
981 H Street, Suite 210
Crescent City, CA 95531
(707) 464-7204

This is a petition to repeal the regulation adopted by the California Fish and Game Commission (Commission) on April 17, 2015 and effective June 4, 2015 located at Title 14 Section 7.50(b)(91.1)(B)(3) of the California Code of Regulations (CCR). If for any reason this petition is not successful at repealing the aforementioned regulation it shall be interpreted as a petition to amend the stated regulation sections for the following fishing season (2016).

This Petition is based upon the following statutes, background information, and justifications.

Applicable Statutes:

Government Code 11340.6 states "Except where the right to petition for adoption of a regulation is restricted by statute to a designated group or where the form of procedure for such a petition is otherwise prescribed by statute, any interested person may petition a state agency requesting the adoption, amendment, or repeal of a regulation as provided in Article 5."

Fish and Game Code §220 states "(a) Any regulation of the commission added or amended pursuant to this article shall remain in effect for the period specified therein or until superseded by subsequent regulation of the commission or by statute. (b) Notwithstanding this article, the commission may add, amend, or repeal regulations at any regular or special meeting if facts are presented to the commission which were not presented at the time the original regulations were adopted and if the commission

determines that those regulations added, amended, or repealed are necessary to provide proper utilization, protection, or conservation of fish and wildlife species or subspecies.

Fish and Game Code §315 states "The commission may at any time close any stream, lake, or other inland waters, or portions thereof, to the taking of any species or subspecies of fish to protect and properly conserve the fish, except for the taking of fish otherwise permitted by this code under a commercial fishing license, for such time as the commission may designate, or until such time as new legislation thereon enacted by the Legislature may become effective."

Fish and Game Code §315.3 states "The commission may, at any time when facts are presented to the commission which were not presented to the commission at the time of its December meeting held pursuant to Section 209, open any stream, lake, or other inland waters, or portions thereof, to the taking of any species or subspecies of fish for the proper utilization of the fish, for such time as the commission may designate or until such time as new legislation thereon enacted by the Legislature may become effective."

Fish and Game Code §703.3 states "It is the policy of the state that the department and commission use ecosystem-based management informed by credible science in all resource management decisions to the extent feasible. It is further the policy of the state that scientific professionals at the department and commission, and all resource management decisions of the department and commission, be governed by a scientific quality assurance and integrity policy, and follow well-established standard protocols of the scientific profession, including, but not limited to, the use of peer review, publication, and science review panels where appropriate. Resource management decisions of the department and commission should also incorporate adaptive management to the extent possible."

Fish and Game Code §703.5 states "It is the policy of the state as follows: (a) That the department and the commission seek to create, foster, and actively participate in effective partnerships and collaborations with other agencies and stakeholders to achieve shared goals and to better integrate fish and wildlife resource conservation and management with the natural resource management responsibilities of other agencies. (b) That the department and commission participate in interagency coordination processes that facilitate consistency and efficiency in review of projects requiring multiple permits, including, but not necessarily limited to, joint state, federal, and local permit review teams that enable early consultation with project applicants, and provide improved sharing of data, information, tools, and science to achieve better alignment of planning, policies, and regulations across agencies."

Fish and Game Code §6920 states "(a) The department shall, with the advice of the Advisory Committee on Salmon and Steelhead Trout and the Commercial Salmon Trollers Advisory Committee, prepare and maintain a detailed and comprehensive program for the protection and increase of salmon, steelhead trout, and anadromous fisheries. (b) The department shall consult with every public agency whose policies or decisions may affect the goals of this program to determine if there are feasible means for those public agencies to help the department achieve the goals of this program."

Background Facts:

On April 17, 2015 the Commission voted to close the fishing area of the Klamath River within 500 feet of the mouth of Blue Creek from September 15 to December 31 and to close the area from 500 feet above the mouth of the Blue Creek to ½ mile downstream of the mouth of the Blue Creek June 15 through September 14.

The closure was pursuant to an amendment of Subsections (b)(91.1) and (b)(195) of Section 7.50 Title 14 of the CCR. The amendment was noticed as three Options in the Initial Statement of Reasons for Regulatory Action and in the Final Statement of Reasons for Regulatory Action. Option 1 was the Department proposal. Option 2 was the Yurok Tribe proposal and Option 3 was a “possible combination” of Option 1 and 2.¹ Precipitating the Options was a letter from the Yurok Tribe formally recommending modifications of the regulations. This letter was dated November 19, 2014. The Commission then had a Notice hearing on the proposed amendments on December 3, 2014. The Initial Statement of Reasons was filed on January 12, 2014. A discussion hearing was held on February 12, 2015. The Pre-Adoption Statement of Reasons was filed March 20, 2015. The adoption hearing was held April 17, 2015. The Final Statement of Reasons was filed May 4, 2015. The regulation was approved by the Office of Administrative Law and took effect on June 4, 2015.

The closure was outlined in Options 2 and 3 but was against the recommendation of the Department.² Department staff stated “The Department cannot support that as the preferred option.”³

The closure was not based on scientific data regarding this specific location. The response to public comment by the Commission states that “The Commission adopted the proposed closure at the mouth of Blue Creek as a precautionary conservation measure” and “Scientific studies are needed to determine if, and under what criteria, alternate or additional closures may be necessary.”⁴ The lack of scientific data was discussed by the Commission on April 17, 2015 as well as the need for such scientific data including temperature monitoring.⁵

¹ Option 1 - No catch and release fishing in Spit Area – Department Proposal: All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area. Option 2- Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding to prior to entering Blue Creek. Option 3- (1) All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area. (2) Conservation closure below the mouth of Blue Creek to reduce catch and release mortality in a thermal refugia area and protect late-fall Chinook holding prior to entering Blue Creek.

⁵ Teleconference April 17, 2015 available [http://www.cal-span.org/media.php?folder\[\]=CFG](http://www.cal-span.org/media.php?folder[]=CFG) comment found at 2:34:00 – 2:34:48

Even without the scientific data supporting a closure of the Blue Creek area, the Commission voted to close the area, as one Commissioner stated at the April 17, 2015, “Why not close it and see what happens?”⁶

Justification for Repeal or Amendment

The closure in question was arbitrary and capricious as it was not done with due regard for science, facts, and circumstances. The regulation was adopted in procedural disarray. It appears from the record several Commissioners wished to find out if, scientifically, there would be a need to close the area through temperature monitoring but could not adopt such a regulation because the noticing had not been done for such an alternative.⁷ At the April 17, 2015 meeting, Executive Director Mastrup stated at one point during the motions “this is getting really screwed up quite honestly”⁸ referring to the process of passing the motion on the closure of Blue Creek. The Commissioners lack of understanding of the motion they were passing, whether it was a recommendation of the Department or not, and the process needed to amend the regulation is clear from the record.

The Statement of Reasons promulgated by the Commission did not adequately estimate the impact upon County residents including impacts upon small businesses, in particular businesses consisting of sport fishing. Instead the Final Statement of Impacts states that “The impacted businesses are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of reasons.” The Commission did not adequately consider the economic impact of such actions. Del Norte County had, according to census data, 21.8% of persons living below the poverty level as compared to 15.9% of people statewide.⁹ The effect on small businesses is a significant impact on the County.

Under Title 14 CCR 777.8(c), “Any proposed regulations for which significant adverse environmental effects have been identified during the review process shall not be approved or adopted as proposed if there are feasible mitigation measures or feasible alternatives which would avoid or substantially lessen any significant adverse effect which the proposed regulations may have on the environment, in accordance with Public Resources Code section 21081.” The method in which the Commission noticed, evaluated, and eventually adopted the regulations at issue was wholly inadequate because there were several options which were evaluated together as one proposal when, in reality, they had different consequences and different significance of effects. The Commission eventually adopted what appears to be a combination of the Options which encompassed the Blue Creek closure. “Option 1 “would have been an alternative which would have lessened the significant impact on the local economy and local businesses. Whether the Options were mutually exclusive is unclear from the documents noticing the hearings on the amended regulations, but it appears that on April 17, 2015 the Commission decided they were not mutually exclusive and appears to have adopted a combination of the Options. In a

⁷ Teleconference April 17, 2015 available [http://www.cal-span.org/media.php?folder\[\]=CFG](http://www.cal-span.org/media.php?folder[]=CFG) comment found at 2:31:00-2:49:22

⁸ Teleconference April 17, 2015 available [http://www.cal-span.org/media.php?folder\[\]=CFG](http://www.cal-span.org/media.php?folder[]=CFG) comment found at 2:39:46

⁹ <http://quickfacts.census.gov/qfd/states/06/06015.html>

response to the comments received by the public, the Department states “the final economic effect related to steelhead fishing will have to be assessed post season due to lack of adequate fishing effort data for this area.”¹⁰ Additionally the possibility of an adverse environmental impact due to fish crowding in the Blue Creek area was not fully vetted in accordance with §777.6 of the Title 14 of the CCR. Overall, the adoption of the combination of the Options does not comport with the procedural regulations for implementation of the California Environmental Quality Act of 1970 (CEQA).

The scientific data needs to be evaluated as to whether such a closure is a necessary conservation measure or is scientifically sound. Department staff representative Stafford Lehr stated “That’s where the Department actually wanted to be with the Yurok. These points that have been raised are extremely valid and...they have expressed a concern, the Department has looked at it and said ‘we really don’t know what is the effort really, right at Blue Creek.’”¹¹ The Department staff representative went on to state the Department would like to build temperature criteria and address the issue in the coming year when there is scientific data available and explained that the proposal in front of the Commission would close the area regardless of what the temperature conditions were. Anecdotal data has indicated crowding conditions at the mouth of the Blue Creek partially due to fishing restrictions under the new regulations combined with low water levels are resulting in the deadly parasite ich which was responsible for the 2002 fish kill which caused severe damage to tribal trust resources and commercial and sport fisheries for years to come, undermining the regional economy.¹² Scientific data regarding this specific location as well as consequences to local resources and local economy needs to be considered rather than a “why not close it and see what happens” approach based upon political pressures. This is the exact reason why decision making by a California regulatory authority should not be arbitrary.

Through letters dated February 12, 2015 and May 29, 2015, the County via its Board of Supervisors urged the Fish and Game Commission not to adopt such regulation without supporting scientific data but to no avail. County Counsel wrote a letter on June 9, 2015 expressing the disappointment of the Board after the regulation was amended.

The County Board of Supervisors believe the Commission should collaborate with agencies and stakeholders in a meaningful manner according to its own polices and state law and should work toward solutions together rather than unilaterally denying repeated requests from the County that they reassess their decision making process as to this matter.

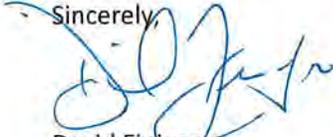

¹⁰ <http://www.fgc.ca.gov/regulations/2015/ktcommentsandresponses.pdf>

¹¹ Teleconference April 17, 2015 available [http://www.cal-span.org/media.php?folder\[\]=CFG](http://www.cal-span.org/media.php?folder[]=CFG) comment found at 2:33:55

¹² See press release from Jared Huffman <https://huffman.house.gov/media-center/press-releases/rep-jared-huffman-insists-federal-agencies-act-to-prevent-klamath-river>

The County now calls upon the Commission to repeal such regulation or, in the alternative, amend the regulation taking into consideration the impacts on the County and all of its residents. The Commission is required to act within 30 days under Government Code §11340.7. The County looks forward to an official response to this Petition.

Sincerely,

David Finigan,
Chairman of the Board
Del Norte County
Board of Supervisors

**TITLE 14. Fish and Game Commission
Notice of Proposed Changes in Regulations**

NOTICE IS HEREBY GIVEN that the Fish and Game Commission (Commission), pursuant to the authority vested by Sections 200, 202, 205, 215, 220, 240, 315, and 316.5, of the Fish and Game Code and to implement, interpret or make specific Sections 200, 202, 205, 215, and 316.5 of said Code, proposes to amend subsections (b)(91.1) and (b)(195) of Section 7.50, Title 14, California Code of Regulations, relating to Klamath River sport fishing.

Informative Digest/Policy Statement Overview

The Klamath River System, which consists of the Klamath River and Trinity River basins, is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service.

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2015 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations.

KRFC Allocation Management

The PFMC 2014 allocation for the Klamath River System recreational harvest was 4,128 adult KRFC. Preseason stock projections of 2015 adult KRFC abundance will not be available from the PFMC until March 2015. The 2015 Klamath River Basin allocation will be recommended by the PFMC in April 2015 and presented to the Commission for adoption prior to its April 2015 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommends the Commission consider an allocation range of 0 – 67,600 adult KRFC in the Klamath River Basin for the river recreational fishery.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

Proposed Changes

No changes are proposed for the general (KRSC) opening and closing season dates, and bag, possession and size limits.

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2015 Klamath River Basin quota is adopted. As in previous years, no retention of adult KRFC salmon is proposed for the following areas, once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31
3. Bag Limit - [0-4] Chinook salmon of which no more than [0-4] fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0-12] over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

SPIT AREA MANAGEMENT

Current regulations specify that the spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total adult KRFC quota has been taken downstream of the Highway 101 bridge.

In 2014 the Department also evaluated restrictive measures for the spit area which included a "no catch and release" regulation for Chinook salmon legally caught in the spit area to protect Chinook stocks from excessive catch and release mortality. The regulatory time frame did not allow for sufficient time to promulgate such a regulation change. The Department informed the Commission that it would consider this change for the 2015 regulatory cycle.

The following options are being provided for Commission consideration:

Option 1 - No catch and release fishing in Spit Area - Department Proposal

After internal discussion and Yurok Tribal coordination, the Department is proposing the following change to the 2015 fall Chinook spit area regulations:

All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.

This regulatory proposal does not preclude anglers from leaving the spit area and fishing other areas once their adult daily bag has been taken. Anglers may fish other areas outside of the spit to fill the grillse (Chinook salmon <22 inches) component of their daily bag limit. This regulation also does not preclude anglers from filling a daily bag composed entirely of grillse salmon while fishing the spit area.

Option 2 - All Chinook salmon must be kept in Spit Area with Blue Creek closure - Yurok Proposal

The Yurok tribe is proposing the following modifications to the Klamath River regulations in the spit area and on the main Klamath River below the confluence with Blue Creek:

- 1) No catch and release fishing allowed in the spit area to reduce pinniped predation on released fish, and
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding prior to entering Blue Creek.

The first modification is to the spit area at the mouth of the Klamath River to allow no release of Chinook salmon, regardless of whether they are legally caught or foul hooked. This option provides an exception from the general snagging prohibitions in Section 2.00. The second modification would add Blue Creek to the September 15 to December 31 stream mouth closures and add a new Klamath River main stem closure from June 15 to September 14 from 500 feet above to ½ mile downstream around the mouth of Blue Creek.

Option 3 – A possible combination of Options 1 and 2

The Commission may combine Option 1's prohibition on catch and release fishing in the spit area with Option 2's Blue Creek conservation closure.

- 1) All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding prior to entering Blue Creek.

ADDITIONAL PROPOSED CHANGES

The name of the road listed in subsection (b)(91.1)(B)2. is proposed to be corrected from "Ishi Pishi Falls road" to "Ishi Pishi Road". Cross references are proposed to be corrected in subsection (b)(195) to reduce public confusion. Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

The benefits of the proposed regulations are in conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (Sections 200, 202, 205, 315, and 316.5, Fish and Game Code). Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of Chinook salmon in the Lower Klamath River Basin.

NOTICE IS GIVEN that any person interested may present statements, orally or in writing, relevant to this action at a hearing to be held in the Resources Building Auditorium, 1416 Ninth Street, Sacramento, California, on Thursday, February 12, 2015, at 8:00 a.m., or as soon thereafter as the matter may be heard.

NOTICE IS ALSO GIVEN that any person interested may present statements, orally or in writing, relevant to this action at a teleconference originating in the Fish and Game Commission conference room, 1416 Ninth Street, Suite 1320, Sacramento, California, on Friday, April 17, 2015, at 8:30 a.m., or as soon thereafter as the matter may be heard. Interested persons may also participate at the following locations: Department of Fish and Wildlife, Conference Room, 50 Ericson Court, Arcata, California; Department of Fish and Wildlife, Conference Room, 20 Lower Ragsdale Drive, Suite 100, Monterey, California; Department of Fish and Wildlife, Conference Room, 1933 Cliff Drive, Suite 9, Santa Barbara, California; and Department of Fish and Wildlife, Conference Room, 4665 Lampson Avenue, Los Alamitos, California. Written comments may be submitted at the address given below, or by fax at (916) 653-5040, or by e-mail to FGC@fgc.ca.gov. Written comments mailed, faxed or e-mailed to the Commission office, must be received before 5:00 p.m. on April 16, 2015. All comments must be received no later than April 17, 2015, at one of the teleconference hearing locations listed above. If you would like copies of any modifications to this proposal, please include your name and mailing address.

The regulations as proposed in strikeout-underline format, as well as an initial statement of reasons, including environmental considerations and all information upon which the proposal is based (rulemaking file), are on file and available for public review from the agency representative, Sonke Mastrup, Executive Director, Fish and Game Commission, 1416 Ninth Street, Box 944209, Sacramento, California 94244-2090, phone (916) 653-4899. Please direct requests for the above mentioned documents and inquiries concerning the regulatory process to Sonke Mastrup or Sherrie Fonbuena at the preceding address or phone number. **Stafford Lehr, Chief of Fisheries Branch, Department of Fish and Wildlife, (916) 327-8840 or Stafford.Lehr@wildlife.ca.gov, has been designated to respond to questions on the substance of the proposed regulations.** Copies of the Initial Statement of Reasons, including the regulatory language, may be obtained from the address above. Notice of the proposed action shall be posted on the Fish and Game Commission website at <http://www.fgc.ca.gov>.

Availability of Modified Text

If the regulations adopted by the Commission differ from but are sufficiently related to the action proposed, they will be available to the public for at least 15 days prior to the date of adoption. Circumstances beyond the control of the Commission (e.g., timing of Federal regulation adoption, timing of resource data collection, timelines do not allow, etc.) or changes made to be responsive to public recommendation and comments during the regulatory process may preclude full compliance with the 15-day comment period, and the Commission will exercise its powers under Section 202 of the Fish and Game Code. Regulations adopted pursuant to this section are not subject to the time periods for adoption, amendment or repeal of regulations prescribed in Sections 11343.4, 11346.4 and 11346.8 of the Government Code. Any person

interested may obtain a copy of said regulations prior to the date of adoption by contacting the agency representative named herein.

If the regulatory proposal is adopted, the final statement of reasons may be obtained from the address above when it has been received from the agency program staff.

Impact of Regulatory Action/Results of the Economic Impact Analysis

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) **Significant Statewide Adverse Economic Impact Directly Affecting Business, Including the Ability of California Businesses to Compete with Businesses in Other States:**

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are projected to have some impact on the net revenues to local businesses servicing sport fishermen. Visitor spending may be reduced and in the absence of the emergence of alternative visitor activities, the drop in spending could induce business contraction. However, this will not likely affect the ability of California businesses to compete with businesses in other states. The preservation of Klamath River salmon stocks is necessary for the success of lower and upper Klamath River Basin businesses which provide goods and services related to fishing. The proposed changes are necessary for the continued preservation of the resource and therefore the prevention of adverse economic impacts.

(b) **Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:**

The proposed regulations range from no fishing of KRFC salmon in 2015; to a normal Klamath River Basin salmon season. The Commission anticipates some impact on the creation or elimination of jobs in California. The potential employment impacts range from 0 to 23 jobs which are not expected to create, eliminate or expand businesses in California. The Commission anticipates impacts on the creation, elimination or expansion of businesses in California ranging from no impact to reduced revenues to approximately 30 businesses that serve sport fishing activities. However, the possibility of growth of businesses to serve substitute activities exists. Adverse impacts to jobs and/or businesses would be less if fishing of grilse KRFC salmon is permitted than under the complete closure to all fishing. The impacted businesses are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of causes. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, subsequently, the promotion and long-term viability of these same small businesses.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon sport fishery encourages consumption of a nutritious food.

The Commission anticipates benefits to the environment by the sustainable management of California's salmon resources.

The Commission does not anticipate any benefits to worker safety.

(c) **Cost Impacts on a Representative Private Person or Business:**

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) **Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:** None.

(e) **Nondiscretionary Costs/Savings to Local Agencies:** None.

(f) **Programs Mandated on Local Agencies or School Districts:** None.

(g) **Costs Imposed on any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:** None.

(h) **Effect on Housing Costs:** None.

Effect on Small Business

It has been determined that the adoption of these regulations may affect small business. The Commission has drafted the regulations in Plain English pursuant to Government Code Sections 11342.580 and 11346.2(a)(1).

Consideration of Alternatives

The Commission must determine that no reasonable alternative considered by the Commission, or that has otherwise been identified and brought to the attention of the Commission, would be more effective in carrying out the purpose for which the action is proposed, would be as effective and less burdensome to affected private persons than the proposed action, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

FISH AND GAME COMMISSION

Dated: January 13, 2015

Sonke Mastrup
Executive Director

Attachment 2

**STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)**

**Amend Subsections (b)(91.1) and (b)(195) of Section 7.50
Title 14, California Code of Regulations
Re: Klamath River Sport Fishing Regulations**

- I. **Date of Initial Statement of Reasons:** January 12, 2015
- II. **Dates and Locations of Scheduled Hearings:**
- (a) **Notice Hearing:** Date: December 3, 2014
Location: Van Nuys
- (b) **Discussion Hearing:** Date: February 12, 2015
Location: Sacramento
- (c) **Adoption Hearing:** Date: April 17, 2015
Location: Teleconference
- III. **Description of Regulatory Action:**
- (a) **Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:**
- The Klamath River System, which consists of the Klamath River and Trinity River basins, is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational and tribal fisheries.
- The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).
- The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.
- Two tribal entities within the Klamath River System, the Hoopa Valley Tribe and the Yurok Tribe, maintain fishing rights for ceremonial,

subsistence and commercial fisheries that are managed consistent with federal fishery management goals. Tribal fishing regulations are promulgated by the Hoopa and Yurok tribes.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2015 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations. KRSC harvest will be monitored on the Lower Klamath River in 2015 and ensuing years by creel survey.

KRFC Allocation Management

The PFMC 2014 allocation for the Klamath River System recreational harvest was 4,128 adult KRFC. Preseason stock projections of 2015 adult KRFC abundance will not be available from the PFMC until March 2015. The 2015 basin allocation will be recommended by the PFMC in April 2015 and presented to the Commission for adoption prior to its April 2015 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommends the Commission consider an allocation range of 0 – 67,600 adult KRFC in the Klamath River Basin for the river recreational fishery. This recommended range encompasses the historical range of the Klamath River Basin allocations and allows the PFMC and Commission to make adjustments during the 2015 regulatory cycle.

The Commission may modify the KRFC in-river recreational salmon harvest allocation which is normally 15 percent of the non-tribal PFMC harvest allocation. Commission modifications need to meet biological and fishery allocation goals specified in law or established in the PFMC Salmon Fishery Management Plan otherwise harvest opportunities may be reduced in the California ocean fisheries.

The annual KRFC in-river harvest allocation is split into 4 geographic areas with subquotas assigned to each. They are as follows:

1. for the main stem Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec -- 17 percent of the recreational fishery allocation;
2. for the main stem Klamath River from downstream of the Highway 96 bridge at Weitchpec to the mouth -- 50 percent of the recreational fishery allocation;
3. for the Trinity River downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat -- 16.5 percent of the recreational fishery allocation; and
4. for the Trinity River downstream from the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River -- 16.5 percent of the recreational fishery allocation.

The spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total Klamath River Basin quota has been taken downstream of the Highway 101 bridge.

These geographic areas are based upon the historical distribution of angler effort and ensure equitable harvest of adult KRFC in the upper Klamath River and Trinity River. The subquota system requires the Department to monitor angler harvest of adult KRFC in each geographic area. All areas will be monitored on a real time basis except for the following:

Klamath River upstream of Weitchpec and the Trinity River: Due to funding and personnel reductions, the Department will be unable to deploy adequate personnel to conduct harvest monitoring in the Klamath River upstream of Weitchpec and in the Trinity River for the 2015 season. The Department has reviewed salmon harvest and run-timing data for these areas. Based on this review, the Department has developed a Harvest Predictor Model (HPM) which incorporates historic creel survey data from the Klamath River downstream of Iron Gate Dam to the confluence with the Pacific Ocean and the Trinity River downstream of Lewiston Dam to the confluence with the Klamath River. The HPM is driven by the positive relationship between KRFC harvested in the Lower and Upper Klamath River. The HPM will be used by the Department to implement fishing

closures to ensure that anglers do not exceed established subquota targets.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The Department presently differentiates the two stocks by the following dates:

Klamath River

1. January 1 through August 14 - General Season KRSC.
For purposes of clarity, daily bag and possession limits apply to that section of the Klamath River downstream the Highway 96 bridge at Weitchpec to the mouth.
2. August 15 to December 31 - KRFC quota management.

Trinity River

1. January 1 through August 31 – General Season KRSC.
For purposes of clarity, daily bag and possession limits apply to that section of the Trinity River downstream of the Old Lewiston Bridge to the confluence with the South Fork Trinity River.
2. September 1 through December 31 – KRFC quota management.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

Proposed Changes

No changes are proposed for the general (KRSC) opening and closing season dates, and bag, possession and size limits.

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2015 Klamath River Basin quota is adopted. As in previous years, no retention of adult KRFC salmon is proposed for the following areas, once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31

3. Bag Limit - [0-4] Chinook salmon – of which no more than [0-4] fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0-12] over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

SPIT AREA MANAGEMENT:

Regulations adopted in 2014 specify the spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) will close to all fishing after 15 percent of the total Klamath River Basin quota has been taken downstream of the Highway 101 bridge. At the same time, the Commission removed language (special note in the regulations for the spit fishery) that allowed the Department to keep the spit fishery open if the Department projected the Klamath River Basin adult fall Chinook would not be met.

In 2014 the Department also evaluated restrictive measures for the spit area which included a “no catch and release” regulation for Chinook salmon legally caught in the spit area to protect Chinook stocks from excessive catch and release mortality. The regulatory time frame did not allow for sufficient time to promulgate such a regulation change. The Department informed the Commission that it would consider this change for the 2015 regulatory cycle.

At issue is the perception of mortality associated with Chinook salmon which are caught and released by anglers trying to fill their daily grilse bag limit. Typically the fall Chinook bag limit is composed of an adult portion and grilse portion. In 2014 the daily fall Chinook bag limit was three fish, no more than one adult. Thus, anglers fishing the spit area would often catch and keep their one adult and continue fishing for the grilse portion of their daily bag. Some anglers would catch multiple adult fall Chinook and have to release these fish since they already had retained their one adult. Some released Chinook were observed floating downstream, thus becoming easy prey for the marine mammals that congregate in this area.

The following options are being provided for Commission consideration:

Option 1 - No catch and release fishing in Spit Area - Department Proposal

After internal discussion and Yurok Tribal coordination, the Department is proposing the following change to the 2015 fall Chinook salmon spit area regulations:

All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.

This regulatory proposal does not preclude anglers from leaving the spit area and fishing other areas once their adult daily bag has been taken. Anglers may fish other areas outside of the spit to fill the grilse (Chinook salmon <22 inches) component of their daily bag limit. This regulation also does not preclude anglers from filling a daily bag composed entirely of grilse salmon while fishing the spit area.

Option 2 - All Chinook salmon must be kept in Spit Area with Blue Creek closure - Yurok Proposal

The Yurok tribe approached the Commission at the notice hearing for additional proposed modifications to the Klamath River regulations in the spit area and the main Klamath River below the confluence with Blue Creek. The Commission directed the Department to add a regulatory option to allow further consideration of the Yurok proposal:

- 1) No catch and release fishing allowed in the spit area to reduce pinniped predation on released fish, and
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding to prior to entering Blue Creek.

The first modification is to the spit area at the mouth of the Klamath River to allow no release of Chinook salmon. This revision would add a new subarea on the spit area by adding a new subsection (b)(91.1)(E) for the spit area.

The difference between the Yurok Tribe's proposed regulation and the Department's proposal is that the Tribal proposal requires the retention of all fish caught, regardless of whether they are caught legally or foul hooked. The proposed regulations therefore provide, in this one instance, an exception from the snagging prohibitions in subsections (b) and (c) of Section 2.00. The rationale for this is that a substantial proportion of fish caught in this area are foul hooked due to the nature of the fishery. Given that these fish are exhausted when released, and there is a relatively large presence of sea lions and seals that feed upon these released fish, the Tribe recommends that all fish caught (even those foul hooked) be retained and counted toward an angler's daily bag limit.

The second modification would expand subsection (b)(91.1)(B)3. to add Blue Creek to the September 15 to December 31 stream mouth closures and add a new Klamath River main stem closure from June 15 to September 14 from 500 feet above to ½ mile downstream around the mouth of Blue Creek.

This proposed conservation area has two purposes, depending on the time of year:

- 1) Mid-June to mid-September: The intent of this closure to fishing is to protect the large numbers of adult summer steelhead, as well as spring

and fall-run Chinook salmon (thousands during some years), that are seeking thermal respite from the excessively warm Klamath River main stem temperatures. The intent is to prevent these fish from being caught by anglers, played for an extended period of time in the ambient river conditions that are several degrees warmer (sometimes near lethal levels) than the thermal refuge, and then eventually released. Forcing fish to go through such abrupt temperature changes, while putting them through excessive stress, results in physiological trauma that can lead to death.

2) Mid-September through December: The intent of this closure is to protect the genetically unique late-fall run chinook salmon that hold at the mouth of Blue Creek prior migrating upstream to spawn in Blue Creek, similar to the protections that are currently given at the mouths of the Salmon, Scott and Shasta Rivers.

Option 3 – A possible combination of Options 1 and 2

The Commission may combine Option 1's prohibition on catch and release fishing in the spit area with Option 2's Blue Creek conservation closure.

- 1) All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding prior to entering Blue Creek.

ADDITIONAL PROPOSED CHANGES

The name of the road listed in subsection (b)(91.1)(B)2. is proposed to be corrected from "Ishi Pishi Falls road" to "Ishi Pishi Road". Cross references are proposed to be corrected in subsection (b)(195) to reduce public confusion. Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

It is the policy of this State to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the State for the benefit of all the citizens of the State. In addition, it is the policy of this State to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the State. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

The benefits of the proposed regulations are in conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 215, 220, 240, 315 and 316.5, Fish and Game Code.

Reference: Sections 200, 202, 205, 215 and 316.5, Fish and Game Code.

- (c) Specific Technology or Equipment Required by Regulatory Change:

None.

- (d) Identification of Reports or Documents Supporting Regulation Change:

In-River Sport Fishing Economics Technical Report, National Oceanographic and Atmospheric Administration, National Marine Fisheries Service (NMFS), September 2011.

- (e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are being held prior to the notice publication. The 45-day comment period provides adequate time for review of the proposed amendments.

IV. Description of Reasonable Alternatives to Regulatory Action:

- (a) Alternatives to Regulation Change:

The use of more liberal regulations for bag limits, possession limits and fishing methods. For KRFC salmon, more liberal regulations would be less desirable than those proposed because they could create risk of an intense fishery reaching or exceeding the quota in a very short time. Reaching the quota in a very short time could be damaging to the local economy. Exceeding the allowable harvest could be damaging to the KRFC salmon stocks.

- (b) No Change Alternative:

The No Change Alternative would leave the current 2014 regulations in place and would not conform to the PFMC Klamath River Basin quota for 2015. Nor would it address the excessive catch and release mortality within the spit area. The change is necessary to continue appropriate harvest rates and an equitable distribution of the harvestable surplus.

(c) **Consideration of Alternatives:**

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. **Mitigation Measures Required by Regulatory Action:**

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. **Impact of Regulatory Action:**

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) **Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:**

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are projected to have some impact on the net revenues to local businesses servicing sport fishermen. Visitor spending may be reduced and in the absence of the emergence of alternative visitor activities, the drop in spending could induce business contraction. However, this will not likely affect the ability of California businesses to compete with businesses in other states. The preservation of Klamath River salmon stocks is necessary for the success of lower and upper Klamath River Basin businesses which provide goods and services related to fishing. The proposed changes are necessary for the continued preservation of the resource and therefore the prevention of adverse economic impacts.

(b) **Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:**

The proposed regulations range from no fishing of KRFC salmon in 2015; to a normal Klamath River Basin salmon season. The Commission anticipates some impact on the creation or elimination of jobs in California. The potential employment impacts range from 0 to 23 jobs which are not

expected to create, eliminate or expand businesses in California. The Commission anticipates impacts on the creation, elimination or expansion of businesses in California ranging from no impact to reduced revenues to approximately 30 businesses that serve sport fishing activities. However, the possibility of growth of businesses to serve substitute activities exists. Adverse impacts to jobs and/or businesses would be less if fishing of grilse KRFC salmon is permitted than under the complete closure to all fishing. The impacted businesses are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of causes. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, subsequently, the promotion and long-term viability of these same small businesses.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon sport fishery encourages consumption of a nutritious food.

The Commission anticipates benefits to the environment by the sustainable management of California's salmon resources.

The Commission does not anticipate any benefits to worker safety.

(c) **Cost Impacts on a Representative Private Person or Business:**

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) **Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:**

None.

(e) **Nondiscretionary Costs/Savings to Local Agencies:**

None.

(f) **Programs Mandated on Local Agencies or School Districts:**

None.

(g) **Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:**

None.

(h) **Effect on Housing Costs:**

None.

VI. Economic Impact Assessment:

The regulatory amendments of subsections of Section 7.50 under consideration will set the 2014 Klamath River Basin salmon sport fishing regulations to conform to Pacific Fishery Management Council (PFMC) Fall Chinook allocation guidelines. The Klamath River Basin is anticipated to be open for sport salmon fishing at levels similar to the 2014 quotas; however the possibility of marine fishery area closures still exists. Ocean closures may in turn result in PFMC recommendations for Klamath River Basin sport salmon fishery closures for the take of adult salmon. Adverse or positive impacts to jobs and businesses will depend on the exact regulations ultimately adopted by PFMC and the Fish and Game Commission (Commission).

The Commission is considering proposed changes to Klamath River Fall Chinook (KRFC) quota management and the management of the Klamath River Basin spit area which is the area within 100 yards of the channel through the sand spit formed at the Klamath River mouth:

1) KRFC QUOTA MANAGEMENT

The proposed regulations range from 100% of last year's Klamath River Basin salmon season to 0% or no salmon fishing on adult Chinook salmon (greater than 22 inches) in 2015. Under all scenarios sport fishing will be allowed for grilse fall-run Chinook salmon (2 year-old salmon 22 inches or less) regardless of PFMC regulations, thus any adverse impacts to businesses would be less severe than under a complete closure of fishing.

The projections evaluated here are as follows: 100% of the 2014 Klamath River Basin catch limit; 50% of the 2014 basin catch limit; and 0% of the 2014 basin catch limit.

A. Effects of the Regulation on the Creation or Elimination of Jobs

Projection 1. 100% catch limit: The Commission does not anticipate any adverse impacts on the creation or elimination of jobs, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Based on a 2011 NOAA National Marine Fisheries Service (NMFS) report on In-River Sport Fishing Economics of the Klamath River, under a normal season non-resident Klamath River sport salmon anglers contribute about \$2,037,424 (2013\$) in total economic output to California businesses. This revenue supports about 35 jobs in the state.

An assumption of the NMFS report is that increases in expenditures by resident anglers associated with expanded fishing opportunities would be accommodated by reduced expenditures on other locally purchased goods and services – with

no net change in local economic activity. For non-resident anglers, however, increases in local expenditures associated with increases in local fishing opportunities would be accomplished by diverting money that they would otherwise spend outside the local area. Thus the economic impact analysis focuses on non-resident angler expenditures, which represent 'new money' whose injection serves to stimulate the local economy.

The NMFS study excluded the Trinity River, the largest tributary to the Klamath. The Trinity River is allocated 33% of the Klamath Basin fall-run Chinook salmon total allocation. Using the Trinity allocation as a measure of angler effort, and thus impacts on associated businesses that support anglers, the total non-resident angler contribution to the entire Klamath Basin (including the Trinity River) is estimated to be \$2,709,774 (2013\$) in total economic output. This revenue, again using a 33% increase to account for the Trinity River, provides an estimated total of 47 jobs in the state (assuming that personnel costs also rise with inflation). This is a conservative estimate of total economic impact as it counts only non-resident angler expenditures. Non-resident average expenditures are estimated to be \$106.43 (2013\$) per angler day (for lodging, food, gasoline, fishing gear, boat fuel, and guide fees) based on a NMFS sponsored survey. Resident average expenditures per angler day are estimated to be 60% less (markedly reduced lodging, gasoline and food expenditures) which yields an estimate of \$42.60 per angler day. Resident anglers comprise about 36% of Klamath Basin anglers.

Projection 2. 50% catch limit: The Commission anticipates some impact on the creation or elimination of jobs. A 50% catch reduction will likely reduce visitor spending by slightly less than 50%, given price elasticities of demand for salmon fishing activity of less than one. As the "price" of fishing per unit catch increases the demand for fishing trips declines by a lesser extent, particularly in the short-run. While difficult to predict, job losses associated with a 50% reduction in the catch limit are expected to be less than half of the estimated total jobs supported by angler visits (i.e. fewer than 23 jobs).

Projection 3. 0% catch limit: In the event of fisheries closures in some or all Klamath River basin areas, the Commission anticipates less than 50% reduction in fishery-related jobs. As mentioned earlier, sport fishing for grilse fall-run Chinook salmon (2-year-old salmon less than 22 inches) will still be allowed, thus lessening any job losses. A closure on the take of adult Chinook salmon was instituted in 2006 and only grilse salmon could be legally harvested that year. The effect of the 2006 closure, as measured by angler days on the Klamath River, resulted in an approximate 50% drop in angler days, compared to the 2000- 2005 average (12,000 angler days vs. 23,300 angler days). Job creation or elimination is assumed to lag in adjustment to changes in consumer demand as is characteristic of the labor market. Thus, the potential impacts of a closure on the take of adult Chinook are estimated to result in the loss of fewer than 23 jobs.

B. Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses

Projection 1: 100% catch limit: The Commission does not anticipate any impacts on the creation of new business or the elimination of existing businesses, as the quotas would not decrease effort nor curtail the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2. 50% catch limit: The Commission anticipates a decline in visits to the fishery areas of less than 50%. This may result in some decline in business activity and no business creation for businesses directly related to fishing activities. However, with less effort being expended on fishing, the possibility of substitute activities and the growth of businesses to serve those activities exists.

Projection 3. 0% catch limit: In the event of fisheries closures in some or all Klamath River basin areas, the Commission anticipates a decline in regional spending and thus reduced revenues to the approximately 30 businesses that serve sport fishing activities. However adverse impacts will be mitigated by the continued opportunity to harvest grilse salmon. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, subsequently, the long-term viability of these same small businesses.

C. Effects of the Regulation on the Expansion of Businesses in California

Projection 1. 100% catch limit: The Commission does not anticipate any impacts on the expansion of businesses in California as the quotas would not increase effort nor increase the number of visitors and thus probable visitor expenditures in the fisheries areas.

Projection 2. 50% catch limit: The Commission does not anticipate any impacts on the expansion of businesses in California. Decreases in expenditures by resident anglers associated with reduced fishing opportunities may be offset by increased expenditures on other locally purchased goods and services – with no net change in local economic activity. For non-resident anglers, however, decreases in local expenditures associated with decreases in local fishing opportunities may result in increases in other expenditures outside the Klamath River basin area.

Projection 3. 0% catch limit: In the event of fisheries closures in some or all Klamath River basin areas, the Commission does not anticipate any expansion of businesses in California. Decreases in expenditures by anglers associated with reduced fishing opportunities may be partially offset by increased expenditures on other locally purchased goods and services as visitors substitute salmon fishing with other recreational pursuits.

D. Benefits of the Regulation

Concurrence with Federal Law:

California's sport fishing regulations need to conform to the new Federal regulations to achieve optimum yield in California. The PFMC annually reviews the status of west coast salmon populations. As part of that process, it

recommends west coast adult salmon fisheries regulations aimed at meeting biological and fishery allocation goals specified in law or established in the Salmon Fishery Management Plan. These recommendations coordinate west coast management of sport and commercial ocean salmon fisheries off the coasts of Washington, Oregon, and California and California inland sport salmon fisheries. These recommendations are subsequently implemented as ocean fishing regulations by the NMFS and as sport salmon regulations for state marine and inland waters by the Commission.

Promotion of businesses that rely on Klamath River basin sport salmon fishing. Adoption of scientifically-based inland and ocean salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence and future salmon sport fishing opportunities, and subsequently the long-term viability of businesses that rely on Klamath River Basin sport fishing. Under a normal season, Klamath River Basin (including the Trinity River) sport salmon anglers contribute about \$2,709,774 (2013\$) in total economic output to the State's business sector. This is based on a 2011 NOAA National Marine Fisheries Service (NMFS) report on In-River Sport Fishing Economics of the Klamath River Basin. This revenue provides for about 47 jobs in the state.

Benefits to the environment: sustainable management of Klamath River basin salmon resources

Projection 1. 100% catch limit: The Commission anticipates benefits to the environment. It is the policy of this state to encourage the conservation, maintenance, and utilization of the living resources of the ocean and inland waters under the jurisdiction and influence of the state for the benefit of all the citizens of the state. In addition, it is the policy of this state to promote the development of local California fisheries in harmony with federal law respecting fishing and the conservation of the living resources of the ocean and inland waters under the jurisdiction and influence of the state. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use. Adoption of scientifically-based Klamath River Basin salmon seasons, size limits, and bag and possession limits provides for the maintenance of sufficient populations of salmon to ensure their continued existence.

Projection 2. The Commission anticipates benefits to the environment similar to as stated in Projection 1.

Projection 3. The Commission anticipates benefits to the environment similar to as stated in Projection 1.

Benefits to the health and welfare of California residents

Projection 1. The Commission anticipates benefits to the health and welfare of California residents through the protection of aquatic and riparian habitats and

the fish and wildlife resources that depend upon them. Providing opportunities for a Klamath River Basin sport salmon fishery encourages consumption of a nutritious food. Salmon sport fishing also contributes to increased mental health of its practitioners as fishing is a hobby and form of relaxation for many. Salmon sport fishing also provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of California's natural resources.

Projection 2. The Commission anticipates benefits to the health and welfare of California residents similar to as stated in Projection 1.

Projection 3. The Commission anticipates benefits to the health and welfare of California residents similar to as stated in Projection 1.

Benefits to worker safety

Projection 1. The Commission does not anticipate benefits to worker safety because the proposed regulations will not impact worker conditions.

Projection 2. The Commission does not anticipate benefits to worker safety as stated in Projection 1.

Projection 3. The Commission does not anticipate benefits to worker safety as stated in Projection 1.

Informative Digest/Policy Statement Overview

The Klamath River System, which consists of the Klamath River and Trinity River basins, is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service (NMFS).

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2015 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations.

KRFC Allocation Management

The PFMC 2014 allocation for the Klamath River System recreational harvest was 4,128 adult KRFC. Preseason stock projections of 2015 adult KRFC abundance will not be available from the PFMC until March 2015. The 2015 Klamath River Basin allocation

will be recommended by the PFMC in April 2015 and presented to the Commission for adoption prior to its April 2015 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommends the Commission consider an allocation range of 0 – 67,600 adult KRFC in the Klamath River Basin for the river recreational fishery.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

Proposed Changes

No changes are proposed for the general (KRSC) opening and closing season dates, and bag, possession and size limits.

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2015 Klamath River Basin quota is adopted. As in previous years, no retention of adult KRFC salmon is proposed for the following areas, once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31
3. Bag Limit - [0-4] Chinook salmon of which no more than [0-4] fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0-12] over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

SPIT AREA MANAGEMENT

Current regulations specify that the spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total adult KRFC quota has been taken downstream of the Highway 101 bridge.

In 2014 the Department also evaluated restrictive measures for the spit area which included a "no catch and release" regulation for Chinook salmon legally caught in the spit area to protect Chinook stocks from excessive catch and release mortality. The regulatory time frame did not allow for sufficient time to promulgate such a regulation change. The Department informed the Commission that it would consider this change for the 2015 regulatory cycle.

The following options are being provided for Commission consideration:

Option 1 - No catch and release fishing in Spit Area - Department Proposal

After internal discussion and Yurok Tribal coordination, the Department is proposing the following change to the 2015 fall Chinook spit area regulations:

All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.

This regulatory proposal does not preclude anglers from leaving the spit area and fishing other areas once their adult daily bag has been taken. Anglers may fish other areas outside of the spit to fill the grilse (Chinook salmon <22 inches) component of their daily bag limit. This regulation also does not preclude anglers from filling a daily bag composed entirely of grilse salmon while fishing the spit area.

Option 2 - All Chinook salmon must be kept in Spit Area with Blue Creek closure - Yurok Proposal

The Yurok tribe is proposing the following modifications to the Klamath River regulations in the spit area and on the main Klamath River below the confluence with Blue Creek:

- 1) No catch and release fishing allowed in the spit area to reduce pinniped predation on released fish, and
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding prior to entering Blue Creek.

The first modification is to the spit area at the mouth of the Klamath River to allow no release of Chinook salmon, regardless of whether they are legally caught or foul hooked. This option provides an exception from the general snagging prohibitions in Section 2.00. The second modification would add Blue Creek to the September 15 to December 31 stream mouth closures and add a new Klamath River main stem closure from June 15 to September 14 from 500 feet above to ½ mile downstream around the mouth of Blue Creek.

Option 3 – A possible combination of Options 1 and 2

The Commission may combine Option 1's prohibition on catch and release fishing in the spit area with Option 2's Blue Creek conservation closure.

- 1) All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.
- 2) Conservation closure below the mouth of Blue Creek to reduce catch and release in a thermal refuge area and protect late-fall Chinook holding prior to entering Blue Creek.

ADDITIONAL PROPOSED CHANGES

The name of the road listed in subsection (b)(91.1)(B)2. is proposed to be corrected from "Ishi Pishi Falls road" to "Ishi Pishi Road". Cross references are proposed to be corrected in subsection (b)(195) to reduce public confusion. Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

The benefits of the proposed regulations are in conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (sections 200, 202, 205, 315, and 316.5, Fish and Game Code). Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of Chinook salmon in the Lower Klamath River Basin.

Attachment 3

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
FINAL STATEMENT OF REASONS FOR REGULATORY ACTION

Amend Subsections (b)(91.1) and (b)(195) of Section 7.50
Title 14, California Code of Regulations
RE: 2015 Klamath River Basin Sport Fishing Regulations

- I. Date of Initial Statement of Reasons: January 12, 2014
- II. Date of Pre-adoption Statement of Reasons: March 20, 2015
- III. Date of Final Statement of Reasons: May 4, 2015
- IV. Dates and Locations of Scheduled Hearings:
 - (a) Notice Hearing: Date: December 3, 2014
Location: Van Nuys
 - (b) Discussion Hearing: Date: February 12, 2015
Location: Sacramento
 - (c) Adoption Hearing: Date: April 17, 2015
Location: Teleconference
- V. Update:

At the April 17, 2015 teleconference, the Fish and Game Commission (Commission) adopted the following Klamath Basin bag and possession limits, adult quota, and conservation measures:

- (1) A daily bag limit of 3 Chinook salmon of which no more than 2 fish greater than 22 inches in length may be taken when the take of adults is allowed.
- (2) A possession limit of 9 Chinook salmon of which no more than 6 fish greater than 22 inches in length may be retained when the take of adults is allowed.
- (3) A basin quota of 14,133 adult Chinook salmon greater than 22 inches in length.
- (4) A closure of the main stem Klamath River near the confluence of Blue Creek between June 15 and December 31. The main stem Klamath River will be closed to sport fishing from 500 feet upstream of the mouth of Blue Creek to ½ mile downstream from the mouth of Blue Creek from June 15 through September 14 and within 500 feet of the Blue Creek confluence from September 15 through December 31.
- (5) A mandatory retention of all legally hooked and landed Chinook salmon in

the spit area (mouth of the Klamath River). Additionally, once anglers have retained the adult component of the daily Chinook bag limit, they must cease fishing in the spit area. Anglers may continue to fish other areas of the Klamath River after leaving the spit if they have not retained their daily bag limit.

Sport fishing seasons for KRFC remain unchanged and are as follows:

- (1) Klamath River - August 15 through December 31
- (2) Trinity River - September 1 through December 31

The Klamath Basin quota of 14,133 adult KRFC aligns with federal regulations which provide guidance on allocations between ocean sport and commercial fisheries, inland sport fisheries, and recognized tribal fisheries.

The Commission adopted non-substantive changes for clarity and consistency.

VI. Summary of Primary Considerations Raised in Support of or Opposition to the Proposed Actions and Reasons for Rejecting Those Considerations:

See Attachment 1 titled "Summary of Public Comments and Responses."

VII. Location and Index of Rulemaking File: A rulemaking file with attached file index is maintained at:

California Fish and Game Commission
1416 Ninth Street
Sacramento, CA 95814

VIII. Location of Department of Fish and Wildlife files:

Department of Fish and Wildlife
1416 Ninth Street
Sacramento, CA 95814

IX. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulatory Action:

The use of more liberal regulations for bag limits, possession limits, and fishing methods. For KRFC, more liberal regulations would be less desirable than those proposed because they could create risk of an intense fishery reaching or exceeding the quota in a very short time. Reaching the quota in a very short time could be damaging to the local economy. Exceeding the allowable harvest could be damaging to the KRFC stocks.

(b) No Change Alternative:

The No Change Alternative would leave the current 2014 regulations in place and would not conform to the Pacific Fishery Management Council Klamath River Basin quota for 2015, nor would it address the excessive catch and release mortality within the spit area. The change is necessary to continue appropriate harvest rates and an equitable distribution of the harvestable surplus.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the adopted regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

X. Impact of Regulatory Action:

The potential for significant Statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant Statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are projected to have some impact on the net revenues to local businesses servicing sport fishermen. Visitor spending may be reduced and in the absence of the emergence of alternative visitor activities, the drop in spending could induce business contraction. However, this will not likely affect the ability of California businesses to compete with businesses in other states. The preservation of Klamath River salmon stocks is necessary for the **long-term sustainability and success of lower and upper Klamath River Basin businesses that provide goods and services related to fishing.** The proposed changes are necessary for the continued preservation of the resource and, **in the long-term, prevention of adverse economic impacts.**

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The proposed regulations range from no fishing of KRFC in 2015 to a

normal Klamath River Basin salmon season. The Commission anticipates some impact on the creation or elimination of jobs in California. The potential employment impacts range from 0 to 23 jobs which are not expected to create, eliminate, or expand businesses in California. The Commission anticipates impacts on the creation, elimination, or expansion of businesses in California ranging from no impact to reduced revenues for approximately 30 businesses that serve sport fishing activities. However, the possibility of growth of businesses to serve substitute activities exists. Adverse impacts to jobs and/or businesses would be less if fishing of grilse KRFC is permitted than under the complete closure to all fishing. The impacted businesses are generally small businesses employing few individuals and, like all small businesses, are subject to failure for a variety of causes. Additionally, the long-term intent of the proposed action is to increase sustainability in fishable salmon stocks and, subsequently, the promotion and long-term viability of these same small businesses.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon sport fishery encourages outdoor recreational activity and consumption of a nutritious food.

The Commission anticipates benefits to the environment by the sustainable management of California's salmon resources.

The Commission does not anticipate any benefits to worker safety.

(c) Cost Impacts on a Representative Private Person or Business:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

(e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

Updated Informative Digest/Policy Statement Overview

The Klamath River System which consists of the Klamath River and Trinity River basins is managed through a cooperative system of State, federal, and tribal management agencies. Salmonid regulations are designed to meet natural and hatchery escapement needs for salmonid stocks, while providing equitable harvest opportunities for ocean recreational, ocean commercial, river recreational, and tribal fisheries.

The Pacific Fishery Management Council (PFMC) is responsible for adopting recommendations for the management of recreational and commercial ocean salmon fisheries in the Exclusive Economic Zone (three to 200 miles offshore) off the coasts of Washington, Oregon, and California. When approved by the Secretary of Commerce, these recommendations are implemented as ocean salmon fishing regulations by the National Marine Fisheries Service.

The California Fish and Game Commission (Commission) adopts regulations for the ocean salmon recreational (inside three miles) and the Klamath River System recreational fisheries which are consistent with federal fishery management goals.

For the purpose of PFMC mixed-stock fishery modeling and salmon stock assessment, salmon greater than 22 inches are defined as adult salmon (ages 3-5) and salmon less than or equal to 22 inches are defined as grilse salmon (age 2).

Klamath River Fall-Run Chinook

Klamath River fall-run Chinook salmon (KRFC) harvest allocations and natural spawning escapement goals are established by the PFMC. The KRFC harvest allocation between tribal and non-tribal fisheries is based on court decisions and allocation agreements between the various fishery representatives.

The 2015 KRFC in-river recreational fishery allocation recommended by the PFMC is currently unknown. All proposed closures for adult KRFC are designed to ensure sufficient spawning escapement in the Klamath River Basin and equitably distribute harvest while operating within annual allocations.

Klamath River Spring-Run Chinook

The Klamath River System also supports Klamath River spring-run Chinook salmon (KRSC). Naturally produced KRSC are both temporally and spatially separated from KRFC in most cases.

Presently, KRSC stocks are not managed or allocated by the PFMC. The in-river recreational fishery is managed by general basin seasons, daily bag limit, and possession limit regulations.

KRFC Allocation Management

The PFMC 2014 allocation for the Klamath River System recreational harvest was 4,128 adult KRFC. Preseason stock projections of 2015 adult KRFC abundance will not be available from the PFMC until March 2015. The 2015 Klamath Basin allocation will be recommended by the PFMC in April 2015 and presented to the Commission for adoption prior to its April 2015 meeting.

For public notice requirements, the Department of Fish and Wildlife (Department) recommended the Commission consider an allocation range of 0 - 67,600 adult KRFC in the Klamath River Basin for the river recreational fishery.

Current Recreational Fishery Management

The KRFC in-river recreational harvest allocation is divided into geographic areas and harvest is monitored under real time subquota management. KRSC in-river recreational harvest is managed by general season, daily bag limit, and possession limit regulations.

The daily bag and possession limits apply to both stocks within the same sub-area and time period.

No changes are proposed for the general KRSC opening and closing season dates, and bag, possession, and size limits.

Proposed Changes

The following changes to current regulations are proposed:

KRFC QUOTA MANAGEMENT: Seasons, Bag, and Possession Limits

For public notice requirements, a range of KRFC bag and possession limits are proposed until the 2015 Klamath Basin quota is adopted. As in previous years, no retention of adult KRFC is proposed for the following areas once the subquota has been met.

The proposed open seasons and range of bag and possession limits for KRFC salmon stocks are as follows:

1. Klamath River - August 15 to December 31
2. Trinity River - September 1 to December 31
3. Bag Limit - [0-4] Chinook salmon of which no more than [0-4] fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length.
4. Possession limit - [0-12] Chinook salmon of which [0-12] over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

SPIT AREA MANAGEMENT

Current regulations specify that the spit area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) closes to all fishing after 15 percent of the total adult KRFC quota has been taken downstream of the Highway 101 bridge.

In 2014, the Department also evaluated restrictive measures for the spit area which included a "no catch and release" regulation for Chinook salmon legally caught in the spit area to protect Chinook stocks from excessive catch and release mortality. The regulatory time frame did not allow for sufficient time to promulgate such a regulation change. The Department informed the Commission it would consider this change for the 2015 regulatory cycle.

The following options are being provided for Commission consideration:

Option 1: No catch and release fishing in spit area – Department Proposal

After internal discussion and Yurok Tribal coordination, the Department is proposing the following change to the 2015 fall Chinook spit area regulations:

All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.

This regulatory proposal does not preclude anglers from leaving the spit area and fishing other areas once their adult daily bag has been taken. Anglers may fish other areas outside of the spit to fill the grilse (Chinook salmon ≤ 22 inches) component of their daily bag limit. This regulation also **does not** preclude anglers from filling a daily bag composed entirely of grilse salmon while fishing the spit area.

Option 2: All Chinook salmon must be kept in spit area with Blue Creek closure – Yurok Tribe Proposal

The Yurok Tribe is proposing the following modifications to the Klamath River regulations in the spit area and on the main Klamath River below the confluence with Blue Creek:

- (1) No catch and release fishing allowed in the spit area to reduce pinniped predation on released fish, and
- (2) Conservation closure below the mouth of Blue Creek to reduce catch and release **mortality** in a thermal **refugia** area and protect late-fall Chinook holding prior to entering Blue Creek.

The first modification is to the spit area at the mouth of the Klamath River to allow no release of Chinook salmon, regardless of whether they are legally caught or foul hooked. This option provides an exception from the general snagging prohibitions in section 2.00. The second modification would add Blue Creek to the September 15 to December 31 stream mouth closures and add a new Klamath River main stem closure

from June 15 to September 14 from 500 feet above to ½ mile downstream around the mouth of Blue Creek.

Option 3: A possible combination of Options 1 and 2

The Commission may combine Option 1's prohibition on catch and release fishing in the spit area with Option 2's Blue Creek conservation closure:

- (1) All legally caught Chinook salmon must be retained. Once the adult Chinook component of the daily bag has been retained, the angler must cease fishing in the spit area.
- (2) Conservation closure below the mouth of Blue Creek to reduce catch and release **mortality** in a thermal **refugla** area and protect late-fall Chinook holding prior to entering Blue Creek.

ADDITIONAL PROPOSED CHANGES

The name of the road listed in subsection (b)(91.1)(B)(2) is proposed to be corrected from "Ishi Pishi Falls road" to "Ishi Pishi Road." Cross references are proposed to be corrected in subsection (b)(195) to reduce public confusion. Other changes are proposed for clarity and consistency.

Benefits of the Proposed Regulations

The benefits of the proposed regulations are in conformance with federal law, sustainable management of Klamath River Basin salmon resources, and promotion of businesses that rely on recreational salmon fishing in the Klamath River Basin.

The proposed regulations are neither inconsistent nor incompatible with existing State regulations. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (Sections 200, 202, 205, 315, and 316.5 of the Fish and Game Code). Commission staff has searched the California Code of Regulations and has found no other State regulations related to the recreational take of Chinook salmon in the Lower Klamath River Basin.

At the April 17, 2015 teleconference the Commission adopted the following Klamath Basin bag and possession limits, adult quota, and conservation measures:

- (1) **A daily bag limit of 3 Chinook salmon of which no more than 2 fish greater than 22 inches in length may be taken when the take of adults is allowed.**
- (2) **A possession limit of 9 Chinook salmon of which no more than 6 fish greater than 22 inches in length may be retained when the take of adults is allowed.**
- (3) **A basin quota of 14,133 adult Chinook salmon greater than 22 inches in length.**

- (4) A closure of the main stem Klamath River near the confluence of Blue Creek between June 15 and December 31. The main stem Klamath River will be closed to sport fishing from 500 feet upstream of the mouth of Blue Creek to ½ mile downstream from the mouth of Blue Creek from June 15 through September 14 and within 500 feet of the Blue Creek confluence from September 15 through December 31.**
- (5) A mandatory retention of all legally hooked and landed Chinook salmon in the spit area (mouth of the Klamath River). Additionally, once anglers have retained the adult component of the daily Chinook bag they must cease fishing in the spit area. Anglers may continue to fish other areas of the Klamath River after leaving the spit if they have not retained their daily bag limit.**

Sport fishing seasons for KRFC remain unchanged and are as follows:

- (1) Klamath River- August 15 through December 31.**
- (2) Trinity River- September 1 through December 31.**

The Basin quota, 14,133 adult KRFC, aligns with federal regulations which provide guidance on allocations between ocean sport and commercial fisheries, inland sport fisheries, and recognized tribal fisheries.

The Commission adopted non-substantive changes for clarity and consistency.

Attachment 4

**Attachment 1
Summary of Public Comments and Responses**

	Name of Commenter	Type/Date	Summary of Comments	Response
1	Jim Newton	Faxed letter received 10/8/14	Requests repeal of the regulation that prohibits filleting of salmonids until at a place of permanent residence (section 1.45).	Reject: Filleting of salmon in the field creates enforcement issues concerning threatened and endangered species in coastal waters including the Klamath River.
2	Xai Her	Email received 10/17/14	Recommends a regulation that only single point barbless hooks be used for salmon in both inland and saltwater.	Reject: The use of barbless hooks is already required when fishing in anadromous waters of the Klamath River system, and further requiring single point hooks will not measurably reduce hooking mortality. The portion of the recommendation regarding other inland waters and ocean waters is outside the scope of this rulemaking.
3	Thomas O'Rourke, Chairman Yurok Tribe	Letter c/o e-mail from Diane Bowers received 11/20/15	<p>a. Letter documenting Yurok Tribe proposals for Klamath river regulations including:</p> <p>b. All Fall Chinook caught in the spit area must be retained (no catch and release fishing of Fall Chinook regardless of whether the fish is legally taken). Once an angler's daily bag limit (regardless of whether it is an adult or jack) is obtained in the spit area, they must stop fishing for the day.</p>	<p>a. The Yurok Tribe's proposed conservation closure and a modified version of the Yurok Tribe's proposal for the spit area were included in the ISOR as potential options for the 2015 sport fishing season.</p> <p>b. Reject: The Commission adopted the Department alternative for the Klamath River mouth that prohibits catch and release fishing of Chinook salmon for all legally hooked fish. Once the adult component of the total daily bag limit has been retained, anglers must cease fishing in the spit area. The Department option was a compromise option to alleviate catch and release concerns while retaining anti- snagging regulations. The Yurok Tribe's proposal to require anglers to fully stop fishing for entire day unnecessarily reduces fishing opportunities in other river areas.</p>

			e. Suggests using a low flow or temperature closure for regulating the Blue Creek area as is in place for many of the other coastal streams.	e. See Response 6b.
29	Eileen Cooper	Verbal comment 04/17/15	a. Supports no catch and release fishing at all when river temperatures are high. b. Supports the Yurok Tribe's proposed catch and release regulations at spit and Blue creek area.	a. See Response 6b. b. See Responses 3b and 3c.
30	Ted Souza, Friends of Del Norte	Verbal comment 04/17/15	States that catch and release fishing is a problem. States that a study by Dr. Bruce Tufts, Queen's University, Canada, shows that 7 out of 10 fish die when out of water more than 30 seconds. States that while he has practiced catch and release fishing in the past, he now believes anglers should keep what they catch or not fish at all in order to protect the fishery.	Comments noted. The Department research does not support this comment.

Attachment 5

Regulatory Language

Subsection (b)(91.1) of Section 7.50 is amended to read:

(91.1) Anadromous Waters of the Klamath River Downstream of Iron Gate Dam (Lower Klamath River Basin). The regulations in this subsection apply only to waters of the Klamath River system which are accessible to anadromous salmonids. They do not apply to waters of the Klamath River which are inaccessible to anadromous salmon and trout, for example, portions of the Klamath River system upstream of Iron Gate Dam, portions of the Trinity River system upstream of Lewiston Dam, and the Shasta River and tributaries upstream of Dwinell Dam. Fishing in these waters is governed by the General Regulations for non-anadromous waters of the North Coast District (see Section 7.00(a)(4)).

(A) Hook and Weight Restrictions.

1. Only barbless hooks may be used. (For definitions regarding legal hook types, hook gaps and rigging see Chapter 2, Article 1, Section 2.10.)

2. During closures to the take of adult salmon, anglers shall not remove any adult Chinook salmon from the water by any means, such as by dragging the fish on shore or using a net.

(B) General Area Closures.

1. No fishing is allowed within 750 feet of any Department of Fish and Wildlife fish-counting weir.

2. No fishing is allowed from the Ishi Pishi Falls ~~road~~ Road bridge upstream to and including Ishi Pishi Falls from August 15 through December 31. EXCEPTION: members of the Karuk Indian Tribe listed on the current Karuk Tribal Roll may fish at Ishi Pishi Falls using hand-held dip nets.

3. No fishing is allowed from September 15 through December 31 in the Klamath River within 500 feet of the mouths of the Salmon, the Shasta and the Scott rivers and Blue Creek.

4. No fishing is allowed from June 15 through September 14 in the Klamath River from 500 feet above the mouth of Blue Creek to ½ mile downstream of the mouth of Blue Creek.

(C) Klamath River Basin Possession Limits.

1. Trout Possession Limits.

a. The brown trout possession limit is 10 brown trout.

b. The hatchery trout or hatchery steelhead possession limits are as follows:

(i) Klamath River - 4 hatchery trout or hatchery steelhead.

(ii) Trinity River - 4 hatchery trout or hatchery steelhead.

2. Chinook Salmon Possession Limits.

a. Klamath River downstream of the Highway 96 bridge at Weitchpec from January 1 to August 14 and the Trinity River downstream of the Old Lewiston Bridge to the confluence of the South Fork Trinity River from January 1 to ~~August 31.~~ August 31: 2 Chinook salmon.

~~(i) 2 Chinook salmon.~~

b. Klamath River from August 15 to December 31 and Trinity River from September 1 to ~~December 31.~~ December 31: 9 Chinook salmon. No more than 6 Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

~~(i) 9 Chinook salmon. No more than 3 Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.~~

(D) Klamath River Basin Chinook Salmon Quotas.

The Klamath River fall Chinook salmon take is regulated using quotas. Accounting of the tribal and non-tribal harvest is closely monitored from August 15 through December 31 each year. These quota areas are noted in subsection (b)(91.1)(E) with "Fall Run Quota" in the *Open Season and Special Regulations* column.

1. Quota for Entire Basin.

The ~~20142015~~ Klamath River Basin quota is ~~4,128-14,133~~ Klamath River fall Chinook salmon over

Regulatory Language

Subsection (b)(91.1) of Section 7.50 is amended to read:

(91.1) Anadromous Waters of the Klamath River Downstream of Iron Gate Dam (Lower Klamath River Basin). The regulations in this subsection apply only to waters of the Klamath River system which are accessible to anadromous salmonids. They do not apply to waters of the Klamath River which are inaccessible to anadromous salmon and trout, for example, portions of the Klamath River system upstream of Iron Gate Dam, portions of the Trinity River system upstream of Lewiston Dam, and the Shasta River and tributaries upstream of Dwinell Dam. Fishing in these waters is governed by the General Regulations for non-anadromous waters of the North Coast District (see Section 7.00(a)(4)).

(A) Hook and Weight Restrictions.

1. Only barbless hooks may be used. (For definitions regarding legal hook types, hook gaps and rigging see Chapter 2, Article 1, Section 2.10.)
2. During closures to the take of adult salmon, anglers shall not remove any adult Chinook salmon from the water by any means, such as by dragging the fish on shore or using a net.

(B) General Area Closures.

1. No fishing is allowed within 750 feet of any Department of Fish and Wildlife fish-counting weir.
2. No fishing is allowed from the Ishi Pishi Falls Road bridge upstream to and including Ishi Pishi Falls from August 15 through December 31. EXCEPTION: members of the Karuk Indian Tribe listed on the current Karuk Tribal Roll may fish at Ishi Pishi Falls using hand-held dip nets.
3. No fishing is allowed from September 15 through December 31 in the Klamath River within 500 feet of the mouths of the Salmon, the Shasta and the Scott rivers and Blue Creek.
4. No fishing is allowed from June 15 through September 14 in the Klamath River from 500 feet above the mouth of Blue Creek to 1/2 mile downstream of the mouth of Blue Creek.

(C) Klamath River Basin Possession Limits.

1. Trout Possession Limits.

- a. The brown trout possession limit is 10 brown trout.
- b. The hatchery trout or hatchery steelhead possession limits are as follows:
 - (i) Klamath River - 4 hatchery trout or hatchery steelhead.
 - (ii) Trinity River - 4 hatchery trout or hatchery steelhead.

2. Chinook Salmon Possession Limits.

- a. Klamath River downstream of the Highway 96 bridge at Weitchpec from January 1 to August 14 and the Trinity River downstream of the Old Lewiston Bridge to the confluence of the South Fork Trinity River from January 1 to August 31. August 31: 2 Chinook salmon.

~~(i) 2 Chinook salmon.~~

- b. Klamath River from August 15 to December 31 and Trinity River from September 1 to December 31: 9 Chinook salmon. No more than 6 Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.

~~(i) 9 Chinook salmon. No more than 3 Chinook salmon over 22 inches total length may be retained when the take of salmon over 22 inches total length is allowed.~~

(D) Klamath River Basin Chinook Salmon Quotas.

The Klamath River fall Chinook salmon take is regulated using quotas. Accounting of the tribal and non-tribal harvest is closely monitored from August 15 through December 31 each year. These quota areas are noted in subsection (b)(91.1)(E) with "Fall Run Quota" in the *Open Season and Special Regulations* column.

1. Quota for Entire Basin.

The ~~20142015~~ Klamath River Basin quota is ~~4,128~~ 14,133 Klamath River fall Chinook salmon over

22 inches total length. The department shall inform the commission, and the public via the news media, prior to any implementation of restrictions triggered by the quotas. (NOTE: A department status report on progress toward the quotas for the various river sections is updated weekly, and available at 1-800-564-6479.)

2. Subquota Percentages.

a. The subquota for the Klamath River upstream of the Highway 96 bridge at Weitchpec and the Trinity River is 50% of the total Klamath River Basin quota.

(i) The subquota for the Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec is 17% of the total Klamath River Basin quota.

(ii) The subquota for the Trinity River main stem downstream of the Old Lewiston Bridge to the Highway 299 West bridge at Cedar Flat is 16.5% of the total Klamath River Basin quota.

(iii) The subquota for the Trinity River main stem downstream of the Denny Road bridge at Hawkins Bar to the confluence with the Klamath River is 16.5% of the total Klamath River Basin quota.

b. The subquota for the Lower Klamath River downstream of the Highway 96 bridge at Weitchpec is 50% of the total Klamath River Basin quota.

(i) The Spit Area (within 100 yards of the channel through the sand spit formed at the Klamath River mouth) will close when 15% of the total Klamath River Basin quota is taken downstream of the Highway 101 bridge.

(E) Klamath River Basin Open Seasons and Bag Limits.

All anadromous waters of the Klamath River Basin are closed to all fishing for all year except those areas listed in the following table. Bag limits are for trout and Chinook salmon in combination unless otherwise specified.

Body of Water	Open Season and Special Regulations	Daily Bag Limit
1. Bogus Creek and tributaries.	Fourth Saturday in May through August 31. Only artificial lures with barbless hooks may be used.	2 hatchery trout or hatchery steelhead**
2. Klamath River main stem from 3,500 feet downstream of Iron Gate Dam to the mouth.		
a. Klamath River from 3,500 feet downstream of the Iron Gate Dam to the Highway 96 bridge at Weitchpec.	January 1 to August 14.	0 Chinook salmon 2 hatchery trout or hatchery steelhead**
	Fall Run Quota <u>7022,403</u> Chinook Salmon August 15 to December 31, <u>20142015</u> .	3 Chinook salmon - no more than <u>42</u> fish over 22 inches total length until subquota is met, then 0 fish over 22 inches total length. 2 hatchery

		trout or hatchery steelhead**
	Fall Run Quota Exception: Chinook salmon over 22 inches total length may be retained from 3,500 feet downstream of Iron Gate Dam to the Interstate 5 bridge when the department determines that the adult fall-run Chinook salmon spawning escapement at Iron Gate Hatchery exceeds 8,000 fish. Daily bag and possession limits specified for fall-run Chinook salmon apply during this exception.

Re: Lower Klamath River fishing regulations

Dear Commissioners:

The Yurok Tribe formally recommends modifications to the Lower Klamath River recreational fishery regulations. Yurok typically does not become involved with the management of State fisheries unless we consider an issue to be a conservation concern that affects the health of our fishery resource. We propose two modifications to the lower Klamath River regulations within the boundaries of the Yurok Reservation: 1) there should be no catch-and-release fishing allowed in the spit area, where the Klamath River flows through the sand bar to meet the ocean, due to high levels of pinniped predation upon released fish, and 2) we recommend adoption of a conservation closure at the confluence and immediately downstream of Blue Creek (approximately river mile 17) to minimize catch and release fishing for fish that are seeking thermal respite, and to protect late fall-run Chinook that are holding prior to entering Blue Creek.

As you may recall, we provided comments to the Commission during the February and April meetings last year (see attachments) regarding these proposed regulatory modifications, but learned that we were too late to affect change for the 2014 regulation process. Per recommendation of your staff, we are providing recommendations for consideration at your December 2014 meeting, with the hope that these proposed regulations will comprise at least one of the options for public consideration/comment as you move through your 2015 regulatory process.

Recommendation 1 *Catch and Release fishing in the spit-area*

Previous regulations have allowed catch-and-release fishing in the spit area that has resulted in unquantified, but substantial predation upon released fish by the numerous pinnipeds occupying this area. During some previous years, the most successful anglers have released dozens of fish within a given day.

We recommend the Commission adopt regulations requiring all fall Chinook caught within this area be retained, and that there be no catch and release fishing of fall Chinook. Once an

angler’s daily bag limit for Chinook (regardless of whether it is an adult or jack) is obtained, they must stop fishing for the day. We propose the following:

Body of Water	Open Season and Special Regulations	Daily Bag Limit
Klamath River Spit (within 100 yards of the channel through the sand spit formed at the Klamath River mouth)	All Chinook salmon (regardless of size) captured must be harvested (i.e. no releasing Chinook salmon). Once the daily bag limit for Chinook is obtained, fishing must stop for the day.	“x” Chinook salmon (regardless of size)

Such a regulation would allow the fishery to continue—which is important for shore-based anglers as well as the local economy—while minimizing excessive mortality associated with releasing fish in the presence of sea lions, such predation is a problem that undeniably needs to be addressed and we hope to work with the Commission in doing so.

Yurok are well aware that many of the fish caught in this fishery are not legally hooked, but snagged outside of the mouth. I appreciate the concern this causes for some regarding the retention of fish that are snagged, because of the perceived precedent this may have to other areas of the state where snagging occurs. However, it’s important to realize the uniqueness of this fishery given the presence of pinnipeds preying upon released fish. It is also important to realize that this fishery takes place within the boundaries of the Yurok Reservation, a sovereign nation and Co-Manager of the resource. The wasting of fish is contrary to our culture and a violation of our own Fishing Rights Ordinance.

Recommendation 2 *Blue Creek Conservation Closure*

We recommended the Commission adopt a conservation closure at the mouth of Blue Creek. This conservation closure would serve two purposes: 1) it would provide thermal refugia—free of catch-and-release fishing—for adult salmon (spring and fall Chinook) and summer-run steelhead that migrate up the Klamath River during the summer months (mid-June through mid-September) when ambient water temperatures are excessively warm, and 2) during mid-September through November, it would protect late-run fall chinook that are staging to enter Blue Creek, similar to the closures that are currently in place at the mouths of the Salmon, Scott, and Shasta Rivers.

During the summer months, especially during years of low flow, water temperatures in the mainstem Klamath River often reach 73 - 79° F, well above the optimal migration range and near the acute lethal limit for adult Chinook salmon (Bell 1990, Strange 2010¹). At these times, adult salmon and steelhead will stop migrating and hold in the cold water effluent

¹ Bell, M.C. 1991. Fisheries Handbook of Engineering Requirements and Biological Criteria. Strange, J.S. 2010. *Upper Thermal Limits to Migration in Adult Chinook Salmon: Evidence from the Klamath River Basin*. Transactions of the American Fisheries Society 139: 1091 – 1108.

from the mouth of Blue Creek to approximately half mile downstream. During many low flow years, such as we just experienced in 2014, this area holds up to several thousand adult salmonids (steelhead and Chinook), that are escaping the intolerably warm Klamath River. Video footage of a 100 meter stretch of the 2,000 meters these fish in during August 2014 is available at: <https://www.youtube.com/watch?v=jpX6lCJZeuA>

We believe fish that make it to the thermal refugia should be allowed respite. It is inappropriate to harass (via hook and line) these fish at a time when they are so physiologically vulnerable. Furthermore, often these fish (steelhead and/or salmon) will be hooked while holding in the thermal refugia, then played for an extended period of time in the ambient river conditions that are several degrees warmer (sometimes at lethal levels), and then eventually released. Forcing fish to go through such dramatic temperature changes, while putting them through excessive stress, is contrary to fish culture practices associated with rearing and/or releasing fish, and undoubtedly results in excessive stress and mortality. We recommend that this thermal conservation closure extend from the mouth of Blue Creek to half mile downstream of the wetted channel of Blue Creek.

The second reason for the conservation closure at the mouth of Blue Creek is to protect the genetically unique adult late-fall run Chinook salmon that return to spawn from mid-October through December. These fish are known to hold in the confluence pool in the Klamath River until substantial rains stimulate their migration up Blue Creek. Blue Creek late-fall run Chinook are the stronghold of the Lower Klamath and likely the source population for other Lower Klamath Tributaries. We request that fish holding in this area be given protection from harvest pressure similar to what is given to Chinook returning to the Salmon, Scott, and Shasta Rivers. California regulations currently provide the protection for these stocks:

“No fishing is allowed from September 15 through December 31 in the Klamath River within 500 feet of the mouths of the Salmon, the Shasta and the Scott rivers.” We recommend adding Blue Creek to this provision.

In summary, we recommend the Commission allow the above-mentioned regulatory changes be considered during the upcoming public hearing process for Klamath River sport fishing regulations, and we hope this process results in the adoption of such regulations to conserve the resource that is so important to our people. If you have any questions regarding this letter, or would like to schedule a meeting with our Council, please don't hesitate to contact myself or Dave Hillemeier (Fisheries Program Manager) at the address in the letterhead.

Finally, I would like to reiterate my invitation to the Commission We would welcome the Commission to visit the Yurok Reservation and meet with our Tribal Council. Such a meeting would allow us to discuss issues of mutual concern in regard to the management of the Klamath River fishery and provide you an opportunity to visit the Lower Klamath River via a boat ride if your schedules allow.

Yurok Tribe – Klamath River fishing regulations, November 19 2014

Sincerely,

A handwritten signature in blue ink, appearing to be 'T. O'Rourke', written in a cursive style.

Re: Klamath River fishing regulations

Dear Commissioners:

I am writing to express concern with proposed sport fishing regulations for the "spit area" in the Lower Klamath River, which is located within the boundaries of the Yurok Reservation. While we support the continuation of the spit fishery (i.e. we oppose the closure of the spit fishery, as proposed in Option #3 that is being considered by the Commission), we believe it is essential that catch and release fishing in this area be prohibited, to minimize the excessive predation upon released fish by marine mammals. We request that the Commission adopt regulations prohibiting catch and release fishing in this area for the upcoming 2014 season.

We typically do not comment on the management of other fisheries, unless we consider an issue to be a conservation concern. The unquantified, but obviously excessive loss of caught and released fish to marine mammal predation in the spit area is a conservation concern. This problem was most pronounced last year, when fish spent an unusual amount of time within the spit area, resulting in some anglers catching and releasing several dozen fish per day. While catch and release fishing in the presence of marine mammals has been a concern of the Tribe for the past couple decades, as noted in a white paper we presented to the Commission in 1996¹, the problem escalated far beyond acceptable levels during 2013.

As noted in the testimony and handout (attached) that was submitted to you on behalf of the Tribe on February 5, 2014, we are concerned that excessive mortality from marine mammal predation is associated with catch and release fishing in this area. Therefore, we recommend that all fish caught in this area be retained, and that catch and release fishing be prohibited. When our Fisheries Program Manager, Dave Hillemeier, recommended such a regulation at

¹ The following quote is from an issues paper the Yurok Tribe submitted to the Fish and Game Commission on March 6, 1996: "In addition to hooking mortality, a major concern the Yurok Tribe has with the catch and release fishery in the lower river is the mortality associated with sea lion and seal predation after fish are released. Over 300 seals and several sea lions were seen by Yurok Tribal net harvest monitors in the estuary while fish were being caught and released by sport fishermen.."

Yurok Tribe Klamath River fishing regulations

the February 5th Commission meeting, it was noted by the Commission, and their attorneys, that such a regulation is within the bounds of the three options currently being considered by the Commission; i.e. such a regulation could be adopted for the 2014 fall season. At a subsequent meeting in Eureka, the Commission's Executive Director noted that the Commission may have been incorrect, however after the meeting he did acknowledge that such a regulation may be possible, but challenging, to implement this year. Our recommendation is that the Commission adopt language similar to the following for 2014 season:

Body of Water	Open Season and Special Regulations	Daily Bag Limit
Klamath River Spit (within 100 yards of the channel through the sand spit formed at the Klamath River mouth)	All Chinook salmon (regardless of size) captured must be harvested (i.e. no releasing Chinook salmon). Once the daily bag limit for Chinook is obtained, fishing must stop for the day.	"x" Chinook salmon (regardless of size)

Such a regulation would allow the fishery to continue, which is important to shore anglers as well as the local economy, while minimizing the excessive mortality associated with releasing fish in the presence of sea lions; a problem that undeniably needs to be addressed.

We had also recommended at your February 5th meeting (see attachment) that the Commission adopt a conservation closure at the mouth of Blue Creek, to provide thermal refuge for migrating adult salmon and steelhead, as well as to protect staging late-fall run Chinook salmon returning to Blue Creek. We learned at this meeting that we were making this proposal too late in your process for consideration in the 2014 regulations, and it did not fall within the bounds of other options already being considered. Therefore, we look forward to discussing this issue with the Commission as you are crafting regulations for 2015.

Finally, I would like to take this opportunity to invite the Commission to visit the Yurok Reservation to meet with the Yurok Tribal Council. Such a meeting would allow us to discuss issues of mutual concern in regard to the management of the Klamath River fishery. We would also welcome you for a boat ride on the Lower Klamath River to experience first-hand the beauty of our land, the fishery in progress, the spit area, and the area near Blue Creek where we are proposing a conservation closure. If you have any questions regarding this letter, or would like to schedule a meeting with our Council, please don't hesitate to contact myself or Dave Hillemeier (Fisheries Program Manager) at the address in the letterhead.

Sincerely,

Thomas O'Rourke, Chairman

Yurok Tribal Comments to the California Fish and Game Commission regarding Lower Klamath River Recreational Fishing Regulations

February 5, 2014

The following recommendations are submitted on behalf of the Yurok Tribe in regard recreational fishing regulations for the Lower Klamath River. We normally do not make recommendations regarding the management of other fisheries, unless there is a conservation concern, which is the basis for these recommendations. We recommend that catch and release fishing in the estuary of the Klamath River be prohibited due to the excessive predation by marine mammals on released fish. We also request that a conservation closure be implemented within the cold water refugia at the confluence and immediately downstream of Blue Creek (river mile 17), to provide thermal refuge for adult salmon and steelhead migrating up the Klamath River when ambient river temperatures are inhospitable; we also recommend a closure during late-September through November, when late-fall chinook are staging to enter Blue Creek, similar to the closures you currently have in place at the mouths of the Salmon, Scott, and Shasta Rivers.

The Yurok reservation is located on the Lower 44 miles of the Klamath River. The fishery resource of the Klamath River is integral to the Yurok way of life for subsistence, cultural, and economic purposes. We go to great lengths to manage our fishery for future generations and request that you do the same when managing Klamath fisheries. Both of these proposed conservation measures we are recommending are for in-river sport fishing that occurs within the boundaries of the Yurok Reservation and is managed under the authority of the California Fish and Wildlife Service.

Catch and Release Fishing in the Estuary of the Klamath River

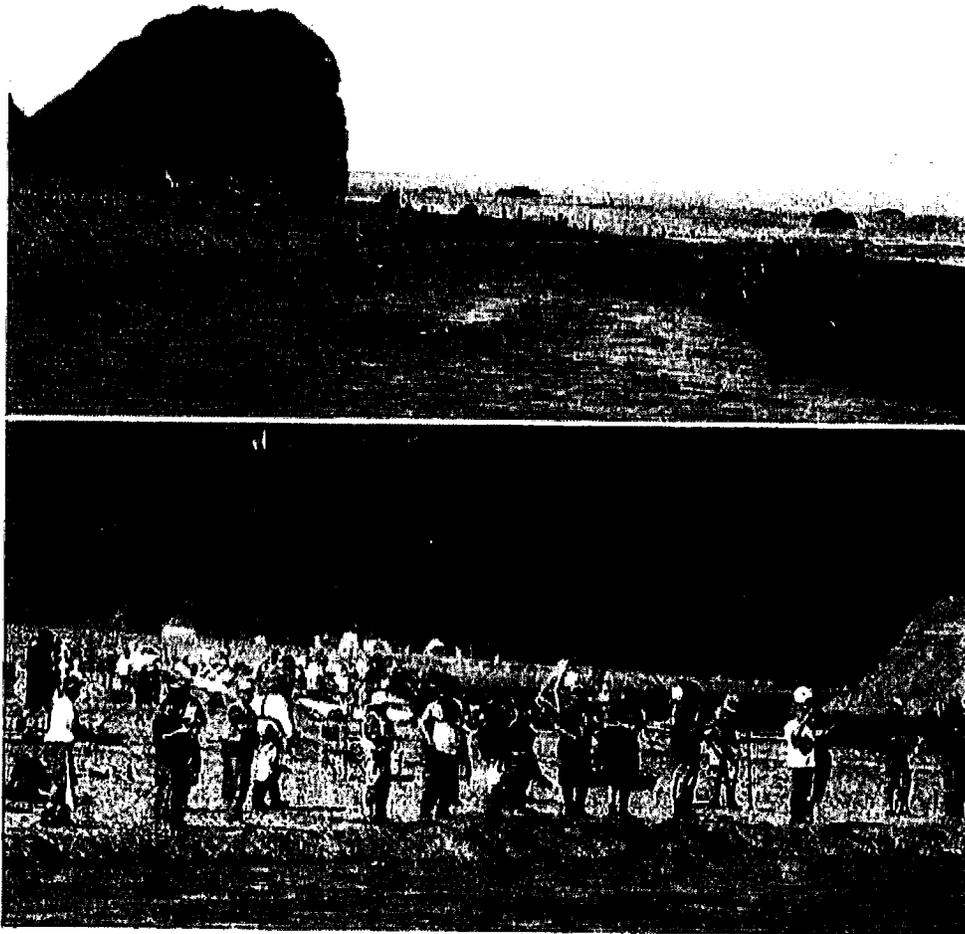

As you may be aware, hook and line fishing at the mouth of the Klamath river, in what is known as the "chute" (where the river meets the ocean), was extraordinary during the late summer of 2013. Due to apparent water quality conditions in the estuary, and the long chute that formed along the spit, the sand bar that separates the river from the ocean, adult salmon spent extended periods of time migrating up and down the chute, rather than entering the estuary. As a result, extremely large numbers of fish were caught by angling (typically by "lining" - a type of "snagging"). There were several problems that arose from this relatively unique situation, such as fish being buried and left in the sand, non-tribal anglers selling fish to Tribal members so they could then be sold in our commercial fishery (against the regulations for both fisheries); however, the worst problem from our perspective was one that has been around for years, fish being caught and released to the waiting sea lions and seals.

While fishermen are notorious for "fish stories", embellishments weren't necessary during the 2013 chute fishery, as catches were off the charts. Some anglers literally caught dozens of fish/day (some more than 60), for many days/weeks during the season. While such fishing is typically considered good, the chute fishery last year was a major conservation concern because most of these fish were released, in an exhausted condition, to a gauntlet of predatory seals and sea lions. Often times sport Fishers would catch their limit of three adults, and then continue fishing under the pretense of fishing for a jack

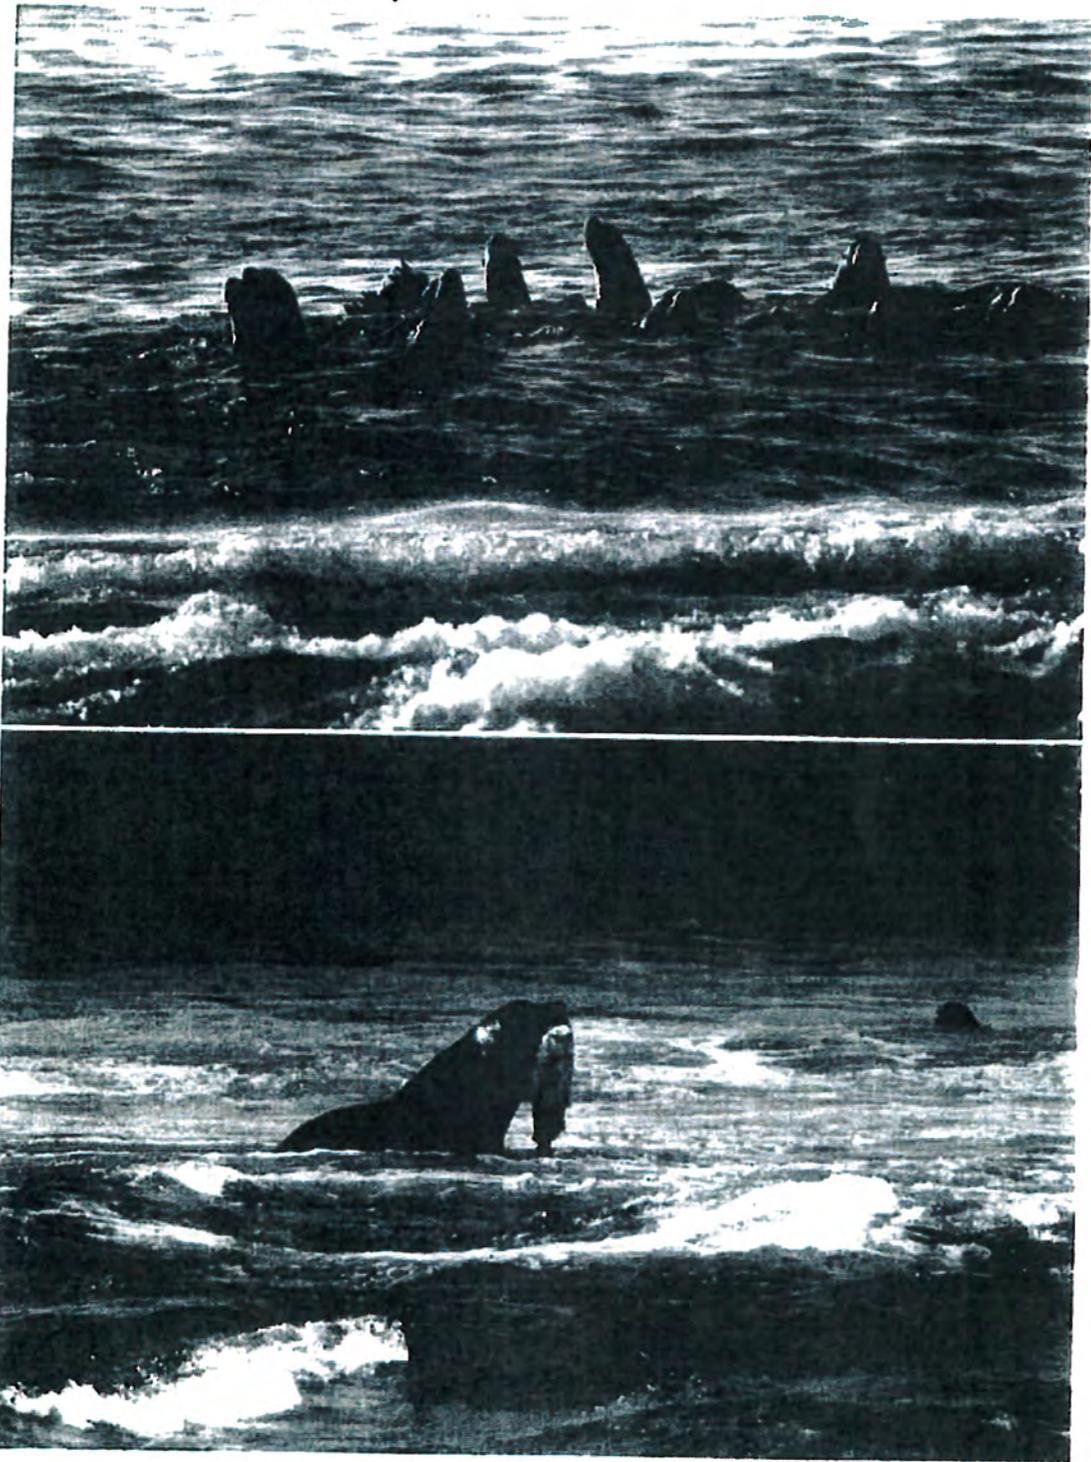

(or steelhead). All the fish that were caught while fishing for this jack had to be released, resulting in many exhausted fish being eaten by the seals and sea lions lined up near the bottom of the chute/surf interface.

We recommend, as we did back in 1996 to the Fish and Game Commission, that catch and release fishing not be allowed in the presence of marine mammals. While the problem was exacerbated in 2013 due to the relatively large number of fish that were caught, it is a problem any time that catch and release fishing occurs in the presence of pinnipeds. Any fish that are caught in the estuary should be harvested, not released to be eaten by sea lions/seals. We recommend that only "catch and keep" fishing occur in the estuary, or at least in the lower portion of the estuary (e.g. downstream of the Requa boat ramp).

Figures 1 and 2. Pictures of the fishery in the Klamath River "chute" during late summer, 2013 (photos courtesy of Thomas Dunklin).

Figures 3 and 4. Pinnipeds at the lower end of the Klamath River "chute" during the 2013 fishery (photos courtesy of Thomas Dunklin).

Blue Creek Refugia

The Yurok Tribe recommends the Fish and Game Commission adopt an additional conservation closure at the confluence and immediately downstream of Blue Creek (river mile 17). This conservation closure would serve two purposes: 1) during the summer months (mid-June through mid-September) it would provide thermal refugia for adult salmon (spring and fall Chinook) and steelhead that migrate up the Klamath River when ambient water temperatures are excessively warm, and 2) during mid-September through November, it would protect late-run fall chinook that are staging to enter Blue Creek during the fall months, similar to the closures that are currently in place at the mouths of the Salmon, Scott, and Shasta Rivers.

During the summer months, especially during years of low flow, water temperatures in the mainstem Klamath River often reach 73 - 79° F (Figure 5 – Yurok Tribal Fisheries Program data), well above the optimal migration range and near the acute lethal limit for adult Chinook salmon (Bell 1990, Strange 2010¹). During these times, adult salmon and steelhead will stop migrating and hold in the cold water effluent from the mouth of Blue Creek to approximately ½ mile downstream, including “Blue Hole” which is along the bedrock outcropping just downstream of the confluence (Figure 7). During many low flow years, this area holds several hundred, up to a couple thousand, adult salmonids (steelhead and Chinook), that are escaping the intolerably warm Klamath River. These fish are basically on thermal life support.

We believe fish that make it to the thermal refugia should be allowed respite. It is inappropriate to harass (via hook and line) these fish at a time when they are so physiologically vulnerable. Furthermore, often these fish (steelhead and/or salmon) will be hooked while holding in the thermal refugia, but then played for an extended period of time in the ambient river conditions that are several degrees warmer (sometimes at lethal levels) to be eventually released. Forcing fish to go through such dramatic temperature changes, while putting them through excessive stress, is contrary to fish culture practices associated with rearing and/or releasing fish, and undoubtedly results in excessive mortality. We recommend that this thermal conservation closure extend from the mouth of Blue Creek to ½ mile downstream of the wetted channel of Blue Creek, the area where we’ve detected thermal refugia.

The second reason for the conservation closure at the mouth of Blue Creek is to protect the genetically unique adult late-fall run Chinook salmon that return to spawn from late October through December. These fish are known to hold in the confluence pool in the Klamath River until substantial rains stimulate their migration up Blue Creek. Blue Creek late-fall run Chinook are the stronghold of the Lower Klamath and likely the source population for other Lower Klamath Tributaries.

Blue Creek and other Lower Klamath (downstream of the Trinity River) late-fall run Chinook are genetically unique from other Klamath Basin stocks. The Klamath Basin chinook population upstream of

Strange, J.S. 2010. *Upper Thermal Limits to Migration in Adult Chinook Salmon: Evidence from the Klamath River Basin*. Transactions of the American Fisheries Society 139: 1091 – 1108.

the confluence of the Klamath and Trinity Rivers is part of the Upper Klamath-Trinity ESU, while the Lower Klamath River Chinook population, comprised primarily of fish from Blue Creek, is part of the California Coastal Chinook Salmon ESU. We request that fish holding in this area be given protection from harvest pressure similar to what is given to Chinook returning to the Salmon, Scott, and Shasta Rivers. California regulations currently provide the following protection for these stocks:

“No fishing is allowed from September 15 through December 31 in the Klamath River within 500 feet of the mouths of the Salmon, the Shasta and the Scott rivers.”

Rep. Jared Huffman insists federal agencies act to prevent Klamath River fish kill

Aug 3, 2015 | Press Release

Huffman: "The U.S. Bureau of Reclamation must preserve cold water in Trinity Lake to prevent a repeat of the tragic 2002 salmon run."

WASHINGTON—Congressman Jared Huffman, D-San Rafael, has [called on](#) the U.S. Department of the Interior to act quickly to prevent a repeat of a massive fish kill on the lower Klamath River as extreme drought conditions threaten struggling salmon.

The deadly parasite that killed up to 68,000 salmon in 2002, commonly known as ich, is infecting this year's run of salmon as they try to survive hot, warm water by crowding into the lower Klamath tributary Blue Creek. The largest portion of the fall run of salmon is likely to begin within the next two or three weeks, and could drastically increase crowding and the spread of the disease.

"I have asked Secretary Sally Jewell to work closely with the Yurok and Hoopa tribes and Humboldt County on a plan to release additional water from the Trinity River, which will boost flows on the Klamath," Huffman said. **"The U.S. Bureau of Reclamation must preserve cold water in Trinity Lake to**

prevent a repeat of the tragic 2002 salmon run disaster.”

The 2002 fish kill caused severe damage to tribal trust resources and commercial and sport fisheries for years to come, undermining the regional economy.

In a letter to Secretary Jewell, Huffman asked for up-to-date information on water diversions, temperature, and the incidence of disease on the Klamath and Trinity rivers. He also asked that the bureau minimize any additional export of water from Trinity Lake and to reexamine its future operations on the rivers in light of the unprecedented California drought. Huffman also asked that Reclamation draw on Humboldt County’s contractual right to 50,000 acre feet of water from the Trinity River as well as additional flows the tribes, county and agencies have requested to improve conditions on the Klamath.

“Humboldt County’s allocation of 50,000 acre feet should be used to protect the fisheries our region depends on,” said Humboldt County Fifth District Supervisor Ryan Sundberg. **“We hope the Interior Department recognizes this as an available resource and used that and other sources of water to avoid another horrible fish kill this year.”**

“We take this threat to our fish very seriously, and we’re looking at every option to protect our fish,” said Thomas P. O’Rourke, Chairman of the Yurok Tribe. **“We don’t want to go through another catastrophe like the fish kill in 2002, and we will do anything we can to avoid that outcome this year.”**

“The Hoopa Valley Tribe and North Coast communities remain concerned about the health of Klamath and Trinity rivers,” said Hoopa Valley Tribe Fisheries Director Mike Orcutt. **“We hope and pray that the Interior Department will take appropriate actions to prevent a fish kill this year.”**

Blue Creek fishing closure: Parties air their grievances

By [Laura Jo Welter, The Triplicate](#) July 16, 2015 03:34 pm

Yurok Tribe hosts public forum to discuss recent disagreements about Blue Creek

Another dry year has the lower Klamath River crawling with tepid water and in low supply, putting its fish population in a vulnerable position — this is an issue that should be considered when making fishing policy decisions, people generally agree, but they don't agree on how the matter should be addressed.

The cooler water from the mouth of Blue Creek enters warmer mainstem Klamath, providing thermal refugia for many fish. Courtesy Dave Jensen

The Yurok Tribe hosted a public forum in Klamath on Monday evening to discuss these differences of opinion following the California Fish and Game Commission's controversial decision to close the Blue Creek-Klamath confluence to sportfishing, beginning last month. It was a meeting well attended by fishing guides, tribal members, public officials and environmentalists.

"The process"

Fishers and Del Norte County supervisors criticized the commission for closing the Blue Creek confluence without due notice to make complaints. By the time supervisors Chris Howard and Gerry Hemmingsen marched their board's grievances to a June 10 Fish and Game Commission meeting in Mammoth Lakes, the decision had already been made to establish a no-fishing buffer zone near the mouth of Blue Creek, between a half mile downstream of the creek to 500 feet above it until mid-September. After that, until the end of the year, the restricted area will be reduced to 500 feet above and below.

Hemmingsen maintained Monday that in addition to the potential impacts on the county's economy if guides aren't able to pull out fish where they reside, he also objects to "the process" that led to the closure.

"This was kind of a push-through deal," he said.

In June, the commission advised the Board of Supervisors to follow pertinent issues more closely to avoid being surprised by policy changes. On Monday, Friends of Del Norte Don Gillespie called out the Board of Supervisors for spending taxpayer money on a too-late, 10-hour trek to Mammoth Lakes, when they could have spoken up earlier. Hemmingsen told the Triplicate last month, however, that the supervisors had written letters to the commission on the issue without hearing a response.

Commissioner Jacque Hostler-Carmesin, of McKinleyville, acknowledged that keeping track of Fish and Game's upcoming decisions is a considerable task.

"It's very difficult if you don't keep up with the rule-making calendar that comes out in December," she said,

adding that she only has three days to read 2,000–3,000 pages pertaining to the meeting's agenda, a feat she said was impossible.

Tribal officials were heard by the commission, however, which took their sportfishing regulation recommendations into consideration this year.

Supporting science

Executive Director Troy Fletcher, who facilitated Monday's meeting, said the Yurok Tribe has been striving to address the Klamath's dwindling fishery for years now, and the closure at Blue Creek is, in part, a result of that.

Having recommended to the Fish and Game Commission a policy that disallows catch and release fishing at the mouth of Blue Creek as well as at the mouth of the Klamath, the commission opted to close the creek's confluence completely, since the state requires that all wild steelhead that are caught be released.

It's well documented that anadromous fish don't take kindly to warm water, and this was the basis for the tribe's recommendation.

Throng of cold-water fish congregate in the thermal refugia at the mouth of Blue Creek, the first cool-water haven salmonids meet, some 17 miles up the main stem, after heading inland from the chilly Pacific Ocean.

That makes for prime fishing at this spot, particularly in exceptionally hot and dry years, and the fact that it's an important refuge for fish is indisputable, Yurok Fisheries Program Manager Dave Hillemeier addressed the group.

"You know that because you know where the fish are," he said.

But once the fish are dragged on a hook into the warmer water, before being released, their chance of survival lessens with every minute of exposure, their mortality rate increasing as temperatures climb above 20 degrees Centigrade, Hillemeier said, citing a 1995 Trinity River study.

Recent main stem temperatures have been hovering around 23.5 degrees centigrade until last week's thunderstorms cooled the river some, Hillemeier said.

Mike Coopman, of Mike Coopman's Guide Service, said he appreciated the open dialogue at the meeting, but he still wanted to see specific numbers pertaining to the mortalities at Blue Creek. It's possible the stress the fish suffered when hooked could be alleviated, he suggested, if they were released in the cooler water.

"I'm going to tell you, the mortality rate is not what people were projecting — I can see the bottom of that river just like anybody else. I landed 75 fish a day in my boat alone at Blue Creek last year," Mick Thomas of Lunker Fish Trips attested. "The whole bottom of the river would be lined with fish.

Fisheries biologist Terry Roelofs, a professor emeritus at Humboldt State University, told the Triplicate that the only reason the fish are hunkered down in Blue Creek like that, and seemingly for the picking, is precisely because of the dire conditions of the low-flowing Klamath.

With virtually no snow in the Trinity Alps or the Marble Mountains this winter, Klamath's exceedingly low flows — lower even than they were in 2002, when the Klamath saw the largest fish kill on record — have officials bracing for another die-off.

"That makes perfect sense" that the commission would opt to protect the fish's singular stronghold, Roelofs said, by restricting the fishing there — the closure was warranted years ago.

“The cold water isn’t even flowing at the surface, but through the rocks at Blue Creek. And when the Klamath is almost lethally hot, hundreds and hundreds of fish are packed in there,” Roelofs said.

When fish are crowded at such high concentrations and for extended periods of time, Hellemeier pointed out, the conditions are ripe for the parasite Ich to incubate. An Ich infestation is responsible for the killing of over 68,000 salmon in 2002. By the time Ich is detected, the four days it takes for a water release to reach the lower river is too late to prevent a die-off.

Chinook salmon and other anadromous fish hang out by the thousands at the mouth of Blue Creek, making the area both an attractive fishing hole and an important area to conserve.

Courtesy Barrie Kovish

“It’s not our doing”

Tribal member James Dunlap lamented that inflexible policies don’t address the shifting problems at hand, though in the meantime they manage to affect the livelihood of people who rely on the fisheries for income.

“You’re trying to curtail problems with abusers and problems in our fisheries as well with a crapload of laws, but (the abusers are) not here, and they’re not going to follow the policies anyway. It is going to hurt the guys that do follow the rules,” Dunlap said.

Margaret Carlson lives on the river, near the confluence with Blue Creek. She said she had won fishing rights in 1978, along with the Yurok Tribe, and she wasn’t about to let them go.

“I’m getting too old to fish, but I will catch my catch. I will fill my smoke house, and I will see to it that my children are protected because I am an organized tribe. I organized before the Yurok ever was a tribe. And that Blue Creek there, it belongs to us, and it is our prayer ground,” she announced with authority. “I don’t like to see the fish being depleted, but it’s not our doing, and they’re not stopping the people that are farming ahead of us that are poisoning the water.”

Margaret’s grandson Pergish Carlson, of Blue Creek Guide Service, echoed Mick Thomas’ sentiment when he described diving in Blue Creek, and swimming with 500 salmon. He said he was the only Yurok living on tribal land with a guide service, and he did not intend to stop fishing and lose his way of life, though he’d already seen a loss in revenue.

Hearing all of these comments, Commissioner Hostler-Carmesin assured the group that the Fish and Game Commission was not planning an indefinite closure at Blue Creek, as fishing guides feared. It would be reassessed again in the coming year, taking the public’s remarks into consideration.

In the meantime, Yurok Tribe officials are agreeable to more studies that would measure the population of fish hiding out in the cool waters trickling from Blue Creek and the stressors that impact them, which may result in better informed policy decisions in the future.

Regular meetings, involving fishing guides, tribal members and county officials were suggested, too, as a means to keep people in the know, and ensure that everybody has a chance to be heard.

RE: Lower Klamath River Fishing Regulations – Blue Creek Closure

Dear Executive Director Mastrup:

On behalf of the Humboldt County Board of Supervisors, I am writing to express our concern with the lack of communication and consequences of closures related to sports fishing at the mouth of the Klamath River and Blue Creek, tributary to the Klamath River.

The proposed amendments to Subsections 7.50(b)(91.1) and (b)(195), Title 14, CCR related to the Klamath River sports fishery closure were hastily made without full consideration to the economic impacts within Humboldt County and our neighbor Del Norte County. Additionally, as supported by the California Department of Fish and Wildlife during reports given to the Commission on February 12, 2015, that science should have been explored to support the decision.

While local input was included for consideration, we feel that they were ignored and the closure of Blue Creek was not fully vetted with sport fishery stakeholders and small businesses that rely on this fishery to support 50% of their yearly revenue. The closure does not just impact fishing guides, but rather a whole host of traveling public that spends the majority of their travel budget on food, lodging and transportation, directly affecting the regional economy.

At a minimum, run timing and species specific impacts affected by this closure should have been considered. As currently suggested by proponents of the closure, do Blue Creek Chinook salmon hold at Blue Creek during this time of year or are these Chinook migrating further up the Klamath? The period impacted traditionally only impacted summer steelhead runs, which guides target at the mouth of Blue Creek, not Chinook salmon. Is there the general belief that Chinook Salmon populations on the Klamath River are in trouble? It is my understanding based on quota's set over the last five (5) years that the Klamath Chinook fishery has been robust. There has been no discussion as to how steelhead fishing fits into any of the proposed closures. As of now, the closure has tied all our hands, keeping fisheries biologists from collecting vitally important information which could help answer some of these questions.

Humboldt County wants to see our vital resources protected. We rely on our fisheries both off and on shore, on the Smith and Klamath Rivers to support our tourism driven economy, it is critical that we work together to insure all aspects of these decisions are considered carefully before we close off resources that affect our economy. As there are many questions left unanswered concerning a population of Chinook that is currently not considered threatened, we would strongly recommend the Commission reconsider the Blue Creek Conservation Closure and the economic impacts to small businesses in our region.

While we understand that the decision has been made for this season, and even if corrective action were taken today, we respectfully request that the Commission reconsider their decision and commit to removing the closure next year at the mouth of Blue Creek so the proper studies requested by the Yurok Tribe can be initiated to form the foundation for decision making processes.

Sincerely,

A handwritten signature in blue ink that reads "Estelle Fennell". The signature is written in a cursive, flowing style.

Estelle Fennell, Chair
Humboldt County Board of Supervisors

**FISH AND GAME COMMISSION
STATEMENT OF EMERGENCY ACTION
FOR RE-ADOPTION OF EMERGENCY REGULATIONS**

Emergency Action to Re-adopt Section 8.01, Title 14, CCR,
Re: Fisheries at Risk

I. Request for Approval of Re-adoption of Emergency Regulations

In response to the continued extreme drought conditions, the Department of Fish and Wildlife (Department) is requesting that the Fish and Game Commission (Commission) extend the Department's authority set forth in Section 8.01, Title 14 of the California Code of Regulations, to temporarily close fisheries that are experiencing rapidly degrading environmental conditions within waters of the state. The Department requests that the Commission readopt the emergency regulations that went into effect on July 2, 2015 for an additional period of 90 days while a Certificate of Compliance rulemaking is under consideration.

II. Emergency Regulation in Effect to Date

On January 17, 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency to exist in California due to severe drought conditions. As part of the declaration, the Governor ordered the Department to work with the Commission, using the best available science, to determine whether restricting fishing in certain areas would become necessary and prudent as drought conditions persist.

Over the next several months, environmental conditions resulting from the drought requires temporary restrictions on fishing on parts of four rivers to protect fish populations and sustain future opportunity. The Department and the Commission determined that another approach was needed to give the Department more efficient tools to provide quicker response to deteriorating water quality and quantity conditions in California's waters. As a result, on June 11, 2015, the Commission adopted emergency regulations which established a process to temporarily close fisheries experiencing degraded environmental conditions that may affect fish populations or their habitat within waters of the state. The criteria set forth in these regulations are intended to ensure that fisheries are protected under critical conditions stemming from the drought.

Since adoption of the emergency regulations the Department has implemented one emergency fishing closure on state waters, of the lower Merced River, on August 18, 2015. The Department used the criteria established in subsection (b) of Section 8.01 to determine that a closure was warranted.

Following protocol, the Department held a public meeting in Merced prior to the fishing closure. In addition, the Department provided the Commission the

biological data used to justify the closure and made the data available to the public on the Department's Emergency Fishing Closure webpage. The Department and Commission are currently working together to formulate a regular rulemaking proposal that will refine the approach and associated language based on experience and feedback from the public, and with revisions to increase the efficacy of this emergency action.

III. Statement of Emergency

The hydrological conditions in 2015 deteriorated from the record low 2014 conditions. The Department of Fish and Wildlife (Department) continues to evaluate and manage the changing impacts of drought on threatened and endangered species and species of special concern, and to develop contingency plans for state Wildlife Areas and Ecological Reserves to manage reduced water resources in the public interest.

Statewide water quality and quantity in many systems is likely to be inadequate to support fisheries until significant and sustained rain and snow accumulate, resulting in impeded passage of spawning fish, increased vulnerability to mortality from predation and physiological stress, and increased angling harvest and/or hooking mortality. Furthermore, survival of eggs and juvenile fish in these systems over the coming months is expected to be extremely low. The historically low water conditions will continue to concentrate coldwater fish populations into shrinking pools of cold water habitat making them easy prey for illegal angling methods such as snagging, increased hooking mortality due to legal catch and release, over-harvest, as well as other human-related disturbances within their freshwater habitat. When coupled with drought-related environmental stressors, such as high water temperature, low dissolved oxygen, and severely reduced suitable habitat, these stressors can seriously affect reproductive success and survival rates.

Since 2014, the Department has worked with the Commission using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist. The Department and Commission have determined that a temporary approach is needed to give the Department effective tools to respond more rapidly to deteriorating water quality and quantity conditions in California's waters for 2015 and early 2016.

V. Re-adoption Criteria

1) Same or Substantially Equivalent

Pursuant to Government Code Section 11346.1(h), the text of a re-adopted regulation must be the "same or substantially equivalent" to the text of the original emergency regulation. The proposed language for the re-adopted

regulatory amendment is substantially the same as the language of the original emergency regulation. The new rulemaking will seek to adjust the following:

- A consecutive 2-day exposure for dissolved oxygen (DO) levels addresses natural variability and risk for juvenile and early life stages of fish
- The 50/500 rule addresses the effects on both the localized level for smaller sub-populations and larger meta-population complexes
- A 14-day recovery for water temperature and DO accounts for natural variability and fluctuations once the upper limits have been exceeded

(2) Substantial Progress

Government Code Section 11346.1(h) specifies that the emergency rulemaking agency must demonstrate that it is making “substantial progress and has proceeded with due diligence” to comply with the standard rulemaking provisions. The Commission, at its December 10, 2015 meeting was requested by the Department to authorize staff to file this emergency readopt, as well as file notice of its intent to file a Certificate of Compliance.

Work on the emergency standard has been conducted by DFW biologists to determine longer term impacts which necessitated filing the notice of the Commission's intent to file a Certificate of Compliance in December. Due to the statutory requirement for the Commission to hear the proposed Certificate of Compliance rulemaking at its February 11, 2016 and April 14, 2016 meetings, it is necessary for the Commission to request this first Emergency Readopt for a period of 90-days, followed by a second 90 day request which is proposed to be voted on at the Commission's March 15, 2016 teleconference.

CALIFORNIA FISH AND GAME COMMISSION
STATEMENT OF PROPOSED EMERGENCY REGULATORY ACTION

Emergency Action to
Add Section 8.01,
Title 14, California Code of Regulations
Re: Special Measures for Fisheries at Risk due to Drought Conditions

I. Statement of Facts Constituting the Need for Emergency Regulatory Action

California continues to suffer under severe drought conditions with record low snow packs in 2014 and 2015. In early 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency for California directing state officials to take all necessary actions to prepare for the record level of drought conditions and also signed an Executive Order redoubling state drought actions with additional measures to strengthen the state's response to drought. On April 1, 2015, the Governor ordered state agencies to impose statewide mandatory water restrictions that will save water, increase enforcement against water waste, streamline the state's drought response, and invest in new drought resilient technologies for California.

The hydrological conditions in 2015 are expected to deteriorate from the record low 2014 conditions. The Department of Fish and Wildlife (Department) continues to evaluate and manage the changing impacts of drought on threatened and endangered species and species of special concern, and develop contingency plans for state Wildlife Areas and Ecological Reserves to manage reduced water resources in the public interest.

Statewide water quality and quantity in many systems is likely to be inadequate to support fisheries as the summer progresses, resulting in impeded passage of spawning fish, increased vulnerability to mortality from predation and physiological stress, and increased angling harvest and/or hooking mortality. Furthermore, survival of eggs and juvenile fish in these systems over the coming months will be extremely low. The historically low water conditions will concentrate coldwater fish populations into shrinking pools of cold water habitat making them easy prey for illegal angling methods such as snagging, increased hooking mortality due to legal catch and release, over-harvest, as well as other human-related disturbances within their freshwater habitat. When coupled with drought-related environmental stressors, such as high water temperature, low dissolved oxygen, and severely reduced suitable habitat, these stressors can seriously affect reproductive success and survival rates.

Since 2014, the Department has worked with the Fish and Game Commission (Commission), using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist. The Department and the Commission have determined that a temporary approach is needed to give the Department effective tools to respond more rapidly to the deteriorating water quality and quantity conditions in California's waters for 2015.

Regulatory Proposal

Environmental conditions resulting from the drought may require temporary restrictions on fishing to protect fish populations and sustain future opportunity. These conditional changes may affect each waterbody and fish population differently based on hydrological responses to the drought. Increased angling mortality, harvest, and angling pressure are the key components used to evaluate potential effects associated with degraded environmental conditions and will need to be evaluated on a water by water basis and over time as conditions change.

To ensure that fisheries are protected under critical conditions stemming from the drought, the Department is proposing a set of triggers to guide fishing closure and reopening decisions. The Department's decision to close or open a water will be based on the most current information available, collected by professional staff trained in the associated fields. Criteria for evaluating aquatic conditions are based on site-specific monitoring efforts with an emphasis on listed fish species, species of special concern, and gamefish.

The following proposed criteria will be used to determine if an emergency fishing closure or associated reopening is warranted:

Any water of the state not currently listed in Section 8.00 of these regulations may be closed to fishing by the Department when the Director, or his or her designee, determines one or more the following conditions have been met:

- Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days.
- Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.
- Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.
- Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.
- Adult breeding population levels are estimated to be below 500 individuals.

All waters closed pursuant to this section will be reopened by the Department when the Director, or his or her designee, determines all of the following conditions have been met:

- Water temperatures in occupied habitat do not exceed 70° Fahrenheit for over eight hours a day for seven consecutive days.
- Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level for seven consecutive days.
- Fish passage is available and that no impediment exists to strand or concentrate adults or juveniles during their migration.

- Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.
- Adult breeding populations are estimated to be recovered to greater than 500 individuals.

Justification and associated data for closure and reopening decisions will be provided to the Commission for any water that is subject to a fishing closure.

The Department and the Commission will work together to formulate a regular rulemaking proposal that will refine the approach and associated language based on experiences learned, feedback from the public, and revisions to increase the efficacy of this emergency action.

II. Impact of Regulatory Action

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following determinations relative to the required statutory categories have been made:

- (a) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

- (b) Nondiscretionary Costs/Savings to Local Agencies:

None.

- (c) Programs Mandated on Local Agencies or School Districts:

None.

- (d) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

- (e) Effect on Housing Costs:

None.

III. Authority and Reference

The Fish and Game Commission proposes this emergency action pursuant to the authority vested by sections 200, 202, 205, 240, and 315 of the Fish and Game Code and to implement, interpret, or make specific sections 200, 202, 205, 240, and 315 of said Code.

IV. Section 240 Finding

Pursuant to Section 240 of the Fish and Game Code, the Commission finds that the adoption of this regulation is necessary for the immediate conservation, preservation, or protection of birds, mammals, reptiles, or fish, including, but not limited to, any nests or eggs thereof.

Updated Informative Digest (Plain English Overview)

California continues to suffer under severe drought conditions with record low snow packs in 2014 and 2015. In early 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency for California directing state officials to take all necessary actions to prepare for the record level of drought conditions and also signed an Executive Order redoubling state drought actions with additional measures to strengthen the state's response to drought. On April 1, 2015, the Governor ordered state agencies to impose statewide mandatory water restrictions that will save water, increase enforcement against water waste, streamline the state's drought response, and invest in new drought resilient technologies for California.

The hydrological conditions in 2015 are expected to deteriorate from the record low 2014 conditions. The Department of Fish and Wildlife (Department) continues to evaluate and manage the changing impacts of drought on threatened and endangered species and species of special concern, and develop contingency plans for state Wildlife Areas and Ecological Reserves to manage reduced water resources in the public interest.

Statewide water quality and quantity in many systems is likely to be inadequate to support fisheries as the summer progresses, resulting in impeded passage of spawning fish, increased vulnerability to mortality from predation and physiological stress, and increased angling harvest and/or hooking mortality. Furthermore, survival of eggs and juvenile fish in these systems over the coming months will be extremely low. The historically low water conditions will concentrate coldwater fish populations into shrinking pools of cold water habitat making them easy prey for illegal angling methods such as snagging, increased hooking mortality due to legal catch and release, over-harvest, as well as other human-related disturbances within their freshwater habitat. When coupled with drought-related environmental stressors, such as high water temperature, poor water quality, and severely reduced suitable habitat, these stressors can seriously affect reproductive success and survival rates.

Since 2014, the Department has worked with the Fish and Game Commission (Commission), using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist. The Department and the Commission have determined that a temporary approach is needed to give the Department effective tools to respond more rapidly to the deteriorating water quality and quantity conditions in California's rivers and streams for 2015.

The following proposed criteria will be used to determine if an emergency fishing closure or associated reopening is warranted:

Any water of the state not currently listed in Section 8.00 of these regulations may be closed to fishing by the Department when the Director, or his or her designee, determines one or more of the following conditions have been met:

- Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days.

- Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.
- Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.
- Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.
- Adult breeding population levels are estimated to be below 500 individuals.

All waters closed pursuant to this section will be reopened by the Department when the Director, or his or her designee, determines all of the following conditions have been met:

- Water temperatures in occupied habitat do not exceed 70° Fahrenheit for over eight hours a day for seven consecutive days.
- Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level for seven consecutive days.
- Fish passage is available and that no impediment exists to strand or concentrate adults or juveniles during their migration.
- Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.
- Adult breeding populations are estimated to be recovered to greater than 500 individuals.

Justification and associated data for closure and reopening decisions will be provided to the Commission for any water that is subject to a fishing closure.

The Department and the Commission will work together to formulate a regular rulemaking proposal that will refine the approach and regulatory language based on experiences learned, feedback from the public, and revisions to increase the efficacy of this emergency action.

Benefits: The proposed regulation will provide benefits to the environment through the conservation and preservation of listed species, species of special concern, and gamefish populations.

The proposed regulations are neither inconsistent nor incompatible with existing state regulations. The Legislature has delegated authority to the Commission to promulgate sport fishing regulations (sections 200, 202, 205, 240, and 315 Fish and Game Code).

Pursuant to its June 11, 2015 meeting in Mammoth Lakes, the Fish and Game Commission adopted the emergency action.

Regulatory Language

Section 8.01, Title 14, CCR is amended to read:

Section 8.01. Special Gear Provisions Measures for Fisheries at Risk due to Drought Conditions.

(a) In response to continued extreme drought conditions, the commission has established a quick response process to temporarily close fisheries experiencing degraded environmental conditions that may affect fish populations or their habitat within waters of the state. The criteria set forth in subsections (b) and (c) are intended to ensure that fisheries are protected under critical conditions stemming from the drought. These criteria will be monitored in statewide inland fisheries, and they will be evaluated on a water by water basis over time as conditions change.

(b) The department may close to angling any waters of the state not currently listed in Section 8.00 of these regulations if the director, or his or her designee, finds one or more of the following conditions have been met:

(A) Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days

(B) Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.

(C) Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.

(D) Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.

(E) Adult breeding population levels are estimated to be below 500 individuals.

(c) Waters closed pursuant to subsection (b) shall be reopened by the department when the director, or his or her designee, finds all of the following conditions have been met:

(A) Water temperatures in occupied habitat do not exceed 70° Fahrenheit over eight hours a day for seven consecutive days

(B) Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level over seven consecutive days.

(C) Fish passage is available and no impediment exists to strand or concentrate adults or juveniles during their migration.

(D) Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.

(E) Adult breeding population levels are estimated to be recovered to greater than 500 individuals.

(d) It shall be unlawful to take fish in any waters of the state closed to angling pursuant to this Section.

(e) Notification of department actions.

(1) The department shall maintain a list of closed waters of the state and update that list on Wednesday of each week by 1:00 pm. In the event that water conditions change later in the week, the fishing status for each specific water will not change until the day following the next Wednesday. It shall be the responsibility of the angler to use the telephone number provided on the department's website to obtain the current status of any water. The number to call for information is (916) 445-7600.

Note: Authority cited: Sections 200, 202 ~~and 210~~, 205, 240, and 315, Fish and Game Code. Reference: Sections 200, 202, 205 ~~and 210~~, 240, and 315, Fish and Game Code.

Memorandum

Date: November 16, 2015

To: Sonke Mastrup
Executive Director
Fish and Game Commission

From: Charlton H. Bonham
Director

Subject: **Agenda Item for the December 9-10, 2015 Fish and Game Commission Meeting Re: Request to Extend Existing Emergency Regulations Establishing Measures for Fisheries at Risk due to Drought Conditions, Section 8.01, Title 14, California Code of Regulations**

In response to the continued extreme drought conditions, the Department of Fish and Wildlife (Department) is requesting that the Fish and Game Commission (Commission) extend the Department's authority set forth in Section 8.01, Title 14 of the California Code of Regulations, to temporarily close fisheries that are experiencing rapidly degrading environmental conditions within waters of the state. The Department requests that the Commission readopt the emergency regulations that went into effect on July 2, 2015 for an additional period of 90 days while the regular rulemaking is under consideration.

On January 17, 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency to exist in California due to severe drought conditions. As part of the declaration, the Governor ordered the Department to work with the Commission, using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist.

Over the next several months, environmental conditions resulting from the drought requires temporary restrictions on fishing on parts of four rivers to protect fish populations and sustain future opportunity. The Department and the Commission determined that an approach was needed to give the Department more efficient tools to provide quicker response to the deteriorating water quality and quantity conditions in California's waters. As a result, on June 11, 2015, the Commission adopted emergency regulations which establish a process to temporarily close fisheries experiencing degraded environmental conditions that may affect fish populations or their habitat within waters of the state. The criteria set forth in these regulations are intended to ensure that fisheries are protected under critical conditions stemming from the drought.

Since adoption of the emergency regulations the Department has implemented one emergency fishing closure on state waters. This emergency closure was implemented on the lower Merced River on August 18, 2015. The Department used the criteria established in subsection (b) of Section 8.01 to determine that a closure was warranted.

Sonke Mastrup, Executive Director
Fish and Game Commission
November 16, 2015
Page 2

Following protocol, the Department held a public meeting in Merced prior to the fishing closure. In addition, the Department provided the Commission the biological data used to justify the closure and made the data available to the public on the Department's Emergency Fishing Closure webpage. The Department and the Commission are currently working together to formulate a regular rulemaking proposal that will refine the approach and associated language based on experiences learned, feedback from the public, and revisions to increase the efficacy of this emergency action.

If you have any questions regarding this item, please contact Stafford Lehr, Chief, Fisheries Branch, via telephone at (916) 327-8840 or via e-mail at Stafford.Lehr@wildlife.ca.gov.

Fisheries at Risk

Proposed Regulatory Action

Fish and Game Commission Meeting
December 10, 2015
Stafford Lehr
Fisheries Branch

Overarching Goal

To ensure that fisheries are protected from increased angling mortality, harvest, and angling pressure under critical environmental conditions.

Problem Statements

- Environmental conditions resulting in degraded habitat quality and/or extremely low population size may require temporary restrictions on fishing to protect fish populations and sustain future opportunity
- The Department needs a quick response process to temporarily close fisheries experiencing degraded habitat quality and or quantity or extremely low population size within waters of the state

Proposed Solution

- Department **may** close any water when established criteria have been met
- Decisions based on current information collected by trained staff
- Emphasis on listed fish species, species of special concern, and gamefish
- Justification for any closure will be provided to the Commission

Criteria for Fishing Closures

Any water may be closed to fishing when one or more the following conditions have been met:

- Water temperatures exceed 70°F for over eight hours a day for three consecutive days
- Dissolved oxygen levels drop below 5 mg/L for any period of time over **two** consecutive days

Criteria for Fishing Closures

- Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait
- Water levels for ponds, lakes and reservoirs drop below 10% of capacity
- Adult breeding population levels are estimated to be below **50 individuals for a subpopulation** and **500 for a standard or meta-population**

Re-opening Criteria

- Waters closed to fishing will be reopened when the initial closure-based criteria are no longer met; and
- **Water temperatures do not exceed 70°F for over eight hours a day for 14 consecutive days**
- **DO levels remain above 5 mg/L for 14 consecutive days**

Changes from Emergency Regulations

- A consecutive two day exposure for DO addresses natural variability and risk for juvenile and early life stages of fish
- The 50/500 rule addresses the effects on both the localized level for smaller sub-populations and larger meta-population complexes
- A 14 day recovery for water temperature and DO accounts for natural variability and fluctuations once the upper limits have been exceeded

Questions / Thank You

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-publication of Notice Statement)

Add Section 8.01,
Title 14, California Code of Regulations
Re: Special Measures for Fisheries at Risk due to Drought Conditions

I. Date of Initial Statement of Reasons: August 21, 2015

II. Dates and Locations of Scheduled Hearings:

- | | | | |
|-----|---------------------|-----------|-------------------|
| (a) | Notice Hearing: | Date: | December 10, 2015 |
| | | Location: | San Diego |
| (b) | Discussion Hearing: | Date: | February 11, 2016 |
| | | Location: | Sacramento |
| (c) | Adoption Hearing: | Date: | April 14, 2015 |
| | | Location: | Santa Rosa |

III. Description of Regulatory Action:

- (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

California continues to suffer under severe drought conditions with record low snow packs since 2014. In early 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency for California directing state officials to take all necessary actions to prepare for the record level of drought conditions and also signed an Executive Order redoubling state drought actions with additional measures to strengthen the state's response to drought. On April 1, 2015, the Governor ordered state agencies to impose statewide mandatory water restrictions that will save water, increase enforcement against water waste, streamline the state's drought response, and invest in new drought resilient technologies for California.

California's hydrological conditions are expected to deteriorate from the record low 2014 conditions in the near future. The Department of Fish and Wildlife (Department) continues to evaluate and manage the changing impacts of drought on threatened and endangered species and species of special concern, and develop contingency plans for state Wildlife Areas and Ecological Reserves to manage reduced water resources in the public interest.

Statewide water quality and quantity in many systems is likely to be inadequate to support fisheries as the summer progresses, resulting in impeded passage of spawning fish, increased vulnerability to mortality from predation and physiological stress, and increased angling harvest and/or hooking mortality. Furthermore, survival of eggs and juvenile fish in these systems over the coming months will be extremely low. The historically low water conditions will concentrate coldwater fish populations into shrinking pools of cold water habitat making them easy prey for illegal angling methods such as snagging, increased hooking mortality due to legal catch and release, over-harvest, as well as other human-related disturbances within their freshwater habitat. When coupled with drought-related environmental stressors, such as high water temperature, low dissolved oxygen, and severely reduced suitable habitat, these stressors can seriously affect reproductive success and survival rates.

Since 2014, the Department has worked with the Fish and Game Commission (Commission), using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist. The Department and the Commission have determined that an approach is needed to give the Department effective tools to respond more rapidly to the deteriorating water quality and quantity conditions in California's waters.

Regulatory Proposal

Environmental conditions resulting from the drought may require temporary restrictions on fishing to protect fish populations and sustain future opportunity. These conditional changes may affect each waterbody and fish population differently based on hydrological responses to the drought. Increased angling mortality, harvest, and angling pressure are the key components used to evaluate potential effects associated with degraded environmental conditions and will need to be evaluated on a water by water basis and over time as conditions change.

To ensure that fisheries are protected under critical conditions stemming from the drought, the Department is proposing a set of triggers to guide fishing closure and reopening decisions. The Department's decision to close or open a water will be based on the most current information available, collected by professional staff trained in the associated fields. Criteria for evaluating aquatic conditions are based on site-specific monitoring efforts with an emphasis on listed fish species, species of special concern, and gamefish.

The following proposed criteria will be used to determine if a fishing closure or associated reopening is warranted:

Any water of the state not currently listed in Section 8.00 of these regulations may be closed to fishing by the Department when the Director, or his or her designee, determines one or more the following conditions have been met:

- Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days.
- Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.
- Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.
- Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.
- Adult breeding population levels are estimated to be below 500 individuals.

All waters closed pursuant to this section will be reopened by the Department when the Director, or his or her designee, determines all of the following conditions have been met:

- Water temperatures in occupied habitat do not exceed 70° Fahrenheit for over eight hours a day for seven consecutive days.
- Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level for seven consecutive days.
- Fish passage is available and that no impediment exists to strand or concentrate adults or juveniles during their migration.
- Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.
- Adult breeding populations are estimated to be recovered to greater than 500 individuals.

Justification and associated data for closure and reopening decisions will be provided to the Commission for any water that is subject to a fishing closure.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 205, 240 and 315, Fish and Game Code.

Reference: Sections 200, 205, 240, and 315, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None.

(d) Identification of Reports or Documents Supporting Regulation Change:

None.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

No public meetings are scheduled prior to the notice publication. The 45-day public notice comment period provides adequate time for review of the proposed changes.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified.

(b) No Change Alternative:

The no change alternative would leave existing regulations in place.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

(a) Significant Statewide Adverse Economic Impact Directly Affecting

Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action is not anticipated to have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states because the expected impact of the proposed regulations on the amount of fishing activity is anticipated to be minimal relative to recreational angling effort statewide.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The expected impact of the proposed regulations on the amount of fishing activity is anticipated to be minimal relative to recreational angling effort statewide. Therefore the Commission does not anticipate any impacts on the creation or elimination of jobs, the creation of new business, the elimination of existing business or the expansion of businesses in California.

The Commission anticipates benefits to the health and welfare of California residents. Providing opportunities for a salmon and trout sport fishery encourages consumption of a nutritious food.

The Commission does not anticipate any non-monetary benefits to worker safety.

The Commission anticipates benefits to the environment by the sustainable management of California's sport fishing resources.

- (c) Cost Impacts on a Representative Private Person or Business:

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:

None.

- (e) Nondiscretionary Costs/Savings to Local Agencies:

None.

(f) Programs Mandated on Local Agencies or School Districts:

None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed Under Part 7 (commencing with Section 17500) of Division 4, Government Code:

None.

(h) Effect on Housing Costs:

None.

VII. Economic Impact Assessment:

If any closures of waters due to proposed regulatory criteria enacted, the Department's approach will be to achieve adequate resource protection with minimized disruptions to recreational activities and the economy of the immediate surrounding locales. Closures are expected to be implemented over limited areas for short time periods. In many instances, anglers can shift to other areas of the river that remain open. Additionally, other recreational activities such as rafting, hiking, and swimming will most often still be allowed, which can mitigate potential losses in visitor spending to the local economies. However, to derive the most conservative estimates of future economic impacts, any potential mitigation of total economic impact from shifts in effort was not formally considered in the Department quantitative analysis. Estimates of future economic impacts are done with the assumption that anglers would not substitute fishing for other activities in the area or shift trips to other higher effort months of the year.

Impacts of Potential Closures:

Economic impact assessments of past emergency closures provide reasonable estimates of the potential impact of future closures under the proposed regulations. In 2013, a combined emergency closure of the lower American River, Russian River, and a combined coastal area consisting of portions of North Coast, Central Coast and South Central District Low Flow Restricted Areas were in effect for up to three months. In 2014 and 2015, emergency closures along a portion of the Merced River were put into effect for up to five months. Additionally a hypothetical 2016 seasonal closure of the Klamath River Basin (~50% of the available area) was used to model potential impacts of large watershed closure. Table 1 presents a comparison of the above economic

impact assessments to illustrate the potential low-, mid- and high-economic impact of potential closures under Section 8.01.

Table 1. Economic Impact of Potential Closures (2015\$)

Year	Affected Area	Angler Spending	Total Output Loss	Job Loss
2013	American River	-\$77,000	-\$93,000	-1.9
2013	Russian River	-\$24,000	-\$29,000	-0.6
2013	Coastal Low-Flow Areas	-\$34,000	-\$41,000	-0.8
2014	Merced River	-\$1,300	-\$1,500	-0.03
2015	Merced River	-\$1,000	-\$1,200	-0.02
2016	Klamath River	-\$1,000,000	-\$1,040,000	-21.3

- The Merced River 2014 and 2015 closures resulted in a relatively low total economic output loss estimate of \$1,200 to \$1,500 with less than one job lost for each closure.
- The 2013 Russian River closure occurred during peak fishing months and resulting in an estimated loss of 280 angler trips with an associated \$24,000 drop in angler spending resulting in a mid-range total output loss of \$29,000 and less than one job lost from the three month closure period.
- The concurrent 2013 coastal low-flow closures resulted in a slightly higher total economic output loss estimate of \$34,500 with less than one job lost.
- The American River closure during the same time, resulted in a higher estimated loss of 900 angler trips with an associated \$77,000 drop in angler spending resulting in a higher total output loss of \$93,000 and about two jobs lost.
- The 2016 hypothetical Klamath River Basin closure is projected to result in the loss of 4,000 angler trips with an associated \$1,000,000 drop in angler spending resulting in the highest expected total output loss of \$1,040,000 and about 21 jobs lost.

A. Effects of the Regulation on the Creation or Elimination of Jobs

The Commission does not anticipate significant adverse impacts on the creation or elimination of jobs to be precipitated by temporary closures of isolated inland fisheries.

The potential impacts of a short-term closure were estimated to result in the loss of less than one job loss at the low end to a high impact of up to 21 jobs loss depending upon area, duration and location of the potential closure. However overall, the number of visitors and thus probable visitor expenditures in the fisheries areas is expected to decline for the closure period but most often,

significant impacts on job creation or elimination is not likely to occur given the short time period and lags in employment level adjustment.

B. Effects of the Regulation on the Creation of New Businesses or the Elimination of Existing Businesses

The projected loss in angler spending for a freshwater closure is estimated to range from \$1,000 to \$1,000,000. This spending loss is associated with a drop in total economic output as each dollar spent is passed through the economy in the range of \$1,200 to \$1,040,000. This estimated output loss would be shared by a number of businesses over several months, such that it is not anticipated to constitute sufficient impact to trigger the creation of new businesses or elimination of existing businesses.

C. Effects of the Regulation on the Expansion of Businesses in California

The projected loss in angler spending for a freshwater closure is estimated to range from \$1,000 to \$1,000,000. This spending loss is associated with a drop in total economic output as each dollar spent is passed through the economy in the range of \$1,200 to \$1,040,000. This estimated output loss would be shared by a number of businesses over more several months, such that it is not anticipated to constitute sufficient impact to trigger expansion of new businesses.

D. Benefits of the Regulation

Concurrence with Federal Law: N/A

Benefits of the Regulation to the Health and Welfare of California

Residents:

The Commission anticipates benefits to the health and welfare of California residents through the protection of aquatic and riparian habitats and the fish and wildlife resources that depend upon them. Trout and salmon are a nutritious food source and increasing inland sport fishery opportunities encourages consumption of this nutritious food. Sport fishing also contributes to increased mental health of its practitioners as fishing is a hobby and form of relaxation for many. Sport fishing also provides opportunities for multi-generational family activities and promotes respect for California's environment by younger generations, the future stewards of California's natural resources.

Benefits to the Environment:

The Commission anticipates benefits to the environment through the protection of aquatic and riparian habitats and the fish and wildlife resources that depend upon them. Stream flows in many systems are inadequate to allow passage of spawning anadromous fish, increasing their vulnerability to mortality from predation, physiological stress, and fishing. Furthermore, survival of eggs and

juvenile fish in these systems is likely to be extremely low in higher temperature waters. Under these extreme conditions, conservation and protection of the juvenile fish populations will protect as many adult fish as possible. It is the policy of the state to encourage the conservation, maintenance, and utilization of the living resources of the inland waters under the jurisdiction and influence of the state for the benefit of all its citizens and to promote the development of local California fisheries. The objectives of this policy include, but are not limited to, the maintenance of sufficient populations of all species of aquatic organisms to ensure their continued existence and the maintenance of a sufficient resource to support a reasonable sport use, taking into consideration the necessity of regulating individual sport fishery bag limits in the quantity that is sufficient to provide a satisfying sport.

Benefits to Worker Safety: The Commission does not anticipate benefits to worker safety because the proposed regulations will not impact worker conditions.

Informative Digest/Policy Statement Overview

California continues to suffer under severe drought conditions with record low snow packs since 2014. In early 2014, Governor Edmund G. Brown Jr. proclaimed a State of Emergency for California directing state officials to take all necessary actions to prepare for the record level of drought conditions and also signed an Executive Order redoubling state drought actions with additional measures to strengthen the state's response to drought. On April 1, 2015, the Governor ordered state agencies to impose statewide mandatory water restrictions that will save water, increase enforcement against water waste, streamline the state's drought response, and invest in new drought resilient technologies for California.

California's hydrological conditions are expected to deteriorate from the record low 2014 conditions in the near future. The Department of Fish and Wildlife (Department) continues to evaluate and manage the changing impacts of drought on threatened and endangered species and species of special concern, and develop contingency plans for state Wildlife Areas and Ecological Reserves to manage reduced water resources in the public interest.

Statewide water quality and quantity in many systems is likely to be inadequate to support fisheries as the summer progresses, resulting in impeded passage of spawning fish, increased vulnerability to mortality from predation and physiological stress, and increased angling harvest and/or hooking mortality. Furthermore, survival of eggs and juvenile fish in these systems over the coming months will be extremely low. The historically low water conditions will concentrate coldwater fish populations into shrinking pools of cold water habitat making them easy prey for illegal angling methods such as snagging, increased hooking mortality due to legal catch and release, over-harvest, as well as other human-related disturbances within their freshwater habitat. When coupled with drought-related environmental stressors, such as high water temperature, low dissolved oxygen, and severely reduced suitable habitat, these stressors can seriously affect reproductive success and survival rates.

Since 2014, the Department has worked with the Fish and Game Commission (Commission), using the best available science, to determine whether restricting fishing in certain areas will become necessary and prudent as drought conditions persist. The Department and the Commission have determined that an approach is needed to give the Department effective tools to respond more rapidly to the deteriorating water quality and quantity conditions in California's waters.

Regulatory Proposal

Environmental conditions resulting from the drought may require temporary restrictions on fishing to protect fish populations and sustain future opportunity. These conditional changes may affect each waterbody and fish population differently based on hydrological responses to the drought. Increased angling mortality, harvest, and angling pressure are the key components used to evaluate potential effects associated

with degraded environmental conditions and will need to be evaluated on a water by water basis and over time as conditions change.

To ensure that fisheries are protected under critical conditions stemming from the drought, the Department is proposing a set of triggers to guide fishing closure and reopening decisions. The Department's decision to close or open a water will be based on the most current information available, collected by professional staff trained in the associated fields. Criteria for evaluating aquatic conditions are based on site-specific monitoring efforts with an emphasis on listed fish species, species of special concern, and gamefish.

The following proposed criteria will be used to determine if a fishing closure or associated reopening is warranted:

Any water of the state not currently listed in Section 8.00 of these regulations may be closed to fishing by the Department when the Director, or his or her designee, determines one or more the following conditions have been met:

- Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days.
- Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.
- Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.
- Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.
- Adult breeding population levels are estimated to be below 500 individuals.

All waters closed pursuant to this section will be reopened by the Department when the Director, or his or her designee, determines all of the following conditions have been met:

- Water temperatures in occupied habitat do not exceed 70° Fahrenheit for over eight hours a day for seven consecutive days.
- Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level for seven consecutive days.
- Fish passage is available and that no impediment exists to strand or concentrate adults or juveniles during their migration.
- Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.
- Adult breeding populations are estimated to be recovered to greater than 500 individuals.

Justification and associated data for closure and reopening decisions will be provided to

the Commission for any water that is subject to a fishing closure.

Regulatory Language

Section 8.01, Title 14, CCR is added to read:

Section 8.01. Special ~~Gear Provisions~~Measures for Fisheries at Risk due to Drought Conditions.

(a) In response to continued extreme drought conditions, the commission has established a quick response process to temporarily close fisheries experiencing degraded environmental conditions that may affect fish populations or their habitat within waters of the state. The criteria set forth in subsections (b) and (c) are intended to ensure that fisheries are protected under critical conditions stemming from the drought. These criteria will be monitored in statewide inland fisheries, and they will be evaluated on a water by water basis over time as conditions change.

(b) The department may close to angling any waters of the state not currently listed in Section 8.00 of these regulations if the director, or his or her designee, finds one or more of the following conditions have been met:

(A) Water temperatures in occupied habitat exceed 70° Fahrenheit for over eight hours a day for three consecutive days

(B) Dissolved oxygen levels in occupied habitat drop below 5 mg/L for any period of time over three consecutive days.

(C) Fish passage is impeded or blocked for fish species that rely on migration as part of a life history trait.

(D) Water levels for ponds, lakes and reservoirs drop below 10% of their capacity.

(E) Adult breeding population levels are estimated to be below 500 individuals.

(c) Waters closed pursuant to subsection (b) shall be reopened by the department when the director, or his or her designee, finds all of the following conditions have been met:

(A) Water temperatures in occupied habitat do not exceed 70° Fahrenheit over eight hours a day for seven consecutive days

(B) Dissolved oxygen levels in occupied habitat rise above 5 mg/L and are maintained at that level over seven consecutive days.

(C) Fish passage is available and no impediment exists to strand or concentrate adults or juveniles during their migration.

(D) Water levels for ponds, lakes and reservoirs have recovered to greater than 10% of their capacity.

(E) Adult breeding population levels are estimated to be recovered to greater than 500 individuals.

(d) It shall be unlawful to take fish in any waters of the state closed to angling pursuant to this Section.

(e) Notification of department actions.

(1) The department shall maintain a list of closed waters of the state and update that list on Wednesday of each week by 1:00 pm. In the event that water conditions change later in the week, the fishing status for each specific water will not change until the day following the next Wednesday. It shall be the responsibility of the angler to use the telephone number provided below or go to the department's website at <https://www.wildlife.ca.gov/Regulations> to obtain the current status of any water. The

number to call for information is (916) 445-7600.

Note: Authority cited: Sections 200, ~~202 and 240~~, 205, 240, and 315, Fish and Game Code. Reference: Sections 200, 202, ~~205 and 240~~, 240, and 315, Fish and Game Code.

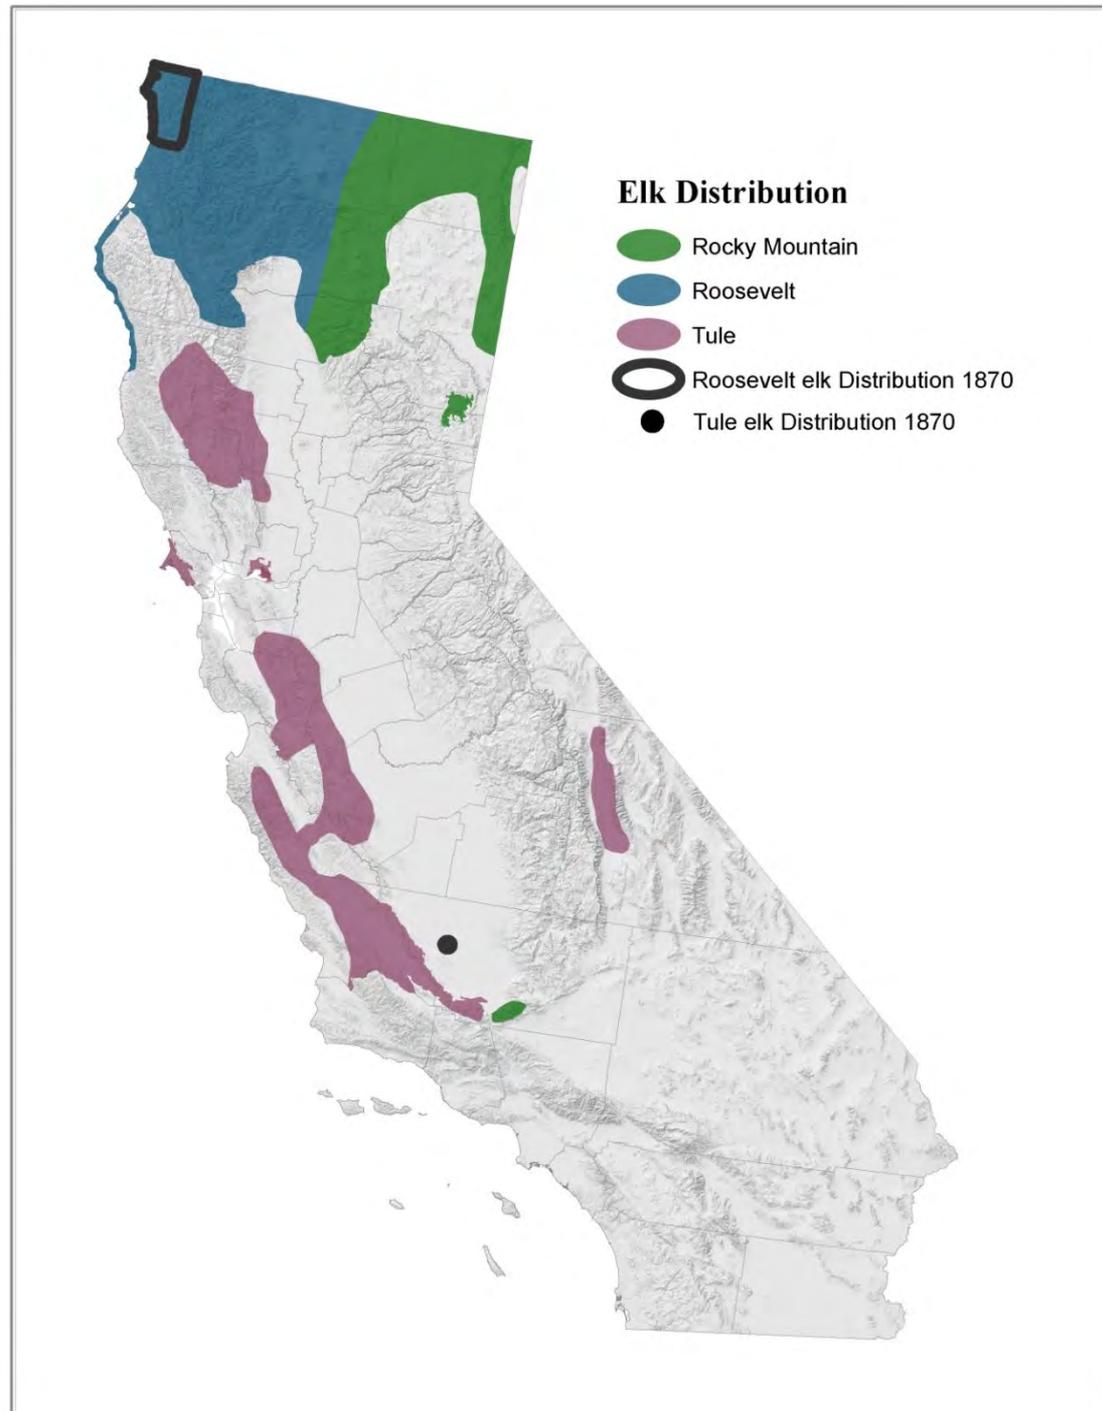

2016 Proposed Elk Hunting Regulation Changes

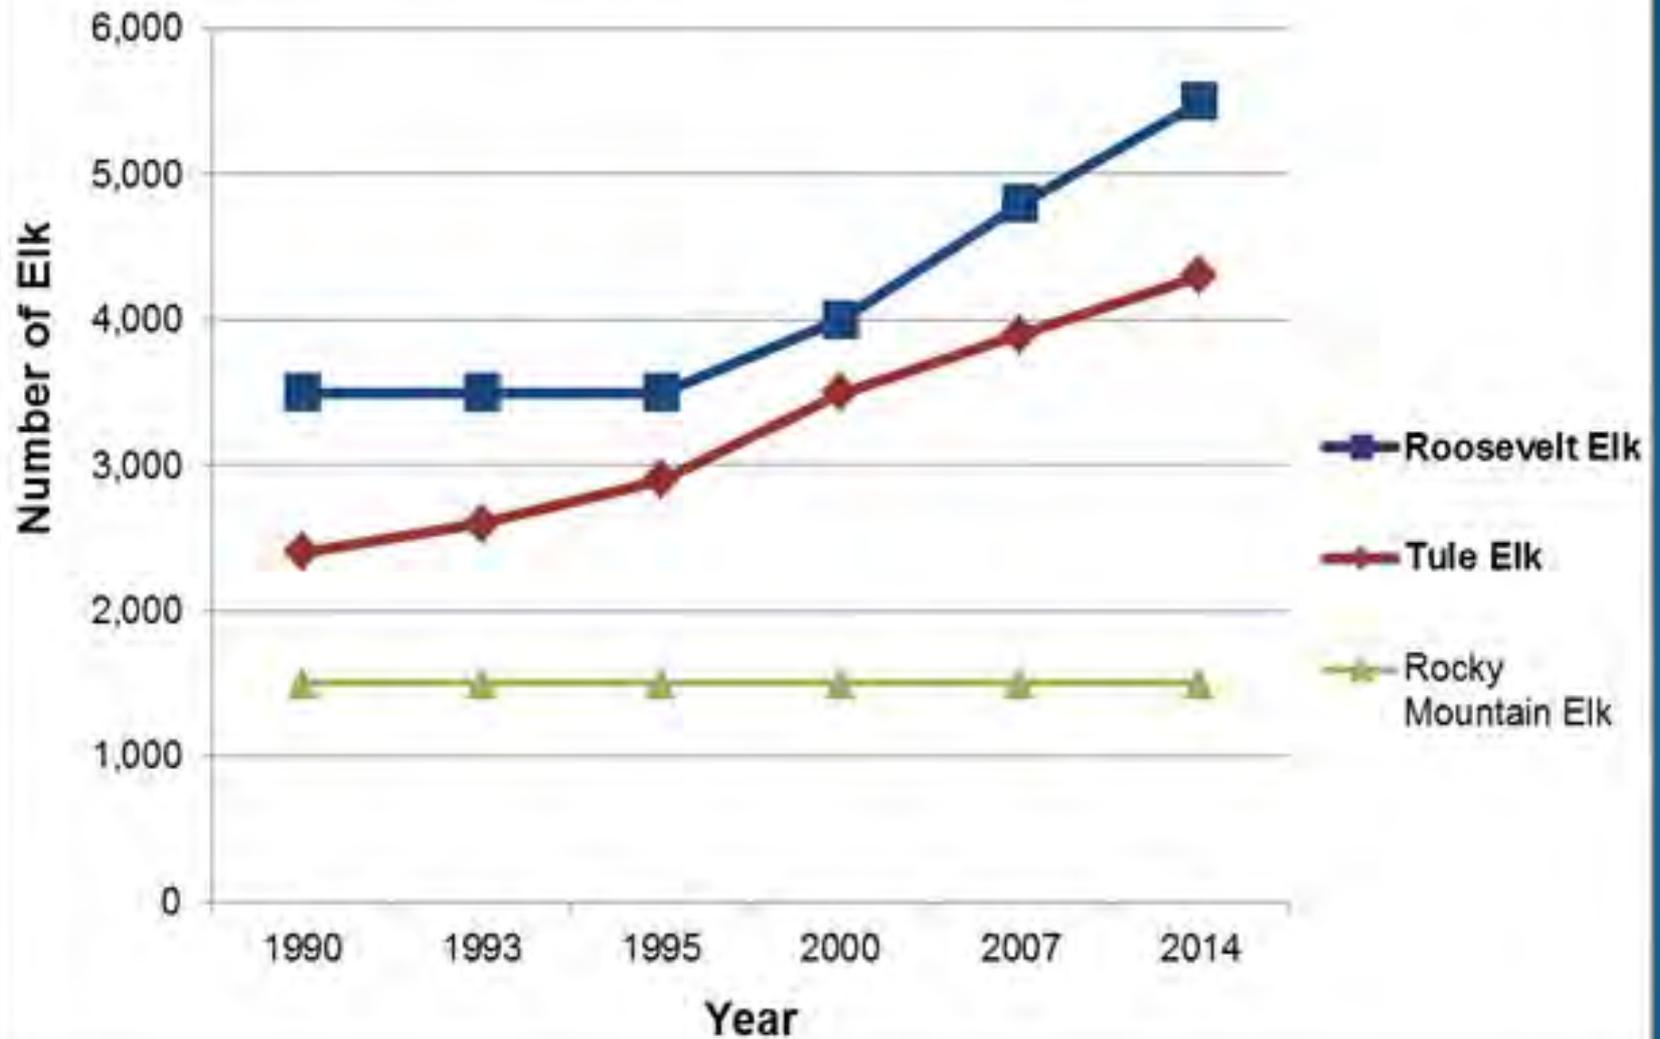

Background on California's Elk

Three subspecies in CA

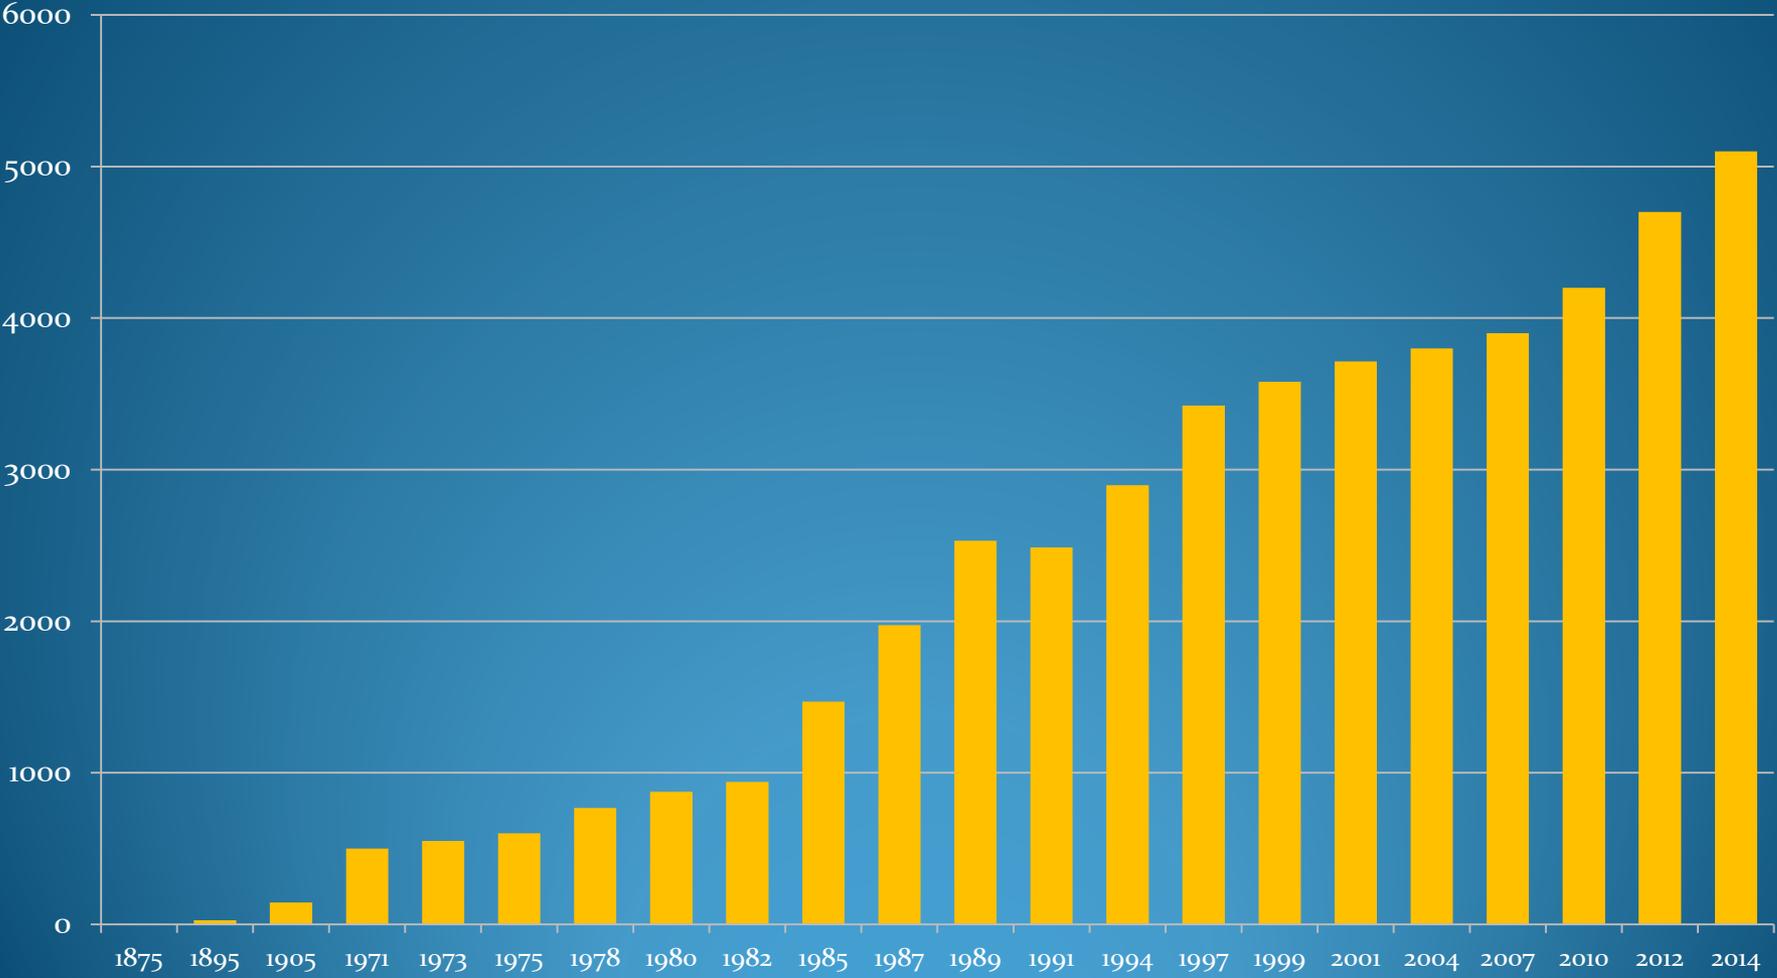

Tule Elk is endemic

Estimated Elk Populations, 1990-2014

California's Estimated Tule Elk Population

Specific to Tule Elk

- Legislative action in 1971 - goal of 2,000 tule elk, above which the Commission may authorize take. See FGCode 3951
- Relocate elk to suitable areas where possible.
- Manage each tule elk herd to reduce property and environmental damage.
- *1979 Management Plan for the Conservation of Tule Elk* (Tule Elk Interagency Task Force) has been, and continues to be, a success for Tule elk conservation

Example model run in Elk Draft ED

SAN EMIGDIO ELK HERD - SIMULATION RUNS, GENERAL, SHARE, & PLM 2016

Ratio = 52/100/20 - Maximum Calf Survival = 67%

THIS PROGRAM CALCULATES CHANGES IN
HERD

CHARACTERISTICS BASED ON VARIOUS HARVEST RATES.

PROPOSED PROJECT: BULL, COW, INCLUDING COOPERATIVE
TAGS

TO HARVEST UP TO 10 BULLS & 24 ANTLERLESS

Various combination of tags to achieved harvest, includes cooperative tags

Assuming success rate of 80% bull and 75% antlerless

	HERD SIZE	360	ELK
% BULLS LOST TO NON HUNTING CAUSES		25	%
% COWS LOST TO NON HUNTING CAUSES		12	%
% OF BULLS KILLED BY HUNTERS		10	%
% OF COWS KILLED BY HUNTERS		12	%

BULL.

CALF

As a result of the Commission, Department, and others efforts for over 108 years since hunting licenses were 1st required, regulations were starting to be enforced, and active management and relocation began to occur:

- Great wildlife conservation and management success story for tule elk in California
- Eliminated nearly all confined herds (now free-ranging); limited opportunity for more relocation
- Widespread in California's Coastal Ranges & Owens Valley
- Extremely popular game animal
- Increasingly seen and enjoyed by the public for wildlife viewing
- Continuing to increase (as evidenced by increased problems from landowners)

- **Roosevelt Elk**- Similar story to tule elk in terms of decline and then rebuilding through management efforts and regulation of harvest to attempt to manage growth of the population
- Elk concentrate on bottomlands/pastures in NW part of state = increasing conflict with landowners
- Population concentration too high in these areas, and there is limited access for hunting opportunity, but great viewing opportunity along the Hwy 101 corridor

Proposed Solutions:

Complete statewide management plan

- Draft Statewide framework plan nearly done
- Specific EMU- Elk Management Unit drafts nearly done

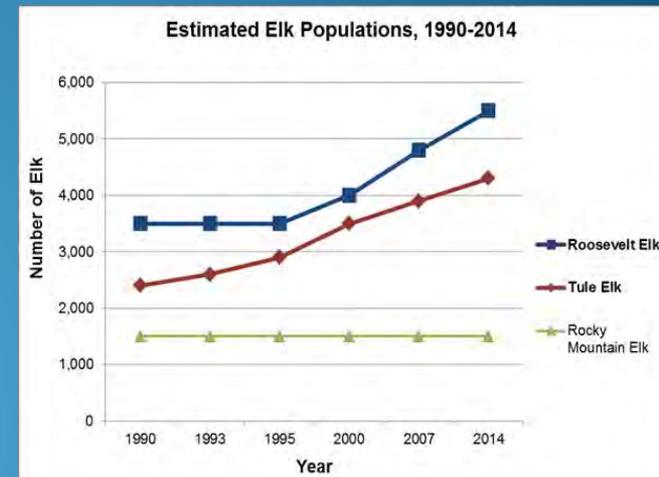

Proposed regulations consistent with final plan because both are necessarily guided by existing legislative mandate.

Redefine boundaries/add zones for effective use of hunting to address elk/landowner conflict; provide hunting opportunity

Increase tag quotas where elk problems are increasing

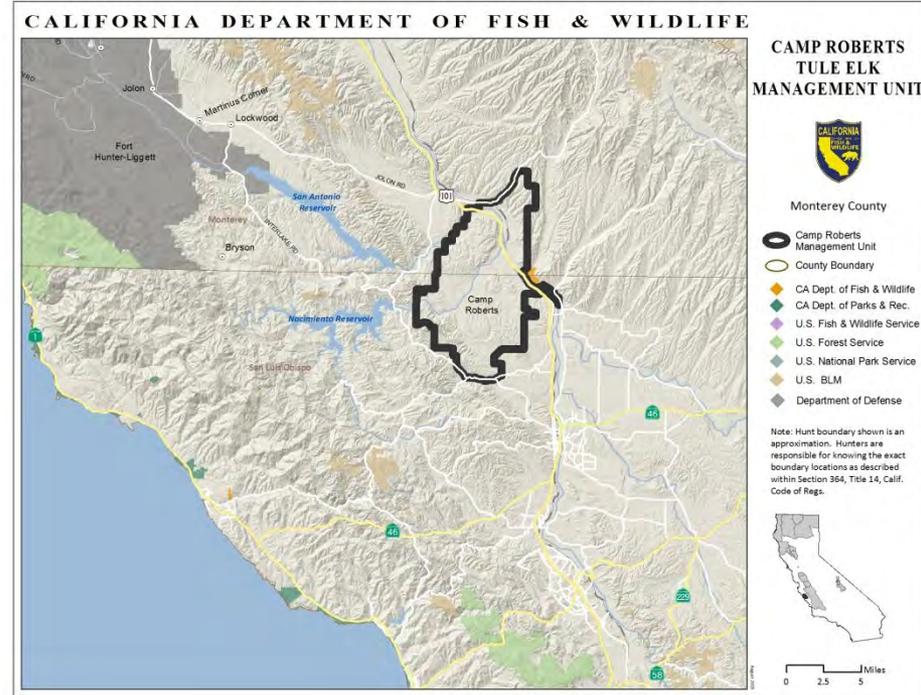

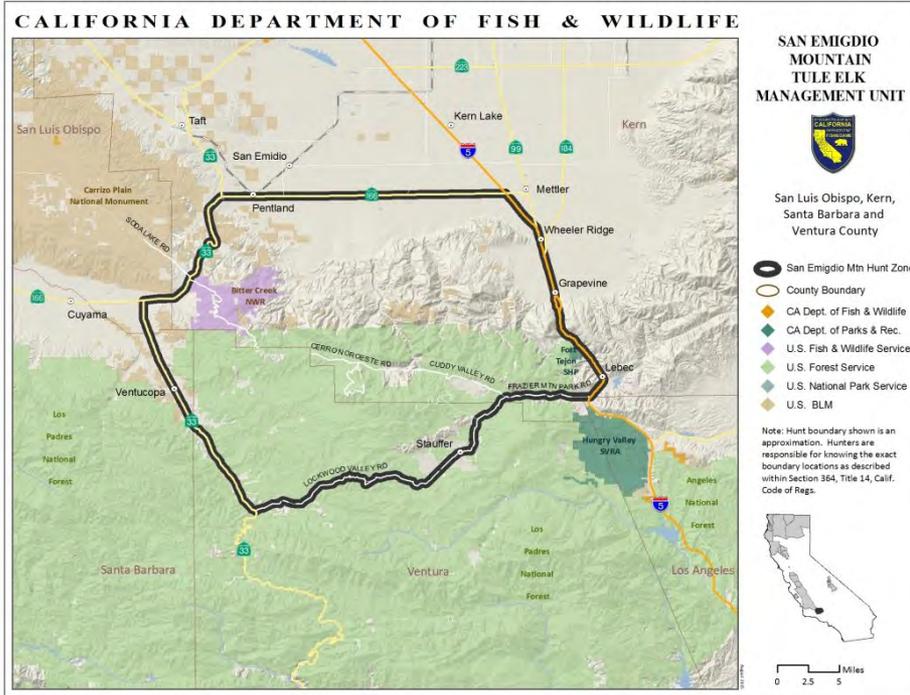

Incentive-based to increase landowner support
Of elk on their property (SHARE or PLM)

Reduce need/pressure to issue depredation permits

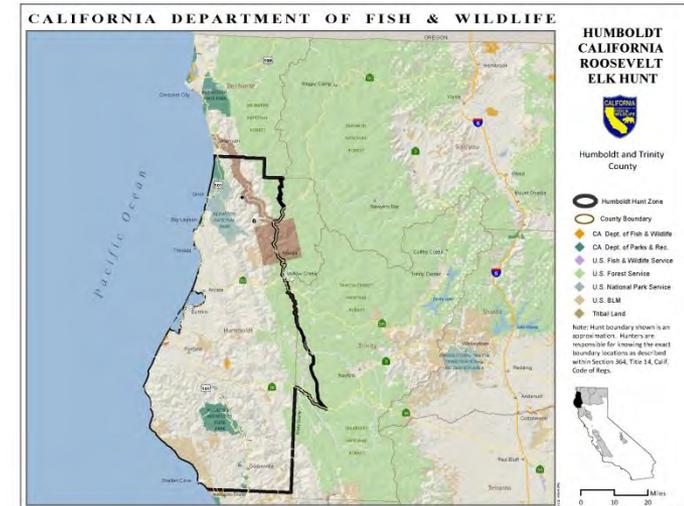

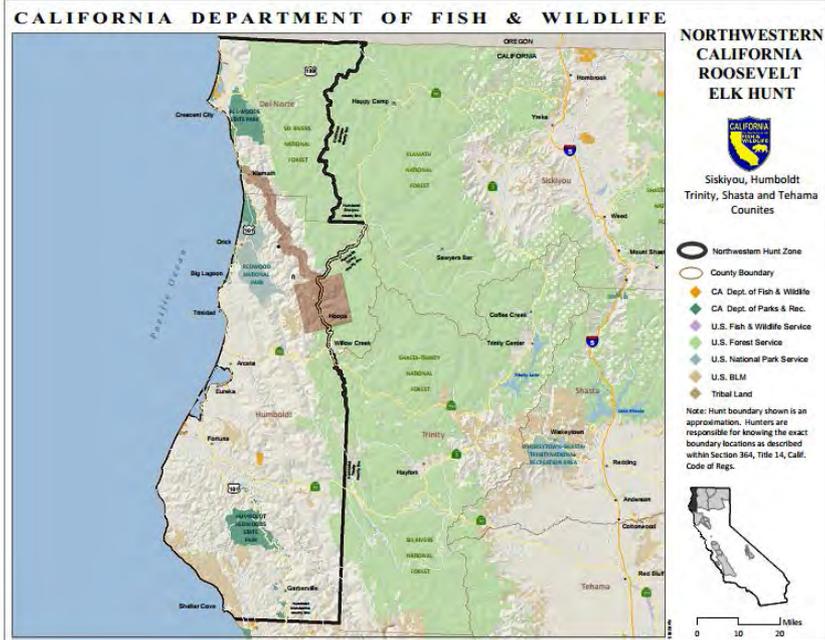

Example- New Zones

- San Emigdio (Kern, San Luis Obispo, Santa Barbara, and Ventura Counties)
- Camp Roberts (Monterey and San Luis Obispo Counties)

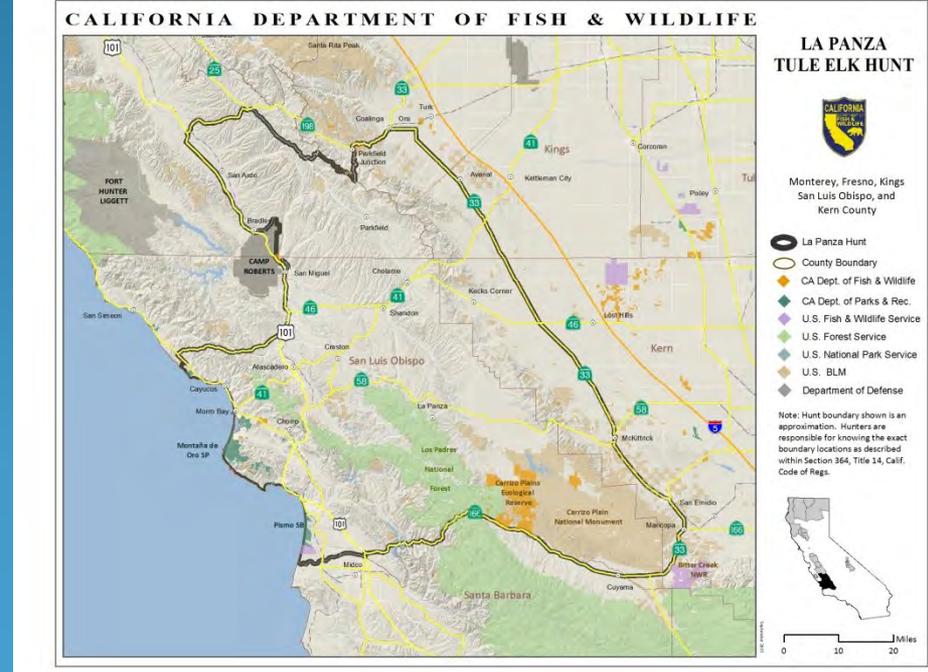

Example -Zone Splits - Northwestern

Now - Del Norte and Humboldt
(minor boundary modification to follow roads)

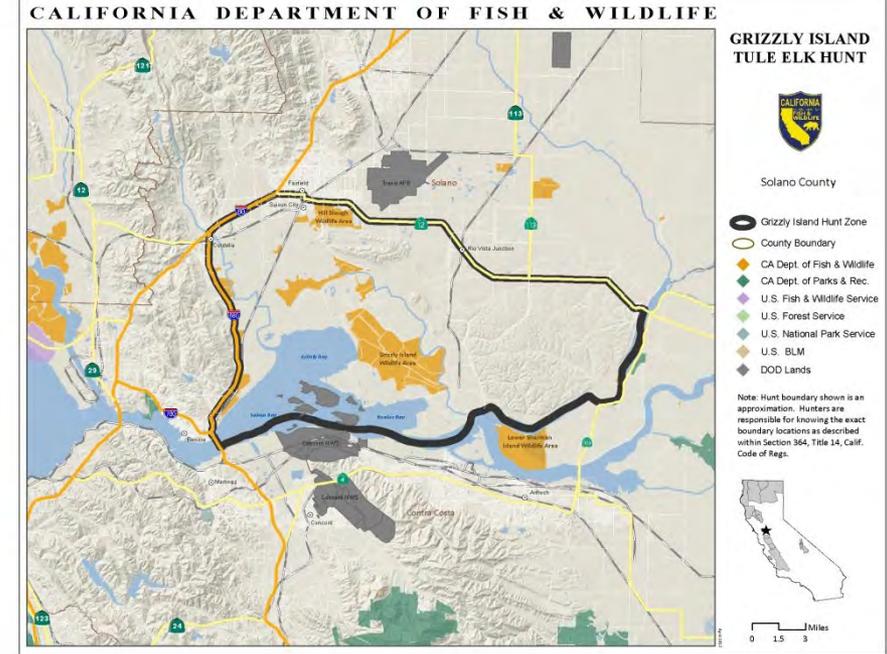

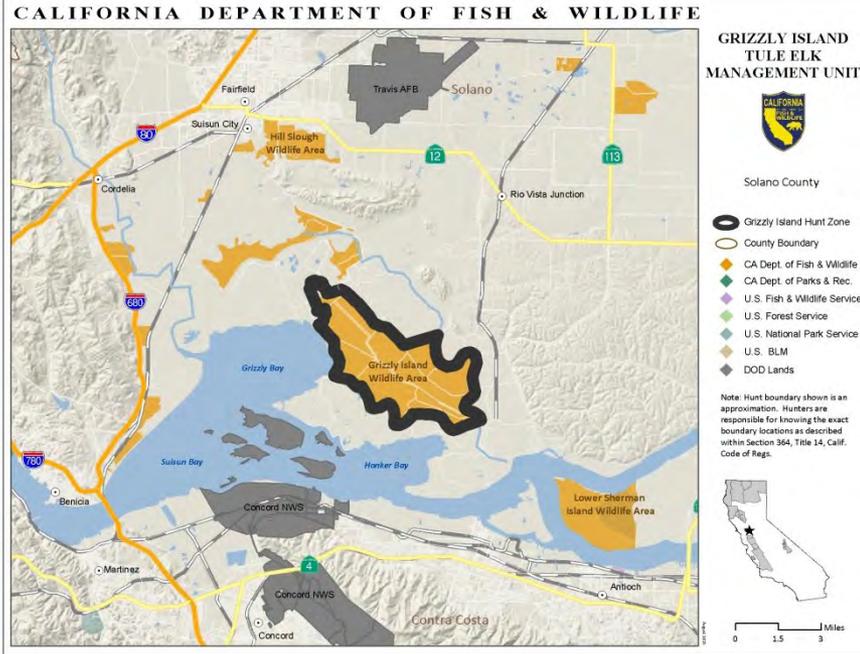

Example- Zone Modifications – La Panza

Overall boundaries modified – Expanded to the west

Example- Zone Modification - Grizzly Island

Expanded boundary

Proposal Would Result in: Additional Hunt Periods and Types

- Del Norte and Humboldt (5 periods)
- Marble Mountain North and South (3 periods and muzzleloader/archery period)
- Siskiyou (3 periods and muzzleloader/archery period)
- San Luis Reservoir (3 periods)
- Grizzly Island (13 periods)
- Lake Pillsbury (3 Periods)

Proposal also modifies:

Multi-Zone Fund Raising Tag

- Modify season dates so it is consistent across all zones
- Tag is valid in Del Norte, Humboldt, Marble Mountain North, Marble Mountain South, Siskiyou, Northeastern, and La Panza.
- Tag will be valid for 90 days beginning in mid-August

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 3960, 3960.2 and 3960.4, Fish and Game Code. Reference: Sections 200, 202, 203, 203.1, 207, 3960, 3960.2, 3960.4 and 4756, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change: None.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission's Wildlife Resources Committee (WRC) meeting held on September 9, 2015 in Fresno, California. The proposed changes to the regulation were discussed and the members of the WRC concurred with the Department's recommendations.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified.

(b) No Change Alternative:

The no change alternative was considered and rejected because it would not eliminate the unnecessary regulation concerning the use of treeing switches. The no change alternative would also continue the regulation prohibiting the use of GPS equipped collars and therefore continue the problem of hunters unable to retrieve wounded game (wanton waste) or locating lost dogs.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. Removing outdated prohibitions on treeing switches and GPS collars are not anticipated to affect current levels of hunting effort for species that can legally be pursued with dogs.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Representative Private Persons/Business:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.
- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.
- (f) Programs Mandated on Local Agencies or School Districts: None.
- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None.
- (h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

The proposed action will have no statewide economic or fiscal impact because the proposed action modifies the regulation regarding the use of electronic dog collars while hunting only for deer and wild pigs. The regulation eliminates unnecessary language prohibiting the use of treeing switches; and, permits GPS equipped collars increasing the hunter's ability to find and retrieve downed wild pigs and deer as well as lost dogs. There are no costs to businesses or persons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because it is unlikely to cause an increase or decrease in hunting effort.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not create new businesses or eliminate businesses within the State because it is unlikely to cause an increase or decrease in hunting effort.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State:

The regulation will not affect the expansion of businesses currently doing business in the State because it is unlikely to cause an increase or decrease in hunting effort.

- (d) Benefits of the regulation to the health and welfare of California residents:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment:

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources of the State. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

INFORMATIVE DIGEST

(Policy Statement Overview)

Amend Section 265, Title 14, CCR, by deleting subsections (d)(1) and (d)(2). The current regulations prohibit the use of treeing switches and GPS collar equipment for dogs used in the taking of mammals. Recent changes to statutes have restricted the use of dogs by hunters to only the taking of wild pigs and deer. The prohibition on the use of treeing switches is therefore unnecessary. Allowing the use of GPS collar equipment will improve a hunter's ability to find and retrieve downed game and lost dogs.

Benefits of the regulations

The regulation eliminates unnecessary language regarding the prohibition on the use of treeing switches; and, permits GPS equipped collars increasing the hunter's ability to find and retrieve downed wild pigs and deer as well as lost dogs.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to the use of dogs for hunting mammals to be consistent with the provisions of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 265, Title 14, CCR is amended to read:

§265. Use of Dogs for Pursuit/Take of Mammals or for Dog Training.

... [No changes to subsections (a) through (c)]

~~(d) Prohibition on Treeing Switches and Use of Global Positioning System Equipment.~~

~~(1) Treeing Switches. Electronic dog retrieval collars containing functioning treeing switches (devices consisting of a switch mechanism that results in a change in the transmitted signals when the dog raises its head to a treed animal) are prohibited on dogs used for the pursuit/take of mammals.~~

~~(2) Global Positioning System Equipment. Electronic dog retrieval collars employing the use of global positioning system equipment (devices that utilize satellite transmissions) are prohibited on dogs used for the pursuit/take of mammals.~~

Authority cited: Sections 200, 202, 203, 3960, 3960.2 and 3960.4, Fish and Game Code. Reference: Sections ~~200, 202, 203, 203.1, 207,~~ 3960, 3960.2, and 3960.4 and 4756, Fish and Game Code.

projectile types is confusing to hunters and difficult to interpret by law enforcement. Furthermore, frangible bullets designed primarily for security or tactical purposes are not an efficient and effective means to take big game.

The commonly accepted industry standard for centerfire cartridges (recommended by most major bullet/ammunition manufacturers for the take of big game animals) is a softnose or expanding type bullet that upon impact or while passing through animal tissue: 1) increases in diameter (mushrooms) from its original diameter; and 2) maintains close to its original manufactured weight. Bullets designed to demonstrate these terminal performance characteristics are considered the most effective in obtaining the quickest, most efficient humane kills. Further, softnose or expanding bullets are thought to provide the best combination of deep penetration through various tissue types including bone, and expansion (mushrooming) which results in the greatest damage to vital organs through direct trauma to tissues and surrounding areas, and to circulatory and central nervous systems through hydrostatic and hydraulic forces.

Frangible bullets are typically manufactured by fusing or binding a powdered metal component composed of copper or copper-tin in jacketed or unjacketed formats. Frangible bullets are designed to disintegrate or fragment upon impact with a hard surface, with the intent to reduce or eliminate ricochet and pass through conditions which can result in impact to secondary or unintended targets under non-hunting uses. In hunting applications this would result in a decrease in penetration due to the loss of momentum through extreme fragmentation.

The terminal performance characteristics of the more traditional softnose or expanding bullets differ substantially from those of frangible bullets. While the intended design of softnose/expanding bullets is to maintain a bullet's integrity in order to obtain maximum penetration and tissue destruction, the opposite is true regarding frangible bullets designed to disintegrate or break into a number of bullet fragments resulting in reduced penetration.

The proposed regulation changes are as follows:

- 1) Add clause to subsection 353(a) specifically making it unlawful to use methods of take or projectiles for big game other than what is authorized in Sections 250.1 and 353;
- 2) Add a new subsection 353(b)(1) defining the term "softnose or expanding projectile" based upon design and common accepted terminology of mushrooming, bullet diameter increase, and bullet weight retention; and
- 3) Add a new subsection 353(b)(2) to clarify that "frangible" bullets are not softnose or expanding projectiles and therefore not legal for the take of big game in accordance with subsection 353(c).

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority cited: Sections 200, 202 and 203, Fish and Game Code. Reference: Sections 2005, 2055, 3004.5 and 3950, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None

(d) Identification of Reports or Documents Supporting Regulation Change: None

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

The Department's regulation change concepts for the 2016-17 big game hunting seasons were presented and discussed at the Fish and Game Commission Wildlife Resources Committee meeting held in Fresno on September 9, 2015.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternative was identified.

(b) No Change Alternative:

The "No Change Alternative" was considered and found inadequate to attain the project objectives. Retaining the current terminology without clear, concise definitions results in confusion on the part of hunters and creates a legal obstacle to enforcement of existing method of take restrictions.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

(d) Description of Reasonable Alternatives That Would Lessen Adverse Impact on Small Business: None.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States.

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adds definitions to method of take regulations for big game in order to clarify regulations for law enforcement and legal applications, and eliminate possible confusion on the part of hunters. The proposal is economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents and to the state's environment. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Private Persons.

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None

- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None

- (f) Programs Mandated on Local Agencies or School Districts: None

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment

The purpose of the proposed amendments is to specifically require compliance with sections 353 and 250.1 when taking big game, and to clarify which cartridges may be used by defining “softnose or expanding projectile.” There are no costs to businesses or persons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because defining projectile types that are authorized for big game hunting is unlikely to change current levels of hunting activity.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not create new businesses or eliminate businesses within the State because defining projectile types that are authorized for big game hunting is unlikely to change current levels of hunting activity.

(c) Effects of the regulation on the expansion of businesses currently doing business within the State:

The regulation will not affect the expansion of businesses currently doing business in the State because defining projectile types that are authorized for big game hunting is unlikely to change current levels of hunting activity.

(d) Benefits of the regulation to the health and welfare of California residents:

The Commission anticipates benefits to the health and welfare of California residents and benefits to the State’s environment because the proposed regulation assists the Department in the sustainable management of California’s big game populations.

(e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

(f) Benefits of the regulation to the State's environment:

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action does not impact the State’s environment.

INFORMATIVE DIGEST (Policy Statement Overview)

Amend Section 353, Title 14, California Code of Regulations (CCR), Methods Authorized for Taking Big Game. The purpose of the proposed amendments is to specifically require compliance with sections 353 and 250.1 when taking big game, and to clarify which cartridges may be used by defining “softnose or expanding projectile.”

The current regulations in Section 353, Title 14, CCR, provide method of take restrictions for big game using centerfire cartridges in rifles, pistols and revolvers. The projectiles used in these firearms are required to be “softnose or expanding.” However, these words are not defined in the regulation. While “softnose or expanding” is commonly accepted from the standpoint of bullet design and trade industry terminology, some have suggested that it could include frangible bullets. The lack of distinction between projectile types is confusing to hunters and difficult to interpret by law enforcement. Furthermore, frangible bullets are not an efficient and effective means to take big game.

The proposed regulation changes are as follows:

- 1) Add clause to subsection 353(a) specifically making it unlawful to use methods of take or projectiles for big game other than what is authorized in Sections 250.1 and 353;
- 2) Add a new subsection 353(b)(1) to define “softnose or expanding projectile” based upon design and common accepted terminology of mushrooming, bullet diameter increase and bullet weight retention; and
- 3) Add a new subsection 353(b)(2) to clarify that “frangible” bullets are not softnose or expanding projectiles.

Benefits of the regulations

The Commission anticipates benefits to the health and welfare of California residents and benefits to the State’s environment because the proposed regulation assists the Department in the sustainable management of California’s big game populations.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate the hunting of big game species in California. Commission staff has searched the California Code of Regulations and has found the proposed regulations are consistent with the hunting of big game species, specifically Sections 360, 362, 363, 364, 365 and 368 of Title 14. Therefore the Commission has determined that the proposed amendment is neither inconsistent nor incompatible with existing State regulations.

The proposed amendments are consistent with federal laws, which generally allow states to specify ammunition that is appropriate to be used for hunting purposes.

REGULATORY TEXT

Section 353 is amended to read:

§353. Methods Authorized for Taking Big Game.

(a) It shall be unlawful to take or attempt to take big game in violation of this section or Section 250.1. The take or attempted take of any big game (as defined by Section 350 of these regulations) with a firearm shall be in accordance with the use of nonlead projectiles and ammunition pursuant to Section 250.1 of these regulations.

(b) Definition. For purposes of this section, a projectile is any bullet, ball, sabot, slug, buckshot or other device that is expelled from a firearm through a barrel by force. The following definitions shall apply:

(1) A softnose or expanding projectile is a bullet designed to increase from its original diameter, commonly referred to as “mushrooming”, and retain a significant part of its original weight upon impact with, or when passing through the tissues of an animal.

(2) Projectiles commonly referred to as “frangible” bullets, designed to disintegrate upon impact with, or when passing through the tissues of an animal are not softnose or expanding projectiles.

... [No changes to subsections (c) through (m)]

Note: Authority cited: Sections 200, 202 and 203, Fish and Game Code. Reference: Sections ~~200, 202, 203, 203.1, 207,~~ 2005, 2055, 3004.5 and 3950, Fish and Game Code.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Subsection 360(a)
Title 14, California Code of Regulations (CCR)
Re: Deer: A, B, C, and D Zone Hunts

I. Date of Initial Statement of Reasons: September 21, 2015

II. Dates and Locations of Scheduled Hearings:

- | | | |
|-------------------------|-----------|-------------------|
| (a) Notice Hearing: | Date: | December 10, 2015 |
| | Location: | San Diego, CA |
| | | |
| (b) Discussion Hearing: | Date: | February 11, 2016 |
| | Location: | Sacramento, CA |
| | | |
| (c) Adoption Hearing: | Date: | April 14, 2016 |
| | Location: | Santa Rosa, CA |

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

1. Number of Tags

Existing regulations provide for the number of deer hunting tags in the A, B, C, and D zones. The proposed action changes the number of tags for all existing zones to a series of ranges as indicated in the Informative Digest.

This proposal initially provides a range of tag numbers for each zone from which a final number will be determined, based on the post-winter status of each deer herd. Ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of available bucks next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

This regulatory proposal changes the number of tags for all Deer Zone Hunts to a series of ranges presented in the table below.

Deer: § 360(a) A, B, C, and D Zone Hunts			
Tag Allocations			
§	Zone	Current 2015	Proposed 2016 [Range]
(1)	A	65,000	30,000-65,000
(2)	B	35,000	35,000-65,000
(3)	C	8,150	5,000-15,000
(4)	D3-5	33,000	30,000-40,000
(5)	D-6	10,000	6,000-16,000
(6)	D-7	9,000	4,000-10,000
(7)	D-8	8,000	5,000-10,000
(8)	D-9	2,000	1,000-2,500
(9)	D-10	700	400-800
(10)	D-11	5,500	2,500-6,000
(11)	D-12	950	100-1,500
(12)	D-13	4,000	2,000-5,000
(13)	D-14	3,000	2,000-3,500
(14)	D-15	1,500	500-2,000
(15)	D-16	3,000	1,000-3,500
(16)	D-17	500	100-800
(17)	D-19	1,500	500-2,000

The actual tag numbers for each affected zone will be reflected in the Final Statement of Reasons and will be selected from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where various environmental factors including severe winter conditions can adversely affect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None

(d) Identification of Reports or Documents Supporting Regulation Change:

2007 Final Environmental Document Regarding Deer Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission Wildlife Resources Committee meeting held in Fresno on September 9, 2015.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

The Fish and Game Commission forwarded the following public recommendations to the Department for study and consideration:

Section 360(a). Sam Craig – 8/23/14. Request for changes in B zones for black-tailed deer.

Response: Rejected. Deer hunting seasons and quotas are established based on a combination of herd performance, harvest, terrain, weather patterns, and hunter demand, relative to individual deer herd management plan objectives. There is no data to suggest that restricting hunter opportunity by implementing the changes requested would serve to increase deer populations. The Department rejects this proposal because it is inconsistent with objectives outlined in individual deer herd management plans, would not produce the results identified by the requestor, and would unnecessarily restrict hunter opportunity.

Section 360(a). Lucas Murgia – 10/6/14. Requests temporary ban on deer hunting in zone D-7.

Response: Rejected. Deer hunting seasons are established based on a combination of herd performance, harvest, terrain, weather patterns, and hunter demand, relative to individual deer herd management plan objectives. Hunting in Zone D-7 as proposed is not expected to have a negative effect on

the deer population. The Department rejects this proposal because it conflicts with objectives outlined in the individual deer herd management plans and Section 1801 of the Fish and Game Code, and would unnecessarily restrict hunter opportunity.

Section 360 (a). Brian Russell – 12/18/14. Request to include harvesting of 3-point or better bucks in zone C4.

Response: Rejected. The Department rejects the recommendation to return to the three point or better restriction because it is inconsistent with sound management practices. The bag and possession limit for zones X-1 through X-5C was modified from bucks three point or better to forked horn or better beginning with the 1990 season in order to reduce waste due to illegal killing of forked-horn bucks and to reduce harvest pressure on older age class bucks. The result of the change was that fewer forked horn bucks were killed by mistake and left in the field during the season and more large antlered bucks remained in the herd post season. The recommendation would cause an unnecessary waste of illegally killed forked horned bucks and require the Department to reduce the tag quotas to compensate for increased kill.

Section 360 (b),(c). Lassen County Board of Supervisors - Supervisors request an overall tag allocation of 10% archery, 10% muzzleloader, and 80% rifle for hunt zones 3, 4, 5, 6, 7, X1, X3A, X3B, X4, X7A and C4 to increase hunting opportunities (Resolution 14-016).

Response: Rejected. Tag quotas recommended by the Department are established in conformance with management objectives contained within individual deer herd management plans. The distribution of tag quotas between various methods of take is based on a combination of herd performance and allowable buck harvest (ABH); method specific harvest success; and method specific demand. Therefore, because the Department uses a data-driven objective process to determine deer tag quotas, this proposal is rejected.

(b) No Change Alternative:

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current number of tags for the zones listed may not be responsive to changes in the status of the herds. The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by modifying the number of tags. The “No Change Alternative” would not allow management of the desired proportion of bucks stated in the approved deer herd management plans.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the

regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

- (d) Description of Reasonable Alternatives That Would Lessen Adverse Impact on Small Business: None.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the most recent Final Environmental Document Regarding Deer Hunting and related documents.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made:

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States.

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing deer hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents and to the state's environment. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Private Persons.

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None
- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None
- (f) Programs Mandated on Local Agencies or School Districts: None
- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None
- (h) Effect on Housing Costs: None

VII. Economic Impact Assessment:

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the last deer season in the A, B, C, and D zones. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved deer herd management plans to preserve herd health and hunting opportunities in subsequent seasons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation is unlikely to result in the creation of new businesses or the elimination of existing businesses because no major changes in the number of tags issued are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation is unlikely to cause the expansion of businesses currently doing business within the State because no major changes in the number of tags issued are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will have a positive effect on the health and welfare of California residents. Recreational hunting is a healthy outdoor activity and venison is a nutritious food.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety because it does not address working conditions.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action will forward this core objective.

INFORMATIVE DIGEST
(Policy Statement Overview)

Existing regulations provide for the number of license tags available for deer in the A, B, C, and D Zones. This regulatory proposal changes the number of tags for all existing zones to a series of ranges presented in the table below. These ranges are necessary because the final number of tags cannot be determined until spring herd data are collected in March/April. Because various environmental factors including severe winter conditions can adversely affect herd recruitment and over-winter adult survival, the final recommended quotas may fall below the current proposed range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

Deer: § 360(a) A, B, C, and D Zone Hunts Tag Allocations			
§	Zone	Current 2015	Proposed 2016 [Range]
(1)	A	65,000	30,000-65,000
(2)	B	35,000	35,000-65,000
(3)	C	8,150	5,000-15,000
(4)	D3-5	33,000	30,000-40,000
(5)	D-6	10,000	6,000-16,000
(6)	D-7	9,000	4,000-10,000
(7)	D-8	8,000	5,000-10,000
(8)	D-9	2,000	1,000-2,500
(9)	D-10	700	400-800
(10)	D-11	5,500	2,500-6,000
(11)	D-12	950	100-1,500
(12)	D-13	4,000	2,000-5,000
(13)	D-14	3,000	2,000-3,500
(14)	D-15	1,500	500-2,000
(15)	D-16	3,000	1,000-3,500
(16)	D-17	500	100-800
(17)	D-19	1,500	500-2,000

Benefits of the regulations

The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by annually modifying the number of hunting tags. The final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate deer hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to deer tag allocations are consistent with Sections 361, 701, 702, 708.5 and 708.6 of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Subsection (a) of Section 360 is amended to read:

§360. Deer.

Except as otherwise provided in this Title 14, deer may be taken only as follows:

(a) A, B, C, and D Zone Hunts.

(1) Zone A.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~30,000~~ [30,000-65,000]. Zone A tags are valid in Zone A-South Unit 110 and Zone A-North Unit 160.

(2) Zone B.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~35,000~~ [35,000-65,000]. Zone B tags are valid in Zones B-1, B-2, B-3, B-4, B-5 and B-6

(3) Zone C.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~8,150~~ [5,000-15,000]. Zone C tags are valid in Zones C-1, C-2, C-3, and C-4 during the general season only as described above in subsections 360(a)(3)(B)1. through 4.

(4) Zone D-3-5.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~33,000~~ [30,000-40,000]. The Zone D-3-5 tag is valid in zones D-3, D-4, and D-5.

(5) Zone D-6.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~40,000~~ [6,000-16,000].

(6) Zone D-7.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~9,000~~ [4,000-10,000].

(7) Zone D-8.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~8,000~~ [5,000-10,000].

(8) Zone D-9.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~2,000~~ [1,000-2,500].

(9) Zone D-10.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~700~~ [400-800].

(10) Zone D-11.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5,500~~ [2,500-6,000].

... [No change to subsection (E)]

(11) Zone D-12.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~950~~ [100-1,500].

(12) Zone D-13.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~4,000~~ [2,000-5,000].

... [No change to subsection (E)]

(13) Zone D-14.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~3,000~~ [2,000-3,500].

(14) Zone D-15.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~4,500~~ [500-2,000].

... [No change to subsection (E)]

(15) Zone D-16.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~3,000~~ [1,000-3,500].

(16) Zone D-17.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~500~~100-800. [100-800].

(17) Zone D-19.

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~4,500~~ [500-2,000].

[subsections (b), (c), (d), (e)]

Note: Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code. Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

The following table provides a proposed range of tag numbers for each zone from which a final number of tags will be determined:

Deer: § 360(b) X-Zone Hunts Tag Allocations			
§	Zone	Current 2015	Proposed 2016 [Range]
(1)	X-1	775	1,000-6,000
(2)	X-2	160	50-500
(3)	X-3a	315	100-1,200
(4)	X-3b	795	200-3,000
(5)	X-4	435	100-1,200
(6)	X-5a	75	25-200
(7)	X-5b	50	50-500
(8)	X-6a	320	100-1,200
(9)	X-6b	305	100-1,200
(10)	X-7a	225	50-500
(11)	X-7b	135	25-200
(12)	X-8	210	100-750
(13)	X-9a	650	100-1,200
(14)	X-9b	325	100-600
(15)	X-9c	325	100-600
(16)	X-10	400	100-600
(17)	X-12	680	100-1,200

The actual tag numbers for each affected zone will be reflected in the Final Statement of Reasons and will be selected from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where various environmental factors such as severe winter conditions can adversely affect herd recruitment and over-winter adult survival, final tag quotas may fall

below the proposed tag range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change:

None

(d) Identification of Reports or Documents Supporting Regulation Change:

2007 Final Environmental Document Regarding Deer Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission Wildlife Resources Committee meeting held in Fresno on September 9, 2015.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

There is no reasonable alternative to the proposed action.

(b) No Change Alternative:

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current number of tags for the zones listed may not be responsive to changes in the status of the herds. The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by modifying the number of hunting tags. The “No Change Alternative” would not allow management of the desired proportion of bucks stated in the approved deer herd management plans.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the

statutory policy or other provision of law.

- (d) Description of Reasonable Alternatives That Would Lessen Adverse Impact on Small Business: None.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the most recent Final Environmental Document regarding Deer Hunting and related documents.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing deer hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents and to the state's environment. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California because it will not result in significant changes in hunting effort in the affected zones, The proposed action does not provide benefits to worker safety because it does not address working conditions..

- (c) Cost Impacts on Private Persons:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None
- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None
- (f) Programs Mandated on Local Agencies or School Districts: None
- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None
- (h) Effect on Housing Costs: None

VII. Economic Impact Assessment:

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the 2015 deer season in the X zones. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved deer herd management plans to preserve herd health and hunting opportunities in subsequent seasons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no significant changes in hunting activity levels are anticipated.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no significant changes in hunting activity levels are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no significant changes in hunting activity levels are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will benefit the health and welfare of California residents by maintaining healthy deer herds and providing opportunities for the public to participate in a healthy outdoor activity.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the State's living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST
(Policy Statement Overview)

Existing regulations provide for the number of deer hunting tags for the X zones. The proposed action changes the number of tags for all existing zones to a series of ranges presented in the table below. These ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April. Because various environmental factors such as severe winter conditions can adversely affect herd recruitment and over-winter adult survival, the final recommended quotas may fall below the current proposed range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

Deer: § 360(b) X-Zone Hunts Tag Allocations			
§	Zone	Current 2015	Proposed 2016 [Range]
(1)	X-1	775	1,000-6,000
(2)	X-2	160	50-500
(3)	X-3a	315	100-1,200
(4)	X-3b	795	200-3,000
(5)	X-4	435	100-1,200
(6)	X-5a	75	25-200
(7)	X-5b	50	50-500
(8)	X-6a	320	100-1,200
(9)	X-6b	305	100-1,200
(10)	X-7a	225	50-500
(11)	X-7b	135	25-200
(12)	X-8	210	100-750
(13)	X-9a	650	100-1,200
(14)	X-9b	325	100-600
(15)	X-9c	325	100-600
(16)	X-10	400	100-600
(17)	X-12	680	100-1,200

Benefits of the regulations

The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by annually modifying the

number of hunting tags. The final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate deer hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to deer tag allocations are consistent with Sections 361, 701, 702, 708.5 and 708.6 of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Subsection (b) of Section 360 is amended to read:

§360. Deer.

[subsection (a)]...

(b) X-Zone Hunts.

(1) Zone X-1.

[No changes to subsections (A) through (C)]

(D) Number of Tags: ~~775~~ [1,000-6,000].

(2) Zone X-2.

[No changes to subsections (A) through (C)]

(D) Number of Tags: ~~460~~ [50-500].

(3) Zone X-3a.

[No changes to subsections (A) through (C)]

(D) Number of Tags: ~~315~~ [100-1,200].

(4) Zone X-3b.

Note: Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code. Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Subsection 360(c)
Title 14, California Code of Regulations (CCR)
Re: Deer: Additional Hunts

I. Date of Initial Statement of Reasons: September 21, 2015

II. Dates and Locations of Scheduled Hearings:

- | | | |
|-------------------------|-----------|-------------------|
| (a) Notice Hearing: | Date: | December 10, 2015 |
| | Location: | San Diego, CA |
| | | |
| (b) Discussion Hearing: | Date: | February 11, 2016 |
| | Location: | Sacramento, CA |
| | | |
| (c) Adoption Hearing: | Date: | April 14, 2016 |
| | Location: | Santa Rosa, CA |

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

1. Number of Tags

Existing regulations provide for the number of deer hunting tags in the Additional Hunts. The proposed action provides a range of tag numbers for each hunt from which a final number will be determined, based on the post-winter status of each deer herd. Ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of available bucks next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

The proposed action changes the number of tags for all existing hunts to a series of ranges as indicated in the following table:

Deer: § 360(c) Additional Hunts Tag Allocations			
§	Hunt Number (and Title)	Current 2015	Proposed 2016 [Range]
(1)	G-1 (Late Season Buck Hunt for Zone C-4)	2,710	500-5,000
(2)	G-3 (Goodale Buck Hunt)	35	5-50
(3)	G-6 (Kern River Deer Herd Buck Hunt)	50	25-100
(4)	G-7 (Beale Either-Sex Deer Hunt)	20 Military*	20 Military*
(5)	G-8 (Fort Hunter Liggett Antlerless Deer Hunt)	20 Tags Total* (10 Military & 10 Public)	20 Tags Total* (10 Military and 10 Public)
(6)	G-9 (Camp Roberts Antlerless Deer Hunt)	0	30 Tags Total* (15 Military and 15 Public)
(7)	G-10 (Camp Pendleton Either-Sex Deer Hunt)	250 Military*	250 Military*
(8)	G-11 (Vandenberg Either-Sex Deer Hunt)	200 Military*, DOD and as Authorized by the Installation Commander**	200 Military*, DOD and as Authorized by the Installation Commander**
(9)	G-12 (Gray Lodge Shotgun Either-Sex Deer Hunt)	30	10-50
(10)	G-13 (San Diego Antlerless Deer Hunt)	300	50-300

(42)	J-20 (Zone X-7b Apprentice Either-Sex Deer Hunt)	20	5-20
(43)	J-21 (East Tehama Apprentice Either-Sex Deer Hunt)	50	20-80

* *Specific numbers of tags are provided for military hunts through a system which restricts hunter access to desired levels and ensures biologically conservative hunting programs.*

** *DOD = Department of Defense and eligible personnel as authorized by the Installation Commander.*

The actual tag numbers for each affected hunt will be reflected in the Final Statement of Reasons and will be selected from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where various

environmental factors including severe winter conditions can adversely affect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

Note: The current tag quota of zero (0) for additional deer hunt G-9 (Camp Roberts Antlerless Deer Hunt) reflects the Base’s closure to hunting while construction was under way on the base. Construction was scheduled for completion in 2013; however the timetable for resumption of base hunting programs has not been determined. The Department is currently in meetings with base command, and a decision regarding tag quotas is anticipated by the early March Fish and Game Commission meeting date. At this time, the current tag quota of zero (0) has been modified to the former tag quota of thirty (30) in anticipation of the possible resumption of deer hunting activities by the Base in the 2016/2017 season. However, if Base operations take precedence over conducting the G-9 hunt, the tag quota will be reduced to zero (0) and reflected in the Final Statement.

In addition, Fort Hunter Liggett base command has requested a minor tag quota increase of 10 total tags back to their original tag quota for Hunt J-10 (From 75 to 85 total tags) identified in the authorizing Environmental Document. This request has been accepted by the Department and is reflected in the proposed regulatory change.

2. Modify Season for Additional Hunt G-8

Existing regulations in subsection 360(c)(5) for Additional Hunt G-8 (Fort Hunter Liggett Antlerless Deer Hunt) provide for hunting to begin on October 3 and October 10, and continue for 2 and 3 days respectively, inclusive of the Columbus Day holiday, in order to accommodate Base operations and other hunt opportunities.

The current proposal would modify the season to account for the annual calendar shift by changing the season dates to open on October 8 and continue for three (3) consecutive days, including the Columbus Day holiday, and reopen on October 15 and continue for two (2) consecutive days. Additionally, the Base requested the season for Hunt G-8 be shifted one week later in order to accommodate base operations and eliminate season overlap with elk hunts and conflict with deer hunts during the first week of October. These activities had effectively reduced the size of the hunt area for G-8 deer hunters. No loss of hunter opportunity would result from this action and the proposal is consistent with existing deer herd management plan recommendations.

3. Modify Season for Additional Hunt J-10

Existing regulations in subsection 360(c)(32) for Additional Hunt J-10 (Fort Hunter Liggett Junior Either-Sex Deer Hunt) provide for hunting to begin on October 3 and October 10, and continue for 2 and 3 days respectively,

inclusive of the Columbus Day holiday, in order to accommodate for Base operations and other hunt opportunities.

The current proposal would modify the season to account for the annual calendar shift by changing the season dates to open on October 8 and continue for three (3) consecutive days, including the Columbus Day holiday, and reopen on October 15 and continue for two (2) consecutive days. Additionally, the Base requested the season for Hunt J-10 be shifted one week later in order to accommodate for base operations and eliminate season overlap with elk hunts and conflict with deer hunts during the first week of October. These activities had effectively reduced the size of the hunt area for J-10 deer hunters. No loss of hunter opportunity would result from this action and the proposal is consistent with existing deer herd management plan recommendations.

4. Minor Editorial Changes

Minor editorial changes are necessary for consistency in subsection numbering, spelling, grammar, and clarification.

Recent changes to Section 550 require that such references be changed to Section 551.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None

(d) Identification of Reports or Documents Supporting Regulation Change:

2007 Final Environmental Document Regarding Deer Hunting.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission Wildlife Resources Committee meeting held in Fresno on September 9, 2015.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

1. Number of Tags

There is no reasonable alternative to the proposed action.

2. Modify Season for Additional Hunt G-8

Modify season to include all weekdays. This proposal was considered and rejected because it would not accommodate for military operations which primarily occur on weekdays, resulting in daily hunt cancellations, hunter dissatisfaction and the unnecessary restricting of hunter opportunity.

3. Modify Season and Special Conditions for Additional Hunt J-10

Modify season to include all weekdays. This proposal was considered and rejected because it would not accommodate for military operations which primarily occur on weekdays, resulting in daily hunt cancellations, hunter dissatisfaction and the unnecessary restriction of hunter opportunity.

4. Minor Editorial Changes

There is no reasonable alternative to the proposed action.

(b) No Change Alternative:

1. Number of Tags

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current number of tags for the hunts listed may not be responsive to changes in the status of the herds. The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by modifying the number of tags. The “No Change Alternative” would not allow management of the desired proportion of bucks stated in the approved deer herd management plans.

2. Modify Season for Additional Hunt G-8

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current season length and timing would be unresponsive to Base operations, scheduled activities and unnecessarily restrict hunter opportunity.

3. Modify Season for Additional Hunt J-10

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current season length and timing would be unresponsive to Base operations, scheduled activities and/or unnecessarily restrict hunter opportunity.

4. Minor Editorial Changes

The “No Change Alternative” was considered and found inadequate to attain the project objectives, because inconsistencies in section and subsection references, numbering, spelling, grammar and lack of clarification would exist within the regulations, potentially leading to confusion and possible violations.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the most recent Final Environmental Document regarding Deer Hunting and related documents.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and following initial determinations relative to the required statutory categories have been made.

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts, modifies season dates for two hunts on military land and makes minor editorial changes for consistency in Section numbering. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State’s Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family

activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California because it will not result in a change in hunting effort. The proposed action does not provide benefits to worker safety because it does not address working conditions.

(c) Cost Impacts on Private Persons:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None

(e) Other Nondiscretionary Costs/Savings to Local Agencies: None

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment:

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the 2015 deer season in the additional hunt zones. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved deer herd management plans to preserve herd health and hunting opportunities in subsequent seasons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no significant changes in hunting activity levels are anticipated.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no significant changes in hunting activity levels are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no significant changes in hunting activity levels are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will benefit the health and welfare of California residents by maintaining sustainable deer populations and providing opportunities for the public to participate in a healthy outdoor activity.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the State's living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST
(Policy Statement Overview)

Existing regulations provide for the number of deer hunting tags in the Additional Hunts. The proposed action provides a range of tag numbers for each hunt from which a final number will be determined, based on the post-winter status of each deer herd. These ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April. Because various environmental factors such as severe winter conditions can adversely affect herd recruitment and over-winter adult survival, the final recommended quotas may fall below the current proposed range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

Existing regulations for Additional Hunts G-8 (Fort Hunter Liggett Antlerless Deer Hunt) and J-10 (Fort Hunter Liggett Apprentice Either-Sex Deer Hunt) provide for hunting to begin on October 3 and continue for two (2) consecutive days and reopen on October 10 and continue for three (3) consecutive days, inclusive of the Columbus Day holiday, in order to accommodate for Base operations and other hunt opportunities. The proposal would modify the season to account for the annual calendar shift and move the seasons one week later to eliminate conflicts with elk hunting during the first week of October. The proposal would change the season dates to open on October 8 and October 15, for 3 and 2 consecutive days respectively, and include the Columbus Day holiday, in order to accommodate for Base operations.

Minor editorial changes are necessary to provide consistency in subsection numbering, spelling, grammar, and clarification.

The proposed action changes the number of tags for all existing hunts to a series of ranges as indicated in the table below.

Deer: § 360(c) Additional Hunts Tag Allocations			
§	Hunt Number (and Title)	Current 2015	Proposed 2016 [Range]
(1)	G-1 (Late Season Buck Hunt for Zone C-4)	2,710	500-5,000
(2)	G-3 (Goodale Buck Hunt)	35	5-50
(3)	G-6 (Kern River Deer Herd Buck Hunt)	50	25-100

**Specific numbers of tags are provided for military hunts through a system which restricts hunter access to desired levels and ensures biologically conservative hunting programs.*

***DOD = Department of Defense and eligible personnel as authorized by the Installation Commander.*

Benefits of the regulations

The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by annually modifying the number of hunting tags. The final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate deer hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to deer tag allocations are consistent with Sections 361, 701, 702, 708.5 and 708.6 of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Subsection (c) of Section 360 is amended to read:

§360. Deer.

...[subsections (a) and (b)]

(c) Additional Hunts.

(1) G-1 (Late Season Buck Hunt for Zone C-4).

... [No change to subsections (A) through (C)]

(D) Number of Tags: ~~2,740~~ [500-5,000].

(2) G-3 (Goodale Buck Hunt).

... [No change to subsections (A) through (C)]

(D) Number of Tags: ~~35~~ [5-50].

(3) G-6 (Kern River Deer Herd Buck Hunt).

... ... [No change to subsections (A) through (C)]

(D) Number of Tags: ~~50~~ [25-100].

... [No change to subsection (c)(4)]

(5) G-8 (Fort Hunter Liggett Antlerless Deer Hunt).

... [No change to subsection (A)]

(B) Season: The season for additional hunt G-8 (Fort Hunter Liggett Antlerless Deer Hunt) shall open on October ~~3~~ 8 and extend for ~~2~~ 3 consecutive days and reopen on October ~~4~~ 15 and extend for ~~3~~ 2 consecutive days, except if rescheduled by the Commanding Officer with Department concurrence between the season opener and December 31.

... [No change to subsections (C) through (E)]

(6) G-9 (Camp Roberts Antlerless Deer Hunt).

... [No change to subsections (A) through (C)]

(D) Number of Tags: ~~0~~ 30 (15 military and 15 public).

... [No change to subsection (E)]

... [No change to subsections (c)(7) and (8)]

(9) G-12 (Gray Lodge Shotgun Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~30~~ [10-50].

... [No change to subsection (E)]

(10) G-13 (San Diego Antlerless Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~300~~ [50-300].

(11) G-19 (Sutter-Yuba Wildlife Areas Either-Sex Deer Hunt).

(A) Area: Those portions of Yuba and Sutter counties within the exterior boundaries of: (1) the Feather River Wildlife Area, and (2) the Sutter Bypass Wildlife Area (as defined in Section ~~550~~ 551, Title 14, CCR).

... [No changes to subsections (B) and (C)]

(D) Number of Tags: ~~25~~ [10-50].

... [No change to subsection (E)]

(12) G-21 (Ventana Wilderness Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~25~~ [25-100].

(13) G-37 (Anderson Flat Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~25~~ [25-50].

(14) G-38 (X-10 Late Season Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~300~~ [50-300].

(15) G-39 (Round Valley Late Season Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-150].

(16) M-3 (Doyle Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~20~~ [10-75].

... [No change to subsection (E)]

(17) M-4 (Horse Lake Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-50].

... [No change to subsection (E)]

(18) M-5 (East Lassen Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-50].

... [No change to subsection (E)]

(19) M-6 (San Diego Muzzleloading Rifle Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~80~~ [25-100].

... [No change to subsection (E)]

(20) M-7 (Ventura Muzzleloading Rifle Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~450~~ [50-150].

... [No change to subsection (E)]

(21) M-8 (Bass Hill Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~20~~ [5-50].

... [No change to subsection (E)]

(22) M-9 (Devil's Garden Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~45~~ [5-100].

... [No change to subsection (E)]

(23) M-11 (Northwestern California Muzzleloading Rifle Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~20~~ [20-200].

... [No change to subsection (E)]

(24) MA-1 (San Luis Obispo Muzzleloading Rifle/Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~450~~ [20-150].

... [No change to subsection (E)]

(25) MA-3 (Santa Barbara Muzzleloading Rifle/Archery Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~450~~ [20-150].

... [No change to subsection (E)]

(26) J-1 (Lake Sonoma Apprentice Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~25~~ [10-25].

... [No change to subsection (E)]

(27) J-3 (Tehama Wildlife Area Apprentice Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~45~~ [15-30].

... [No change to subsection (E)]

(28) J-4 (Shasta-Trinity Apprentice Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~45~~ [15-50].

... [No change to subsection (E)]

(29) J-7 (Carson River Apprentice Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~45~~ [10-50].

... [No change to subsection (E)]

(30) J-8 (Daugherty Hill Wildlife Area Apprentice Either-Sex Deer Hunt).

(A) Area: That portion of Yuba County within the exterior boundaries of the Daugherty Hill Wildlife Area (as defined in Section ~~550~~ 551, Title 14, CCR).

... [No changes to subsections (B) through (C)]

(D) Number of Tags: ~~45~~ [10-20].

... [No change to subsection (E)]

(31) J-9 (Little Dry Creek Apprentice Shotgun Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-10].

... [No change to subsection (E)]

(32) J-10 (Fort Hunter Liggett Apprentice Either-Sex Deer Hunt).

... [No change for subsection (A)]

(B) Season: The season for additional hunt J-10 (Fort Hunter Liggett Apprentice Either-Sex Deer Hunt) shall open on October ~~3~~8 and extend for ~~2~~3 consecutive days and reopen on October ~~10~~15 and extend for ~~3~~2 consecutive days, except if rescheduled by the Commanding Officer with Department concurrence between the season opener and December 31.

... [No change to subsection (C)]

(D) Number of Tags: ~~75~~85 (~~45~~25 military and 60 general public).

... [No change to subsection (E)]

(33) J-11 (San Bernardino Apprentice Either-Sex Deer Hunt).

... [No changes for subsections (A) through (C)]

(D) Number of Tags: ~~40~~ [10-50].

... [No change to subsection (E)]

(E) Special Conditions:

(34) J-12 (Round Valley Apprentice Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~40~~ [10-20].

Note: Authority: Sections 200, 202, 203, 220, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code. Reference: Sections 200, 202, 203, 203.1, 207, 458, 459, 460, 3051, 3452, 3453, 3953 and 4334, Fish and Game Code.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Section 361
Title 14, California Code of Regulations (CCR)
Re: Archery Deer Hunting

I. Date of Initial Statement of Reasons: October 12, 2015

II. Dates and Locations of Scheduled Hearings:

(a) Notice Hearing: Date: December 10, 2015
 Location: San Diego, CA

(b) Discussion Hearing: Date: February 11, 2016
 Location: Sacramento, CA

(c) Adoption Hearing: Date: April 14, 2016
 Location: Santa Rosa, CA

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

1. Number of Tags

Existing regulations provide for the number of deer hunting tags for area-specific archery hunts. The proposed action provides a range of tag numbers for each hunt from which a final number will be determined, based on the post-winter status of each deer herd. Ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of available bucks next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

This proposed regulatory action would change the number of tags for all existing hunts to a series of ranges as indicated in the following table:

Archery Deer Hunting: § 361(b)			
Tag Allocations			
§	Hunt Number (and Title)	Current 2015	Proposed 2016 [Range]
(1)	A-1 (C Zones Archery Only Hunt)	1,945	[150-3,000]
(2)	A-3 (Zone X-1 Archery Hunt)	115	[50-1,000]
(3)	A-4 (Zone X-2 Archery Hunt)	10	[5-100]
(4)	A-5 (Zone X-3a Archery Hunt)	35	[10-300]
(5)	A-6 (Zone X-3b Archery Hunt)	70	[25-400]
(6)	A-7 (Zone X-4 Archery Hunt)	120	[25-400]
(7)	A-8 (Zone X-5a Archery Hunt)	15	[15-100]
(8)	A-9 (Zone X-5b Archery Hunt)	5	[5-100]
(9)	A-11 (Zone X-6a Archery Hunt)	50	[10-200]
(10)	A-12 (Zone X-6b Archery Hunt)	90	[10-200]
(11)	A-13 (Zone X-7a Archery Hunt)	45	[10-200]
(12)	A-14 (Zone X-7b Archery Hunt)	25	[5-100]
(13)	A-15 (Zone X-8 Archery Hunt)	40	[5-100]
(14)	A-16 (Zone X-9a Archery Hunt)	140	[50-500]
(15)	A-17 (Zone X-9b Archery Hunt)	300	[50-500]
(16)	A-18 (Zone X-9c Archery Hunt)	350	[50-500]
(17)	A-19 (Zone X-10 Archery Hunt)	100	[25-200]

Archery Deer Hunting: § 361(b) Tag Allocations			
§	Hunt Number (and Title)	Current 2015	Proposed 2016 [Range]
(18)	A-20 (Zone X-12 Archery Hunt)	100	[50-500]
(19)	A-21 (Anderson Flat Archery Buck Hunt)	25	[25-100]
(20)	A-22 (San Diego Archery Either-Sex Deer Hunt)	1,000	[200-1,500]
(21)	A-24 (Monterey Archery Either-Sex Deer Hunt)	100	[25-200]
(22)	A-25 (Lake Sonoma Archery Either-Sex Deer Hunt)	35	[20-75]
(23)	A-26 (Bass Hill Archery Buck Hunt)	30	[10-100]
(24)	A-27 (Devil's Garden Archery Buck Hunt)	5	[5-75]
(25)	A-30 (Covelo Archery Buck Hunt)	40	[20-100]
(26)	A-31 (Los Angeles Archery Either-Sex Deer Hunt)	1,000	[200-1,500]
(27)	A-32 (Ventura/Los Angeles Archery Late Season Either-Sex Deer Hunt)	250	[50-300]
(28)	A-33 (Fort Hunter Liggett Late Season Archery Either-Sex Deer Hunt)	50 Tags Total* (25 Military & 25 Public)	50 Tags Total* (25 Military & 25 Public)

The actual tag numbers for each affected hunt will be reflected in the Final Statement of Reasons and will be selected from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where various environmental factors such as severe winter conditions can adversely affect herd recruitment and over-winter adult survival, final tag quotas may fall

below the proposed tag range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

A minor editorial correction is proposed for subsection 361(b)(26)(C) changing the referenced subsection to 351(c) which is the correct citation for the definition of either-sex deer.

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 220, and 4370, Fish and Game Code.

Reference: Sections 200, 202, 203, 203.1, 207, and 4370, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None

(d) Identification of Reports or Documents Supporting Regulation Change:

2007 Final Environmental Document Regarding Deer Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission Wildlife Resources Committee meeting held in Fresno on September 9, 2015.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

There is no reasonable alternative to the proposed action.

(b) No Change Alternative:

The “No Change Alternative” was considered and found inadequate to attain the project objectives. Retaining the current number of tags for the hunts listed may not be responsive to changes in the status of the herds. The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by modifying the number of hunting tags. The “No Change Alternative” would not allow management of the desired proportion of bucks stated in the approved deer herd management plans.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the

regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

- (d) Description of Reasonable Alternatives That Would Lessen Adverse Impact on Small Business: None.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the most recent Final Environmental Document Regarding Deer Hunting and related documents.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents and to the state's environment. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California because no significant changes in hunting activity levels

are anticipated. The proposed action does not provide benefits to worker safety.

(c) Cost Impacts on Private Persons:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

(d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None

(e) Other Nondiscretionary Costs/Savings to Local Agencies: None

(f) Programs Mandated on Local Agencies or School Districts: None

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None

(h) Effect on Housing Costs: None

VII. Economic Impact Assessment:

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the 2015 deer season in the archery hunt zones. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved deer herd management plans to preserve herd health and hunting opportunities in subsequent seasons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no significant changes in hunting activity levels are anticipated.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no significant changes in hunting activity levels are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no significant changes in hunting activity levels are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will benefit the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the State's living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST
(Policy Statement Overview)

Existing regulations provide for the number of deer hunting tags for existing area-specific archery hunts. The proposed action changes the number of tags for existing hunts to a series of ranges presented in the table below. These ranges are necessary at this time because the final number of tags cannot be determined until spring herd data are collected in March/April. Because various environmental factors such as severe winter conditions can adversely affect herd recruitment and over-winter adult survival, the final recommended quotas may fall below the current proposed range into the “Low Kill” alternative identified in the most recent Environmental Document Regarding Deer Hunting.

Archery Deer Hunting: § 361(b)			
Tag Allocations			
§	Hunt Number (and Title)	Current 2015	Proposed 2016 [Range]
(1)	A-1 (C Zones Archery Only Hunt)	1,945	[150-3,000]
(2)	A-3 (Zone X-1 Archery Hunt)	115	[50-1,000]
(3)	A-4 (Zone X-2 Archery Hunt)	10	[5-100]
(4)	A-5 (Zone X-3a Archery Hunt)	35	[10-300]
(5)	A-6 (Zone X-3b Archery Hunt)	70	[25-400]
(6)	A-7 (Zone X-4 Archery Hunt)	120	[25-400]
(7)	A-8 (Zone X-5a Archery Hunt)	15	[15-100]
(8)	A-9 (Zone X-5b Archery Hunt)	5	[5-100]
(9)	A-11 (Zone X-6a Archery Hunt)	50	[10-200]
(10)	A-12 (Zone X-6b Archery Hunt)	90	[10-200]
(11)	A-13 (Zone X-7a Archery Hunt)	45	[10-200]

(13)	A-15 (Zone X-8 Archery Hunt)	40	[5-100]
(14)	A-16 (Zone X-9a Archery Hunt)	140	[50-500]
(15)	A-17 (Zone X-9b Archery Hunt)	300	[50-500]
(16)	A-18 (Zone X-9c Archery Hunt)	350	[50-500]
(17)	A-19 (Zone X-10 Archery Hunt)	100	[25-200]
(18)	A-20 (Zone X-12 Archery Hunt)	100	[50-500]
(19)	A-21 (Anderson Flat Archery Buck Hunt)	25	[25-100]
(20)	A-22 (San Diego Archery Either-Sex Deer Hunt)	1,000	[200-1,500]
(21)	A-24 (Monterey Archery Either-Sex Deer Hunt)	100	[25-200]
(22)	A-25 (Lake Sonoma Archery Either-Sex Deer Hunt)	35	[20-75]
(23)	A-26 (Bass Hill Archery Buck Hunt)	30	[10-100]
(24)	A-27 (Devil's Garden Archery Buck Hunt)	5	[5-75]
(25)	A-30 (Covelo Archery Buck Hunt)	40	[20-100]
(26)	A-31 (Los Angeles Archery Either-Sex Deer Hunt)	1,000	[200-1,500]
(27)	A-32 (Ventura/Los Angeles Archery Late Season Either-Sex Deer Hunt)	250	[50-300]
(28)	A-33 (Fort Hunter Liggett Late Season Archery Either-Sex Deer Hunt)	50 Tags Total* (25 Military & 25 Public)	50 Tags Total* (25 Military & 25 Public)

* *Specific numbers of tags are provided for military hunts through a system which restricts hunter access to desired levels and ensures biologically conservative hunting programs.*

Benefits of the regulations

The deer herd management plans specify objective levels for the proportion of bucks in the herds. These ratios are maintained and managed in part by annually modifying the number of hunting tags. The final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate archery deer hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to archery deer tag allocations are consistent with Sections 360, 701, 702, 708.5 and 708.6 of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 361 is amended to read:

§361. Archery Deer Hunting.

... [No changes in subsection (a)]

(b) Archery Hunting With Area-specific Archery Tags. Deer may be taken only with archery equipment specified in Section 354, only during the archery seasons as follows:
(1) A-1 (C Zones Archery Only Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~1,945~~ [150-3,000] A-1 (C Zones Archery Only Hunt) tags are valid in Zones C-1, C-2, C-3, and C-4 only during the archery season as specified above in subsections 361(b)(1)(B)1 through 4.

(2) A-3 (Zone X-1 Archery Hunt)

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~115~~ [50-1,000].

(3) A-4 (Zone X-2 Archery Hunt)

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~10~~ [5-100].

(4) A-5 (Zone X-3a Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~35~~ [10-300].

(5) A-6 (Zone X-3b Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~70~~ [25-400].

(6) A-7 (Zone X-4 Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~120~~ [25-400].

(7) A-8 (Zone X-5a Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~15~~ [15-100].

(8) A-9 (Zone X-5b Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-100].

(9) A-11 (Zone X-6a Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~50~~ [10-200].

(10) A-12 (Zone X-6b Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~90~~ [10-200].

(11) A-13 (Zone X-7a Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~45~~ [10-200].

(12) A-14 (Zone X-7b Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~25~~ [5-100].

(13) A-15 (Zone X-8 Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~40~~ [5-100].

(14) A-16 (Zone X-9a Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~440~~ [50-500].

(15) A-17 (Zone X-9b Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~300~~ [50-500].

(16) A-18 (Zone X-9c Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~350~~ [50-500].

(17) A-19 (Zone X-10 Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~400~~ [25-200].

(18) A-20 (Zone X-12 Archery Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~400~~ [50-500].

(19) A-21 (Anderson Flat Archery Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~25~~ [25-100].

(20) A-22 (San Diego Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~4,000~~ [200-1,500].

(21) A-24 (Monterey Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~400~~ [25-200].

(22) A-25 (Lake Sonoma Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~35~~ [20-75].

... [No change to subsection (E)]

(23) A-26 (Bass Hill Archery Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~30~~ [10-100].

(24) A-27 (Devil's Garden Archery Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~5~~ [5-75].

(25) A-30 (Covelo Archery Buck Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~40~~ [20-100].

(26) A-31 (Los Angeles Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (B)]

(C) Bag and Possession Limit: One either-sex deer (see subsection 351-~~(b)~~ (c)) per tag.

(D) Number of Tags: ~~1,000~~ [200-1,500].

(27) A-32 (Ventura/Los Angeles Late Season Archery Either-Sex Deer Hunt).

... [No changes to subsections (A) through (C)]

(D) Number of Tags: ~~250~~ [50-300].

... [No changes to subsection (b)(28)]

... [No changes to subsections (c) through (e)]

Note: Authority cited: Sections 200, 202, 203, 220 and 4370, Fish and Game Code.
Reference: Sections 200, 202, 203, 203.1, 207 and 4370, Fish and Game Code.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Subsection 362,
Title 14, California Code of Regulations (CCR)
Re: Nelson Bighorn Sheep

Date of Initial Statement of Reasons: November 2, 2015

II. Dates and Locations of Scheduled Hearings:

- | | |
|--------------------------|---|
| (a) Notice Hearing: | Date: December 10, 2015
Location: San Diego, CA |
| (b) Discussion Hearings: | Date: February 11, 2016
Location: Sacramento, CA |
| (c) Adoption Hearing: | Date: April 14, 2016
Location: Santa Rosa, CA |

III. Description of Regulatory Action:

- (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

In accordance with management goals and objectives, and in order to maintain hunting quality, tag quotas for hunts need to be adjusted annually. Current regulations specify the number of bighorn sheep hunting tags for the 2015 season. This proposed regulatory action will amend subsection 362(d) providing the number of tags for bighorn sheep hunting in 2016.

Preliminarily, the tag numbers are presented in ranges (e.g., [0-3]) in the table in subsection 362(d) of the amended Regulatory Text. Final tag quotas for each zone will be identified and recommended to the Fish and Game Commission at the April 14, 2016, adoption hearing.

Section 4902 of the Fish and Game Code specifies that the Commission may allow the take of no more than 15 percent of the mature Nelson bighorn rams estimated in the hunt areas in a single year, based on the Department's annual estimate of the population in each management unit. The Department is currently implementing aerial surveys. The proposed tag ranges are biologically conservative by design to ensure that harvest is consistent with management plan guidelines for individual units and not more than 15 percent of the mature rams in any zone are taken. The Department's research indicates that aerial surveys do not detect all mature rams present.

The Department's recommendations to the Commission will be consistent with the following criteria as supported by management plans:

- If the Department's annual population estimate for any of the individual management units is below 50 adult ewes and/or the ram/ewe ratio falls below 40:100, then the Department will recommend a 0 tag quota for the 2016 season in that unit.
- If no substantial reduction in population is determined in the estimate of the population, then tag quotas for 2016 will be recommended consistent with management plan guidelines and the statutory requirement that no more than 15% of the mature rams may be harvested through hunting, Fish and Game Code section 4902(a)(2).

(b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 200, 202, 203, 220, 1050, and 4902, Fish and Game Code.

Reference: Sections 1050, 3950, and 4902, Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change:

2011 Final Environmental Document Regarding Bighorn Sheep Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified.

(b) No Change Alternative:

The no-change alternative was considered and rejected because it would not attain project objectives of providing for hunting opportunities while maintaining bighorn sheep populations within desired population objectives. Retaining the current tag quota for each zone may not be responsive to biologically-based changes in the status of various herds.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the

regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the 2011 Final Environmental Document Regarding Bighorn Sheep Hunting.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made.

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts. Given the number of tags available and the area over which they are distributed, these proposals are economically neutral to business.

(b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

(c) Cost Impacts on Representative Private Persons/Business:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.
- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.
- (f) Programs Mandated on Local Agencies or School Districts: None.
- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None.
- (h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the last bighorn sheep season. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved management plans to preserve herd health and hunting opportunities in subsequent seasons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no substantial changes in hunting activity are anticipated.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no substantial changes in hunting activity are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no substantial changes in hunting activity are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

(f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST (Policy Statement Overview)

The current regulation in Section 362, T14, CCR, provides for limited hunting of Nelson bighorn rams in specified areas of the State. The proposed amendments are intended to adjust the number of hunting tags for the 2016 season based on the Department's annual estimate of the population in each of the nine hunt zones. The Department's final recommendations will ensure that the take will be no more than 15 percent of the mature rams estimated in each zone in accordance with Fish and Game Code Section 4902.

Preliminarily, the tag numbers are presented as ranges (e.g., [0 -3]) in the table in subsection 362(d) of the amended Regulatory Text. Final tag quotas for each zone will be identified and recommended to the Fish and Game Commission at the April 14, 2016, adoption hearing.

Benefits of the regulations

The Nelson Bighorn Sheep management plans specify objective levels for the herds. These ratios are maintained and managed in part by annually modifying the number of tags. The final values for the license tag numbers will be based upon findings from the population surveys.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate Nelson Bighorn Sheep hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to Nelson Bighorn Sheep tag allocations are consistent with the provisions of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Subsection (d) of Section 362, Title 14, CCR is amended to read:

§ 362. Nelson Bighorn Sheep.

[No changes to subsections (a) through (c)]

(d) Number of License Tags:

<i>Nelson Bighorn Sheep Hunt Zones</i>	<i>Tag Allocation</i>
Zone 1 - Marble/Clipper Mountains	3 [0-4]
Zone 2 - Kelso Peak/Old Dad Mountains	0 [0-4]
Zone 3 - Clark/Kingston Mountain Ranges	4 [0-2]
Zone 4 - Orocopia Mountains	4 [0-2]
Zone 5 - San Gorgonio Wilderness	2 [0-3]
Zone 6 - Sheep Hole Mountains	0 [0-2]
Zone 7 - White Mountains	4 [0-5]
Zone 8 - South Bristol Mountains	4 [0-3]
Zone 9 - Cady Mountains	2 [0-4]
Open Zone Fund-Raising Tag	4 [0-1]
Marble/Clipper/South Bristol Mountains Fund-Raising Tag	0 [0-1]
Kelso Peak/Old Dad Mountains Fund-Raising Tag	0 [0-1]

[No change to subsection (e)]

Note: Authority cited: Sections 200, 202, 203, 220, 1050 and 4902, Fish and Game Code. Reference: Sections ~~200, 202, 203, 203.1, 207,~~ 1050, 3950 and 4902, Fish and Game Code.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Section 363
Title 14, California Code of Regulations (CCR)
Re: Pronghorn Antelope

I. Date of Initial Statement of Reasons: October 12, 2015

II. Dates and Locations of Scheduled Hearings:

(a) Notice Hearing: Date: December 10, 2015
Location: San Diego, CA

(b) Discussion Hearings: Date: February 11, 2016
Location: Sacramento, CA

(c) Adoption Hearing: Date: April 14, 2016
Location: Santa Rosa, CA

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

1. Number of Tags

In accordance with management goals and objectives, and in order to maintain hunting quality, tag quotas for hunts need to be adjusted annually. Current regulations specify the number of pronghorn antelope hunting tags for the 2015 season. This proposed regulatory action will amend subsection 363(m) providing the number of tags for hunting in 2016.

Preliminarily, the tag numbers are presented as ranges (e.g., [0-3]) in the table in subsection 363(m) of the amended Regulatory Text. Final tag quotas for each zone will be identified and recommended to the Fish and Game Commission at the April 14, 2016, adoption hearing.

Ranges are necessary because final quotas cannot be determined until survey data is analyzed. Winter surveys are scheduled for January, 2016. Analysis of survey results will be completed by March, 2016. Final tag quotas will allow for a biologically appropriate harvest of bucks and does in the population and will achieve/maintain buck ratios at or above minimum levels specified in appropriate management plans. Administrative procedures and the Fish and Game Code require the Fish and Game Commission to receive proposed changes to existing regulations prior to the time winter pronghorn

antelope surveys are completed. Final tag quotas for each zone will be identified and reported in the Final Statement of Reasons based upon findings from the annual winter surveys.

2. Minor Editorial Changes

The current regulations specify the Number of License Tags (i.e. quota) for each hunt in two places: within the hunt zone text itself (for example, subsection 363(a)(4)(A and B); and, the same quota appears in subsection 363 (m) Pronghorn Antelope Tag Allocations Table. In order to simplify, insure accuracy, and make clear, all references to Number of License Tags in the hunt zones 363(a) through (k) are deleted and the Table in 363(m) will remain.

Clarifying language regarding license possession and accompaniment by an adult chaperon is proposed for Lassen apprentice tag holders to be consistent with the other apprentice hunt information.

The regulations also propose replacing area boundary descriptions for the apprentice hunts with a reference to the general zone boundaries to reduce redundancy.

Minor editorial changes are also proposed for consistency in subsection numbering, spelling, grammar, and clarity.

(b) Authority and Reference:

Authority: Fish and Game Code sections 219, 220, 331, 1050 and 10502.

Reference: Fish and Game Code Sections 331, 713, 1050, 10500 and 10502.

(c) Specific Technology or Equipment Required by Regulatory Change:

None.

(d) Identification of Reports or Documents Supporting Regulation Change:

None.

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

1. Number of Tags

No alternatives were identified. Pronghorn antelope license tag quotas must be changed periodically in response to a variety of biological and environmental conditions.

2. Minor Editorial Changes

No alternatives were identified.

(b) No Change Alternative:

1. Number of Tags

The no change alternative was considered and rejected because it would not attain project objectives of providing for hunting opportunities while maintaining pronghorn antelope populations within desired population objectives. Retaining the current tag quota for each zone may not be responsive to biologically-based changes in the status of various herds. Management plans specify minimum desired buck to doe ratios which are attained/maintained in part by modifying tag quotas on an annual basis. The no change alternative would not allow for adjustment of tag quotas in response to changing environmental/biological conditions.

2. Minor Editorial Changes

The no change alternative was considered and rejected because it would not attain consistency across or reduce redundancy in regulation.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The maximum number of tags available in the newly proposed range is at or below the number of tags analyzed in the 2004 Final Environmental Document Regarding Pronghorn Antelope Hunting.

VI. Impact of Regulatory Action.

This proposed action adjusts tag quotas for existing hunts. Given the number of tags available, and the area over which they are distributed, this proposal is economically neutral to business.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States.

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed action adjusts tag quotas for existing hunts. Considering the small number of tags issued over the entire state, this proposal is economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Private Persons.

The agency is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.

- (f) Programs Mandated on Local Agencies or School District: None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None.

- (h) Effect on Housing Costs: None.

VII. Economic Impact Analysis

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the last pronghorn antelope season. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved management plans to preserve herd health and hunting opportunities in subsequent seasons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no substantial changes in hunting activity are anticipated.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no substantial changes in hunting activity are anticipated.

(c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no substantial changes in hunting activity are anticipated.

(d) Benefits of the regulation to the health and welfare of California residents:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources.

(e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

(f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST (Policy Statement Overview)

Amend Section 363, Pronghorn Antelope, Title 14, California Code of Regulations (CCR).

In accordance with management goals and objectives, and in order to maintain hunting quality, tag quotas for Pronghorn Antelope hunts need to be adjusted annually. Current regulations specify the number of pronghorn antelope hunting tags for the 2015 season. This proposed regulatory action will amend subsection 363(m) providing the number of tags for hunting in 2016.

Preliminarily, the tag numbers are presented as ranges (e.g., [0-3]) in the table in subsection 363(m) of the amended Regulatory Text. Final tag quotas for each zone will be identified and recommended to the Fish and Game Commission at the April 14, 2016, adoption hearing.

Other minor changes to the regulatory text to reduce redundancy, improve accuracy and clarity are proposed.

Benefits of the regulations

The management plans specify objective levels for the herds. These ratios are maintained and managed in part by annually modifying the number of tags. The final values for the license tag numbers will be based upon findings from the population surveys.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate pronghorn antelope hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to pronghorn antelope tag allocations are consistent with the provisions of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 363 is amended to read:

§ 363. Pronghorn Antelope.

The Lava Beds National Monument and Federal and State Game Refuges lying within the hunt boundary are closed to pronghorn antelope hunting, except for the state's Hayden Hill (1S) and Blacks Mountain (1F) game refuges in Lassen County and the Clear Lake National Wildlife Refuge in Modoc County. Refer to subsection 363(b)(5) for special conditions for permission to enter and hunt pronghorn antelope in the Clear Lake National Wildlife Refuge.

(a) Zone 1 - Mount Dome:

... [No changes to subsections 363(a)(1) through (3)]

~~(4) Number of License Tags:~~

~~(A) General Season: 0 buck tags and 0 doe tags.~~

~~(B) Archery Only Season: 0 buck tags and 0 doe tags.~~

(b) Zone 2 - Clear Lake:

... [No changes to subsections 363(b)(1) through (3)]

~~(4) Number of License Tags:~~

~~(A) General Season: 15 buck tags and 0 doe tags.~~

~~(B) Archery Only Season: 1 buck tags and 0 doe tags.~~

~~(5) (4) Special Conditions:~~ The special regulations regarding the Peninsula "U" portion of the Clear Lake National Wildlife Refuge are summarized as follows:

... [No changes to subsections 363(b)(5)(A) through (E)]

(c) Zone 3 - Likely Tables:

... [No changes to subsections 363(c)(1) through (3)]

~~(4) Number of License Tags:~~

~~(A) General Season: Period One: 40 buck tags and 0 doe tags. Period Two: 40 buck tags and 0 doe tags.~~

~~(B) Archery Only Season: 10 buck tags and 0 doe tags.~~

(d) Zone 4 - Lassen:

... [No changes to subsections 363(d)(1) through (3)]

~~(4) Number of License Tags:~~

~~(A) General Season: Period One: 45 buck tags and 0 doe tags. Period Two: 45 buck tags and 0 doe tags.~~

~~(B) Archery Only Season: 10 buck tags and 0 doe tags.~~

(e) Zone 5 - Big Valley:

... [No changes to subsections 363(e)(1) through (3)]

- ~~(4) Number of License Tags:~~
- ~~(A) General Season: 20 buck tags and 0 doe tags.~~
- ~~(B) Archery Only Season: 1 buck tags and 0 doe tags.~~
- ~~(f) Zone 6 - Surprise Valley:~~

... [No changes to subsections 363(f)(1) through (3)]

- ~~(4) Number of License Tags:~~
- ~~(A) General Season: 10 buck tags and 0 doe tags.~~
- ~~(B) Archery Only Season: 1 buck tags.~~
- ~~(g) Big Valley Pronghorn Antelope Apprentice Hunt:~~
- ~~(1) Area: Those portions of Modoc, Lassen, Shasta and Siskiyou counties within a line beginning at the intersection of Highway 299 and 89; north and northwest along Highway 89 to the Bartle-Telephone Flat Road; northeast along the Bartle-Telephone Flat Road to the Iodine Prairie-Long Bell Road; southeast along the Iodine Prairie-Long Bell Road to the North Main Road at Long Bell Forest Service Station; northeast along the North Main Road and the Mud Springs-Mud Lake Road to Modoc County Road 91; south along Modoc County Road 91 to the Happy Camp-Cottonwood Flat Road; southeast along the Happy Camp-Cottonwood Flat Road to the Cottonwood Flat-Canby Bridge Road; southeast along the Cottonwood Flat-Canby Bridge Road to Highway 299; south along Highway 299 to the Hunters Ridge-Sweagert Flat Road near Lower Rush Creek Recreation Site; east and south along the Hunters Ridge-Sweagert Flat Road to the Sweagert Flat-Hunsinger Draw Road; south and west along the Sweagert Flat-Hunsinger Draw Road to the Adin-Madeline Road; southeast along the Adin-Madeline Road to the Hunsinger Flat-Willow Creek Road; southeast and southwest along the Hunsinger Flat-Willow Creek Road to Highway 139; northwest along Highway 139 to the Hayden Hill-Snag Hill Road; south and southwest along the Hayden Hill-Snag Hill Road to the Boyd Hill-Dixie Valley Road; southeast along the Boyd Hill-Dixie Valley Road to the Dixie Valley-Coyote Canyon Road; southeast along the Dixie Valley-Coyote Canyon Road to the State Game Refuge 1S boundary; southeast along the State Game Refuge 1S boundary to U.S. Forest Service Road 35N06; south and west along U.S. Forest Service Road 35N06 to U.S. Forest Service Road 22; west along U.S. Forest Service Road 22 to Highway 89 near the Hat Creek Ranger Station; north along Highway 89 to Highway 299, to the point of beginning.—The tag shall be valid in the area described in subsection 363(e)(1).~~

... [No changes to subsections 363(g)(2) and (3)]

- ~~(4) Number of License Tags: 1 either-sex tags.~~
- ~~(5) (4) Special Conditions: Tagholders wishing to hunt the Ash Creek Wildlife Area may contact Ash Creek Wildlife Area by telephone at (530) 294-5824, and shall attend an orientation meeting before hunting. Only persons possessing valid junior hunting licenses and apprentice hunt license tags may hunt during the pronghorn antelope apprentice hunt season in the Ash Creek Wildlife Area. Tagholders shall be accompanied by a nonhunting, licensed adult chaperon 18 years of age or older while hunting.~~
- ~~(h) Lassen Pronghorn Antelope Apprentice Hunt:~~

~~(1) Area: Those portions of Lassen, Plumas and Shasta counties within a line beginning at the junction of Highway 36 and the Juniper Lake Road in the town of Chester; north along the Juniper Lake Road to the Lassen National Park boundary; north and west along the Lassen National Park boundary to Highway 89; north along Highway 89 to U.S. Forest Service Road 22 near the Hat Creek Ranger Station; east along U.S. Forest Service Road 22 to U.S. Forest Service Road 35N06; east and north along U.S. Forest Service Road 35N06 to the State Game Refuge 1S boundary; northwest along the State Game Refuge 1S boundary to the Coyote Canyon-Dixie Valley Road; northwest along the Coyote Canyon-Dixie Valley Road to the Dixie Valley-Boyd Hill Road; northwest along the Dixie Valley-Boyd Hill Road to the Snag Hill-Hayden Hill Road; northeast and north along the Snag Hill-Hayden Hill Road to Highway 139; southeast on Highway 139 to the Willow Creek-Hunsinger Flat Road; northeast and northwest along the Willow Creek-Hunsinger Flat Road to the Adin-Madeline Road; southeast along the Adin-Madeline Road to Highway 395 at the town of Madeline; south along Highway 395 to the Madeline-Clarks Valley Road; east along the Madeline-Clarks Valley Road to the Clarks Valley-Tuledad Road; east and southeast along the Clarks Valley-Tuledad Road to the California-Nevada state line; south along the California-Nevada state line to the Lassen-Sierra county line; west along the Lassen-Sierra county line to the Lassen-Plumas county line; north and west along the Lassen-Plumas county line to Highway 36, west along Highway 36 to the Juniper Lake Road, to the point of beginning. The Honey Lake Wildlife Area shall not be open to antelope apprentice hunt tag holders. The tag shall be valid in the area described in subsection 363(d)(1).~~

... [No changes to subsection 363(h)(2) and (3)]

~~(4) Number of License Tags: 5 either-sex tags.~~

~~(4) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult chaperon 18 years of age or older while hunting. The Honey Lake Wildlife Area shall not be open to antelope apprentice hunt tag holders.~~

~~(i) Surprise Valley Pronghorn Antelope Apprentice Hunt:~~

~~(1) Area: Those portions of Modoc and Lassen counties within a line beginning at the intersection of the crest of the Warner Mountains and the California-Oregon state line; east along the California-Oregon state line to the California-Nevada state line; south along the California-Nevada state line to the Tuledad-Clarks Valley Road; west and northwest along the Tuledad-Clarks Valley Road to the Clarks Valley-Long Valley Road; north on the Clarks Valley-Long Valley Road to the South Warner Road; east along the South Warner Road to the Summit Trail near Patterson Guard Station; north along the Summit Trail to the crest of the Warner Mountains at Pepperdine Camp; north along the crest of the Warner Mountains to the California-Oregon state line to the point of beginning. The tag shall be valid in the area described in subsection 363(f)(1).~~

... [No changes to subsections 363(i)(2) and (3)]

~~(4) Number of License Tags: 4 either-sex tags.~~

~~(5) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult chaperon 18 years of age or older while hunting.~~

~~(j) Likely Tables Pronghorn Antelope Apprentice Hunt~~

~~(1) Area: Those portions of Modoc and Lassen counties within a line beginning at the junction of the Crowder Flat Road and the California-Oregon state line; east along the California-Oregon state line to the crest of the Warner Mountains; south along the crest of the Warner Mountains to the Summit Trail at Pepperdine Camp; south along the Summit Trail to the South Warner Road near Patterson Forest Service Station; west along the South Warner Road to the Long Valley-Clarks Valley Road; south along the Long Valley-Clarks Valley Road to the Clarks Valley-Madeline Road; west along the Clarks Valley-Madeline Road to Highway 395 at the town of Madeline; north along Highway 395 to the Madeline-Adin Road; northwest along the Madeline-Adin Road to the Hunsinger Draw-Sweagert Flat Road; east and north along the Hunsinger Draw-Sweagert Flat Road to the Sweagert Flat-Hunters Ridge Road; north and west along the Sweagert Flat-Hunters Ridge Road to Highway 299 near Lower Rush Creek Recreation Site; north along Highway 299 to the Canby Bridge-Cottonwood Flat Road; northwest along the Canby Bridge-Cottonwood Flat Road to the Cottonwood Flat-Happy Camp Road; northwest along the Cottonwood Flat-Happy Camp Road to Modoc County Road 91; north along Modoc County Road 91 to Highway 139; north along Highway 139 to the Hackamore-Sorholus Tank Road; northeast along the Hackamore-Sorholus Tank Road to the Browns Well-Badger Well Road; north along the Browns Well-Badger Well Road to the Badger Well-Deadhorse Flat Road; northeast and east along the Badger Well-Deadhorse Flat Road to the Mowitz-Blue Mountain Road; north and east along the Mowitz-Blue Mountain Road to Modoc County Road 136; east along Modoc County Road 136 to Modoc County Road 73; north along Modoc County Road 73 to the Crowder Flat Road; north along the Crowder Flat Road to the California-Oregon state line, to the point of beginning. The tag shall be valid in the area described in subsection 363(c)(1).~~

... [No changes to subsections 363(j)(2) and (3)]

~~(4) Number of License Tags: 5 either-sex tags.~~

~~(5) Special Conditions: Tagholders must possess valid junior hunting licenses and apprentice hunt license tags. Tagholders shall be accompanied by a nonhunting, licensed adult chaperon 18 years of age or older while hunting.~~

~~(k) Fund-raising Hunt:~~

... [No changes to subsections 363(k)(1) through (3)]

~~(4) Number of License Tags: 2 buck tags.~~

... [No changes to subsection 363(l)]

~~(m) Pronghorn Antelope Tag Allocations Table.~~

2015-2016 Pronghorn Antelope Tag Allocations						
Hunt Area	Archery-Only Season		General Season			
	Buck	Doe	Buck	Doe	Buck	Doe
Zone 1 - Mount Dome	0 [0-10]	0 [0-3]	0 [0-60]	0 [0-20]	0	0
Zone 2 - Clear Lake	4 [0-10]	0 [0-3]	15 [0-80]	0 [0-25]	0	0
Zone 3 - Likely Tables	10 [0-20]	0 [0-7]	40 [0-150]	0 [0-50]	40 [0-130]	0 [0-50]
Zone 4 – Lassen	10 [0-20]	0 [0-7]	45 [0-150]	0 [0-50]	45 [0-130]	0 [0-50]
Zone 5 - Big Valley	4 [0-15]	0 [0-5]	20 [0-150]	0 [0-50]	0	0
Zone 6 - Surprise Valley	4 [0-10]	0	10 [0-25]	0 [0-7]	0	0

Lassen Apprentice Hunt	N/A		5-[0-15] Either Sex		0	
Big Valley Apprentice Hunt	N/A		4-[0-4] Either Sex		0	
Surprise Valley Apprentice Hunt	N/A		4-[0-5] Either Sex		0	
Fund-Raising Hunt	N/A		2-[0-10] Buck			

Note: Authority cited: Sections 219, 220, 331, 1050, Fish and Game Code. Reference: Sections 331, 713, and 1050, Fish and Game Code.

USDA Forest Service Road 77 to USDA Forest Service Road 15 (Harris Spring Road); south along USDA Forest Service Road 15 to USDA Forest Service Road 13 (Pilgrim Creek Road); southwest along USDA Forest Service Road 13 to Highway 89; northwest along Highway 89 to Interstate Highway 5; north along Interstate Highway 5 to the point of beginning.

(B) Season: The season shall open on the Wednesday preceding the second Saturday in September and continue for 12 consecutive days.

(C) Number of License Tags: 20 bull tags and 20 antlerless tags.

Subparts (B) Season, and (C) Number of License Tags, are proposed to be moved to the new Table as shown in the example below:

§	Hunt	1. Bull Tags	2. Antlerless Tags	3. Either-Sex Tags	4. Spike Tags
		5. Season			
(r) Department Administered General Methods Roosevelt Elk Hunts					
(1)(A)	Siskiyou	20	20		
		Shall open on the Wednesday preceding the second Saturday in September and continue for 12 consecutive days.			

The complete Table and text is found in the attached amended Regulatory Text of Section 364.

2. Number of Tags.

In order to maintain appropriate harvest levels and hunting quality it is necessary to annually adjust quotas (total number of tags) in response to dynamic environmental and biological conditions. Current regulations in Section 364 specify elk license tag quotas for each hunt in accordance with management goals and objectives.

The proposed amendments will modify Section 364, adding new subsections 364(r) through (aa) in a Table which specifies the number of elk tags in each hunt type and area for the 2016 season. However, since the Department's final recommendations for quotas cannot be determined until winter survey data and harvest results are analyzed, the amendments to Section 364 will begin with a range of tags (expressed as [0-40], etc.). The final number of tags will be recommended to the Commission at the adoption hearing in April 2016.

The proposed ranges of elk tags for 2016 are presented in the amended Regulatory Text of Section 364.

3. Remove, Amend, and Establish New Hunt Areas:

The Department is recommending changes to the Hunt Areas as described in amended subsections 364(a)(1) through (d)(20). Some hunt areas are deleted, split into new hunt areas or boundaries changed as necessary to distribute

hunting pressure, address landowner concerns over elk damage, and increase or decrease hunting opportunity. Boundary and Area changes are made while providing a biologically appropriate harvest within each zone in accordance with management goals and objectives.

(Note: The following text which is proposed for deletion (italicized) refers to the current subsection number. Text to be added or amended (normal type) refers to the new renumbered subsection. The referenced subsections appear in the same order as in the attached amended regulatory text.)

The following Hunt Areas are proposed for amendment:

364(a)(2) Big Lagoon Roosevelt Elk Hunt: (Deleted from regulation)

This hunt boundary is no longer being utilized and has been split and incorporated into the Del Norte and Humboldt Roosevelt Elk Hunts.

364(a)(3) Northwestern California Roosevelt Elk Hunt: (Deleted from regulation)

This hunt boundary is no longer being utilized and has been split and incorporated into the Del Norte and Humboldt Roosevelt Elk Hunts.

364(a)(4) Klamath Roosevelt Elk Hunt: (Deleted from regulation)

This hunt boundary is no longer being utilized and has been split and incorporated into the Del Norte and Humboldt Roosevelt Elk Hunts.

364(a)(5) Del Norte Roosevelt Elk Hunt: (Deleted from regulation)

This hunt boundary is no longer being utilized; this hunt area has been incorporated into the larger new Del Norte hunt area.

364(a)(2) Del Norte General Methods Roosevelt Elk Hunt: (Added to regulation)

Two new zones will be created by splitting the Northwestern Roosevelt elk zone (Del Norte and Humboldt). The establishment of these zones will allow the Department to manage hunting pressure in relation to elk distribution, increase opportunity, and obtain an appropriate harvest level.

364(a)(3) Humboldt General Methods Roosevelt Elk Hunt: (Added to regulation)

Two new zones will be created by splitting the Northwestern Roosevelt elk zone (Del Norte and Humboldt). The establishment of these zones will allow the Department to manage hunting pressure in relation to elk distribution, increase opportunity, and obtain an appropriate harvest level.

364(a)(6) Marble Mountains Roosevelt Elk Hunt: (Deleted from regulation)

This area has been separated into two separate zones within Humboldt, Shasta, Siskiyou, and Trinity counties (Marble Mountain North and Marble Mountain South Roosevelt elk hunts).

364(a)(4) Marble Mountains North General Methods Roosevelt Elk Hunt: (Added to regulation)

Two new zones will be created by splitting the Marble Mountain Roosevelt elk zone (North and South). The establishment of these zones will allow the Department to manage hunting pressure in relation to elk distribution, increase opportunity, and obtain an appropriate harvest level.

364(a)(5) Marble Mountains South General Methods Roosevelt Elk Hunt: (Added to regulation)

Two new zones will be created by splitting the Marble Mountain Roosevelt elk zone (North and South). The establishment of these zones will allow the Department to manage hunting pressure in relation to elk distribution, increase opportunity, and obtain an appropriate harvest level.

364(c)(1) Mendocino Elk Hunt: (Deleted from regulation)

This area has been split and expanded into five separate zones within Mendocino County as follows:

364(c)(1) Mendocino North Coast General Methods Roosevelt/Tule Elk Hunt: (Added to regulation);

364(c)(2) Mendocino Middle Fork General Methods Roosevelt/Tule Elk Hunt: (Added to regulation);

364(c)(3) Mendocino Upper Russian River General Methods Roosevelt/Tule Elk Hunt: (Added to reg);

364(c)(4) Mendocino Little Lake General Methods Roosevelt/Tule Elk Hunt: (Added to regulation);

364(c)(5) Mendocino South Coast General Methods Roosevelt/Tule Elk Hunt: (Added to regulation):

It is proposed to split and expand the existing Mendocino Roosevelt/Tule elk hunt into five elk hunts within Mendocino County. Public opportunities to hunt elk are limited in Mendocino County. Sufficient numbers of elk occur within the proposed hunt boundaries to provide opportunity for the public to hunt elk. The establishment of these zones will allow the Department to distribute hunting pressure to address landowner concerns over elk damage and increase hunter opportunity while providing a biologically appropriate harvest within each zone

364(d)(2) La Panza General Methods Tule Elk Hunt: (Amend regulatory text)

Some of the area previously within the La Panza zone north of highway 198 will now be within the Fort Hunter Liggett Central Coast zone described in subsection

364(d)(12). This is intended to better distribute harvest within these zones, increase opportunity, and address landowner concerns. The La Panza season framework will remain as previously identified.

364(d)(4) Independence General Methods Tule Elk Hunt: (Amend regulatory text)

It is proposed to split the Independence tule elk hunt area in Inyo County and establish a new tule elk zone (Goodale) in the Owens Valley. Sufficient numbers of elk occur within the proposed hunt boundary to provide opportunity for the public to hunt elk. Creating a new hunt boundary (splitting the zone) allows the Department to more appropriately manage harvest.

364(d)(5) Goodale General Methods Tule Elk Hunt: (Added to regulatory text)

In conjunction with zone boundary modifications for the Independence tule elk zone, a new zone (Goodale) is proposed to be created by dividing the zone. This new zone is being established to efficiently distribute hunting pressure and manage harvest.

364(d)(11) Grizzly Island General Methods Tule Elk Hunt: (Amend regulatory text)

The area description for Grizzly Island is proposed to be amended. Existing regulations specify boundaries for the Grizzly Island tule elk hunt. During the last several years elk population numbers have increased and their range has expanded beyond existing hunt boundaries. The modifications will expand the boundary to outside of the Grizzly Island Wildlife Area. The proposal to expand boundaries for the Grizzly Island tule elk hunt is necessary to improve hunter opportunity and implement an appropriate harvest level.

364(d)(11) Fort Hunter Liggett Tule Elk Hunt: (Deleted from regulation)

Public opportunities to hunt elk in Monterey, San Benito, and San Luis Obispo counties are currently limited to the lands within the boundary of the Fort Hunter Liggett Military base and a portion of the La Panza and San Luis Reservoir tule elk zones. To increase public hunting opportunity (military only remains within the perimeter of the base) the boundary is proposed to be expanded as set forth in 364(n)(12).

364(d)(12) Fort Hunter Liggett Central Coast General Public General Methods Tule Elk Hunt: (Added to regulatory text)

Public opportunities to hunt elk in Monterey, San Benito, and San Luis Obispo counties are currently limited to the lands within the confines of the Fort Hunter Liggett Military base and a portion of the La Panza and San Luis Reservoir tule elk zones. Tule elk populations have increased and their range has expanded beyond the existing hunt boundaries. The proposal increases the boundary for the Fort Hunter Liggett Central Coast zone to encompass areas not previously part of an established hunt zone except for the inclusion of the northern portion of the La Panza zone north of highway 198 to the boundary of the San Luis

Reservoir tule elk zone. This will improve hunter opportunity, address expanding elk populations, and respond to landowner concerns. (Note: the military only hunts will remain within the exterior boundaries of the military base.)

364(d)(19) San Emigdio Mountain General Methods Tule Elk Hunt: (Added to regulatory text)

The proposed amendment establishes a new tule elk hunt in portions of Kern, San Luis Obispo, Santa Barbara, and Ventura Counties). Public opportunities to hunt elk have been limited or non-existent. Sufficient numbers of elk occur within the proposed hunt boundary to provide additional opportunity for the public to hunt elk.

364(d)(20) Camp Roberts General Methods Tule Elk Hunt: (Added to regulatory text)

The proposed amendment establishes a new tule elk hunt in portions of Monterey and San Luis Obispo Counties. Public opportunities to hunt elk have been limited. Sufficient numbers of elk occur within the proposed hunt boundary to provide additional opportunity for the public to hunt elk.

4. Add New Opportunities for Specialized Hunts:

The Department makes many different specialized hunts available to the public including Archery, Muzzleloader, and Apprentice hunts. Because of the proposed new hunt areas, some new opportunities will be made available:

364(e)(1) Siskiyou General Methods Roosevelt Elk Apprentice Hunt

364(e)(2) Marble Mountains North General Methods Roosevelt Elk Apprentice Hunt

364(e)(3) Marble Mountains South General Methods Roosevelt Elk Apprentice Hunt

364(e)(9) Fort Hunter Liggett Central Coast General Methods General Public Tule Elk Apprentice Hunt

364(f)(3) Goodale Tule Elk Archery Only Hunt

364(f)(7) Fort Hunter Liggett Central Coast General Public Tule Elk Archery Only Hunt

364(g)(3) Goodale Tule Elk Muzzleloader Only Hunt

364(g)(4) Fort Hunter Liggett Central Coast General Public Tule Elk Muzzleloader Only Hunt:

364(h)(1) Siskiyou Roosevelt Elk Muzzleloader/Archery Only Hunt

354(i)(2) Marble Mountains North Roosevelt Elk Muzzleloader/Archery Only Hunt

364(i)(3) Marble Mountains South Roosevelt Elk Muzzleloader/Archery Only Hunt

364(j)(5) Camp Roberts Military Only Tule Elk Hunt

5. Modify Season Dates and Hunt Periods:

The Department makes many different times and seasons of the year available to the public. In order to provide opportunity for hunters, the Department modifies the calendar day for the start of hunts and the number of days of hunting. The new Table in subsections 364(r) through (aa) proposes the recommended days for each hunt.

These recommended changes will increase opportunity and address private property conflicts through the establishment of multiple hunt periods while maintaining an appropriate harvest level. Opportunity is also provided by separate hunting periods for bull, antlerless, either-sex, and spike elk.

In a number of hunt areas the elk population has increased substantially over the last several years. The proposed seasonal framework, additional hunt periods, and the proposed number of tags, are designed to safely distribute the additional hunting pressure while maintaining an appropriate level of harvest.

Due to military use constraints at Fort Hunter Liggett and Camp Roberts, hunt dates are subject to change from year to year and may be changed or cancelled by the base commander

6. Modifications to Hunt Area Special Conditions.

Current regulations require a hunter orientation in certain hunt areas prior to hunting. This requirement is not necessary in most areas since all pertinent information is sent to the successful tag purchaser (hunter) along with their tag. Tag holders are also provided contact numbers for local Department employees to answer any additional questions. Where required, the Special Conditions appear in regulation with the hunt area description.

Special Conditions for hunting on military installations appear in subsection (u) Fort Hunter Liggett Special Conditions; and, (v) Camp Roberts Special Conditions.

7. Minor Editorial Changes.

364(l)(4) Proposed amendments to this subsection clarify the definition of either-sex elk and make it clear that a spike elk is included within the definition of either-sex elk.

364(n) is proposed for deletion as it restates subsection (m).

Other minor editorial changes are proposed for consistency in subsection numbering, spelling, grammar, and clarity.

a) Authority and Reference:

Authority: Fish and Game Code sections 200, 202, 203, 332 and 1050.

Reference: Fish and Game Code sections 332 and 1050.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change:

2016 Draft Environmental Document Regarding Elk Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

1. Improve the hunting regulations and make them more user-friendly.

No alternatives were identified. The Department makes extensive use of Tables in regulations. Currently, tables are used in Section 362, Big Horn Sheep, 363 Antelope, and 364.1 SHARE Elk. Department publications use tables to provide information to the public in an easier format than written text.

2. Number of Tags

A recommendation was submitted 10/1/2014 by the Colusa County Fish and Game Commission. Request to increase elk hunting in Stonyford to control the growing size of the herd:

Department staff met with the Colusa County Fish and Game Commission last year to discuss potential solutions. The Department has analyzed the potential for increased harvest in this zone in the Draft Environmental Document. Tag adjustments will be reviewed after surveys are complete. One of the limiting factors for this zone is access to private property for public elk hunters; currently there is very limited public land for elk hunters to access which contain elk. The newly adopted SHARE elk tags (Section 364.1) are a potential solution for allowing access to private lands for elk hunters. Depending on tag allocation for the general draw and analyzed harvest rates, SHARE elk tags may be available for landowners within the Priest Valley desiring to contract with the Department.

Elk license tag quotas must be adjusted periodically in response to a variety of environmental and biological conditions including forage availability, population structure, and over-winter survival rates. Elk populations have increased and landowner conflicts have also escalated in several areas. Adjusting tag quotas provides for appropriate harvest levels within the zones.

3. Remove, Amend, and Establish New Hunt Areas:

Public recommendation submitted 3/27/2014 by Howard Strohn. Request for better herd management of tule elk in Priest Valley:

With this rulemaking, the Department has recommended boundary modification which would include the Priest Valley elk herd within the proposed Fort Hunter Liggett Central Coast zone. This would potentially increase the number of landowner tags available. In addition to the proposed boundary modifications the Department has analyzed the potential for increased harvest for this zone in the Draft Environmental Document (DED). Tag adjustments will be reviewed after surveys are complete. In 2015 the Department implemented the SHARE elk tag (Section 364.1) as an option for landowners. Depending on tag allocation for the general draw and analyzed harvest rates, SHARE elk tags may be available for landowners within the Priest Valley desiring to contract with the Department.

Not modifying boundaries would not allow the Department to appropriately manage the subgroups through existing harvest regulations. New hunt areas for San Emigdio Mountain and Camp Roberts elk zones are necessary because existing regulations provide no public elk hunting opportunity in these areas. These areas currently maintain adequate numbers of elk to support a limited harvest. Establishing (new) tule elk hunts in these areas is proposed to improve hunter opportunity and provide an appropriate harvest level.

4. Add New Opportunities for Specialized Hunts:

No alternatives were identified. Not modifying opportunity for special hunts would not allow the Department to appropriately manage the subgroups through existing harvest regulations.

5. Modify Season Dates and Hunt Periods:

No alternatives were identified. The Department makes many different times and seasons of the year available to the public. In order to provide opportunity for each group, the Department modifies the calendar day for the start of hunts and the number of days of hunting.

Due to military use constraints at Fort Hunter Liggett and Camp Roberts, hunt dates are subject to change from year to year and may be changed or cancelled by the base commander.

6. Modifications to Hunt Area Special Conditions.

No alternatives were identified. Current regulations require a hunter orientation in certain hunt areas prior to hunting. Where required, the Special Conditions appear in regulation with the hunt area description.

(b) No Change Alternative:

The no-change alternative was considered and rejected because it would not attain project objectives. Elk hunts and opportunity must be adjusted periodically in response to a variety of environmental and biological conditions including forage availability, population structure, and over-winter survival rates. Elk populations have increased and landowner conflicts have also escalated in several areas. Adjusting tag quotas provides for appropriate harvest levels within the hunt zones.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The number of tags that will be issued from the newly proposed tag range will result in a harvest that is at or below the harvest analyzed in the 2016 Draft Environmental Document Regarding Elk hunting.

VI. Impact of Regulatory Action.

This proposed action adjusts tag quotas, modifies existing hunt zones, and creates new zones to increase hunting opportunities for the public. Given the number of tags available, and the area over which they are distributed, this proposal is economically neutral to business.

(a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businessmen to Compete with Businesses in Other States.

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. Considering the relatively small number of tags issued over the entire state, this proposal is economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Representative Private Persons/Business.

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.

- (f) Programs Mandated on Local Agencies or School Districts: None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4: None.

- (h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

The proposed action will have no statewide economic or fiscal impact because the proposed action would not constitute a significant change from the 2015 elk season. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved management plans to sustainably manage elk populations and maintain hunting opportunities in subsequent seasons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no significant changes in hunting activity levels are anticipated.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no significant changes in hunting activity levels are anticipated.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no significant changes in hunting activity levels are anticipated.

- (d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will benefit the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources and the action contributes to the sustainable management of natural resources.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the State's living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST (Policy Statement Overview)

Existing regulations in Section 364, Title 14, CCR, specify elk license tag quotas for each hunt. In order to achieve elk herd management goals and objectives and maintain hunting quality, it is periodically necessary to adjust quotas, seasons, hunt areas and other criteria, in response to dynamic environmental and biological conditions. The proposed amendments to Section 364 will establish 2016 tag quotas within each hunt adjusting for annual fluctuations in population number, season dates and tag distribution.

The complete amended text is found in the amended Regulatory Text of Section 364 with the Initial Statement of Reasons.

Proposed Amendments:

1. The current Elk Hunt regulations in Title 14, Section 364, are overly long and the format makes it difficult to navigate to find pertinent hunting information. The Department of Fish and Wildlife (Department) is recommending placing a substantial amount of information from Section 364 in a Table to improve the hunting regulations and make them more user-friendly.
2. In order to achieve appropriate harvest levels and maintain hunting quality it is necessary to annually adjust quotas (total number of tags) in response to dynamic environmental and biological conditions. Section 364 regulations specify elk license tag quotas for each hunt in accordance with management goals and objectives.
3. Remove, Amend, and Establish New Hunt Areas. The Department is recommending changes to the Hunt Areas as described in amended subsections 364(a)(1) through (d)(20).
4. Add New Opportunities for Specialized Hunts. The Department makes many different specialized hunts available to the public including Archery, Muzzleloader, and Apprentice hunts. Because of the new areas added, some new opportunities will be made available.
5. Modify Season Dates and Hunt Periods. The Department makes many different times and seasons of the year available to the public. In order to provide opportunity for hunters, the Department modifies the calendar day for the start of individual hunts and the number of days of hunting. The new Table sets forth the recommended days for each hunt.
6. Modifications to Hunt Area Special Conditions.

Current regulations require a hunter orientation in certain hunt areas prior to hunting. This requirement is not necessary in most areas since all pertinent information is sent to the successful tag purchaser (hunter) along with their tag. Tag holders are also provided contact numbers for local Department employees to answer any additional questions. Where required, the Special Conditions appear in regulation

with the hunt area description. Special Conditions for hunting on military installations appear in new subsections (p) Fort Hunter Liggett Special Conditions; and, (q) Camp Roberts Special Conditions.

7. Minor Editorial Changes are proposed to improve clarity and reduce redundancy.

Benefits of the regulations

The proposed regulations will contribute to the sustainable management of elk populations in California. Existing elk herd management goals specify objective levels for the proportion of bulls in the herds. These ratios are maintained and managed in part by annually modifying the number of tags. The final values for the license tag numbers will be based upon findings from annual harvest and herd composition counts where appropriate.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate elk hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to elk tag allocations are consistent with Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 364 is amended to read as follows:

§364. Elk Hunts, Seasons, and Number of Tags

(a) Department Administered General Methods Roosevelt Elk Hunt Areas.

(1) Siskiyou General Methods Roosevelt Elk Hunt:

(A) Area: In that portion of Siskiyou County beginning at the junction of Interstate Highway 5 with the California-Oregon state line; east along the state line to Hill Road at Ainsworth Corner; south along Hill Road to Lava Beds National Monument Road; south along Lava Beds National Monument Road to USDA Forest Service Road 49; south along USDA Forest Service Road 49 to USDA Forest Service Road 77; west along USDA Forest Service Road 77 to USDA Forest Service Road 15 (Harris Spring Road); south along USDA Forest Service Road 15 to USDA Forest Service Road 13 (Pilgrim Creek Road); southwest along USDA Forest Service Road 13 to Highway 89; northwest along Highway 89 to Interstate Highway 5; north along Interstate Highway 5 to the point of beginning.

~~(B) Season: The season shall open on the Wednesday preceding the second Saturday in September and continue for 12 consecutive days.~~

~~(C) Number of License Tags: 20 bull tags and 20 antlerless tags.~~

(2) Big Lagoon Roosevelt Elk Hunt:

~~(A) Area: In that portion of Humboldt County owned or leased by the California Redwood Company and the Green Diamond Resource Company within a line beginning at the intersection of Highway 101 and Hiltons Road; south on Hiltons Road to the western boundary of Redwood National Park; south and east along the western to its southern tip; north and east along the eastern boundary of Redwood National Park to Redwood Creek; south along Redwood Creek to Highway 299; east along Highway 299 to Forest Service Road 1; south along Forest Service Road 1 to Roddiscraft Road; west along Roddiscraft Road to the intersection of Snow Camp Road and the power line road within the right-of-way of Humboldt-Trinity 115 Line and Trinity-Maple Creek 60 Line power line; west along the power line road within the right-of-way of the Humboldt-Trinity 115 Line and Trinity-Maple Creek 60 Line to Maple Creek Road; south along Maple Creek Road to Butler Valley Road; west along Butler Valley Road to Fickle Hill Road; north along Fickle Hill Road to Bayside Road; west along Bayside Road and 7th Street to Highway 101; north along Highway 101 to point of beginning.~~

~~(B) Season: The season shall open the last Wednesday in August and continue for 10 consecutive days.~~

~~(C) Number of License Tags: 0 bull tags and 0 antlerless tags.~~

~~(D) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting after receipt of their elk license tags.~~

(3) Northwestern California Roosevelt Elk Hunt:

(A) Area: In those portions of Humboldt and Del Norte counties within a line beginning at the intersection of Highway 299 and Highway 96, north along Highway 96 to the Del

~~Norte-Siskiyou county line, north along the Del Norte-Siskiyou county line to the California-Oregon state line, west along the state line to the Pacific Coastline, south along the Pacific coastline to the Humboldt-Mendocino county line, east along the Humboldt-Mendocino county line to the Humboldt-Trinity county line, north along the Humboldt-Trinity county line to Highway 299, west along Highway 299 to the point of beginning, excluding those areas owned or leased by the California Redwood Company and the Green Diamond Resource Company within existing elk hunt boundaries as described in subsections 364(a)(2)(A), (a)(4)(A), and (a)(5)(A).~~

~~(B) Season: The season shall open on the first Wednesday in September and continue for 23 consecutive days.~~

~~(C) Number of License Tags: 0 bull tags, 0 antlerless tags, and 45 either-sex tags.~~

~~(4) Klamath Roosevelt Elk Hunt:~~

~~(A) Area: Those portions of Humboldt and Del Norte counties owned or leased by the Green Diamond Resource Company within a line beginning at the intersection of Highway 101 and the Klamath River; south on Highway 101 to South Klamath Beach Road; west on South Klamath Beach Road to the Redwood National Park boundary; southwest and south along the Redwood National Park boundary to Highway 101; south on Highway 101 to the Redwood National Park boundary; southeast along the Redwood National Park boundary to the Bald Hills Road; southeast along the Bald Hills Road to the Klamath River; northwest along the Klamath River to the point of beginning.~~

~~(B) Season: The season shall open on the first Wednesday in September and continue for 10 consecutive days.~~

~~(C) Number of License Tags: 0 bull tags and 0 antlerless tags.~~

~~(D) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting after receipt of their elk license tags.~~

~~(5) (2) Del Norte General Methods Roosevelt Elk Hunt:~~

~~(A) Area: Those portions of Del Norte County owned or leased by the Green Diamond Resource Company within a line beginning at the intersection of Highway 101 and the California-Oregon state line; south along Highway 101 to North Bank Road; southeast along North Bank Road to High Divide Road; northeast along High Divide Road to North Fork Smith River/Wimer Road; north along North Fork Smith River/Wimer Road to the California-Oregon state line; west along the California-Oregon state line to the point of beginning. In those portions of Del Norte County within a line beginning at the intersection of the California-Oregon state line and the Del Norte Siskiyou County line; south along the Del Norte County line to the intersection of the Siskiyou-Humboldt county lines; west along the Del Norte County Line to the Pacific coastline; north along the Pacific coastline to the Oregon-California border; east along the border to the intersection with the Del Norte-Siskiyou County line at the point of beginning.~~

~~(B) Season: The season shall open on the last Wednesday in August and continue for 10 consecutive days.~~

~~(C) Number of License Tags: 0 bull tags and 0 antlerless tags.~~

~~(D) Special Conditions: All tagholders will be required to attend a mandatory orientation. Tagholders will be notified of the time and location of the orientation meeting upon receipt of their elk license tags.~~

(3) Humboldt General Methods Roosevelt Elk Hunt:

(A) Area: In those portions of Humboldt and Trinity counties within a line beginning at the intersection of the Del Norte, Humboldt, and Siskiyou county lines; south along Forest Service Road 12N12 (Cedar Camp Road) to the intersection of Forest Service Road 11N05 (Slate Creek Road); south along Forest Service Road 11N05 (Slate Creek Road) to the intersection of Highway 96; south along Highway 96 to Highway 299; south along Highway 299 to the Intersection of the South Fork of the Trinity River; south along the South Fork of the Trinity River to the intersection of Highway 36; west along Highway 36 to the Humboldt-Trinity county lines; south along the Humboldt -Trinity County line to the intersection of the Humboldt-Mendocino County line; west along the Mendocino County line to the Pacific Coast; north along the Pacific coast to the Humboldt-Del Norte County line; east along the Humboldt County line to the intersection of the Humboldt-Del Norte-Siskiyou County lines at the point of beginning.

~~(6)~~ (4) Marble Mountains North General Methods Roosevelt Elk Hunt:

~~(A) Area: In those portions of Humboldt, Tehama, Trinity, Shasta and Siskiyou counties beginning at the intersection of Interstate Highway 5 and the California-Oregon state line; west along the state line to the Del Norte County line; south along the Del Norte County line to the intersection of the Siskiyou-Humboldt county lines; east along the Siskiyou-Humboldt county lines to Highway 96; south along Highway 96 to Highway 299; south along Highway 299 to the Intersection of the Humboldt/Trinity County line; south along the Humboldt Trinity County Line to the intersection of Highway 36; east along Highway 36 to the intersection of Interstate 5; north on Interstate Highway 5 to the point of beginning.~~ In those portions of Humboldt and Siskiyou counties beginning at the intersection of Interstate Highway 5 and the California-Oregon state line; west along the state line to the Del Norte County line; south along the Del Norte County line to the intersection of the Siskiyou-Humboldt county lines; south along Forest Service Road 12N12 (Cedar Camp Road) to the intersection of Forest Service Road 11N05 (Slate Creek Road); south along Forest Service Road 11N05 (Slate Creek Road) to the intersection of Highway 96; north along Highway 96 to the intersection of Salmon River Road; east along Salmon River Road to the intersection of Cecilville Road in the town of Forks of Salmon; east along Cecilville Road to the intersection of Highway 3 in the town of Callahan; south along Highway 3 to the intersection of Gazelle Callahan Road; east along Gazelle Callahan Road to the intersection of Old Highway 99 in the town of Gazelle; south along Old Highway 99 to the intersection of Interstate Highway 5; north on Interstate Highway 5 to the point of beginning.

~~(B) Season: The season shall open on the Wednesday preceding the second Saturday in September and continue for 12 consecutive days.~~

~~(C) Number of License Tags: General Season: 35 bull tags and 10 antlerless tags.~~

(5) Marble Mountains South General Methods Roosevelt Elk Hunt:

(A) Area: In those portions of Humboldt, Tehama, Trinity, Shasta, and Siskiyou counties beginning at the intersection of Interstate Highway 5 and Highway 36; north along Interstate 5 to the intersection of Old Highway 99 near the town of Edgewood; north along Old Highway 99 to the intersection of the Gazelle Callahan road in the town of Gazelle; west along Gazelle Callahan Road to the intersection of Highway 3; west along Highway 3 to the intersection of Cecilville Road in the town of Callahan; west along

Cecilville Road to the intersection of Salmon river Road at Forks of Salmon; North and West along Salmon River Road to the intersection of Highway 96 near Somes Bar; south along Highway 96 to Highway 299; south along Highway 299 to the Intersection of the South Fork of the Trinity River; south along the South Fork of the Trinity River to the intersection of Highway 36; east along Highway 36 to the intersection of Interstate 5; north on Interstate Highway 5 to the point of beginning.

(b) Department Administered General Methods Rocky Mountain Elk Hunts:

(1) Northeastern California General Methods Rocky Mountain Elk Hunt:

(A) Area: Those portions of Siskiyou, Modoc, Lassen, and Shasta counties within a line beginning in Siskiyou County at the junction of the California-Oregon state line and Hill Road at Ainsworth Corner; east along the California-Oregon state line to the California-Nevada state line; south along the California-Nevada state line to the Tuledad-Red Rock-Clarks Valley Road (Lassen County Roads 506, 512 and 510); west along the Tuledad-Red Rock-Clarks Valley Road to Highway 395 at Madeline; west on USDA Forest Service Road 39N08 to the intersection of Highway 139/299 in Adin; south on Highway 139 to the intersection of Highway 36 in Susanville; west on Highway 36 to the intersection of Interstate 5 in Red Bluff; north on Interstate 5 to Highway 89; southeast along Highway 89 to USDA Forest Service Road 13 (Pilgrim Creek Road); northeast along USDA Forest Service Road 13 to USDA Forest Service Road 15 (Harris Spring Road); north along USDA Forest Service Road to USDA Forest Service Road 77; east along USDA Forest Service Road 77 to USDA Forest Service Road 49; north along USDA Forest Service Road 49 to Lava Beds National Monument Road; north along Lava Beds National Monument Road to Hill Road; north along Hill Road to the point of beginning.

~~(B) Season: The season shall open on the Wednesday preceding the third Saturday in September and continue for 12 consecutive days.~~

~~(C) Number of License Tags: 15 bull tags and 10 antlerless tags.~~

(c) Department Administered General Methods Roosevelt/Tule Elk Hunts:

(1) Mendocino North Coast General Methods Roosevelt/Tule Elk Hunt:

(A) Area: Those portions in Mendocino County within a line beginning at the Pacific Coastline and the Mendocino/Humboldt County line south of Shelter Cove; ~~east along the Mendocino/Humboldt County line to the intersection of the Humboldt, Mendocino, and Trinity County lines; south and east along the Mendocino/Trinity County line to the intersection of the Mendocino, Trinity, and Tehama County lines; south along the Mendocino County line to the intersection of Highway 20; north and west along Highway 20 to the intersection of Highway 101 near Galpella; south along Highway 101 to the intersection of Highway 253; southwest along Highway 253 to the intersection of Highway 128; north along Highway 128 to the intersection of Mountain View Road near the town of Boonville; west along Mountain View Road to the intersection of Highway 1; south along Highway 1 to the intersection of the Garcia River; west along the Garcia River to the Pacific Coastline; north along the Pacific Coastline to the point of beginning.~~ proceed east along the Mendocino- Humboldt-Trinity County line to its intersection with the Eel River Main stem; proceed south along the Eel River Main stem to confluence of Outlet Creek and the State Highway 162 crossing; west on State Highway 162 to the intersection with State Highway 101, south on State Highway 101 to its intersection with

State Highway 20 (Willits); west on State Highway 20 to the intersection with State Highway 1; north on State Highway 1 to the intersection of the Noyo River; west along the Noyo River to the Pacific Coast and north along with Pacific Coast to the Mendocino- Humboldt County line point of beginning.

~~(B) Season: The season shall open on the Wednesday preceding the fourth Saturday in September and continue for 12 consecutive days.~~

~~(C) Number of License Tags: 2 bull tags and 2 antlerless tags.~~

(2) Mendocino Middle Fork General Methods Roosevelt/Tule Elk Hunt:

(A) Area: Those portions in Mendocino County within a line beginning at the Eel River Main stem intersection with the Mendocino-Trinity County line; east along the Mendocino-Trinity County line to the intersection with the Mendocino-Tehama County line; south along the Mendocino County line (Glenn-Lake County) to its junction with the Eel River Main stem; north along the Eel River Main stem to its intersection with Mendocino-Trinity County line point of beginning.

(3) Mendocino Upper Russian River General Methods Roosevelt/Tule Elk Hunt:

(A) Area: Those portions in Mendocino County within a line beginning at East Road intersection with State Highway 20 (Redwood Valley) proceed north on East Road to Tomki Road and continue to Hearst Road/Willits-Hearst Road east to the Eel River Main stem; follow the Eel River Main stem east to the Mendocino-Lake County line; then south along the Mendocino-Lake County line to its junction with State Highway 20; west on State Highway 20 to the East Road intersection (Redwood Valley) point of beginning.

(4) Mendocino Little lake General Methods Roosevelt/Tule Elk Hunt:

(A) Area: Those portions in Mendocino County within a line beginning at State Highway 101\State Highway 20 intersection Redwood Valley – proceed north on State Highway 101 to the intersection with State Highway 162; proceed east on State Highway 162 to its intersection with the Eel River Main stem; following the Eel River Main stem south to its intersection with the Hearst Road/Willits-Hearst Road bridge; west along the Willits-Hearst Road to its intersection with Tomki Road; south on Tomki Road to its intersection with East Road (Redwood Valley); East Road south to its intersection with State Highway 20; west to intersection with State Highway 101 at the point of beginning.

(5) Mendocino South Coast General Methods Roosevelt/Tule Elk Hunt:

(A) Area: Those portions in Mendocino County within a line beginning at the intersection of the Noyo River and the Pacific Ocean (Noyo Bay). Continue east on the Noyo River to the intersection with State Highway 1. South on State Highway 1 to the intersection of State Highway 20 (Noyo- Fort Bragg); proceed east on State Highway 20 to its intersection with State Highway 101 (Willits); south on State Highway 101 to its intersection with State Highway 20 (Redwood Valley) proceed east to the Mendocino-Lake County line; south along the Mendocino-Lake County line to the Mendocino-Sonoma County line; west along the Mendocino-Sonoma County line to the Pacific Ocean; north along the Pacific Ocean to the intersection with the Noyo River at the point of beginning.

(d) Department Administered General Methods Tule Elk Hunts

(1) Cache Creek General Methods Tule Elk Hunt:

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Section 364.1
Title 14, California Code of Regulations (CCR)
Re: SHARE Elk Hunts

- I. Date of Initial Statement of Reasons: October 12, 2015
 - II. Dates and Locations of Scheduled Hearings:
 - (a) Notice Hearing: Date: December 10, 2015
Location: San Diego, CA
 - (b) Discussion Hearing: Date: February 11, 2016
Location: Sacramento, CA
 - (c) Adoption Hearing: Date: April 14, 2016
Location: Santa Rosa, CA
 - III. Description of Regulatory Action:
 - (a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:
 - 1. It is necessary for the Department of Fish and Wildlife (Department) to improve the hunting regulations and make them more user-friendly.
- Section 364.1, SHARE Elk Hunts, is proposed to be amended in conjunction with the amendments to Section 364, Elk. This is necessary because of the addition of new hunt zones, zone splitting, zone boundary modifications, and tag quota modifications in the amended 364 regulations. The SHARE private property elk hunts correspond with elk hunts identified in 364. These regulations authorize SHARE elk hunts with separate seasons and tag quotas. Tag issuance will be through the SHARE program utilizing the department's existing tag distribution procedures.
- Current subsection 364.1(c) contains a Table setting forth the hunt tag quotas. CDFW proposes to move the area descriptions (in the same order and number as provided in Section 364) to the table. For example, part of the current regulation in subsection 364(a) reads as follows:
- “§ 364.1. SHARE Elk Hunts.
- (a) Department Administered Shared Habitat Alliance for Recreational Enhancement (SHARE) Elk Hunts:

(1) Siskiyou Roosevelt Elk SHARE Hunt:
 (A) Area: Within the boundaries identified in Section 364(a)(1)(A). Individual property boundaries will be identified in the SHARE application package.”

The Table will be formatted in the same order as the hunts described in Section 364 and the Areas will be placed in the amended Table as shown in the example below:

§ 364.1. SHARE: Department Administered Shared Habitat Alliance for Recreational Enhancement Elk Hunts

§	Hunt	(A) Tag Quota	1. Bull Tags	2. Antlerless Tags	3. Either-Sex Tags	4. Spike Tags
			(B) Area			
(i) Department Administered SHARE Roosevelt Elk Hunts						
(1)	Siskiyou	10	10	10		
			(B) Area: The tag shall be valid in the area described in subsection 364(a)(1)(A).			

The complete Table and text is found in the attached amended Regulatory Text of Section 364.1.

2. Number of Tags.

In order to achieve appropriate harvest levels and maintain hunting quality it is necessary to annually adjust quotas (total number of tags) in response to dynamic environmental and biological conditions. Department regulations specify elk license tag quotas for each hunt in accordance with management goals and objectives. The proposed amendments will modify Section 364.1, adding a new subsection (a) to include a Table which specifies the number of elk tags in each hunt area for the 2016 season. However, the amendments to Section 364.1 will begin with a range of tags (expressed as [0 - 40], etc.) since the final recommendations for quotas cannot be determined until winter survey data and harvest results are analyzed.

The final number of tags will be recommended to the Commission at the adoption hearing in April 2016, based upon the completion of winter elk surveys and resulting data analysis.

(b) Authority and Reference:

Authority: Fish and Game Code sections 200, 202, 203, 332 and 1050.
 Reference: Fish and Game Code sections 203, 203.1, 332, 713, and 1050.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change:

2016 Draft Environmental Document Regarding Elk Hunting

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

A public discussion was held at the Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified. Elk tag quotas must be adjusted periodically in response to a variety of environmental and biological conditions including forage availability, population structure, and overwinter survival rates. Elk populations have increased and landowner conflicts have also escalated in several areas. Adjusting tag quotas provides for appropriate harvest levels within the zones.

Failure to adjust SHARE hunt areas in Section 364.1 to correspond with elk hunts in Section 364 would create inconsistency in regulation regarding both zone boundaries and tag ranges.

(b) No Change Alternative:

The no change alternative was considered and rejected because Section 364.1 must correspond with the elk hunts described in amended Section 364; not doing so would create confusion in both zone boundaries and tag ranges.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed. The number of tags that will be issued from the newly proposed range will result in a harvest that is at or below the harvest analyzed in the 2016 Draft Environmental Document Regarding Elk hunting.

VI. Impact of Regulatory Action.

This proposed action adjusts tag quotas. Given the number of tags available, and the area over which they are distributed, this proposal is economically neutral to business.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businessmen to Compete with Businesses in Other States.

The proposed action will not have a significant statewide economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. Considering the small number of tags issued over the entire state, this proposal is economically neutral to business.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The proposed action will not affect jobs or businesses in California and does not provide benefits to worker safety.

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

- (c) Cost Impacts on Representative Private Persons/Business.

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State. None.

- (e) Other Nondiscretionary Costs/Savings to Local Agencies. None.

- (f) Programs Mandated on Local Agencies or School Districts. None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4. None.

- (h) Effect on Housing Costs. None.

VII. Economic Impact Assessment.

The proposed action will have no statewide economic or fiscal impact because the proposed action will not constitute a significant change from the last elk season. The number of tags to be set in regulation for 2016 is intended to achieve or maintain the levels set forth in the approved management plans to sustainably

manage elk populations and maintain hunting opportunities in subsequent seasons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because no significant changes in hunting activity levels are anticipated.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because no significant changes in hunting activity levels are anticipated.

(c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because no significant changes in hunting activity levels are anticipated.

(d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will not have a direct benefit on the health and welfare of California residents.

(e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

(f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST (Policy Statement Overview)

Current regulations in Section 364.1, SHARE Elk Hunts, T14, CCR, specify elk tag quotas for each hunt area. In order to achieve elk herd management goals and objectives and maintain hunting quality, it is periodically necessary to adjust quotas in response to dynamic environmental and biological conditions. In conjunction with proposed amendments to Section 364, Elk, which will delete, amend and add hunt areas, it is necessary to similarly amend Section 364.1 for consistency.

Preliminary tag quota ranges are indicated pending final 2016 tag allocations in accordance with elk management goals and objectives. Survey data collected between October 2015, and March 2016, will be the basis for the final tag numbers recommended to the Commission at the April 2016 adoption hearing. The quota ranges for 2016 elk tags are indicated in the proposed Regulatory Text.

Other minor editorial changes and renumbering have also been made.

The complete Table and text is found in the attached proposed Regulatory Text of Section 364.1.

Benefits of the regulations

The proposed regulations will contribute to the sustainable management of elk populations in California. Existing elk herd management goals specify objective levels for the proportion of bulls in the herds. These ratios are maintained and managed in part by annually modifying the number of tags. The final values for the license tag numbers will be based upon findings from annual harvest and herd composition counts where appropriate.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate elk hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to elk tag allocations are consistent with Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 364.1 is amended to read:

§ 364.1. SHARE-Elk Hunts:

~~(a) Department Administered Shared Habitat Alliance for Recreational Enhancement (SHARE) Elk Hunts~~

~~(1) Siskiyou Roosevelt Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(a)(1)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(2) Big Lagoon Roosevelt Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(a)(2)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(3) Northwestern California Roosevelt Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(a)(3)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(4) Klamath Roosevelt Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(a)(4)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(5) Del Norte Roosevelt Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(a)(5)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(6) Marble Mountains Roosevelt Elk SHARE Hunt~~

~~(A) Area: Within the boundaries identified in Section 364(a)(6)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(7) Northeastern California Rocky Mountain Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(b)(1)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(8) Mendocino Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(c)(1)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(9) Cache Creek Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(1)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(10) La Panza Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(2)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(11) Bishop Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(3)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(12) Independence Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(4)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(13) Lone Pine Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(5)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(14) Tinemaha Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(6)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(15) West Tinemaha Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(7)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(16) Tinemaha Mountain Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(8)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(17) Whitney Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(9)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(18) Grizzly Island Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(10)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(19) Fort Hunter Liggett General Public Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(11)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(20) East Park Reservoir Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(12)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(21) San Luis Reservoir Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(13)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(22) Bear Valley Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(14)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(23) Lake Pillsbury Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(15)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(24) Santa Clara Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(16)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(25) Alameda Tule Elk SHARE Hunt:~~

~~(A) Area: Within the boundaries identified in Section 364(d)(17)(A). Individual property boundaries will be identified in the SHARE application package.~~

~~(b) (a) Season: The overall season shall open on the August 15 through January 31.~~

~~Individual SHARE properties will be assigned seasons corresponding with management goals.~~

~~(c) Number of SHARE Elk License Tags~~

(25)	Alameda	0	-	-	-

(d) (b) Bag and Possession Limit: Each elk tag is valid only for one elk per season and only in the SHARE hunt area drawn, and persons shall only be eligible for one elk tag per season through 364 or 364.1.

(e) Definitions:

(1) Bull elk: Any elk having an antler or antlers at least four inches in length as measured from the top of the skull.

(2) Spike bull: A bull elk having no more than one point on each antler. An antler point is a projection of the antler at least one inch long and longer than the width of its base.

(3) Antlerless elk: Any elk, with the exception of spotted calves, with antlers less than four inches in length as measured from the top of the skull.

(4) Either-sex elk: For the purposes of these regulations, either-sex is defined as bull elk or antlerless elk.

(c) Individual property boundaries will be identified in the SHARE application package.

~~(f)~~(d) Method of Take: Only methods for taking elk as defined in Sections 353 and 354 may be used.

~~(g)~~(e) Tagholder Responsibilities: See subsection 364(z).

~~(1)~~ No tagholder shall take or possess any elk or parts thereof governed by the regulations except as provided herein.

~~(3)~~ Any person taking an elk that has a collar or other marking device attached to it shall

~~(2)~~ The department reserves the right to use any part of the tagholder's elk for biological analysis as long as the amount of edible meat is not appreciably decreased.

provide the department with such marking device within 10 days of taking the elk.

~~(h)~~(f) The use of dogs to take or attempt to take elk is prohibited.

~~(i)~~(g) Applicants shall apply for a SHARE Access Permit, and pay a nonrefundable application fee as specified in Section 602, through the department's Automated License Data System terminals at any department license agent, department license sales office, or online.

~~(j)~~(h) Upon receipt of winner notification, successful applicants shall submit the appropriate tag fee as specified in Section 702 through any department license sales office or online through the department's Automated License Data System.

STATE OF CALIFORNIA
FISH AND GAME COMMISSION
INITIAL STATEMENT OF REASONS FOR REGULATORY ACTION
(Pre-Publication of Notice Statement)

Amend Subsection 472
Title 14, California Code of Regulations (CCR)
Re: Nongame Animals, General Provisions

I. Date of Initial Statement of Reasons: November 2, 2015

II. Dates and Locations of Scheduled Hearings:

(a) Notice Hearing: Date: December 10, 2015
Location: San Diego, CA

(b) Discussion Hearings: Date: February 11, 2016
Location: Sacramento, CA

(c) Adoption Hearing: Date: April 14, 2016
Location: Santa Rosa, CA

III. Description of Regulatory Action:

(a) Statement of Specific Purpose of Regulation Change and Factual Basis for Determining that Regulation Change is Reasonably Necessary:

1. It is necessary to amend subsection 472(a), Title 14, California Code of Regulations (CCR), in order to specify rock doves (*Columba livia*) as a nongame bird in conformance with Fish and Game Code (FGC), Section 3680 regarding take.

The hunting status of rock doves (*Columba livia*), commonly referred to as domestic pigeons, is unclear under existing law. FGC Section 3680 presumes that the shooting or taking of rock doves is lawful. However, since their status (e.g. as a nongame bird) in the Code is unclear, the actual conditions under which they can be shot or taken is also unclear. FGC Section 3800 makes it unlawful to take nongame birds except as authorized by code or regulation. Nongame birds are defined in that section as all birds "...occurring naturally in California..." that are not otherwise classified. While rock doves are not native to California, at this time they are naturally occurring meaning they live and raise their young here. Adding rock doves to subsection 472(a) will make clear their status as nongame birds and the conditions under which they can be taken.

The prohibition on the intentional take of racing pigeons as provided under FGC 3680 will be maintained.

2. It is necessary to extend the season for take of nonnative deer as set forth in subsection 472(b).

The purpose of this amendment is to create new hunting opportunities in order to reduce the populations of nonnative deer species to the benefit of all species that are native to California. This regulation change will extend the hunting season beyond the general deer season by allowing the take of nonnative deer during any deer, elk or pronghorn antelope season and on private properties with authorized hunts.

Current regulation, subsection 472(b), permits the take of nonnative deer [including: fallow (*Dama dama*), sambar (*Rusa unicolor*), sika (*Cervus nippon*), and axis (*Axis axis*) deer] during the general deer season in the deer zone where they are found. However, increased populations of these nonnative species have developed in many areas of California to the detriment of our native wildlife. Nonnative deer species compete with native species for the limited resources, forage, and habitat, necessary for survival. They may also transmit diseases or parasites for which native species have no natural immunity or defenses. (For example, hairless deer syndrome in native deer is associated with lice found naturally on fallow deer.)

The amendment of subsection 472(b) further clarifies that hunters taking nonnative deer must possess a valid hunting license in accordance with Fish and Game Code 3007. However, no tag, stamp, or additional endorsement of any kind is required.

While the take and reduction of nonnative deer populations is considered beneficial by the Department, Fish and Game Code, Section 4304 provides that it is unlawful to allow “flesh normally eaten by humans to go to waste.” For the purpose of clarification, the regulatory text is amended stating that the flesh of nonnative deer should not go to waste.

The proposed amendments to subsection 472(b) specifically:

- Require the possession of a valid CA hunting license, however, no tag, stamp, or additional endorsement of any kind is required;
- Establish an extended season concurrent with the general seasons for deer, elk, or pronghorn antelope and during authorized seasons on private property;
- Clarify that It is unlawful to needlessly waste the edible flesh of nonnative deer; and,
- Establish that there is no bag or possession limit for hunting of nonnative deer.

- (b) Authority and Reference Sections from Fish and Game Code for Regulation:

Authority: Sections 3800 and 4150 Fish and Game Code.

Reference: Sections 2003, 3007, 3680, 3800, 3801, 3801.5, 4150, and 4304, Fish and Game Code.

- (c) Specific Technology or Equipment Required by Regulatory Change: None.
- (d) Identification of Reports or Documents Supporting Regulation Change: None.
- (e) Public Discussions of Proposed Regulations Prior to Notice Publication:

A public discussion was held at the Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

- (a) Alternatives to Regulation Change:

No alternatives were identified.

- (b) No Change Alternative:

Regarding the take of rock doves, the no change alternative was considered and rejected because the regulation would continue to be confusing and applied inconsistently on a state-wide basis.

The no change alternative was considered and rejected for the extended seasons for take of nonnative deer because it would not allow for the management of these nonnative species; the negative impacts to native species populations and their habitats would continue to occur.

- (c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action:

The potential for significant statewide adverse economic impacts that might result from the proposed regulatory action has been assessed, and the following initial determinations relative to the required statutory categories have been made.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businesses to Compete with Businesses in Other States:

The proposed action will not have a significant statewide adverse economic impact directly affecting business, including the ability of California businesses to compete with businesses in other states. The proposed regulations are unlikely to increase or decrease current levels of hunting effort in California.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources. The Commission anticipates benefits to the State's environment in the sustainable management of natural resources.

The proposed action will not have significant impacts on jobs or business within California and does not provide benefits to worker safety.

- (c) Cost Impacts on Representative Private Persons/Business:

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with the proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State:
None.

- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.

- (f) Programs Mandated on Local Agencies or School Districts: None.

- (g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4:
None.

- (h) Effect on Housing Costs: None.

VII. Economic Impact Assessment.

The proposed amendments will clarify the regulation regarding the take of rock doves, and extend the season for the take of nonnative deer. There are no costs to businesses or persons.

- (a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs because it is unlikely to increase or decrease current levels of hunting effort in California.

- (b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not impact the creation of new businesses or the elimination of businesses because it is unlikely to increase or decrease current levels of hunting effort in California.

- (c) Effects of the regulation on the expansion of businesses currently doing business within the State

The regulation will not affect the expansion of businesses currently doing business within the State because it is unlikely to increase or decrease current levels of hunting effort in California.

- (d) Benefits of the regulation to the health and welfare of California residents:

The Commission anticipates benefits to the health and welfare of California residents. Hunting provides opportunities for multi-generational family activities and promotes respect for California's environment by the future stewards of the State's resources.

- (e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

- (f) Benefits of the regulation to the State's environment

It is the policy of the State to encourage the conservation, maintenance, and utilization of the living resources. The proposed action will further this core objective.

INFORMATIVE DIGEST (Policy Statement Overview)

The current regulations in subsections 472(a) and (b), T14, CCR do not address the take of rock doves and limits the take of nonnative deer species (including fallow, sambar, sika, and axis deer) to the general deer season. The proposed amendments will clarify the regulation regarding the take of rock doves, and extend the season for the take of nonnative deer.

Subsection 472(a) will specify rock doves as a nongame species that can be taken by any means at any time.

Subsection 472(b) will extend the season for take of nonnative deer and:

- Require the possession of a valid CA hunting license, however, no tag, stamp, or additional endorsement of any kind is required;
- Permit hunts on properties where an authorized deer, elk or pronghorn antelope season is open;
- Clarify that it is unlawful to needlessly waste the edible flesh of nonnative deer; and,
- Establish that there is no bag or possession for hunting of nonnative deer.

Benefits of the regulations

The regulation will clarify the conditions of take for rock doves to provide consistency in application on a state-wide basis. Establishing specific regulations regarding the take of nonnative deer species will create new hunting opportunities and help reduce negative impacts on native species populations and habitats by reducing the population of the competing nonnative species.

Non-monetary benefits to the public

The Commission does not anticipate non-monetary benefits to the protection of public health and safety, worker safety, the prevention of discrimination, the promotion of fairness or social equity and the increase in openness and transparency in business and government.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate hunting in California and the take of species in general in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to the general provisions of the nongame section consistent with the provisions of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations. There are no related federal regulations.

REGULATORY TEXT

Section 472, Title 14, CCR, is amended to read:

§ 472. General Provisions.

Except as otherwise provided in Sections 478 and 485 and subsections (a) through (d) below, nongame birds and mammals may not be taken.

(a) The following nongame birds and mammals may be taken at any time of the year and in any number except as prohibited in Chapter 6: English sparrow, starling, rock dove (*Columba livia*) (except as prohibited in Fish and Game Code section 3680), coyote, weasels, skunks, opossum, moles and rodents (excluding tree and flying squirrels, and those listed as furbearers, endangered or threatened species).

(b) Fallow, sambar, sika, and axis deer may be taken only ~~concurrently with the general deer season.~~ as follows:

(1) Possession of a valid hunting license is required. No tag, stamp, or additional endorsement of any kind is required.

(2) On properties where an authorized deer, elk or pronghorn antelope season is open.

(3) It shall be unlawful to detach or remove only the head, hide or antlers of any deer taken under this section, or to leave through carelessness or neglect any portion of the flesh normally eaten by humans to go to waste.

(4) Bag and Possession Limit: None.

... [No changes to subsections (c) through (e)]

Note: Authority cited: Sections ~~355~~, 3800 and 4150, Fish and Game Code. Reference: Sections ~~355~~, 2003, 3800, 3007, 3680, 3801, 3801.5, ~~and~~ 4150, and 4304, Fish and Game Code.

the FRT. These include, but are not limited to, illness, military deployment, and hunt area closure (e.g. fire, etc.). However, the decision to return the tag must be made at least ten business days before the start of the season. If possible, the returned FRT will be made available for purchase by the next highest bidder(s).

Proposed Regulations

Add a new Section 708.18 setting forth a procedure to allow the refund of the price of Fund Raising Tags provided that a written request citing the circumstances beyond the control of the holder that prevent the use of the tag, and the tag are received by the Department at least ten business days before the start of the season.

(b) Authority and Reference:

Note: Authority cited: Sections 200, 202, 331, 332, 1050, 4334, and 4902 Fish and Game Code. Reference: Sections 331, 332, 1050, 4334, and 4902 Fish and Game Code.

(c) Specific Technology or Equipment Required by Regulatory Change: None.

(d) Identification of Reports or Documents Supporting Regulation Change: None

(e) Public Discussions of Proposed Regulations Prior to Notice Publication:

Fish and Game Commission's Wildlife Resources Committee meeting held on September 9, 2015 in Fresno, California.

IV. Description of Reasonable Alternatives to Regulatory Action:

(a) Alternatives to Regulation Change:

No alternatives were identified.

(b) No Change Alternative:

The no change alternative was considered and rejected because it does not provide a method by which purchasers of fund-raising tags, who cannot use the tag, may seek a refund.

(c) Consideration of Alternatives:

In view of information currently possessed, no reasonable alternative considered would be more effective in carrying out the purpose for which the regulation is proposed, would be as effective and less burdensome to affected private persons than the proposed regulation, or would be more cost

effective to affected private persons and equally effective in implementing the statutory policy or other provision of law.

V. Mitigation Measures Required by Regulatory Action:

The proposed regulatory action will have no negative impact on the environment; therefore, no mitigation measures are needed.

VI. Impact of Regulatory Action.

- (a) Significant Statewide Adverse Economic Impact Directly Affecting Businesses, Including the Ability of California Businessmen to Compete with Businesses in Other States.

The proposed action will not have a significant statewide adverse economic impact directly affecting businesses, including the ability of California businesses to compete with businesses in other states. The proposed changes merely specify the process for refunding the cost of a FRT that cannot be used by the purchaser due to circumstances beyond their control.

- (b) Impact on the Creation or Elimination of Jobs Within the State, the Creation of New Businesses or the Elimination of Existing Businesses, or the Expansion of Businesses in California; Benefits of the Regulation to the Health and Welfare of California Residents, Worker Safety, and the State's Environment:

The Commission does not anticipate any impact on jobs or businesses in California; the regulation does not provide benefits to California residents or to worker safety.

The Commission does expect a small benefit to the State's environment because the proceeds of the sale of the fund raising tags are deposited to the Big Game Management Account established by the Legislature in Fish and Game Code Section 3953 for the sustainable management of the state's big game resources. The refund process, and subsequent re-sale of the tag, assures hunters that the money spent is worthwhile and without risk.

- (c) Cost Impacts on Representative Private Persons/Business.

The Commission is not aware of any cost impacts that a representative private person or business would necessarily incur in reasonable compliance with this proposed action.

- (d) Costs or Savings to State Agencies or Costs/Savings in Federal Funding to the State: None.

- (e) Other Nondiscretionary Costs/Savings to Local Agencies: None.

- (f) Programs Mandated on Local Agencies or School Districts: None.

(g) Costs Imposed on Any Local Agency or School District that is Required to be Reimbursed under Part 7 (commencing with Section 17500) of Division 4. None.

(h) Effect on Housing Costs: None.

VII. Economic Impact Assessment

The purpose of the proposed amendments is to establish a process for refunding the price of fund raising license tags purchased at auction. Although the hunter may successfully bid on these highly desirable tags, there are rare instances when the hunter cannot use or is prevented from using the tag. The refund is an equitable method of providing relief under circumstances beyond the control of the hunter. There are no costs to businesses or persons.

(a) Effects of the regulation on the creation or elimination of jobs within the State:

The regulation will not affect the creation or elimination of jobs. The proposed changes merely specify the process for refunding the cost of a FRT that cannot be used by the purchaser due to circumstances beyond their control.

(b) Effects of the regulation on the creation of new businesses or the elimination of existing businesses within the State:

The regulation will not create new businesses or eliminate businesses within the State. The proposed changes merely specify the process for refunding the cost of a FRT that cannot be used by the purchaser due to circumstances beyond their control.

(c) Effects of the regulation on the expansion of businesses currently doing business within the State:

The regulation will not affect the expansion of businesses currently doing business in the State. The proposed changes merely specify the process for refunding the cost of a FRT that cannot be used by the purchaser due to circumstances beyond their control.

(d) Benefits of the regulation to the health and welfare of California residents:

The proposed regulation will not have a direct benefit on the health and welfare of California residents.

(e) Benefits of the regulation to worker safety.

The proposed regulation will not affect worker safety.

(f) Benefits of the regulation to the State's environment:

The Commission expects a small benefit to the State's environment because the proceeds of the sale of the fund raising tags are deposited to the Big Game Management Account established by the Legislature in Fish and Game Code Section 3953 for the sustainable management of the state's big game resources.

INFORMATIVE DIGEST (Policy Statement Overview)

Existing regulations in Section 708, T14, CCR specify procedures and conditions for returning or exchanging big game tags and refunding tag fees but do not identify similar procedures to allow the return of big game fund raising tags sold by qualifying non-governmental organizations at auction.

This proposal would add Subsection 708.18 to establish regulations which allow the return of the purchase price for fund raising tags. The new provisions set forth a few possible circumstances beyond the control of the holder under which, by example, the tag holder may not be able to use the FRT. These include, but are not limited to, illness, military deployment, and hunt area closure (i.e., fire, etc.). However, the request to return the tag must be made in writing to the Department, at least ten business days before the start of the season. If possible, the returned FRT will be made available for purchase by the next highest bidder(s).

Benefits of the Regulation

The Commission anticipates benefits to the health and welfare of California residents and benefits to the State's environment because the proposed regulations assist the Department in the sustainable management of California's natural resources.

Consistency with State or Federal Regulations

The Fish and Game Commission, pursuant to Fish and Game Code Sections 200, 202 and 203, has the sole authority to regulate big game hunting in California. Commission staff has searched the California Code of Regulations and has found the proposed changes pertaining to the refund of the price of unused fund raising tags to be consistent with the provisions of Title 14. Therefore the Commission has determined that the proposed amendments are neither inconsistent nor incompatible with existing State regulations.

REGULATORY TEXT

Section 708.18 is added to read as follows:

§ 708.18. Fund Raising Big Game License Tags, Return for Refund

(a) Any tagholder who was awarded a big game fund raising tag through an auction and cannot hunt may submit a written request to the department for a refund of the amount paid for the tag provided that:

(1) The request is due to circumstances beyond the control of the tag holder that prevent the use of the tag during the length of the season and in any zone open for hunting, including, but not limited to:

(A) Serious medical condition, or death, of the tag holder;

(B) Military deployment of the tag holder; or

(C) An area closure that prohibits or limits the tag holder's ability to hunt.

(2) The tag holder shall return the tag with the written request and supporting documentation to the department's License and Revenue Branch at least ten business days before the start of the season for which the tag is valid.

(3) The department will consider the request and may refund the amount paid for the tag.

(4) The department may offer the tag to the next highest bidder(s) at the auction event in the amount of their final bid.

Note: Authority cited: Sections 200, 202, 331, 332, 1050, 4334, and 4902, Fish and Game Code. Reference: Sections 331, 332, 1050, 4334, and 4902, Fish and Game Code.

CHAPTER 1 – SUMMARY

PROPOSED PROJECT AND ALTERNATIVES

The project under consideration consists of adjustments to tag quotas for each deer hunting zone and additional hunts, modifications to existing seasons, creation of new seasons, and modifications of regulation for clarity. The Department is recommending that the Commission adopt regulations that will provide for limited public hunting of buck, antlerless and either-sex deer in a total of 44 hunting zones, 28 area-specific archery hunts, 43 additional hunts, 75 Private Lands Wildlife Habitat Enhancement and Management (PLM) Area Program hunts (PLM areas are licensed in May through September), and 10 fund-raising license tags. Hunter quotas are determined using annual deer herd survey data and deer population modeling techniques. Primary input to these models includes the results of annual deer herd surveys, herd objectives contained in approved deer herd management plans, and both hunting and non-hunting mortality. Because final hunter quotas cannot be established until late March when over-winter fawn survival is determined, the Commission is provided with a range of proposed hunting tag quotas. Upon completion of spring herd composition surveys, consultation with the Interstate Deer Committee and final population modeling, the Department will determine and recommend to the Commission final hunting tag quotas.

The Proposed Project represents management options (elements) within a particular hunt zone that will achieve a desired kill (DK) from the herd(s). DK refers to a harvest strategy that provides for a harvest of animals with a safety margin to protect against over harvesting the herd(s). This safety margin is usually in the form of reduced tag quotas and/or seasons. Alternative 2 represents management options (elements) within a particular hunt zone that will achieve a high kill (HK) from the herd(s). Alternative 3 represents management options (elements) within a particular hunt zone that will produce a relatively small harvest.

The Commission may select a combination of elements within the Proposed Project and Alternatives 2 and 3 for any particular zone because the effects of a combined project will fall within the analysis of the High kill project (Alternative 2) and the Low kill project (Alternative 3). The Commission may also select a reduced (in terms of kill) project or no-change (no project) option for any element within the Proposed Project and Alternatives 2 and 3 because the effects of such an action would fall somewhere within the analysis provided.

SUMMARY OF IMPACTS AND MITIGATION

Table 1. Impact Summary

Alternative	Significant Impact	Nature of Impact	Mitigation Available	Nature of Mitigation
Proposed Project	No	None	N/A	N/A
1. No Change	No	None	N/A	N/A
2. High Kill	No	None	N/A	N/A
3. Low Kill	No	None	N/A	N/A

The removal of individual animals through hunting, together with other natural mortality, from any of the deer herds, should not significantly reduce herd size over the annual cycle. The proposed action is expected to result in maintaining the herd ratio objectives around the approved management plan objectives. The production and survival of young animals within each herd should replace the animals removed by hunting. Therefore, the proposed action of harvesting deer by hunting should not have a significant adverse impact on either local populations or the statewide population of deer beyond the annual cycle.

Mitigation

The project has been designed to limit pain and suffering by the specification of prescribed methods of take. These method restrictions are designed to make the hunting equipment highly lethal to the target animal. Methods for taking deer are regulated during the general season under the provisions of Sections 353 and 354, Title 14, California Code of Regulations.

AREAS OF CONTROVERSY

A public scoping session regarding the preparation of environmental documents for hunting big game species was held on October 11, 2006 at the Wildlife Branch office located at 1812 Ninth Street, Sacramento. At that meeting, the use of lead ammunition to take big game animals in California (primarily within the range of the California condor) and the impact of mountain lion predation on the deer population were identified as areas of controversy.

ISSUES TO BE RESOLVED

Issues to be resolved relate to the decisions regarding how to provide public hunting of deer as an element of deer management. Specific issues to be resolved include the establishment of specific hunt areas, season dates, bag and possession limits, hunter quotas, special conditions and methods of take. Additionally, the issue of whether to adopt the proposed project or an alternative needs to be resolved.

FUNCTIONAL EQUIVALENCY

CEQA review of the proposed project will be conducted in accordance with the Commission's certified regulatory program (CRP) approved by the Secretary for the California Resources Agency pursuant to Public Resources Code section 21080.5 (See generally Cal. Code Regs., tit. 14, §§ 781.5, and 15251, subd. (b).). The California Environmental Quality Act (CEQA) requires all public agencies in the State to evaluate the environmental impacts of projects they approve, including regulations, which may have a potential to significantly affect the environment. The Department has prepared this Environmental Document (ED), which is the functional equivalent of an Environmental Impact Report, on behalf of the Commission in compliance with this requirement. The ED provides the Commission, other agencies, and the general public with an objective assessment of the potential effects.

CHAPTER 2 – THE PROPOSED ACTION

Each alternative and the Proposed Project was analyzed using KILLVARY, a computer simulation model developed to estimate deer population size and analyze the effects of various harvest strategies on deer populations. Inputs to run the model include herd composition data (Appendix 4) and prior year harvest (Appendix 5). The results for the Proposed Project and Alternatives 2 and 3 are described for each hunting zone (Appendix 3) and are accompanied by a table (Appendix 4) to aid the reader in understanding the possible effects of the hunting alternatives. Specifically, the effects of the alternative on total kill, the proportion of bucks in the herd (buck ratio) and the population size are presented. Thus, each alternative receives an equal level of consideration and analysis.

The specific process for developing the elements of the Proposed Project and Alternatives 2 and 3 for each of the zones is depicted in Figures 1 and 2. The KILLVARY Model produces a number of bucks and does that can be harvested to meet the goal/criteria for each element of the Proposed Project and Alternatives 2 and 3. In addition, a harvest buffer is developed and evaluated for each alternative by hunt zone. The harvest buffer is an additional number of deer (unallocated) that could be harvested within the hunt zone that would not have a significant adverse effect on the deer population. Additionally, the number of bucks and does expected to be killed on PLMs and by archery only hunters are subtracted from the harvest allocation (Figure 2). The remaining number of bucks and does are then allocated to the hunts listed under each alternative based on the desired harvest and on past and expected hunter caused mortality rates for each hunt. New hunt tag quotas are based on estimated hunter caused mortality rates of similar existing hunts either in the same or similar zone.

Figure 1. Alternative Evaluation Process

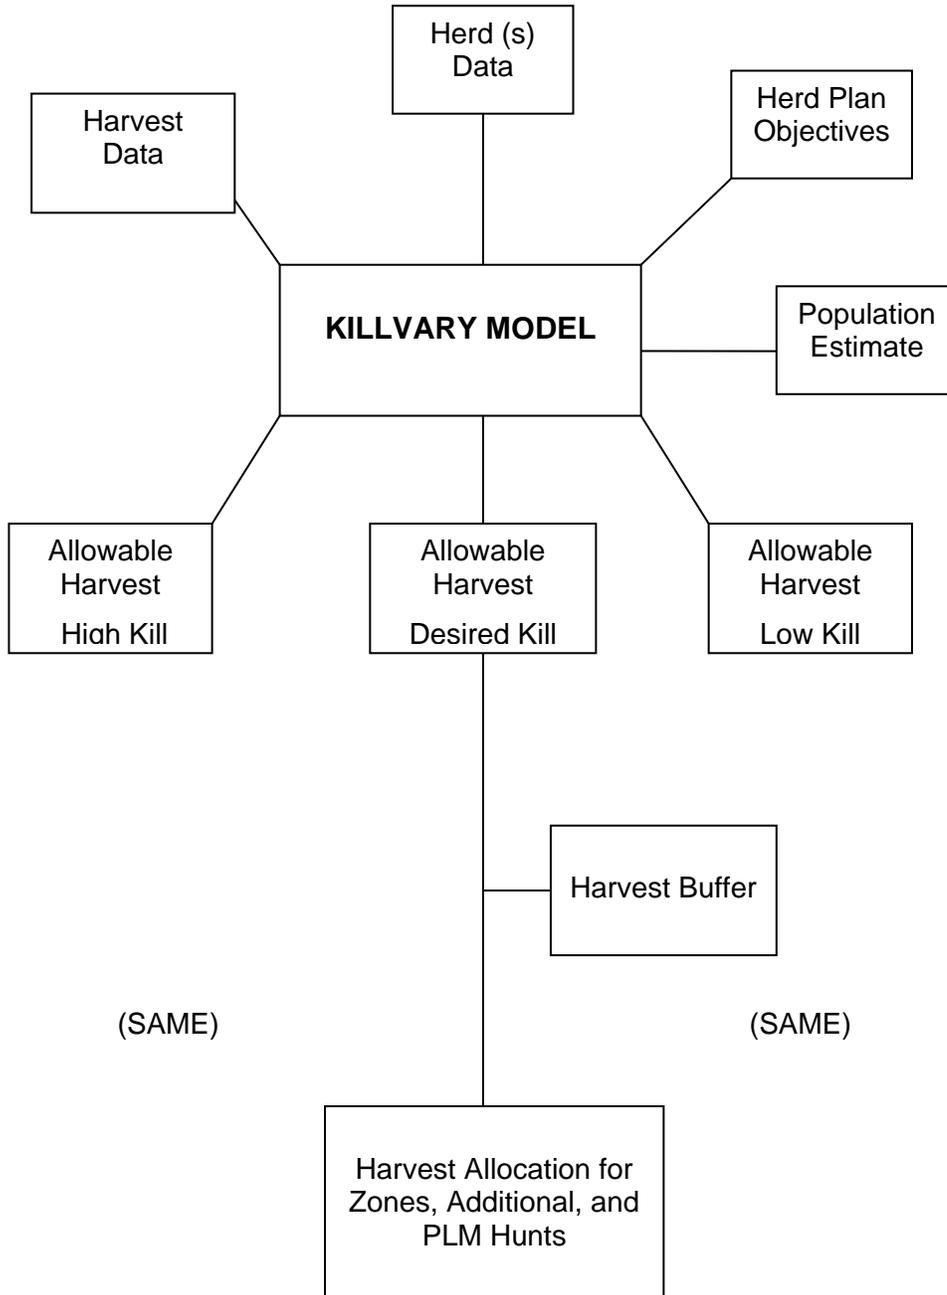

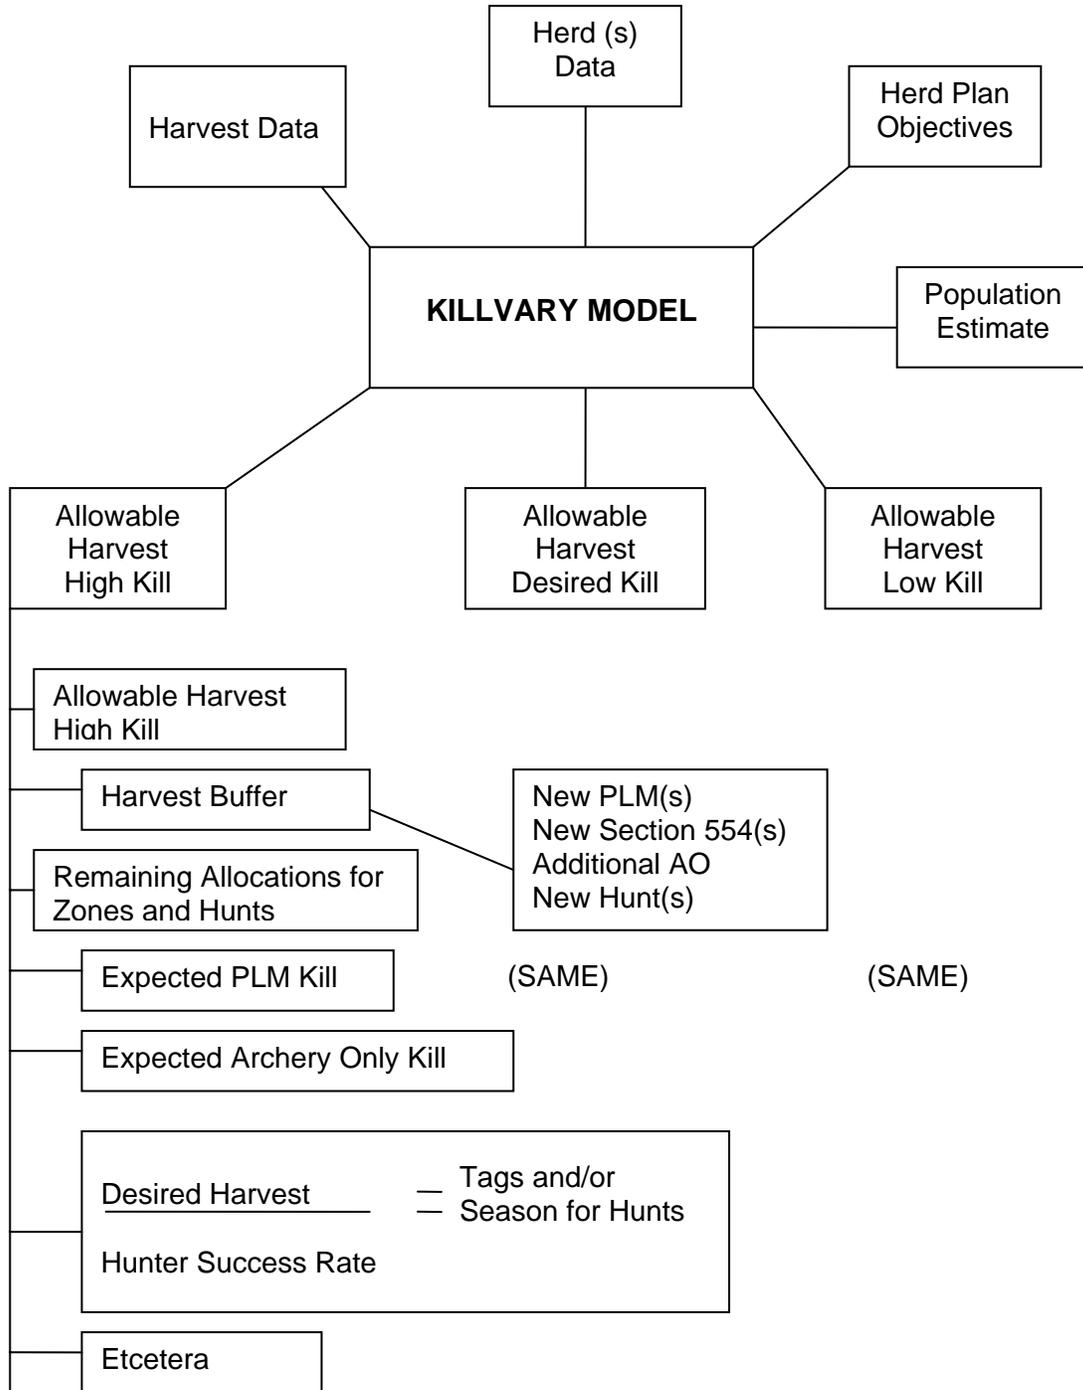

Figure 2. Tag and Season Allocation Process

This process results in the tag range and/or hunt season listed for each of the hunts under the Proposed Project and Alternatives 2 and 3.

The harvest buffer allocation is to allow for small adjustments in tag quotas or hunts, new PLMs, new Section 554 areas, and new hunts that might be proposed by the public during the Commission meetings. The buffers have been developed such that whether or not any part of the buffers are eventually allocated, the hunts will have no significant adverse effect on the deer resource or the ability of the project to achieve its goals.

Section 360(a) – A, B, C, and D Zone Hunts

1. Number of Tags

Existing regulations provide for the number of hunting tags for the A, B, C, and D zones. The proposal changes the number of tags for all existing zones to a series of ranges (See Appendix 1).

The proposal provides a range of tag numbers for each zone from which a final number will be determined, based on the post-winter status of each deer herd. These ranges are necessary, as the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of bucks available next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

The actual tag numbers for each affected zone will be selected and authorized by the Fish and Game Commission from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where severe winter conditions adversely effect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range

Section 360(b) – X Zone Hunts

1. Number of Tags

Existing regulations provide for the number of hunting tags for the X zones. The proposal changes the number of tags for all existing zones to a series of ranges (See Appendix 1).

The proposal provides a range of tag numbers for each zone from which a final number will be determined, based on the post-winter status of each deer herd. These ranges are necessary, as the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of bucks available next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

The actual tag numbers for each affected zone will be selected and authorized by the Fish and Game Commission from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where severe winter conditions adversely effect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range.

Section 360(c and d) – Additional Hunts

1. Number of Tags

Existing regulations provide for the number of hunting tags in the Additional Hunts. The proposal changes the number of tags for all existing hunts to a series of ranges (See Appendix 1).

The proposal provides a range of tag numbers for each hunt from which a final number will be determined, based on the post-winter status of each deer herd. These ranges are necessary, as the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios,

and the predicted number of bucks available next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

The actual tag numbers for each affected hunt will be selected and authorized by the Fish and Game Commission from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where severe winter conditions adversely effect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range.

2. Modify Season for Additional Hunt G-8

Existing regulations for Additional Hunt G-8 (Fort Hunter Liggett Antlerless Deer Hunt) provide for hunting on Saturdays, Sundays, and the Columbus Day holiday only beginning the first Saturday in October and extending for two consecutive weekends. The Base has specifically requested the season be modified to begin on the Thursday preceding the Columbus Day weekend and run for five consecutive days to accommodate Base operations and other hunt opportunities.

The proposal would modify the season by consolidating a hunt season consisting of two weekends and a holiday into a five consecutive day season in order to accommodate other hunts and Base operations. No loss of hunter opportunity would result from this action and the proposal is consistent with existing deer herd management plan recommendations.

3. Modify Season and Special Conditions for Additional Hunt G-10

Existing regulations for Additional Hunt G-10 (Camp Pendleton Either-Sex Deer Hunt) provide for hunting on Saturdays, Sundays, Columbus and Veteran's Day, and the day after Thanksgiving, beginning the third Saturday in September and continuing through the Thanksgiving Day weekend. Certain federal holidays occur on weekdays when the Base is normally closed and additional hunter opportunity has been lost. The Base has specifically requested: the season be lengthened by adding two weeks to the beginning of the season; one week to the end of the season; include all holidays and the day after Thanksgiving, in order to provide additional hunter opportunity. In addition, the Base has requested that additional weekdays be included at the discretion of the Commanding Officer for those days when military operations have been suspended or reduced.

The proposal would modify the season to begin on the first Saturday in September and extend through the first Sunday in December; specifically include all holidays; and allow the Commanding Officer discretion, with Department concurrence, to provide additional hunt days on weekdays during the season should military operations be suspended. Special conditions are also adjusted to account for the additional three weeks added to the season. These actions would provide an increase in hunter opportunity as requested by the Base, while maintaining consistency with existing deer herd management plan recommendations.

4. Modify Season for Additional Hunt J-10

Existing regulations for Additional Hunt J-10 (Fort Hunter Liggett Junior Either-Sex Deer Hunt) provide for hunting on Saturdays, Sundays, and the Columbus Day holiday only beginning the first Saturday in October and extending for two consecutive weekends. The Base has specifically requested the season be modified by adding two days to the beginning of the season in order to provide additional junior hunting opportunity.

The proposal would modify the season by adding two days to the beginning of the season (Thursday and Friday). These actions would result in increased hunter opportunity, and are consistent with existing deer herd management plan recommendations.

Section 361 – Archery Deer Hunting

1. Number of Tags

Existing regulations provide for the number of hunting tags in the Additional Hunts. The proposal changes the number of tags for all existing hunts to a series of ranges (See Appendix 1).

The proposal provides a range of tag numbers for each hunt from which a final number will be determined, based on the post-winter status of each deer herd. These ranges are necessary, as the final number of tags cannot be determined until spring herd data are collected in March/April.

In early spring, surveys of deer herds are conducted to determine the proportion of fawns that have survived the winter. This information is used in conjunction with the prior year harvest and fall herd composition data to estimate overall herd size, sex and age ratios, and the predicted number of bucks available next season. The number of bucks and does needs to be estimated prior to the hunting season to determine how many surplus bucks will exist over and above the number required to maintain the desired buck ratio objectives stated in the approved deer herd management plans.

The actual tag numbers for each affected hunt will be selected and authorized by the Fish and Game Commission from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where severe winter conditions adversely effect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range.

2. Establish New Area-Specific Archery Hunt A-33

Existing regulations provide deer hunting area descriptions, seasons, bag and possession limits, and number of tags for Zone A. The zone currently provides limited late season archery deer hunting opportunities in the zone, Hunt A-32 (Ventura/Los Angeles Late Season Archery Either-Sex Deer Hunt). In an effort to increase opportunity for archery method hunters, provide a higher expectation of success, and meet public demand for increased hunter opportunity while meeting approved deer herd plan objectives, the proposal would establish a new late season archery hunt opportunity in Zone A on the Fort Hunter Liggett Military Base.

The proposal creates a new Area-Specific Archery Hunt, A-33 (Fort Hunter Liggett Late Season Archery Either-Sex Deer Hunt). The area would include that portion of Monterey County lying within the exterior boundaries of the Hunter Liggett Military Reservation, except as restricted by the Commanding Officer. The season would be open on Saturdays, Sundays and holidays only beginning the first Saturday in October and continuing through the Veteran's Day holiday in November, except if rescheduled by the Base Commander between the season opener and December 31 with Department concurrence. The bag and possession limit would be one, either-sex deer with a recommended tag quota range of 20-100 tags to be split between military only personnel, distributed by the Base; and the general public, distributed through Department drawing. Special conditions would include a tag refund exchange policy in case of hunt cancellation by the Commanding Officer. This proposal would meet an expressed public demand for increased late season and archery hunting opportunity, maintain appropriate harvest levels within the Hunter Liggett Military Reservation and Zone A deer herds, and be consistent with existing deer herd management plan recommendations.

The actual tag numbers for each affected hunt will be selected and authorized by the Fish and Game Commission from the range of values provided by this proposal. The number of tags is intended to allow the appropriate level of hunting opportunity and harvest of bucks in the population, while achieving or maintaining the buck ratios at, or near, objective levels set forth in the approved deer herd management plans. These

final values for the license tag numbers will be based upon findings from the annual harvest and herd composition counts. However, under circumstances where severe winter conditions adversely effect herd recruitment and over-winter adult survival, final tag quotas may fall below the proposed tag range.

BACKGROUND AND EXISTING CONDITION

Background

Deer management in California is guided by State law and policies of the Commission and the Department. The goals of deer management are to encourage the conservation, restoration, maintenance and utilization of California's wild deer populations. Deer herd management plans were developed to: (1) assure that conservation of deer is in accordance with maintaining sufficient deer populations and habitat to provide for the beneficial use and enjoyment of wildlife by all citizens of the State; (2) perpetuate deer for their intrinsic and ecological values, as well as for their direct benefits to man; and (3) provide for aesthetic, educational and nonappropriative uses of deer. The objectives of the plans are to restore and maintain healthy deer herds in the wild state and to provide for high-quality and diversified use of deer in California.

As specified in the Fish and Game Code (sections 450-460), deer are managed on a unit basis, where a unit consists of an individual deer herd or group of similar herds. Individual deer herd management objectives are contained in 80 plans, which were prepared by the Department in conjunction with land management agencies, private landowners and the general public. The actions recommended in the herd plans include programs to: obtain information needed about deer; maintain and increase the quality of deer habitat statewide, including the identification, maintenance and management of critical deer habitat; reduce natural mortalities; decrease the illegal taking of deer through modern law enforcement; and provide for both hunting and nonhunting uses of deer, consistent with the inherent productivity of individual deer herds.

The project discussed in this document is deer hunting, a portion of the utilization element of each deer herd management plan. Deer hunting is conducted via a "management by objectives" approach. As such, the deer population in each management unit is monitored, and the status is compared to objectives for each unit. When the status of the deer in each unit changes from the objective, recommendations are made to the Commission to modify the deer hunting regulations for that unit. Deer hunting strategies in individual units are commonly changed by modifying the timing or length of the hunting season, modifying the number of hunters, changing the method of take, changing the type of deer (buck, antlerless or both) to be harvested or by adding or removing an additional hunt to a portion of the unit. The best management strategy for hunting in a given unit is dictated by the current status of the deer in the unit, the deer

herd management plan objectives, Department field biologist recommendations, local conditions and public input.

In 1977, legislation (Assembly Bill 1521, Chapter 839) was introduced by Assemblyman Perino which became the backbone of modern deer management in California. The laws, sections 450 through 460, Fish and Game Code, specify the policy of the Legislature, define general deer hunting, provide direction to the Department about managing deer, specify the content of the annual report to the Legislature and direct the Department regarding hunting regulations.

Section 450 declares that it is the policy of the Legislature to encourage the conservation, restoration, maintenance and utilization of California's wild deer populations. Such conservation shall be in accordance with the principles of wildlife resources conservation set forth in Section 1801, Fish and Game Code, and in accordance with the objectives and elements stated in *A Plan for California Deer* (California Department of Fish and Game, 1976). The objectives stated in *A Plan for California Deer* are to restore and maintain healthy deer herds in the wild state and to provide for high-quality and diversified use of deer in California. The objective of the proposed project, therefore, is to implement the Plan's direction to provide high quality and diversified use of deer through public deer hunting.

Section 451 defines the "general deer hunting season" as the annual season for the area in question, as set by the Commission under its general regulatory powers, or as set by statute, for the taking of male deer.

Section 452 directs the Department to designate deer herd management units and a manager for each unit. The units are to be single deer herds or groups of deer herds having similar management and habitat requirements and characteristics. Boundaries of such units need not follow county boundary lines.

Sections 453 through 455 direct the Department to develop plans for deer herd management units. The objectives of such plans shall be the restoration and maintenance of healthy deer herds in the wild state and to provide for high-quality and diversified use of deer in California. The management plans are to contain programs to: obtain information needed about deer; maintain and increase the quality of deer habitat statewide, including the identification, maintenance and management of critical deer habitat; reduce natural mortalities; decrease the illegal taking of deer through modern law enforcement; and provide for both hunting and non-hunting uses of deer, consistent with the basic individual deer herd management unit capabilities. Specifically, the plans discuss the past history of each deer herd and document existing information for each herd. Current problems are listed, and solutions are identified as recommended actions in each of seven elements of deer management: (1) inventory and investigation; (2) habitat; (3) mortality; (4) utilization; (5) law enforcement; (6) communication of

information; and (7) review and update. The plans are to be reviewed annually and shall be the basis for Department's recommendations to the Commission.

Section 456 directs the Department to produce a biennial report to the Legislature and to the Commission on the progress that is being made toward the restoration and maintenance of California's deer herds. Details of the content of the report are discussed in this Chapter under "Reports to the Legislature and Fish and Game Commission". Additionally, the Department shall not recommend to the Commission any deer management program or any modification of the Commission's deer hunting regulations unless they are consistent with deer herd management plans.

Sections 457 through 459 direct the Department to notify the Commission and specified county boards of supervisors of its intent to recommend the taking of antlerless and either-sex deer prior to the Commission's regulation-setting process. Boards of supervisors of 37 of the 58 counties have the authority to modify or veto any Department recommendations for harvesting antlerless and/or either-sex deer, based upon testimony presented at a hearing of the board and the submission of a resolution by the board to the Commission.

Section 460 requires the Department to notify the Commission prior to its regulation-setting process of deer herd units to be placed under a general season and whether any antlerless deer should be taken. If the Department believes that current hunter numbers would adversely affect the deer herd, impair the hunting experience or endanger the public safety, the Department shall also recommend restrictions on hunter numbers. The Department shall inform the Commission of the condition of each deer herd unit, and the Commission shall make the information known to the public.

In addition to sections 450 through 460, other State laws provide for management of wildlife, including deer, on private and military lands for control of depredation due to deer, increased access to the public, and protection and enhancement of habitats.

Sections 3400 through 3408 of the Fish and Game Code provide for the management of fish and wildlife on private lands, and Section 3409 of the Fish and Game Code requires the Department to report every three years to the Speaker of the Assembly, the Chairman of the Senate Committee on Rules, and the chairmen of the policy committees of each house on the participants of the PLM Program, the wildlife management activities undertaken, the wildlife species managed and the harvest data.

Statutes similar to those for management of fish and wildlife on private lands are in sections 3450 through 3453 of the Fish and Game Code for management on military lands.

Section 4181.5 of the Fish and Game Code provides for the taking of deer by a landowner with property which is damaged or in immediate danger of being damaged. This Section directs the Department to issue a permit for taking depredating deer when evidence indicates that damage or the threat of damage has occurred. In lieu of these permits, with the consent of the landowner, the Commission may issue permits to licensed hunters to take deer to stop the damage or threatened damage to private property (Section 4188, Fish and Game Code).
